A collection of fruits from Messrs. GEO. BUNYARD & Co., Maidstone, including nearly sixty dishes, was given an award of a Silver-gilt Knightian Medal. Apples formed the greater feature, and the numerous varieties were shown in excellent condition, all of them being good in point of size for the present date of the season, and a few of them were remarkable for very fine colour. Pears, Peaches, and Plums, also Early Prolific Filbert Nuts, were all shown well (Silver-gilt Knightian Medal).

The subject of the lecture by M. H. Vilmorin induced several exhibitors to display alpine and other Strawberries.

Messrs. H. CANNELL & SONS, Swanley, Kent, showed plants and a few fruits of Perpetual Strawberry, St. Joseph or rubicunda, a kind of improved alpine variety, with medium-sized, rather acid fruits, and plants of Louis Gauthier, but no ripe fruits of the same.

Messrs. BUNYARD & Co. also showed fruits of St. Joseph. Messrs. LAXTON BROS., Bedford, showed plants of St. Joseph Strawberry in 8-inch pots. Also sprays of fruit and plants in fruit of the "Strawberry-Raspberry," similar to those shown at the last meeting. Sprays of same were shown also by Messrs. HARRISON, Leicester.

Mr. J. HUDSON, gr. to LEOPOLD DE ROTHSCHILD, Esq., Gunnersbury House, Acton, showed fruits of perpetual fruiting Strawberries, Quatre Saisons, Rouge amelioré or Improved Red, Belle de Meaux. Also of Royal Sovereign, from plants that had been forced in spring, and were planted out in May last (Cultural Commendation).

An Award of Merit was recommended to fruits of a variety of the Currant Tomato shown by Mr. WRIGHT from the gardens of the Society at Chiswick. This is by no means a novelty, though no award has been previously made to the type.

A. T. M. PIPON, Esq., Farningham, Kent, showed some fruits of a capital type of Perfection Tomato, named Beauty of Bark.

Mr. ABBOT, South Villa, Regent's Park (gr., Mr. Kelf), showed some fruits of Sea Eagle Peach, of fine quality, considering they were grown within 2 miles of Charing Cross (Vote of Thanks).

Lecture

ON PERPETUAL FRUITING STRAWBERRIES.

IN the afternoon was delivered a lecture on the above subject by M. Henry de Vilmorin, the famous Paris nurseryman. M. Vilmorin said that by perpetual fruiting Strawberries he did not mean to describe varieties that might occasionally (either through climatal variations or circumstances of cultivation) produce flowers and fruit in the autumn. This amounted to nothing more than unusual or accidental flowering, and might be observed in many of the flowering shrubs. Proceeding to state that only plants having the perpetual flowering character of the alpine or wood Strawberry might properly be called perpetual fruiting, M. Vilmorin went on to describe certain efforts that had been made on the continent and elsewhere to obtain a strain of large-fruited perpetual Strawberries, and further gave particulars of the earliest mention of such a type, referring to some that were so spoken of in America in 1856. M. Vilmorin, however, was disposed to consider the fact that certain varieties had fruited somewhat continuously in America, due more to details in the cultivation given them, than to characteristics possessed by the varieties themselves. Coming to the Strawberries recently distributed by M. Vilmorin's firm, the lecturer gave his own experience of the characteristics of the varieties Belle de Meaux, Louis Gauthier, and St. Joseph. All of these are essentially perpetual fruiting in habit, and they have been proved so in this country; several exhibits of fruits from English growers being handed to the audience for inspection. The fruits are larger than those of the ordinary alpine Strawberry, but they are of much the same character. Saint Joseph appears to be the most popular of them, and the plants are described by M. Vilmorin as dwarfish and depressed in habit, stem short, foliage flat, fruit heart-shaped, of moderate size, scarlet in flesh and externally, sweetly acid, and of rich flavour. This variety ought, said the lecturer, to be in every garden, and it possibly might become a profitable plant for supplying fruits for market. But Belle de Meaux was the best variety for the amateur, because it produces the finest fruit in quality, though its habit of growth lacks strength, and its fruits will not bear ill-usage. The raiser of these perpetual Strawberries, according to M. Vilmorin, will not rest upon what he has already achieved, but will seek to raise others that will be improvements upon his first production. Louis Gauthier is a vigorous grower, has dark thick leaves, and the fruits are white fleshed, solid, and juicy. In the cultivation of these Strawberries M. Vilmorin recommends that the plants be not allowed to bloom in May, when it is hopeless for them to compete with the ordinary Strawberry crop, but from July to September, provided they be mulched liberally and afforded sufficient water, they would be certain to yield well. Mr. Geo. Bunyard (chairman) reminded the audience that like the Wood Strawberry, the Alpine varieties should not be exposed to a great amount of sun.

ISLE OF WIGHT.

DURING last week three exhibitions of fruits, flowers, vegetables, and plants were held in the Garden Isle, out of twenty shows held in a twelvemonth.

NITON.

On Thursday, August 18, Niton Horticultural and Cottage Garden Society held their fourth annual exhibition, under the presidency of Mr. A. Innes-Vine, who is a very popular President, and gives every encouragement to the development of horticulture. The exhibits numbered nearly 400, and were of the usual high standard of excellence attained by the inhabitants of this rural district. The show was visited in the afternoon by Mr. Godfrey Baring, J.P., Chairman of the Isle of Wight County Council, who showed much interest in the various exhibits.

Mr. W. COTTON secured the Isle of Wight Horticultural Improvement Association Certificate for Cultural Merit, with a fine collection of Begonias.

SHANKLIN.

The nineteenth annual exhibition in connection with the Shanklin Horticultural Society was held on Wednesday, August 17, in the beautiful grounds of Rylstone, by permission of M. Spartali, Esq. The exhibits numbered 700, and, considering the character of the season, they were excellent.

FRESHWATER.

The annual exhibition of the Freshwater, Totland, and Yarmouth Horticultural Society was held on Wednesday and Thursday, the 17th and 18th inst., in the grounds of Farringford Park, by permission of Lord Tennyson, the President of the Society.

Two large and well-arranged non-competitive groups were staged by Mr. Russell, gr. to Lord TENNYSON; and Mr. A. W. KIME, F.R.H.S., gr. to Col. PEARSON CROZIER. The exhibits maintained their usual standard of excellence, though they were less numerous than in previous years.

HARROGATE HORTICULTURAL.

THIS show has of late years gained in dimensions in a marked manner, inasmuch as this year the committee were bold enough to venture on a two days' exhibition, with satisfactory results, for the two large tents in which the show was recently held were filled to overflowing with exhibits of

first-rate quality. This is just the height of the Harrogate season, and visitors to the town were present in great numbers.

The competition was keen in most of the classes, but the chief interest centred in the groups. The best group arranged for effect, and occupying a space of 10 feet by 12 feet, was set up by E. B. FABER, Esq. (gr., Mr. W. Townsend), the plants being excellent of themselves, and artistically arranged; 2nd, Mrs. GURNEY PEASE, Woodside, Darlington (gr., Mr. McIntyre), a good group containing nicely-coloured Crotons, but lacking the smart finish of the former one. Five competed. In the circular groups E. B. FABER, Esq., was again 1st, with a nice arrangement; 2nd, Rev. T. SHEEPHANKS (gr., Mr. Timmins).

Special mention should be made of the groups shown by E. B. FABER, Esq., as Mr. Townsend, the head gardener, who took the three 1st prizes, being a local exhibitor, displayed great skill as a cultivator, and also an artistic feeling in grouping.

Specimen Plants.—These formed a good section. For six stove and greenhouse plants Mrs. GURNEY PEASE, Darlington was 1st, the collection including good specimens of *Kentias Codiaums*, *Ixoras*, *Anthurium*, &c.; 2nd, E. B. FABER, Esq. Four stove or greenhouse plants, 1st, Mrs. GURNEY PEASE.

For six ornamental foliage (local), 1st, W. BATEMAN, Esq., who staged good examples of *Kentia Belmoreana*, *Cocos Weddelliana*, *Dasyllirion*, *Phoenix* species, and a good specimen of *Cycas revoluta*.

For four Exotic Orchids, E. B. FABER, Esq., was easily 1st, showing among others a pretty piece of *Cattleya Dowiana*.

Fruit was shown in quantity, and the quality was generally good. A very interesting class was that for a collection of English-grown fruit, to cover a space of 5 feet by 2½ feet. In this class the 1st prize was won by Lord BARNARD, Raby Castle (gr., Mr. J. Tullett, the kinds shown being Grapes, Pine-apples, Cherries, Pears, Peaches, Nectarines, and a Melon; 2nd, W. SHEEPHANKS, Esq., Winsley Hurst (gr., Mr. A. Large), who staged good fruit, but which lacked the good quality in the varieties selected.

For a tray of fruit, to consist of six kinds, Lord BARNARD was again 1st, the collection including grand examples of Black Alicante Grapes.

For a tray of hardy fruit, six kinds, Lord BARNARD was 1st; and 2nd, W. C. STOBART, Esq.

The best two bunches of black Grapes were shown by Lady HAWKE, Wighill Park (gr., Mr. Oates), beautiful, well-finished Black Hamburgh; and the best two bunches of white Grapes came from the same exhibitor; and 2nd, E. B. FABER, Esq.

Vegetables were numerous, and of good quality. For a tray of vegetables, nine kinds, 1st, E. A. BROTHERTON Esq., Arthington Hall; 2nd, Captain SLINGSBY, Scriven Park.

Cut Flowers were plentiful and good, and many bouquets tastefully arranged, and the usual florists' objects were found in some quantity.

Trade exhibits came from Mr. W. BONSALE, Roseville Nurseries; from Mr. E. J. BATCHELOR, Harlow Nurseries; Mr. A. J. HALL, Harrogate, and others. These were no competitive.

MARLOW HORTICULTURAL.

AUGUST 10, 11.—The fourth exhibition of this flourishing Society was held on the above dates, on the conveniently situated cricket-ground. Favoured by fine weather and other attractions, the show-ground was crowded with visitors, who were well repaid, in that the exhibition was a great improvement on any previously held.

Groups of plants arranged for effect were a leading feature. Mr. T. Blackmore, gr. to R. HAY-MURRAY, Esq., Spinfeld, Marlow, winning 1st, with a very bright and lightly arranged group, in which *Codiaeums*, *Palms*, *Lilium speciosum*, *Francoa ramosa*, and similar plants distributed over a groundwork of Maidenhair Fern formed the chief constituents; and 2nd, Mr. Gibson, gr. to R. W. HUDSON, Esq., Danesfield.

Medium-sized plants were staged in the specimen-plant classes by Mr. Wood, gr. to Lord BOSTON, Hedsor, who was 1st for three; other successful exhibitors being Mr. BLACKMORE, and Mr. Shape, gr. to Sir W. CLAYTON, Harleyford.

Fruit and Vegetables were extensively shown, the latter especially being excellent, and the competition in both sections of a keen character. For a collection of fruit, Mr. R. Gibson, gr. to R. GRIFFIN, Esq., was 1st; 2nd, Mr. LAWRENCE. With two finely-coloured bunches of Madresfield Court, Mr. BLACKMORE was 1st, for black Grapes; 2nd, Mr. Jordan, gr. to E. RILEY, Esq.; and for white, the latter was 1st, with good bunches of Buckland Sweetwater. Mr. Wood was 1st in a Melon class, in which the competition was strong, but the flavour of the fruits shown generally bad.

Mr. JORDAN was 1st with a fine collection of vegetables; 2nd, Mr. Dover, gr. to H. W. DOYNE, Esq. Numerous classes were provided for amateurs and cottagers, who exhibited well.

A special feature of the show was the non-competitive exhibits. Messrs. VEITCH & SONS contributed a very large collection, running the whole length of the largest tent, of cut flowers, of herbaceous and annual plants—an imposing exhibit.

Mr. C. TURNER, Slough, put up an extensive exhibit of cut Roses in splendid variety, including grand bunches of La France, Mrs. J. Laing, Souvenir de S. A. Prince, The Bride, Marie Van Houtte, Victor Hugo, K. A. Victoria, Ulrich

Brunner, and Captain Christy, among many others. Included in this exhibit were also fine stands of Cactus Dahlias and Carnations.

Mr. R. OWEN, Maidenhead, put up a group of large-flowered Cannas, wreaths, crosses, &c. Mr. E. F. SUCH, Maidenhead, herbaceous flowers and Dahlias.

DEVON AND EXETER HORTICULTURAL.

AUGUST 19.—The August exhibition, being the 187th which the society has held, took place in the grounds of Northernhay on Friday, 19th inst., in delightful weather, an agreeable change to the terrific storm of the previous day.

Among the more prominent features were the groups of plants arranged for effect, in an oval, with diameters of 11 feet and 15 feet. These were arranged very tastefully, and Mr. LOCK and Mr. ROWLANDS put up a very effective display. The Palms of the Rev. HAMILTON GELL, the Tree Ferns of Major BROCK, specimen Codiaums, Cycads, &c., adding greatly to the general effect in the tents.

Cut Flowers.—Cut flowers of herbaceous perennials, of Dahlias, Gladiolus and Roses, the capital lot of fruit, and the excellent quality and quantity of vegetables, rendered this show one of the best hitherto held by this Society.

For twenty-four Dahlia blooms (open), show and fancy, distinct, Messrs. JARMAN & Co. were 1st, with an interesting stand of clean and bright blooms; Mr. W. B. SMALL coming in as a very close 2nd. For twenty-four varieties of Cactus Dahlias, double, distinct, 1st, the DEVON CHRYSANTHEMUM SOCIETY; 2nd, Messrs. JARMAN & Co. These stands were full of showy and beautiful flowers.

J. RAYMONT was 1st for twelve Dahlia blooms, double, distinct; and H. HAMMOND SPENCER 1st for twelve double-flowered Cactus Dahlias; also for six Cactus, similar.

For six varieties of Dahlias, Pompon or bouquet, made up in bunches of three blooms with foliage, C. S. EADY was 1st, and General SPURWAY 2nd.

For forty-eight spikes of Gladiolus, in not fewer than twenty-four varieties, Mr. F. H. FOX was 1st, and Mr. A. KNELL 2nd.

Groups.—For a miscellaneous collection of plants, arranged for effect in an oval 11 feet by 15 feet (open class), Mr. G. LOCK, gr. to B. HILL, Esq., Crediton, and Mr. Rowland, gr. to Major BROCK, Exeter, put up showy and elaborate groups; the former took the 1st prize, Mr. Rowlands being 2nd. In the general prize list, the same competitors appeared when the decisions were reversed, Mr. ROWLAND being 1st, Mr. LOCK 2nd. In a class for similar display in an area measuring 11 feet by 8 feet, G. BAKER, gr. to Lady DUCKWORTH, and W. F. RICHARDS were respectively 1st and 2nd.

Specimen plants.—For twelve stove and greenhouse plants, six in flower and six foliage, distinct. W. BROCK was 1st with large plants, the foliage plants being well coloured Codiaums, Palms, and Cycas revoluta, and the flowering plants Dipladenia Brearleyana, Allamanda nobilis, and A. Hendersoni, Ixora Prince of Orange, and Clerodendron Balfourianum; Mr. BARNES, gr. to Rev. HAMILTON GELL, was 2nd.

For six stove and greenhouse plants, three to be in flower and three foliage, the same exhibitors competed, and were placed in similar positions. Mr. BARNES was awarded 1st for six stove and greenhouse Ferns, including an immense Nephrolepis davalloides, Davallia Mooreana, and D. filiensis, Adiantum cardiophyllum; Mr. ROWLANDS 2nd, having a very distinct plant in his group, viz., Angiopteris elegans?, Dicksonia antarctica, and others. Some very good Fuchsias were staged, and if these plants could have had a little more time and greater space afforded them, they might again form an attraction at our summer shows. G. R. JOHNSON was awarded 1st, and Rev. L. W. FREEMAN 2nd. Mr. T. KNAPMAN was 1st for six Lycopodiums.

Gloxinias and Begonias.—For six Gloxinias, showing nice plants full of flower of the pure white Her Majesty, G. R. JOHNSON was 1st; Rev. E. HEATHCOTE, with nice plants of various colours, 2nd. Begonias were but moderate, for either the heat had spoiled them or they had travelled badly. For six double-flowered varieties, A. KNELL was 1st; the Rev. E. HEATHCOTE 2nd. For three Mr. A. KNELL was again 1st, Lady DUCKWORTH 2nd. For six Begonias, single-flowered, and three ditto, A. KNELL again came to the fore; the 2nd prize for six again falling to Lady DUCKWORTH. Mr. G. R. JOHNSON showed fine plants of foliage Begonias, and was awarded 1st. Mr. BROCK showed some capital Dracaenas, just beating the Rev. A. H. GELL, who was 2nd.

FRUIT.

The competition was keen in these classes, and the quality excellent throughout. The Grapes, although no sensational bunches appeared, were excellent as regarded colour and finish, and some of the Muscats quite up to the highest mark as far as colour was concerned.

For a collection of ten dishes, Mr. LOCK was 1st, showing Muscat of Alexandria and Black Hamburgh Grapes, Royal George Peaches, Elruge Nectarines, Cherries, Plums, Apricots, Melons, &c., in perfect form. J. BRUTON came 2nd with Muscat of Alexandria and Madresfield Court Grapes, Melons, Cherries, Peaches, Nectarines, Figs, &c.; Admiral PARKER was 3rd with four varieties of Grapes, and eight dishes of other fruits, a doubtful exhibit.

For six dishes of fruit, H. HAMMOND SPENCER was 1st; Rev. A. HAMILTON GELL 2nd.

Grapes.—Mr. W. A. SANFORD was 1st with Black Hamburgh Grapes, and J. WASHINGTON 2nd. Some capital

bunches appeared among these classes, Mr. LOCK was 1st with splendid Muscat of Alexandria, H. HAMMOND SPENCER taking 2nd. Mr. LOCK was again 1st with Madresfield Court. Admiral PARKER was 1st with Buckland Sweetwater. Rev. A. HAMILTON GELL securing 1st honours for any other variety with splendid bunches of Black Alicante; F. M. CANN 2nd, with Foster's Seedling.

Miscellaneous.—Plums, Cherries, Melons, Apricots, and Figs were well shown. For a dish of six Peaches, Mr. R. B. JAMES was 1st, with Barrington, of unusual fine size; and Admiral PARKER was 2nd. For six Nectarines, many dishes were shown of very nice fruit, 1st, W. A. SANFORD; 2nd, H. HAMMOND SPENCER. Small bush fruits and Tomatos were well represented.

VEGETABLES.

The tent set apart for these products was well filled. Mr. MAIRS certainly excels in this branch, and again he has proved himself the victor. For a collection of twelve kinds, he was the winner of the Silver Cup, showing, in splendid condition, Carrots, Leeks, Cauliflowers, Parsnips, Onions, Beans, Turnips, Tomatos, Celery, Cucumbers, Onions, Peas, and Potatos—a grand lot. Mr. LOCK, who came 2nd, had a fine collection, but could not equal the 1st prize stand at any point. Here were Brussels Sprouts, shown on the stems; Onions, Cauliflowers, Carrots, Beans, Parsnips, Leeks, Peas, and Potatos.

For six kinds of Vegetables, Mr. BAKER was 1st; Lady WALROND, 2nd. Mr. LEY was 1st for a brace of Cucumbers. Potatos of good quality were shown in the classes set apart for them.

Non-competitive Exhibits.—The EXETER NURSERY COMPANY had a fine display of Allamandas, Crotons, Ixoras, Bougainvilleas, Palms, Ferns, &c., beautifully arranged, and relieved with wreaths, sprays, crosses, bouquets, &c. Mr. W. GODFREY a quantity of Carnations in pots and as cut flowers, among the latter were Lady D. Long, Flora Hill, pure white; Miss Stevens, Queen of the Exe, Exmouth Gem, and Mrs. McBurnie. Single Dahlias, single-flowered Asters, Cactus Dahlias, and Cannas. Cannas, Dahlias, Gladiolus, &c., were staged by the Messrs. R. VEITCH & SONS, Exeter, also some boxes of rock-work, Alpines, &c. Messrs. CURTIS, SANFORD & Co. had a fine display of Roses and other cut blooms. Messrs. WALTERS, of Exeter, had also some good show-stands of Roses. Messrs. JARMAN & Co. staged very fine double and single Begonia blooms. Messrs. TUPLIN & SON, Newton, had some beautiful Carnations, for the cultivation of which they are well known in the West. Sweet Peas were shown by Messrs. CLARK & SONS, Wellington; Mrs. MACALISTER had a dozen very large blooms of Romneya Coulteri; and Mr. SLIDE, gr. to Lord POLLIMORE, staged a group in which a species of Cotton plant, in bloom and pod, stood among plants of Pancratium, Bougainvilleas, Ferns, Palms, &c.

TROWBRIDGE HORTICULTURAL.

AUGUST 17.—A society which has held, as the Trowbridge Society has done, an unbroken series of forty-nine exhibitions, is not only a vital one, but it possesses that which characterises permanency. Notwithstanding that it has to trust very largely to gate-money, the shows usually meet the expenditure if the weather be fine; that of Wednesday, the 17th, was brilliant, there was a fine show, and visitors were numerous.

The Roses formed a leading feature, and seldom are better Roses shown in the middle of August than those we saw at Trowbridge. Next year the Society will celebrate its jubilee, and steps are already being taken to make the event worthy of the town; special prizes are being offered, and a Jubilee Fund is being raised.

Stove and Greenhouse Plants.—These were well shown, for here, as at Taunton, evidence is noted of considerable improvement in the cultivation of large specimen plants. The best nine flowering plants came from Mr. H. Matthews, gr. to Sir W. R. BROWN, Bt., Trowbridge, a young man who is fast taking a leading position in the west of England. He had a fine piece of Erica Eweriana superba, also E. Turnbulli, splendidly-grown and flowered examples of Dipladenia amabilis and Brearleyana, a grand piece of Ixora coccinea, fine in growth and flower; Allamanda nobilis, Stephanotis floribunda, Bougainvillea glabra, and a fine Anthurium Scherzerianum. Mr. G. Pymm, gr. to Mrs. GOULDSMITH, Trowbridge, was 2nd, having well-grown and freely-bloomed plants, among them Erica ampullacea Barnesii, an unusually fine specimen of Plumbago capensis, Clerodendron Balfourianum, a capital piece of Bougainvillea glabra, &c.; Mr. TUCKER, Hilpertons Marsh, was 1st with six specimens, having a well-balanced lot, such as Bougainvillea Sanderiana, Statice Gilberti, a fine Dipladenia Brearleyana, Ixora Morsei, and two others; Mr. H. MATTHEWS came 2nd, having Allamanda Williamsii, Dipladenia amabilis, Bougainvillea Sanderiana, &c., a very good half dozen. Mr. TUCKER, who appeared to have put his strength into the smaller classes, was 1st with three fine specimens, they were Dipladenia Brearleyana, Ixora Tuckeri, and Bougainvillea glabra; Mr. S. Ager, gr. to Mrs. MACKAY, Trowbridge, was 2nd.

The best specimen plant was a remarkably fine Erica McNabiana rosea from Mr. G. TUCKER, a specimen which recalled the old days of Heath culture. Mr. G. PYMM coming 2nd with a very nice half specimen of Erica semula. The

best recently-introduced new plant was the variegated Abutilon Swaetzii, shown by Mr. PYMM.

Mr. MATTHEWS was the only exhibitor of four Orchids, which, however, were good for the time of year. He had Aërides odorata, Cattleya gigas, Dendrobium Schroderi, and Cattleya gigas.

Trowbridge fully maintained its old reputation for specimen Fuchsias. Mr. GEORGE TUCKER was 1st with six fine examples; he had of dark-flowered varieties, Diamond Jubilee, Charming, and Doals' Favourite, and of light ones, Western Beauty, a very fine, free sort; Arabella, and Mrs. Bright; Mr. G. BRIDGEMAN, gr. to E. R. TROTMAN, Esq., Frome, was 2nd. Mr. TUCKER was also 1st with four varieties, having Final and Charming, dark; Surprise and Mrs. Bright, light; Mr. BRIDGEMAN was again 2nd. Amateurs and working-men also showed Fuchsias in fours, and very good plants, too, well grown and bloomed.

Tuberous-rooted Begonias are usually remarkable for good quality at Trowbridge; Mr. G. TUCKER took the 1st prize in the class for six singles, as well as for six double-flowered plants; Mr. G. PYMM being 2nd, with single; and Messrs. W. J. STOKES & SON, Hilpertons, with double-flowered varieties. Some very excellently grown Gloxinias were shown. Here again Mr. TUCKER was 1st, and Mr. S. Ager, gr. to Mrs. MACKAY, Trowbridge, 2nd. Some specimen zonal Pelargoniums were shown in several classes, all well grown and abundantly flowered; while the quality of the Cockscombs was decidedly better than is generally observed nowadays. There were bold and striking collections of nine fine-foliage plants, Mr. H. MATTHEWS being 1st with a Kentia australis, three fine Codiaums, viz., Reidi, Weismanni, and Baron James Rothschild; a large Phormium tenax variegatum, &c. Messrs. E. COLE & SONS, of Bath, were 2nd.

Caladiums were seen in large and vigorous specimens. Mr. H. MATTHEWS was 1st, and Mr. G. PYMM 2nd; while with Coleus Mr. MATTHEWS came in 1st, with finely-grown bushes; Mr. H. KIFF, gr. to J. KEMP, Esq., Trowbridge, was 2nd, with rather brighter-coloured plants, but their foliage not so vigorous.

Ferns and Mosses were shown in collections of fifteen, and there were five entries. Though the specimens were not very large, they are representative of some of the best plants of the kind grown, and they formed quite a large bank. Mr. G. TUCKER was 1st; Messrs. W. STOKES & SON 2nd.

Groups of Plants arranged for effect are necessarily small, owing to the small width of the tents. Mr. G. PYMM was 1st with an arrangement on 50 square feet, an excellent lot of plants artistically put together; Messrs. E. S. COLE & SONS were 2nd. Mr. P. HUTH, Freshford, had the best of the smaller groups.

Cut Flowers, Roses.—A very prominent subject in the cut-flower classes was the Roses. Mr. J. MATTOCK came from Oxford with a very fine lot of blooms for the time of year, and literally carried everything before him; his flowers were fresh, full, and bright in colour. Maréchal Niel, which he had in fine character, was rich in colour, and his Teas were excellent. With twelve varieties, three trusses of each, Mr. MATTOCK was 1st, and Dr. BUDD, Bath, 2nd.

With thirty-six and twenty-four varieties, Mr. MATTOCK also led the way.

Mr. MATTOCK's 1st prize box of twenty-four Teas and Noisettes, in not fewer than twelve varieties, was remarkably good, the chief varieties Maréchal Niel, Catherine Mermet, Madame Hoste, Maman Cochet, Souvenir de S. A. Prince, and 2nd, Mr. MATTOCK, Headington, who had blooms only just inferior.

Some creditable blooms were shown by amateurs and working-men. Cut flowers, in twenty-four varieties, brought the usual stove and greenhouse subjects. Mr. H. MATTHEWS was 1st with a fine collection.

Dahlias.—The best twenty-four blooms came from Mr. J. WALKER, of Thame, but by an error of judgment Mr. G. HUMPHRIES was placed 1st and Mr. WALKER 2nd, which quite surprised the two exhibitors. Mr. WALKER had well-finished fresh blooms of S. Mortimer, Buttercup, Mrs. J. Greaves, William Rawlings, H. Keith, Florence Tranter, Nubian, Miss Cannell, John Wyatt, A. Rawlings, R. T. Rawlings, and J. Standish. In Mr. Humphries' stand was a promising soft yellow self named Klondyke.

Messrs. J. CRAY & SON, Frome, had the best twelve; Mr. F. LINDSAY, also of Frome, was 2nd. Mr. G. HUMPHRIES was 1st with twelve very good Fancies for the season, chief among them being Hercules, Mr. Saunders, Frank Pearce, Rev. J. B. M. Camm, Mabel, Dazzler, Comedian, Lottie Eckford, &c.; Mr. J. WALKER was 2nd. Mr. J. BURGESS, Kingswood, had the best twelve single Dahlias in bunches, all good standard varieties; Mr. THOS. CARR was 2nd.

Mr. J. WALKER was 1st with twelve Pompon varieties, showing neat bunches; Messrs. CRAY & SON were 2nd. A charming stand of twelve varieties of Cactus Dahlias in bunches won the 1st prize for Mr. G. HUMPHRIES. He had, in fine condition, A. Vesey, Cinderella, Starfish, Harmony, Daffodil, Annie Turner, Arachne, Mary Service, &c. Messrs. CRAY & SON were 2nd.

Hollyhocks were remarkably well shown by Mr. SMITH, Kingswood; Gladioli were shown in spikes of twelve, the best coming from Mr. F. HOOPER, Bath, who was also 1st with twenty-four Pansies, and also with twelve Carnations and twelve Picotees, some very good blooms, owing to the lateness of the season, being staged.

Table Decorations were nicely executed, and they generally took the form of centre-pieces; but Miss NELLIE RAWLINGS,

who took the 1st prize, set up a square arrangement for the centre of a dinner-table, working it out nicely with soft-tinted blossoms of German Scabious and appropriate foliage; Messrs. E. S. COLE & SON were 2nd.

FRUIT.—There was, as usual, good fruit, Mr. W. STRUGNELL taking the 1st prize with ten varieties, having in good character Alnwick Seedling and Muscat of Alexandria Grapes, Belle-garde Peaches, Pine-apple and Stanwick Elruge Nectarines, Plums, Figs, &c. Mr. GEO. PYMM was 1st with six kinds, having Black Hamburgh and Muscat of Alexandria Grapes, Royal George Peaches, Lord Napier Nectarine, Apples, and Melon; Mr. W. STRUGNELL was 2nd. Mr. C. BULL, Crediton, was awarded 1st prize for a Smooth Cayenne Pine.

Mr. A. YOUNG, The Gardens, Marston, had the best two bunches of Black Grapes other than Muscats, having Gros Maroc; Mr. J. Dole, gr. to J. MARSHALL, Esq., Bristol, was 2nd with the same. The best two bunches of Black Muscats were Madresfield Court from Mr. F. Smith, gr. to the Bishop of Salisbury; Mr. STRUGNELL was 2nd with the same. Mr. A. YOUNG was the only exhibitor of two bunches of White Muscats, staging very good Muscat of Alexandria. The best two bunches of any other white were Buckland Sweetwater from Mr. F. SMITH. Melons were as usual abundant.

There were good Apricots. Mrs. EATON, Bradford-on-Avon, was 1st, with Moor Park. Mr. H. Clack, gr. to C. E. COLSTON, Esq., M.P., Devizes, had the best dish of Peaches, showing fine Violette Hâtive; Mr. A. G. HAYMAN, Frome, was 2nd, with Barrington. Mr. G. PYMM had the best dish of Nectarines, having Pineapple in very fine form.

The two best dishes of dessert Apples came from Mr. F. SMITH. They were Beauty of Bath and Red Astrachan; Mr. E. FISHER was 2nd, with the former and Irish Peach, in each case the fruit was excellent. Mr. GEO. GERRISH, Broughton Gifford, had the best two dishes of culinary varieties—Eckliuville and Emperor Alexander; Mr. E. HALL was 2nd, with Lord Suffield and Warner's King, clear in the skin and of fine size. Pears were represented by Jargonelle Bon Chrétien, and Souvenir du Congrès. Mr. F. SMITH was 1st, with two dishes. Nuts and Filberts were also well shown.

The best table decoration of fruits and flowers in the form of an epergne, came from Mr. C. YOUNG, Trowbridge, who also had the best table decoration, occupying 6 feet by 4 feet; Messrs. E. S. COLE & SON were 2nd.

The Special Prizes offered by Messrs. SUTTON & SONS, E. WEBB & SONS, and others, brought fine vegetables, and they appeared in many classes for market gardeners, cottagers, working-men, and others.

Miscellaneous Collections.—Chief among these was a collection of garden Roses, especially of the newer type, which was set up by Messrs. G. COOLING & SONS, of Bath. It was a source of great attraction in the principal cut-flower tent.

EYNSFORD HORTICULTURAL.

AUGUST 18.—On Thursday evening, at the Board School, Eynsford, the prizes gained at the recent horticultural show were distributed to the successful exhibitors.

The proceedings commenced with a meat tea, to which nearly 100 members of the society sat down. Mr. H. CANNELL, sen., presided, and he was supported by the following ladies and gentlemen: Miss Allinson, the Rev. J. Smith, Messrs. E. D. Till, W. P. Wright, R. Cannell, J. T. Tiesdale, Phillips, and others. Mr. H. Cannell was elected to the chair, and amongst the other gentlemen on the platform were: Messrs. E. D. Till, R. Cannell, W. P. Wright, Green, W. A. J. Foster, and L. Barber, the hon. sec.

The prizes for poultry were presented by Mr. R. Cannell; those for horticulture by Mr. W. P. Wright, horticultural instructor to the Kent County Council; and those for topiary work by Mr. Till. The last named gentleman in the course of his remarks said, that at the beginning of the year things looked in a very gloomy condition, and it was feared they would finish the season with a balance on the wrong side; but thanks to the untiring efforts of Mr. Barber and Mr. Cannell, the income had been increased from £58 to £82. He concluded by stating the need for more local support.

ROYAL ABERDEEN HORTICULTURAL.

AUGUST 18, 19, 20.—This Society, which was instituted in 1824, held its Annual Show on the above dates, in the beautiful grounds of Duthie Park, and the weather being favourable, the show was well patronised.

Three large marquees were filled with exhibits, and the classes devoted to amateurs and to cottagers, or the working-class as they are termed here, were deserving of much praise, for many of them were well filled, and the exhibits were of more than average merit; this was especially noticeable in plants. Fuchsias four feet high by three feet through, loaded with bloom, zonal and variegated Pelargoniums, and choice British Ferns, were nearly equal to those staged by professional gardeners.

Non-competitive.—Three smaller tents were occupied by the trade, and the exhibit of Messrs. BEN REID & Co., Aberdeen, was the first approached, viz., a quantity of choice shrubs in pots arranged on the grass outside, and on the tables inside were exhibited showy banks of cut flowers including Gladioli, Carnations, Sweet Peas in variety, herbaceous cut flowers and plants. Wreaths, crosses, and other floral decorations were arranged at one end.

Messrs. JAMES COCKER & SONS exhibited splendid Roses, including grand blooms of Her Majesty, set up in baskets of

moss, surrounded with Maidenhair Ferns. Tea and Polyantha Roses were also well shown in bunches. The side tables were adorned with decorative plants and a large collection of herbaceous cut flowers; they also exhibited handsome bouquets of Carnations, Roses and Liliums, and wreaths and crosses. In the centre of this tent was some dinner-table decoration, in which Coreopsis, blue Cornflower, and yellow and white Iceland Poppy were tastefully set up. Messrs. W. SMITH & SONS, Exchange Seed Warehouse, Aberdeen, occupied the end of one large marquee; they had a large mirror in the centre, draped with Smilax, and small Palms, Ferns, and foliage plants around it, with wreaths, bouquets, and crosses arranged in front; on one side stove and greenhouse plants, and on the other, herbaceous flowers and Sweet Peas.

Messrs. DOBBIE & Co., Rothesay, exhibited, in addition to herbaceous flowers, a good collection of Cactus Dahlias, among them being Ensign, Fantasy, Star Fish, and Britannia. Sweet Peas were well set up in loose bunches in small glasses, and included Prince Edward of York, Triumph, Primrose, Firefly, Stanley, Blanche Burpee, and Emily Henderson. Mr. J. SMELLIE, Pansy Gardens, Bushby, N.B., staged Dahlias, Pansies, and Violas in good form.

Competitive Classes.—In the competitive classes, plants, fruit, and vegetables were well shown; but notwithstanding the fact that the entries close six clear days before the show, no class cards were provided for the exhibitors, and visitors to the show had to guess in what class the exhibits were shown in, and to whom they belonged, except in cases where the exhibitors had furnished their own printed cards. When a secretary has carefully made up his class-books from the entries, it is an easy matter with clerical assistance to write out the cards to correspond with the book, together with the name and address of the exhibitor; a space left on the card for a small prize slip would be much better than the large prize cards used at Aberdeen, as these were noticed in some of the classes for single dishes of fruit to lay on the exhibit, consequently the best samples were completely hidden from view.

Roses were not extensively shown, but those staged by Messrs. D. & W. CROLL, Dundee, and Messrs. ADAM & CRAYNELL were superb; the latter gained the premier award for twenty-four Teas, which contained good blooms of Madame Hoste, Souvenir de Thérèse Levet, Catherine Mermet, Bridesmaid, Cleopatra, Amazone, Ethel Brownlow, Francisca Kruger, Innocente Pirola, Jean Ducher, Luciole, Madame Cusin, Madame Willermoz, Rubens, Souvenir de S. A. Prince, and The Bride. Messrs. CROLL were a very close 2nd, and secured the 1st award for thirty six H.P.'s; in their stand were finely developed blooms of Ulrich Brunner, A. K. Williams, Helen Keller, Horace Vernet, Mrs. John Laing, and Dupuy Jamain.

Mr. J. Proctor, gr. to Sir W. HENDERSON, Bart., Devanah House, was the only exhibitor with a circular group of plants 10 feet in diameter—this was artistically arranged; a graceful Cocos mounted on a rustic pedestal was employed for the centre, and over a ground-work of light Ferns were placed Gloxinias, Disas, Masdevallias, Pendorbiums, Oranges, Clerodendron fallax, with graceful plumes of Celosias rising above them, with bright-coloured Crotons and Pandanus mounted on stands, clothed with Asparagus decumbens.

Mr. PROCTOR was placed 1st for six stove and greenhouse plants, but Mr. J. Macdonald, gr. to Mrs. CROMBIE, Balgownie Lodge, ran him very closely, having larger flowering specimens, but a trifle weaker in foliage-plants; the latter was 1st for a single specimen foliage-plant. Mr. A. Howie, gr. to J. S. GAMMELL, Esq., had the best flowering-plant in Disa grandiflora, with three dozen blooms.

Mr. W. Ogg, gr. to Miss TAYLOR, Morkon, staged a grand lot of six single Begonias, strongly grown, and well bloomed; he also had the best six double varieties, good plants, but they were arranged on the ground, and could not be seen to advantage.

Pelargoniums and Fuchsias were well staged by various exhibitors, as were cut flowers of Dahlias, stove and greenhouse flowers, hardy herbaceous, and annuals.

An effective class was one provided for a collection of twenty varieties of cut-flowers and foliage bedding-plants, including annuals best adapted for flower-garden decoration, each sort in bunches and in pots. Several good collections were put up; Mr. J. MACDONALD was a creditable 1st, with Lobelia cardinalis, Double White Stock, Begonias, Salpiglossis, Godetias, Gaillardias, Chrysanthemums, Carnations, Antirrhinums, Sweet Sultan, Sweet Peas, Tropaeolum, Ageratum, Linaria, Calliopsis, Violas, Asters, Mignonette, blue Lobelia and tricolor Pelargoniums.

FRUIT occupied one central table. For nine dishes Mr. A. Reid, gr. to H. R. BAIRD, Esq., was 1st, having good Muscat Grapes, Peaches, Nectarines, Melon, Strawberries, and Cherries. A good collection had to be disqualified owing to the exhibitor disregarding the distinction between "kinds" and "varieties," two dishes distinct varieties but not more than two of any "kind" were allowed, and he having staged two fine dishes of Peaches, could not add another of Nectarines without being disqualified. [Nectarines and Peaches are considered by the Royal Horticultural Society to be for competition purposes distinct "kinds" of fruit. Ed.] Grapes and hardy fruits, such as Raspberries, Strawberries, Gooseberries, Currants, and Cherries occupied considerable space.

The competition in some of the vegetable-classes was not very keen. Mr. J. Grant, gr. to Mrs. CRAWFORD LESLIE, Rothie Castle, was 1st for a collection of eight varieties. G. H. C.

MARKETS.

COVENT GARDEN, AUGUST 25.

We cannot accept any responsibility for the subjoined reports. They are furnished to us regularly every Thursday, by the kindness of several of the principal salesmen, who revise the list, and who are responsible for the quotations. It must be remembered that these quotations do not represent the prices on any particular day, but only the general averages for the week preceding the date of our report. The prices depend upon the quality of the samples, the supply in the market, and the demand; and they may fluctuate, not only from day to day, but often several times in one day. Ed.]

REMARKS.—Large supplies of Plums on Market, both home-grown and foreign and of various sorts of English, the Old Muske, Violet, Diamond, Washington, &c., are in evidence, and of foreign the Prune is good and in fine condition; the only Pines on hand to-day are in the hands of a few dealers. A fresh consignment expected to-morrow. Plums and Apples seem to have a downward tendency, excepting a few choice samples; the few Filberts I have seen have not been sufficiently matured.

SEEDS.

LONDON: August 24.—Messrs. John Shaw & Sons, Seed Merchants, of Great Maze Pond, Borough, London, S.E., report to-day's market thinly attended. In consequence of the long drought, the sowing demand for Trifolium, Mustard, Rape seed, &c., is naturally restricted, but a copious and sufficient downpour of rain would, without doubt, quickly bring about a brisk sale for these articles. Meantime, as regards values all round, there is no quotable variation. Samples of new English Rye and winter Tares are now coming to hand. Canary seed is very strong; the new crops will, it is said, prove short. Hemp seed keeps steady, whilst there is no alteration in either Peas or Haricots.

(Remainder of Markets carried forward to p. ix.)

THE WEATHER.

[The term "accumulated temperature" indicates the aggregate amount, as well as the duration, of degrees of temperature above or below 42° Fahr. for the period named; and this combined result is expressed in Day-degrees—a "Day-degree" signifying 1° continued for twenty-four hours, or any other number of degrees for an inversely proportional number of hours.]

The districts indicated by number in the first column are the following:—

0, Scotland, N. Principal Wheat-producing Districts: 1, Scotland, E.; 2, England, N.E.; 3, England, E.; 4, Midland Counties; 5, England, including London, S. Principal Grazing, &c., Districts: 6, Scotland, W.; 7, England, N.W.; 8, England, S.W.; 9, Ireland, N.; 10, Ireland, S.; * Channel Islands.

THE PAST WEEK.

The following summary record of the weather throughout the British Islands for the week ending August 20, is furnished from the Meteorological Office:—

"The weather during this period was very warm and fine generally. Thunderstorms, however, occurred from time to time in different parts of the Kingdom, those experienced over southern Wales and the south-west of England on Thursday being of unusual severity and duration, and in some places were reported to have been accompanied by a slight earthquake.

"The temperature was above the mean, the excess ranging from 1° to 2° in 'Scotland and Ireland' to 5° in 'England, E., England, S.W.,' and the 'Midland Counties,' 6° in the 'Channel Islands,' and 7° in 'England, S.' The highest of the maxima were registered during the earlier days of the week, when they ranged from 87° in 'England, S.' (at London on Monday), and from 84° in 'England, E.' to between 76° and 74° in 'Scotland' and to 73° in 'Ireland, S.' The lowest of the minima, which occurred during the latter half of the period ranged from 37° in 'Scotland, E.' and 38° in 'Ireland, N.' to 54° in 'England, S.,' and to 57° in the 'Channel Islands.' Over the south and south-east of 'England' the nights were unusually warm.

"The rainfall was less than the mean in most districts, but just equalled it in 'England, S.W.,' and exceeded it in 'Ireland, S.' The fall accompanying the thunderstorms of Thursday appears to have been extremely heavy locally, but the greatest amounts at any of our stations were 1.43 inches, at Plymouth, 1.08 inches at Llandovery, and 1.05 inches at Prawle Point.

"The bright sunshine was in excess of the mean in most districts, particularly in the 'Channel Islands,' 'England, S.,' and 'Scotland, N.,' but there was a deficit over the northern parts of 'England,' and the greater part of 'Scotland.' The percentage of the possible duration ranged from 67 in the 'Channel Islands,' 66 in 'England, S.,' and 56 in 'England, E.,' to 27 in 'Scotland, W.,' 25 in 'England, N.E.,' and 24 in 'Scotland, E.'"

A CORRECTION: PEA THOMAS LAXTON.—In our report of the Pea-trials at Messrs. Hurst & Sons' grounds at Kelvedon, the writer, Mr. R. Dean, inadvertently named the new Pea, "Thomas Laxton," as being similar to Eckford's variety "Essential," when he really had some other than T. Laxton in his mind. See our issue for August 6, p. 100.

CARNATION MAGGOT.—The fly—*Hylenica nigrescens*—lays its egg on the leaf, and this, when hatched out as a maggot, eats its way between the leaf-surfaces, and down the shoot, into the stem; once there the plant is sorely crippled, and most likely will die. The maggot, a minute insignificant creature, must be diligently hunted for with a sharp-pointed needle and a knife; if found in the leaf well and good, an end is soon put to its travels, and if it has left the leaf and entered the shoot, down which a tunnel is made, the shoot should be cut off and the maggot killed, but if the maggot has reached the stem, this must be slit open and the enemy found and killed. It is possible, by the application of quassia-water, to make the leaves distasteful to the fly, or, as in the similar case of the Onion-fly and maggot, it could be kept away from the plants by strewing chaff, sawdust, &c., saturated with petroleum among the latter. Every means should be taken to preserve the wax-like white bloom on the "grass," this being the best protector against pests, insect or fungous; and in applying water to Carnations, the rose watering-can should not be used, but the water applied by means of the spout without wetting the "grass."

CUCUMBERS FAILING: Kingstown. The young fruits decay from some detail in the condition of cultivation being opposite to the requirements of the plants. We cannot speak decisively in the absence of an intimate acquaintance of those conditions, but would advise you to see if the root-drainage is perfect. The water should be able to get away very freely. Let the atmosphere of the house at some part of the day become comparatively dry. Be careful in the use of artificial manures.

CYPERUS AND FERNS DEAD: Bertie G. Jones. We fail to find fungus on either, nor are there any appearances indicating the ravages of weevils or their larvae, or other insects. The treatment afforded the plants last autumn was decidedly unnatural, and calculated to somewhat exhaust their vitality, but not to kill them.

DISQUALIFICATION OF FRUIT EXHIBIT: A. H. The schedule in the case referred to, states that in the collection of nine distinct varieties of fruits, not more than two of any "species or kind" be shown. We are disposed to think that the schedule was unhappily worded, because it was wished probably to prevent merely the exhibitor from showing more than two varieties of Grapes, of Currants, of Melons, or of Plums. Now, the Royal Horticultural Society has laid it down in its *Code of Rules*, that for exhibition purposes, "Peaches, Nectarines, Apples, and Plums," are distinct "kinds"—that is, they are perfectly distinct from each other; the Peach as distinct from the Nectarine as the Plum from the Apple. With this view of the question we quite agree. But in your schedule the compiler says that "not more than two of any species or kind" must be shown. Botanically, of course, the Nectarine is only a smooth-skinned variety of the Peach, and owing to the inclusion of the word *species*, we think the judges were justified in accepting it literally, and accordingly disqualifying the exhibit.

FRUIT DROPPING: J. Prince. This may be due to a variety of causes, viz., injury by spring frost either to the blossom or just after blooming, great dryness of the soil, a common cause with trees on walls; excessive productiveness, when it is an effort of nature to relieve the plant of part of its burden. We should suppose that your trees, like many others in all parts of the country this year, suffered from the inclement weather prevailing at the blossoming time. Those standard trees of Apples and Pears which you inform us are carrying good crops, have their roots probably in the moist subsoil, and the blooms may have been protected by the foliage in the case of late-flowering varieties. In the case of

cordons which have no fruits, the dropping may be due to dryness of the surface soil or to frost. All heavily cropped trees should receive a few copious applications of water and manure-water, previously pricking up the surface so as to let it sink in where it is chiefly wanted. We should strongly advise the copious watering of all wall-tree borders without exception, and keeping the surface crumbly, or mulching it.

GRAPES: Nat. The two bunches sent are suffering from shanking, for a cure of which see *Gardeners' Chronicle*, last issue, under Notices to Correspondents; and from the spot malady, caused by a fungus *Gloeosporium laticolor*, remedies for which have frequently been given in these pages in recent issues.

HYBRID BLACK CURRANT AND GOOSEBERRY: W. Culverwell. We are much obliged by your sending us a sample of this curious hybrid. The flavour of the fruit is a pronounced Black Currant one, and generally in foliage, &c., the plant is intermediate between the parents. The fruit would be excellent for tarts, &c. It has been figured in the *Gardeners' Chronicle*, p. 371, Sept. 3, 1892.

INSECT DESTRUCTIVE TO APPLE-TREE FOLIAGE: W. Castle. The common Vapour-Moth larvæ. The female is wingless, and should be sought out and destroyed. Syringing with petroleum emulsion or soft-soap in water and petroleum would do good; and the webs spun by the larvæ should be searched for in infested and in neighbouring trees, and burned with a lamp or taper.

INSECT OR VEGETATION?: Howden & Co. Totally decayed when it reached this office, and unrecognisable.

LACHENALIAS: T. T. The bulbs are overrun with the "Eucharis mite," *Rhizoglyphus Robini*. The soil where they have grown should be sterilized before bulbs are again planted in it. G. Massee.

MAGGOT IN MARGUERITE LEAVES: H. A. Nothing equals catching them with a needle, or affording them a sharp nip with the thumb nail. They are readily seen in the channels they make between the upper and lower surfaces. This practice, if followed up daily, and cutting off and burning the worst infested leaves, will greatly check the spread of the pest.

NAMES OF FRUIT: W. H. B. Apple Sheep's-nose, an old Devonshire variety.

NAMES OF PLANTS: Correspondents not answered in this issue are requested to be so good as to consult the following number.—F. W., Lichfield. *Oncidium luridum*.—R. T., Epsom. *Odontoglossum Coradinei*.—C. A. B. 5, *Clematis coccinea*; 6, *Hypericum* species, send when in flower. The Conifers next week.—R. F. *Gentiana pneumonanthe*; rare.—W. T., Brighouse. 1, *Amaryllis Belladonna*; 2, *Jacobinia (Justicia) carnea*. The Crotons we are unable to name from the specimens sent.—J. Don. *Syringa Josikea*.—K. W. G. 1, *Epilobium angustifolium*; 3, *Eupatorium macrophyllum*; 4, *Juniperus virginiana*, Red Cedar.

POTATOS: D. M. Bean. Send them to Mr. A. Finlay, a large grower at Markinch, N.B., who would doubtless name them for you.

SPIDERS IN A PLANT HOUSE: J. S. Vaporise the house with Richard's X L All Compound. It will do not the least harm to the plants.

TWO-FACED DAHLIA: F. E. J. A specimen of the two-faced Dahlia, due to the union of two flowers, a species of fasciation. It is very common.

PHOTOGRAPHS, SPECIMENS, &c., RECEIVED WITH THANKS.—

CONTINUED LARGE INCREASE in the CIRCULATION of the "GARDENERS' CHRONICLE."

Important to Advertisers.—The Publisher has the satisfaction of announcing that the circulation of the "Gardeners' Chronicle" has, since the reduction in the price of the paper,

MORE THAN DOUBLED, and that it continues to increase weekly.

Advertisers are reminded that the "Chronicle" circulates among COUNTRY GENTLEMEN, AND ALL CLASSES OF GARDENERS AND GARDEN-LOVERS at home, that it has a specially large FOREIGN AND COLONIAL CIRCULATION, and that it is preserved for reference in all the principal Libraries.

THE

Gardeners' Chronicle.

SATURDAY, SEPTEMBER 3, 1898.

REMINISCENCES OF COVENT GARDEN MARKET.

IT is about fifty years ago since I first became acquainted with this market, then and now the largest in the metropolis. Since that date not only have great changes taken place in the market itself, but in its management, in the enormous increase of its trade, in the extension of the area devoted to selling and buying, and the customs of the salesmen of all sorts, many of whom then resided over their shops, which is not the case at the present day. That the amount of business done, and the number of growers frequenting Covent Garden Market was greatly less than it now is, will be apparent from the staff employed at that date.

There was a superintendent, Mr. Gardner; two collectors, named Stace and Charlwood; three beadies in livery by day who carried canes, and two by night; an engineer, who had charge of the engine for pumping water from a well beneath the shop at the corner of the middle cross-gangway, the shop being then tenanted by Mr. Bennett. The entrance to the engine-house was down an area in the long market, and the water was supplied to the market-tenants (many of whom, as I have said, lived on the premises over the shops), and to the fountain on the conservatory. Lastly there was Jemmy, the marketsweeper. These persons comprised the whole of the staff; the police did not then patrol the market. On the south side were three public-houses, viz., Way's, the Green Man, and the White Horse. There was a large arch next to the middle cross-gangway that used to be occupied by Potato merchants, and here was an entrance to the cellars beneath. Two shops now occupy this space. That section of Covent Garden now called the long market was then open to the sky—it is now covered by a fine glass and iron roof; and the "centre row" consisted entirely of retail shops, with the exception of two, the tenants of which did some wholesale trade. The Apple-market was covered, also the middle cross-gangway at that part; but the square market was nearly all open to the sky; now both are roofed over.

On the north side there existed a large arch, where the notice-boards, rules, regulations, and bye-laws of the market were placed, one on either side. The archway was occupied by sellers of Carrots and Peas; now two shops occupy the site of this arch, at the end of North Row. Near to the cross-gangway was an approach to the conservatory. At that period there were female porters called basket-women employed about the market, who used to carry things on their heads, on a small round pad—just a rim; and these women were furnished with a round metal badge with a number on it—not like those now in use. The baskets were oval, with four handles, one each side for the

hands, and one at each end on the top for lifting. One small shop in the square was occupied by C. Murrell, whose business was exclusively that of a vegetable-flower cutter; the imitation flowers being cut out of Carrots and Turnips, and mounted on a twig of green Box. I have also seen Beetroot similarly manipulated. These flowers could be had plain or coloured, according to desire. On the right-hand side of the gangway, looking towards James Street, Mr. Rubergall, a market-gardener cultivating land at Earl's Court, had a stall, and his waggon used to be backed in, and the goods sold from the tail of the waggon. Outside, in the front of his waggon, a man was allowed to stand who sold pies, his wares being carried in a large basket-affair with a cross handle, the basket being mounted on four legs; next to him stood Miles, a grower from Fulham, who brought his produce to market in a donkey-cart. William came at that time, and was succeeded by Ralph Miles, who came to the market for a great number of years. Next was Hawke, of "Champagne Rhubarb" fame. About that time came Jessop, a large grower from Grove Park, Chiswick. These men sold from the waggon, this being drawn in towards the pavement; as did all growers. Along the north side, at that time many small growers congregated, who came with a cartload of stuff only. Some of these would back in if the produce was loose; if in baskets it would be unloaded; and that was the custom right away round to the west end of South Row.

At the James Street corner of the Piazza was Willis' book-shop, and at the left-hand corner, now the Post Office, stood the "Britannia" public house, kept by Mr. Webber. James Street No. 28 was the market coffee-house, which was open day and night, the only time it was closed being on Sundays, from 11 A.M. till 4 P.M. Large quantities of Peas were then grown in Middlesex by farmers, notably, Sherborne, Vincent, Freeman, Merrick, and others; and the Peas came principally in corn-sacks, the greater part of them, hundreds of sacks daily, coming to the North side and the North-east corner. On Saturdays during the Pea season there would be a second market in the afternoon, commencing about 4 and lasting till sometimes 11 at night, the first arrival coming about 4 o'clock and continuing till, sometimes, between 8 and 9 P.M. Business used then to commence early, that is, from 3 A.M., and keep on till late at night. On Sunday morning a lively trade was carried on, by retailers chiefly, in the open space opposite St. Paul's Church until 9 A.M., when everything would be cleared away sharp, and the cellar-flaps locked down. The shops in the Centre Row being chiefly in the occupancy of retailers, and most of those in North Row doing retail business after the wholesale market was over, which was practically by 10 o'clock P.M., these used to keep open in the summer till 9 P.M., and on Saturday nights till 11 or 12 o'clock, and it was even later before everything was cleared away, which always had to be done on Saturday nights.

The Piazza was at that date continued round to Russell Street, and where the open market entrance is to the floral hall stood the Piazza Hotel, which was pulled down after the destruction by fire of Covent Garden Theatre, which occurred March 5, 1856. The Bedford Hotel occupied most of the upper portion of that part of the Piazza which extended from the Floral Hall to Russell Street. A beadle kept order under the Piazza. The nursery business was carried on under the little Piazza round towards the

front of the church, where, at election times the hustings were erected, and a lively time it often was, particularly was it so when Mr. Cochrane was the candidate. There were two coffee-stalls under the Piazza, one opposite to what is now the Tavistock Restaurant, then an entrance to the renowned Geo. Robins's auction rooms, the other opposite to Burnet's, now Lockhart's.

The church and graveyard have undergone great alterations since then, the portico being at that date enclosed with iron railings, which extended from the corner of King Street, then Bocking's basket shop, where a destructive fire occurred Feb. 25, 1868, at 2.30 A.M., at which Mr. Lobjoit, a market gardener, who lodged in the house, lost his life. The church was galleried and pewed, and the walls were cased with stone outside, now replaced with red brick. Here was an entrance to the churchyard, where now is a public lavatory; and by the side of steps leading into the church was a building in which the fire-engine was kept. This engine, when it turned out to attend fires, was at that time in charge of a beadle, whose name, I think, was Reed.

Quantities of fruit from the Feversham district then came by boat to the inn called the Fox-under-the-Hill, part of the way down an alley off the Strand, now flanked by the western side of the Hotel Cecil. There porters, called "Fox porters," used to carry the fruit, three bushels at a time on the knot, from the river up to the market, and hard work it was, it being all up hill. Each porter carried a cord to put across the top of the basket, which he held in each hand to prevent the basket shifting, and the porters generally wore leather hats. Early Potatoes came from Cornwall in oval baskets containing from $\frac{3}{4}$ to 1 cwt., securely packed with straw, and laced over with tarred string. Truffles from the Alresford district used to be sold by some of the shopkeepers, the usual price being 2s. 6d. per lb. Apples already prepared for table, called Tucker's Norfolk Beefings, were sold in the market. Tucker was a confectioner in Russell Court, who was noted for his dried Apples, which were precisely the shape of the Normandy Pippins sold by grocers to-day. [The same thing. Ed.] The bulk of the Oranges coming to Covent Garden were St. Michael's, and these were packed in the dried envelopes of the Maize culm, and heaped up high above the box, making a most unwieldy package. Of Lemons, Messinas were then the best. Of Grapes, the Almeiras, packed in cork-dust, and the Lisbon (purple) or black, as they were called, came packed in saw-dust in boxes.

Chief of foreign Apples, the French Royal and Bellfleurs, came in long wooden cases, such as eggs are packed in; and Court Pendu Plat in sugar-boxes. Most of the English supply came then by road, large quantities of Apples coming from Berkshire and Oxfordshire by road-waggons, notably by Payne from Oxford, Illsley from Maidenhead, Wickens from Knowle Hill, Wise of Cookham, and many others from different parts. The Apples from the two counties named came chiefly in upright deep baskets holding a reputed bushel. These were furnished with two handles at the top, and a cord was looped round so as to tie over the top, and they would be piled well up, and when packed and tied over they resembled a skittle-pin in shape. Then the maund, of double the capacity of the bushel, and the sack-maund, double the capacity of the maund, were in use, but all of these measures and baskets are now entirely out of use. The varieties of Apples included Ribston and Blenheim Orange Pippins,

Kentish Broadeyes, Buff Russets, Cat's-head, Nonpareils of two kinds, French Crabs, Hawthornden, Golden Knob, Queenings, and Stone Pippins, a peculiarity noticed in the last-named that I never saw in any other Apple, namely, they would have a smaller Apple growing out from the side, and near the bottom; and the same Apple would have two eyes, and were what may be described as twins. Of Pears, we had the Autumn Bergamot, Swan's-egg, Windsor, Crasannes, Easter Beurré, Beurré Rance, Marie Louise, Williams' Bon Chrétien, Chaumontelle, Bishop's Thumb, Gratioli, and several others. Many of the smaller Pears became of very little value in the market, and the trade in them has died out. *T. P.*

(To be continued.)

NEW OR NOTEWORTHY PLANTS.

CEREUS PERUVIANUS MONSTROSUS.

Few Cactus growers are without this very grotesque looking plant, but it is very rare to see it in flower; indeed, Mr. Watson says that he has not seen it. A. P. de Candolle, however, in his *Revue de la famille des Cactées Paris*, 1829, t. 11, gives a figure of it which differs from that now illustrated in the smaller number of petals, their more elongated shape, and their serrulate edge. Our specimen (fig. 46) was kindly forwarded by Mr. Justus Corderay, of Didecot, who says his specimen is 5 feet in height, and has been in his possession for many years, but has never previously flowered. It is remarkable in producing its flowers in cymes, and the scales of the buds are purple, while the petals are pure white. The original *C. peruvianus* was figured so long ago as 1614, in *Tabernaemontanus Kreuterbuch*.

HYPOXIS LONGIFOLIA, Baker.

The species of this genus are scarcely so well known as their merits demand. Botanic gardens are entrusted with the function not only of illustrating "natural orders," but also of conserving plants of horticultural interest till the time when a capricious public learns to appreciate them. We have to thank Mr. Burbidge, of the Trinity College Botanic Garden, Dublin, for the opportunity of illustrating this pretty perennial (see fig. 47, p. 177). It is a native of Algoa Bay, and is generally considered to require greenhouse treatment. Mr. Burbidge, however, has grown it out-of-doors for the last three winters. How much it has prospered under the evolving care of Mr. Burbidge may be estimated by comparing our present figure with that in the *Botanical Magazine*, t. 6035. The flowers are yellow, and the narrow, flaccid, grass-like leaves are remarkable in the genus for their great length.

BOOK NOTICE.

THE PRUNING BOOK.*

THIS is another of the garden-craft series of books written by Professor Bailey, of Cornell University, New York. It deals comprehensively with the subject of pruning fruit-trees. The book is not without errors, and a large proportion of the matter is more applicable to fruit-growing in the United States, where climate and other conditions are certainly dissimilar to our own. Thus it is, we suppose, that some of the details do not agree with our own hard-earned experience.

In the main, this new-comer is a very fair attempt to teach by book what usually takes a person half a lifetime to thoroughly grasp from the oral instructions of a practised master of the art. It is calculated to illustrate the old saying that an ounce of practice is worth a pound of theory. We quite agree with the author in a chapter on the Philosophy of Pruning, when he says, "Its advantages are several and important.

* *The Pruning Book*. By L. H. Bailey. Published by Macmillan & Co., Ltd., London and New York.

There is abundant opportunity for improvement in methods, and every plant needs a particular treatment, and perhaps some species or varieties demand little if any thinning; but, as a whole, pruning is indispensable to successful horticulture."

Although the work is unusually free from technical terms, it is full of useful illustrations showing the actual operations in minute detail. It is, however, exceedingly difficult to make quite clear the many problems that beset the timid or the inexperienced pruner. Nevertheless, the book, in spite of some shortcomings, will be appreciably helpful to the observant and enthusiastic amateur fruit-grower, who will find in it the settlement of difficulties of constant occurrence.

The work may also be recommended to even hard-headed, practical, rule-of-thumb men, who will find in it an amount of sound information respecting the physiology of plant life which will teach them the why and wherefore of methods he already practises. The author has very exceptional knowledge of the subject upon which he writes. The remarks upon the life-history of trees, and upon circumstances that tend to the production of wood or fruit-buds, is very interesting. The author tells us that all the advice in respect to notching, bending, ringing, and the like is born of the amateur and garden culture of the Old World. Whether the authors were conscious of the fact or not, the older American pomological writings were direct offshoots of European "petite culture." Throughout the book it is manifest that the methods and tactics pursued by the enterprising fruit farmers in the States are far superior to the careless way in which most fruit farmers manage their trees in our country.

Fruit-growers should secure an early copy of this work, and sift out and apply such of the advice given as is applicable to their respective cases. *W. C.*

CONCERNING THE CABBAGE.

THE Cabbage is such a common vegetable, so well known, and so universally grown, that it appears to be a subject scarcely worthy of being written about, and yet the Londoner would be badly off without his spring and summer Cabbage. M. Henri de Vilmorin has termed it one of "the most precious vegetables we have, eaten young, in the right season, and well cooked;" and he justly complains of the quality of this precious vegetable as generally served up in hotels and restaurants, an experience common to most of us.

Persistent and rigid selection has done much in the way of producing early, quick-heating Cabbages, tender, and grateful to the palate. The present has been a rare season for Cabbage, for the mild winter left them unharmed, and the moist season quickened their growth. They were so abundant that in the south of England whole fields have been ploughed up because it did not pay to send the produce to market; and yet in London we have to put up with a good deal of this vegetable that is old and tough.

Two important requisites are necessary in a Cabbage, one is, that it shall turn in early; another is, that the plants will not readily "bolt" into seed. Bolting into seed instead of forming a heart is a tendency in the Cabbage which results from causes not easy to determine. He who would have a fine stock of a particular type of Cabbage has to set himself the task of endeavouring to conquer this species of perversity. The chief cause is probably to be found in want of care in seed-saving; and no far as could be observed in the case of a recently inspected trial of Cabbages in Messrs. Sutton & Son's trial-grounds at Reading, it has been largely accomplished. The samples were from autumn-sown seeds, that is, sown during the two last weeks in July, and the two first in August, represented the leading types in cultivation, and in some cases a number of stocks of each. Now, Cabbages vary according to the time of sowing, and it has been well said that if you wish to bring out the defects in a particular stock, sow in the autumn.

Bolting is avoided by rigid and persistent selection of the seed parents; and on looking over the many

rows of Cabbages it did seem as if it is possible by this means to have stocks of Cabbage actually bolt-proof.

The samples under review were sown about August 17 last year, though the best time to sow is from the 5th to the 10th.

For spring sowing, Sutton's Earliest is one of the best; it was seen to be uniform in shape, with plump full hearts, and but few outside leaves. Rapidity of development is one of the characteristics of this variety, for if sown early in the spring, it will come into use as early as some of the autumn-sown Cabbages. While it is recommended for sowing in the spring, it is found that when sown as late as the middle of September it does not bolt. Little Gem is a rather small and early Cabbage; and so rapid in development, that seeds sown in April will, in a favourable season, produce good Cabbages for cutting the last week in July and early in August. It is recommended for sowing in the spring, but the autumn-sown samples in this trial showed that it can be sown at the latter season with decided advantage. Main Crop is a variety which can be sown at both seasons; it is a very fine Cabbage for large gardens, and is recommended for sowing in the spring. Favourite is also a fine and striking variety, and like all the Reading selections quite dwarf in growth, with few outside leaves, and a full sized compact heart. It appears as if the modern selection of Cabbages was operating to considerably reduce anything like waste in the way of outside leaves. Seed can be sown at both seasons, but being best for late summer and autumn use, Favourite should be sown in the spring. Sutton's Imperial represents an early and uniform stock of the Imperial type, for many years one of the best of our garden Cabbages.

For autumn sowing Sutton's April is a very dwarf Cabbage, an excellent variety for gentlemen's gardens; the very few outside leaves are of a deep green, heavily veined with white. It can be planted thickly, and is ready to cut by the third week in April. Sutton's Flower-of-Spring is one of the most perfect types of the modern garden Cabbage. It is a different stock to their April; being larger in size, a little later, developing a fine handsome head, dwarf, short in the stalk; and whether for market or garden purposes very desirable. If a gardener had to grow but one Cabbage, it should be Flower-of-Spring.

There were many samples of Ellam's Cabbage, drawn from various sources; of Nonpareil, and others, in order to have a good opportunity for making comparisons. Ellam's was seen to vary in character from various sources; and the same could be said of the Nonpareil. Early Market, represented by a fine stock, is out-distanced by Flower-of-Spring. A true type of Myatt's Offenham is a good market Cabbage; and of a number of samples of this, nearly every one lacked uniformity of character. The Nonpareil types appear to be better adapted for spring than for autumn sowing. *R. D.*

WINE FERMENT EXPERIMENTS IN FRANCE.

EXPERIMENTS made by the wine growers of France during the last few years, and which are still the subject of earnest investigation, are attracting considerable attention. It was formerly believed that the quality of a wine produced in a given vineyard could only be changed by some injurious adulteration. It is now asserted by the highest authorities in viticulture in France that the quality of such wines can be improved without the introduction of any extraneous or injurious substance. It is held that the qualities of the products of the specially famous vineyards are attributable to the local ferment which acts upon the juice of the Grape to transform it into wine. It is also found that there are notable differences in the local ferments, or rather in the effects which they produce upon the must. Acting upon the knowledge of these facts, the United States Consul at Lyons says that ferments have been selected from the products of a given vineyard, and used in the products of other vineyards, with the most satisfactory results. It will

not make the most famous wine out of the juice of ordinary Grapes, but it will ameliorate the latter and import to it, in a certain degree, the bouquet and taste of the former. It is contended by some that the ferment from a Bordeaux, Burgundy, or Hermitage vintage, will convert the juice of common Grapes into those famous brands. Consul Covert adds, however, that while this opinion is generally rejected, none of the many whom he has questioned on the subject, except wholesale dealers, deny that the addition of the ferment brings the wines nearer to the excellence of the brand from

development by the introduction of another ferment. "The wine thus obtained," says the report, "will possess a bouquet and an aroma hitherto unknown to Algerian wines." This experiment, according to the *Moniteur Vinicole*, was made by a large Bordeaux wine grower. It is said that, in some cases, the ferment may be directly mixed with the must, but it is preferable to make a preliminary preparation as follows:—Two or three days before pressing the main crop, say 50 lbs. of Grapes are thoroughly washed in an abundance of cold water before being pressed. This is to free them from the dust and

ferment, and is ready for use 50 or 60 hours after the beginning of the preparation. It must be mixed with the vintage must, immediately after the latter has been pressed out. The barrel containing the yeast—that is the juice of the first 40 or 50 lbs. of Grapes—should be well stirred in order to avoid the loss of the yeast which settles. The yeast should be mixed with the must as uniformly as possible, and several methods are indicated. Some of the yeast is sprinkled on the vintage tubs, presses, barrels, &c., and generally about one-third of the yeast prepared is thus employed, the remaining

FIG. 46.—CEREUS PERUVIANUS MONSTROSUS (FROM MR. JUSTUS CORDERAY): SCALES PURPLE PETALS WHITE STAMENS YELLOW (SEE P. 174)

which it was taken. Reports come from Algeria that experiments made there a few weeks ago prove that this process, with some modifications, is capable of working great amelioration in very ordinary wines. The method employed is as follows:—The Grapes are first washed and freshened in cold water, and then crushed in a vat. The must is next introduced under a pressure of four atmospheres in a tubular boiler, where the Grapes remain a quarter of an hour in a high temperature. A current of cold water is then passed through the tubes, lowering the temperature. At this time the must contains no ferment capable of development, the treatment having transformed the whole into an absolutely neutral liquid, ready or

germs which may have gathered upon them. They are then pressed, and the juice is separated from the seeds, stems, &c., by means of a fine sieve. The must thus obtained is put into a thoroughly clean barrel, which should be free from all odour; a proper quantity of ferment is mixed with it, and the whole is allowed to stand until needed for use, say two or three days. M. Jacmin, in a recent number of the *Moniteur Vinicole*, gives the following as the proportions to be used:—One litre (1.76 imperial pint) of select ferment is to be used in the juice of from 40 to 50 lbs. of Grapes for every 1600 gallons of the vintage must. The yeast thus set, if properly made, ferments actively under the influence of the selected

two-thirds being used as follows:—About one-sixth is put on the bottom of the vat before the crushed Grapes are emptied into it; the rest of the yeast is mixed with successive layers as the vat is filled up. What remains is finally poured over the top of the must. An ordinary spraying apparatus affords an excellent means, but it must be either new or very carefully cleaned beforehand. It is well to take the spraying machine into the vineyard, and to prepare a tub of yeast diluted with some freshly pressed juice. A single workman with a spraying apparatus is sufficient for a gang of fifty Grape-gatherers. He sprays the yeast on the bottom and sides of the tubs and other means of transport as the Grapes are put

into them. All bunches are thus covered with an imperceptible coating of yeast of good quality, and by this means any difficulty arising from the crushing of the Grapes during transportation is avoided, because any fermentation which begins is of an excellent nature on account of the precautions taken. The preparation and use of the yeast is the same for white wine as for red, although many makers of white wine content themselves with pouring the selected ferments directly into the must after pressing. The preparation of the yeast is more important in a cold season than in a warm one. This question of the use of ferments is receiving the favourable consideration of many great wine growers in France, and chemists have applied scientific rules to the use of the ferments.

Journal of the Society of Arts.

NURSERY NOTES.

THE EXETER NURSERY COMPANY.

THAT great changes take place in regard to business arrangements, whether of private persons or of those in a corporate capacity, is perhaps exemplified in this Company in a manner more noticeable than in many that might be mentioned.

Originally made famous by Messrs. Lucombe, Pince & Co. for its splendid specimens of plants and the fruit culture carried on there; where, too, the proprietors were consulted in landscape work, and themselves carried out the formation of new, and the renovation of old gardens which to-day bear their impress, and are greatly admired; remembering all that has been done in private places, and having evidence of the same kind of work on the nursery-grounds at Exeter, it is a matter of regret that the old has had to give place to the new. But sentiment must now give place to utility, and though the same characteristics may be in evidence, the outcome nowadays is of a totally different character. In days gone by, it was the case that wealthy patrons gave good value for plants, and hoped to see them in their glass-houses year after year. Nowadays the case is altered completely; numerous plants, bright and showy; if of a fleeting character no objection is taken, but they must be in variety, attractive, easy of removal, and there must be an abundance of others to take the places of the spent ones. Ah! that's it, brightness and plenty, scarcely twice to look upon the same combination and arrangement, whether in the mansion or conservatory, and then satisfaction is expressed, and all goes well. That with this desire in private establishments, a corresponding addition to the glass-houses has followed, cannot always be asserted; and where this is the case, as also when no such houses exist, then the market-grower, or such firms as the one in question come in and fill a gap that could not otherwise be easily got over. The many now seek supplies of plants and flowers, and to these attention must be paid. This was borne on me very strongly when passing through this nursery in company with one of the proprietors and their manager. It happened that we first visited the Cucumber and Tomato-houses, and such housefuls of these fruits, which are so easily disposed of, did one good to see. The Tomatos literally are grown by thousands under glass, and the crop is an immense one. The variety is of the firm's special saving, and comparing it with a few other named sorts, grown for trial, its excellencies in regard to vigour and heavy-cropping qualities are at once apparent. One house planted on April 13 is now a veritable thicket on first appearance; but on entering and inspecting them, it was seen that each was taken up by a single stem some 5 to 6 feet high, most of them already having six to eight clusters of green fruit, and on many of these bunches ten fruit, just about the size and shape of tennis balls, were hanging, the first cluster being almost on the ground, and where grown in pots they were hanging close to the edge. It would, however, convey a false idea to speak of one house only; it was Cucumbers and Tomatos in separate houses time and time again, until I omitted to count; but the

enormous weight of the Tomato crop, which would seem to be very much like a cross between Sutton's A 1 and Duke of York, and the crop of Cucumbers, Telegraph being the variety mostly cultivated, was such that I have not seen for a long time. Young plants of Cucumbers were just planted in fresh houses, one of which is 120 feet long; whilst outside the Tomatos were planted in narrow borders close to the walls of the greenhouses, and here later crops were showing, the plants looking healthy and strong.

There being a great demand for cut flowers, it is not to be wondered at that Richardias are grown by thousands. Of *Cœlogyne cristata* a large number of healthy plants was seen; *Cypripedium insignis* by hundreds; *Crinum* and *Pancratium* in large quantities; large beds of Lily of the Valley constantly coming on, to follow the imported crowns in the winter. And then beside all this, the firm annually prepare and dispose of in the autumn of thousands of plants in 5-inch pots of such plants as *Lomaria gibba*, *Adiantum cuneatum*, *Bausei*, and *decorum*; *Solanums* and *Cyclamen*, of which I saw large batches in the different houses and frames; *Pteris Wimsetti*, *P. argyrea*, this latter being in constant request; *Adiantum Farleyense*, too, is a good saleable plant. Ivy-leaved, zonal, and show *Pelargoniums* were here in different houses, full of flower, and represented by thousands of plants; the same may be said of the Palms in small and larger plants, *Fuchsias*, *Grevilleas*, *Hydrangeas*, and *Coleus*. *Maréchal Niel* Roses, too, are grown for autumn disposal, and fine stems, 6 and 8 feet, were already formed, some were then outside; the majority, however, were still under glass. *Niphetos* is largely grown, and in many of the houses it is planted out. It proves itself to be one of the most useful for bouquets, wreaths, crosses, &c. A large number is also grown in pots, also *The Bride*, *Catherine Mermet*, *Gloire de Dijon*, the *Climbing Niphetos*, and others.

In the Croton-house were quantities of small plants, as well as half-specimens; these had little air given them, but plenty of sunlight. The colour of the variegation and vigour of the plants were very noticeable. *Stephanotis* trained on the roofs of houses were numerous, and the plants were densely covered with the white fragrant clusters. *Bouvardias* are also a special feature, and were looking in capital condition.

Passing out into the open again, for it was an intensely hot day, I observed large beds of Carnations, herbaceous plants, including separate quarters of the white double-flowered *Pyrethrum*, a useful variety; and on the standing-out ground, on coal-ashes, were quantities of *Acacias armata*, *Drummondii*, and hybrids, *Choisya ternata* and *stellata*, *Ericas hyemalis*, *Willmoreana* and *gracilis*, *Boronias* of species, *Aralia Sieboldi*, *Hydrangeas*, and then again *Roses*, *Richardias*, and *Genistas*. A large house had been used for *Camellias*, &c., but during the gale of March, 1897, the whole of the glass and woodwork was taken bodily off, now the strong walls alone remain. Here were *Camellias* that must be some thirty to forty years old, with stems 24 to 30 inches in circumference, which had stood the past winter, and were none the worse, though many of them this spring were considerably lessened in height. *Luculia gratissima* in this house appeared none the worse for its winter exposure; whether it will bloom as freely as usual this autumn remains to be proved. *Trachelospermum jasminoides variegata*, in an open border, has been in its present position some twenty-six years unscathed, now is fresh and healthy, and full of flower. *Melanthus major* close by had stood out unharmed. A large specimen of *Salisburia adiantifolia*, some 60 feet high, continually came under one's notice in walking about. The remaining choice Oaks, Beech, Conifers, &c., recalled past days; whilst a grand arrangement of rockeries, now in a condition that would hardly satisfy the original builder, could he see it, still gives some idea of the extent and beauty of this portion of the nursery in the past. Now, the many have to be catered for, and some thirty large houses, 100 and 120 feet long, give employment to a larger number of hands than ever before, and afford supplies to a host of patrons. W. S.

FORESTRY.

OUR WOODS AND FORESTS.

THE recent visit of the Royal Scottish Arboricultural Society to the Forest of Dean has aroused a certain amount of interest amongst foresters in the management of the Crown woodlands, which, we trust, will not be entirely ignored by the powers that be. To nine-tenths of the inhabitants of this country, the "woods and forests" probably exist by name only; and this class would perhaps be greatly surprised to learn that we have anything in the shape of the state forests which are scattered so freely throughout France and Germany. Yet in Hampshire, Gloucestershire, and Berkshire we possess at least three Royal forests which are equal in area to any ordinary State forest on the Continent, and which are ostensibly maintained by the Government for the growth of timber. Two of these, the New Forest and Windsor Forest, are almost household words, it is true, but they are rather associated with the past than the present, and very few indeed concern themselves in the slightest degree as to why they are maintained or how they are managed. Of those who do, however, probably the majority regard them as huge natural parks, and imagine that the trees they contain are identical with those which existed in the days of William Rufus and Herne the Hunter, and rejoice in the belief that in them we still possess relics of the primeval forests which existed in the days of the Roman invasion. A study of their history, however, reveals the fact that all our Crown forests owe their existence as such to the planting enterprise of probably not more than two or three centuries back, and that the majority of the so-called natural woodlands of the country have as artificial an origin as those of the last fifty years, although the ground they stand upon may never have been cultivated or reclaimed. Those who oppose anything of the nature of enclosure, therefore, are really doing their best to destroy all chance of that woodland scenery being perpetuated, the preservation of which they claim to have so much at heart. For a very slight knowledge of tree-growth makes it obvious that natural regeneration of a wood is impossible when the seedlings are eaten down as they appear, by cattle, sheep, donkeys, and ponies; and that so long as this continues, no young crop can exist to take the place of the old trees when they disappear. Yet this is the state of affairs in many of the most picturesque spots of the New Forest, thanks to an Act of Parliament passed in 1877, whereby only those woods planted subsequent to the year 1700 are allowed to be or to remain enclosed. This is the more regrettable owing to the fact that this Act was passed largely owing to erroneous ideas on the subject at issue. The Deer Removal Act, which preceded it, allowed a maximum acreage of 22,000 acres to be enclosed, or protected from cattle at any one time, and any further enclosure had to be accompanied by an equivalent opening up of hitherto enclosed wood. This would have enabled the whole of the forest to have been planted up in rotation, and this probably led many to suppose that the most picturesque parts of the forest would be destroyed to make room for young plantations, and the public denied the right of enjoying them. This certainly ought not to have been, and probably was not the intention of the authorities, and the only difference made by enclosure would, or should, have been the exclusion of those animals which not only destroy young trees, upon which the perpetuation of the forest depends, but which deprive natural woodland scenery of one of its most attractive features. For truly picturesque woodlands do not entirely consist of ancient trees crumbling to decay. The sapling has its part to play as much as the veteran, and the one is quite as indispensable a feature of a typical forest as the other, providing they are associated as Nature always associates her subjects. There must be no hard-and-fast division of territory occupied by the old growth and the new, and no too distinct difference in the age of the trees which compose the younger crop.

The charm of natural forest scenery lies chiefly in the contrasts it presents. The slender sapling springing up beneath the shade of the hoary and decaying trunk, the stunted and deformed stem jutting out from the base of a tall, well-shaped bole, small clumps of young clean timber scattered here and there amongst flat-crowned and mature trees, these are the pictures which Nature provides us with if left to her own devices, and which combine the old growth and

be born, live, and die beneath their shade without noticing any great change in them. But in very old woods, one cannot live amongst them long without noting the gaps which each winter leaves in their ranks, and unless a succession has been well maintained, the character of the wood must ultimately alter for the worse. Londoners will, before very long, have an example of this in their miniature forest of Burnham Beeches. The next half century will see

BICTON.

(Continued from p. 154.)

THE view from the Temple across the flower-garden and slopes to the lake below, and its surroundings, is very charming, and beauty meets one everywhere (figs. 49, 50). Here is a plant of *Arun- dinaria nigra*, 15 feet high, and 20 feet in circumfer- ence, and several such clumps were noticed in that part; *A. japonica* (Métaké), a clump 15 feet high and 60 feet round; and a grand plant of *Magnolia stel- lata*, which blooms in great beauty every spring. *Rhododendron Falconeri* grows with vigour, but up to the present time it has not flowered; a fine speci- men of *Berberis buxifolia* is 30 feet in circum- ference; fine trees of *Magnolia purpurea*, and of *M. grandiflora*; in fact, these *Magnolias* are met with in almost every imaginable spot in the grounds. Hereabouts is a large bed filled with *Lobelia Queen Victoria* and *Hyacinthus candicans*, which have been out all the winter, and they are now strong in growth, and beautifully in flower. A fine clump of *Arun- dinaria falcata*, had been for years a close-growing plant; this spring, however, thirty new shoots have shot up, the rhizomes having run underground, in some cases a distance of 6 feet, before coming through the turf, and some of these shoots have grown to a height of 10 feet, and although the ground is dry and hard, they look as tender as a stem of *Aspa- ragus*. A plant of *Erythrina crista-galli* has stood out for years, and is now showing sixty flower-spikes. Adjoining this is a very large *Macartney Rose*, full of flower-buds, and in August its single white flowers make a glorious display.

We now enter a Fern-house in which *Adiantums* are largely represented, and arranged with these were many white-flowering *Begonias* of the manicata type, *Achimenes*, *Gloxinias*, *Crinums*, and *Streptocarpus*, with just a few *Cypripediums*.

The Temple, facing the flower-garden, is full of rare flowering shrubs, among which I noticed *Canonia capensis*, bearing creamy-white flowers, large speci- mens of *Magnolia fuscata*, *Pieris formosa*, having spikes of flowers resembling a Lily of the Valley; *Metrosideros lanceolatus*, one of the "Bottle- brushes;" *Acacia dealbata*, *Cerasus spinosa*, with clusters of small white flowers; *Pittosporum coria- ceum*, *Eugenia australis*, bearing Myrtle-like flowers, followed by scarlet berries; beside *Eucalyptus* and *Camellias* of different species and varieties. *Hippeas- trums* are grown in large numbers, and flowers may be obtained in almost any week of the year.

The flower-garden is wide and expansive, and the beds are filled with the usual class of bedding plants, but a number of *Cannas*, *Humra elegans*, *Lobelia Queen Victoria*, *Plumbago capensis*, and the old *Cal- ceolaria amplexicaulis* are used freely among the other plants, and thereby much of the flatness of ordinary bedding is taken away. Only two circular beds are filled with *Alternantheras*, *Sedums*, *Echeverias*, *Mesembryanthemums*, &c., and these are very pretty contrasts to the other beds. The fountains here are always playing. In a bed close by I observed *Spiraea alpina*, with pure white flowers; *Desmodium pendu- liflorum*, covered with purple pea-shaped blossoms; *Cytisus capitatus*, with bright yellow clusters; and *Malva moschata alba* and the white *Everlasting Pea*, the flowers of which are much in request for cutting purposes.

A *Cedrus Deodara* in the garden measures 11 feet 6 inches in circumference of the bole; whilst a *Silver Poplar* close by, at 3 feet from the surface, has a girth no less than 19 feet 6 inches.

THE ARBORETUM.

And now, with tape in hand, we make our way to the arboretum, which contains a most comprehensive collection of Conifers, evergreen and deciduous trees, and shrubs, which, unless one has seen it, no idea can be formed of the extent of the area planted, and the completeness of the collection. The length of this school of forestry is just 1½ miles, irregular as regards its breadth, but in some parts widening out to several hundreds of yards; the ground is beau- tifully undulated, and a large lake skirts the arboretum for a good portion of the distance.

FIG. 47.—HYOPSIS LONGIFOLIA: FLOWERS YELLOW. (SEE P. 174.)

the new without spoiling the characteristic beauty of either. If, therefore, enclosure means nothing more than enabling Nature to work out her own designs, her most ardent admirer cannot reasonably object to it, and it could only have been want of knowledge and experience which induced those who had no sordid interests to serve to assist in an agitation which led to the passing of so disastrous an Act as that of 1877. Perhaps some excuse may be found for the course they adopted in the fact that trees such as Oak and Beech die very slowly; a man may

the loss of many of those fantastic trunks which render this wood so famous, and nothing but comparatively young trees will be left to take their places. Very few look so far ahead as fifty years, it is true, with any great deal of anxiety, but the custodians of public property have a duty to per- form to future generations as well as to the present one, and we can only repay the debt we owe our ancestors by doing our duty to those who succeed us. A. C. Forbes.

(To be continued.)

The turf is in excellent keeping, being regularly mown and swept. Every tree is numbered, and a reference-book is kept, so that no difficulty is experienced in obtaining the name of a specimen. The first to come under notice were the Conifers, and grand specimens these are. I noted trees of *Cryptomeria japonica* and *C. Lobbi* 50 feet high, and in form perfect; *Cupressus macrocarpa* with a stem 26 inches in circumference; *C. Lambertiana*, very fine; *Sequoia sempervirens*, with a bole measuring 16 feet in girth; a remarkable *Taujopsis dolabrata*, 20 feet high, the branches covering a circle of 20 feet in diameter; a *Thuya occidentalis*, 40 feet high; *T. plicata* or *T. Lobbi*, of this were several specimens 60 feet high; a dense piece of *Retinospora squarrosa*, 25 feet high; *Thuya Vervaeiana*, also very fine; a capital plant of *R. squarrosa* var. *aurea*, 20 feet high. Close by this is a specimen of *Thuya dolabrata variegata*, and one of *Retinospora obtusa*, a fine densely clothed tree 40 feet high; *Abies Nordmanniana*, 50 feet, a grand tree; so too were *A. grandis*, of similar height, and *A. canadensis*. *Abies nobilis* was good, whilst a tree of *A. Douglasii taxifolia* reached an altitude of 70 feet. A *Pinus insignis*, said to be the finest in Devon, is 70 feet high; *P. Russeliana*, one of the rarest of the Pines; *P. Hartwegi*, rather tender, and *P. australis*, one of the finest in England, is 35 feet high; and *P. pinea* is very fine. *Sciadopytis verticillata*, and *Podocarpus coriarius* are well represented.

Many smaller specimens of other choice species are present, and mention should be made of the Golden Yews, which act as grand foils to what might otherwise be the sombre green of these giants. Still passing, we come to *Phyllocladus asplenifolius*, whose pinna-like foliage reminds one very much of *Asplenium furcatum*. *Pinus Pinaster* var. *Escarana*, and *P. patula* are well-grown specimens of very rare species; *Garrya elliptica*, then immense fruiting-trees of *Filberts*, one of which measured at 3 feet from the ground no less than 7 feet in circumference, and at this height it had divided out into twelve strong limbs. Varieties of *Planes*, *Beeches*, and *Sweet Chestnuts* now come into view, some of the *Beeches* being singularly beautiful, especially *Fagus antartica*, an evergreen species. Some species of *Quercus* were recently planted, and among the established ones *Quercus ruber pectinata*, which has as finely-cut leaves as some of the Japanese Maples; *Q. tinctoria*, with leaves 12 inches long; *Q. cerris* var. *Lonetti*, very fine, with branches down to the grass; *Q. glabra latifolia*, almost like a *Magnolia*; *Q. cerris variegata*, very distinct, a grand tree. Then follow some seventeen species and varieties of *Walnuts*, among which *Juglans amara* and *J. nigra* were very conspicuous; *Celtis Tournefortii* is likewise a distinct-looking tree.

Many and large were the trees of *Birch* and *Alder*, and in a portion of the grounds, where a small stream of water runs, *Poplars* and *Willows* were largely planted. Some forty varieties of *Ash*, many being large trees, were followed by a collection of *Sweet Bays* and *Boxes*. Here also was a large *Buddleia globosa*, with its yellow flower-balls just going over; and then large bushes of *Azaleas* and *Rhododendrons* in great variety. *Fabiana imbricata* is a large bush, with dense corymbs of white, Heath-like flowers. Honey-suckles of species and varieties come next: *Lonicera involucrata* is now covered with its bright scarlet and orange flowers; *Kalmias*, *Hydrangeas*, *Arbutus* then follow; and after these *Escallonia*, *Myrtles*, *Deutzias*, and beds of *Spiraeas* in variety—one of *S. coronata* is beautiful indeed, the plants bearing sprays of creamy-white flowers 2 feet in length; *S. callosa pumila alba*, *S. c. rosea*, and many others, as *Tamarisk*, *Mock Orange* (*Philadelphus*), single and double-flowered *Prunus Cerasus*, *Crataegus*, *Rhus Cotinus*; and here we met with a beautiful object, *Ceanothus azureus*, covered with its pale blue, branching clusters of flowers. Then came *Hollies* in much variety, *Euonymus*, *Limes*, and a fine plant of *Stuartia virginica*, covered with white flowers measuring 3 inches across, and having deep purple-tinted stamens. In a sheltered spot were large shrubs of *Thea Bohea* and *T. viridis*. W. Swan, Exmouth.

(To be continued.)

COLONIAL NOTES.

THE Supplementary Estimate on behalf of the West India Islands, which was prepared by the Colonial Office for submission to the House of Commons, was for a total of £41,500, and included among other items, £10,000 as a grant in aid of the central sugar factories, to enable the Government to assist in the formation and working of such factories in a manner to be hereafter determined upon; £5000 for the purpose of enabling Crown Agents for the Colonies, under the direction of the Secretary of State, to enter into contracts for improving steam-communication between the various West Indian Colonies and other countries, including arrangements for the carriage of fruit and other produce; £4500 as a grant in aid of botanic gardens and agricultural instruction and experiments, also in accordance with the recommendations of the West India Commission, to be used for the purpose of establishing a department of practical instruction in agriculture and botany in the West Indies; for maintaining botanic stations in the islands above-mentioned, together with Tobago and Grenada; £1066 for incidental expenses of the Agricultural Department, this including travelling, the purchase of furniture, books, implements, prizes to local horticultural shows, &c.

THE WEEK'S WORK.

THE ORCHID HOUSES.

By W. H. WHITE, Orchid Grower to Sir Trevor Lawrence, Bart., Burford, Dorset.

Seasonable Treatment of Orchids.—With the advance of the year the treatment afforded the plants will require modification, so as to enable growth to mature thoroughly, and thus allow the plants to pass the winter safely. Novices in Orchid cultivation should bear in mind that it is mistaken practice to be continually damping down, as by so doing an unnecessary degree of humidity is maintained, which is not desirable, in view of the shortening days. From the present date till such time as fire-heat must be more constantly and freely employed, a moderate damping in the morning and afternoon will suffice for all species of Orchids; damping down a little earlier in the afternoon and later in the morning as the days shorten, and in accordance with the inside temperature. For several hours during the middle of the day the air of the house should be allowed to become comparatively dry; and with the reduction of humidity in the houses a gradual increase of ventilation should go on, more or less according to the state of the weather. Great care must be used that the plants in the warmer houses are not chilled. By closing the ventilators of the East India house at about 2.30 P.M. the temperature may be allowed to rise to 80° or 90° by sun-heat, and towards evening the fires should be started gently to prevent the thermometer falling below 70° in the early morning hours. On warm nights the bottom ventilators of the *Cattleya*, *Mexican*, and intermediate-houses may be left wide open, but it is advisable to close the top ones early, and at the same time to have the hot-water pipes slightly warmed. In cool-houses, which need no fire-heat at the present date, ventilation may be afforded as external condition will allow; and it will also be necessary to gradually expose the collection, as a whole, to more sunlight. In reducing the amount of shading, discrimination must be used, especially where a varied collection is grown, some species being liable to lasting injury if exposed to strong sunlight, and amongst those that are thus readily affected are *Phalenopsis*, *Angraecums*, *Phaius*, evergreen *Calanthes*, *Erias*, *Bulbophyllums*, *Cirrhopetalums*, the *Cologynes* and *Cypripediums* generally of the warm-house; *Vandas*, *Boleas*, *Pescatoreas*, *Oncidium*, *Eulophiellias*, *Cymbidiums*, *Lycastes*, and many of the cooler growing *Oncidium*, *Masdevallias*, and *Odontoglossums*.

Masdevallias.—If any of the *Masdevallias* are out of health the present is a good time to examine and repot them. The plants should be turned out of their pots, dead roots and rhizomes cut away, and then be placed in pots just large enough to hold their roots conveniently. Overgrown masses of *M. Harryana*, *M. Lindenii*, *M. Veitchiana*, *M. ignea*, *M. coriacea*, *M. coccinea*, *M. Peristeria*, *M. Chelsoni*, *M. corniculata*, *M. amabilis*, *M. Reichenbachiana*, *M. Barkeana*, *M. macrura*, &c., which are becoming bare in the middle

may be divided, and the pieces potted up separately or remade into more convenient-sized specimens. *Masdevallias* being plants of vigorous growth, require largish pots. These should be about half filled with clean crocks placed in an upright position, and over these lay sphagnum-moss, and over this a compost consisting of peat and sphagnum-moss in equal proportions, with some small crocks mixed with these ingredients. Keep the base of the plants on a level with the rim of the pot, and insinuate the compost among the roots, and occasionally a few thick crocks likewise, potting moderately firmly. The critical time with *Masdevallias* is immediately after repotting, and before the roots have seized upon the compost, any excess of water at that time resulting in the loss of leaves and roots. For a few weeks water should be afforded very sparingly, and the air of the house kept fairly moist. When re-establishment has taken place, the quantity of water at the root may be gradually increased, and the humidity of the air slightly reduced. All the varieties mentioned grow well in pots standing upon a stage. The following species and hybrids do well in pots if placed near the light, viz., *M. Armini*, *M. caudata*, *M. Shuttleworthii*, *M. Ajax*, *M. racemosa Crossii*, *M. elephanticeps*, *M. Gargantua*, *M. Schlimi*, *M. tovarensis*, *M. Davisii*, *M. Courtauldiana*, *M. Gairiana*, *M. splendida*, *M. cucullata*, *M. melanonantha Trochilus*, *M. glaphyrantha*, *M. Asmodea*, *M. Shuttriana Rebecca*, and *M. Pourbaixi*. The dwarf species, as *M. ionocharis*, *M. Wagneriana*, *M. muscosa*, *M. Estradae*, *M. triadactylites*, *M. picturata*, *M. O'Brieniana*, *M. Stella*, *M. infracta*, *M. rosea*, *M. Gelengiana*, *M. simula*, &c., may be grown in small shallow pans hung up close to the roof-glass; but if the atmosphere of the house be naturally dry, a light position upon the stage would suit them better.

THE KITCHEN GARDEN.

By J. W. McHATTIE, Gardener to the Duke of Wellington, Strathfieldsaye, Hants.

Large Onion Bulbs.—The bulbs are now fast approaching ripeness, and a fine dry day may be selected upon which to lift them; removing them afterwards to some suitable place where they can be thoroughly dried. Ainery where the Vines are at rest, or a Peach-house, may be suggested as a convenient place for this purpose. Those who have no convenience for drying the bulbs under cover may spread them out on a hard path, on sheep-hurdles, or the bare smooth ground of the bed, and turn them over a few times. They will need to be stored away subsequently in a dry, cool shed. Those who do not wish to incur the trouble attending the raising of Onion plants from seed early in January would do well to sow their favourite varieties at this season in the open border. This year we have had extra fine specimen bulbs that have been produced from autumn-sown seeds of such sorts as *Ailsa Craig*, *Cranston's Excelsior*, *Golden Rocca*, and *Sutton's Exhibition*.

The Leek.—This crop may be very considerably benefited by affording it a dressing of guano and soot, or some other approved fertiliser. An excellent manure for Leeks, if given in a sufficiently diluted state, is the drainage from the cattle-stalls. Plants that are being cultivated for show specimens should be afforded water as often as it may be required. If the bed, or trenches, be full of roots, a slight dressing of manure may be afforded the soil once a week in order to keep the plants growing freely. At the same time care must be used not to over-feed the plants, or they will become useless.

Late Peas.—Much attention is given to the production of the earliest dishes possible of this delicate vegetable, and as good late Peas are almost equally appreciable, the same care should be given them also. Usually, late Peas require liberal and frequent supplies of water at the roots. Mildew seldom attacks healthy, strongly-grown Peas, but may be trusted to render utterly worthless any rows of starved, stunted plants that have been neglected.

Out-of-door Tomatos.—Gather the fruits now as soon as they have commenced to colour, and place them in a warm, dry position to fully ripen them before they are sent for use into the kitchen. Expose the unripe fruits to the sun as much as possible by pinching off all surplus growths from the plants; and if the plants have not yet been stopped, this should be done at once. In some localities the plants may need water at the root.

Potatos.—Any variety of Potato that is sufficiently ripe should be lifted. Traces of disease may be

observed, but no bad cases have yet come under my notice this season, although I grow about thirty varieties here; however, the sooner they are raised after the tops show signs of ripening the better.

Mushrooms.—Continue to collect manure for the making of new beds, and turn it frequently. An endeavour should be made to get as many beds made before the cold weather sets in as will furnish sufficient Mushrooms for a considerable portion the whole of the winter.

HARDY FRUIT GARDEN.

By W. H. DIVERS, Gardener to the Duke of Rutland, Belvoir Castle, Grantham.

Peaches.—Those trees of early varieties from which the crop of fruit has been gathered should have the whole of the fruiting shoots removed where they are not wanted for extending the tree or filling blank spaces, most of such shoots being useless, and if allowed to remain they would have to be cut out at the winter pruning. Hence it is better to remove them, and allow the new shoots that will bear fruit in 1899 to increase in size and vigour, with the certainty, then, of their blooming strongly. Shoots that are thoroughly matured by exposure to sunshine suffer little or not at all in severe winters, when greener and consequently tenderer shoots often get killed back some distance. After the thinning is finished, the trees should be syringed with Tobacco-water or an infusion of quassia, to free them from aphides, not omitting to put soft-soap at the rate of 4 oz. to 1 gallon of rain-water to the above, and not afterwards rinsing off the insecticide. If red spider and mildew infest the foliage, use Gishurst's soap. Brown scale, a very troublesome insect on Peach-trees, disfiguring the fruit with a sooty-black deposit, and sucking the juices of the tree, may be removed from the skin of the fruits by brushing very lightly with a soft brush if the fruits are firm; but which must not be attempted after the skin gets tender. The scale insect itself should be sought for after the fruit is gathered, insecticides being of no avail against it unless it is first moved from its position on the shoot; the trees may then be well syringed with the insecticides named, but much perseverance is necessary before brown scale is entirely eradicated.

Fruit that is ripening must be examined daily to prevent its falling from the trees, for I think it is a mistake to allow it to ripen so thoroughly as to drop into nets placed to catch such, the greater part of the flavour having departed by that time. It is better practice to test the ripest looking fruits, and if a fruit is found on slightly pressing it near the stalk to yield in the least degree, it should be gently raised and detached from the shoot. The apex of a fruit should lie in the middle of the palm, and the pulling or raising be done with the finger-tips. Fruit may be kept for a day or two to finish in a shady, dry room, or if required for market purposes, or for travelling long distances it may be sent off before the softness of thorough ripeness sets in.

PLANTS UNDER GLASS.

By W. MESSENGER, Gardener to H. C. BERNERS, Esq., Woolverstone Park, Ipswich.

Chrysanthemums.—Plants of the earlier flowering varieties should be removed into a cool, airy house directly the flower-buds show signs of opening; the expanding blooms will thus be secured from damage that would arise from frequent rains or strong winds. Later flowering varieties, however, are best left out-of-doors as long as the weather will permit. In various localities the date will vary considerably, but if preparations be made to house the plants when occasion requires, it will be possible to leave them in their present quarters until frost appears certain. Any plants upon which the flower-buds have not yet been "taken," or rather selected, will need attention at once. All side-shoots must be removed, and leading shoots secured to sticks. When the buds have been "taken," the plants will require less manure. If mildew be observed an application or two of sulphide of potassium may be given, at the rate of 1 oz. to three gallons of water, thoroughly syringing both upper and lower surfaces of the leaves. In view of possible wet weather, care should be taken that the soil does not become water-logged.

Herbaceous Calceolarias.—The earliest plants, now in 3-inch pots, may be transferred to others of 5 inches diameter, and those still in boxes had better be put into 4-inch pots. Make use of a compost consisting of two parts good fibrous loam, one part leaf-mould, and one-seventh of the whole of decayed

manure. A good portion of coarse silver sand should be added to this. Place the plants in a cool, airy frame, and shade from the sun. Until the roots become active be careful that too much water be not afforded. Smaller plants that have been pricked into pans may be transferred to boxes, putting them 3 inches apart. Afterwards place the pots and boxes on a cool and moist base.

Solanums.—Plants which are well berried may now be lifted and potted-up, and if this be done with care they will not suffer any check. The balls may be slightly reduced in size to suit the pots, but endeavour to preserve the roots from injury as much as possible. Should the soil in which the plants stand be dry, apply water copiously the day previous to lifting. When the plants have been potted stand them in a shady position for some days until root action has commenced, when they may be removed to a cool frame. Plants upon which flowers are now setting may be left in the ground some weeks longer.

Marguerites.—Re-pot those plants that having been cut back are now breaking freely into growth; removing a portion of the old soil, and re-potting into a pot one size larger than those from which the plants are taken; and shade and syringe the plants for a few days afterwards, to encourage root activity. Cuttings may be inserted in pots or pans, placing them in an intermediate temperature until they have rooted, when a light, airy position may be assigned them. Plants for autumn flowering may have frequent applications of manure-water.

Achamenes.—The earlier batch of plants will soon be past their best, and they may then be put on a shelf in a light position, where, as the foliage dies off, they will require but little water. Finally, the pots may be stacked on their sides in a cool position.

FRUITS UNDER GLASS.

By G. NORMAN, Gardener to the Marquess of Salisbury, Hatfield House, Herts.

Grape Vines.—The latest Grapes having begun to assume their proper colour, it will be prudent to examine the border, with the object of ascertaining its condition as regards moisture, as at this period a Vine makes large demands upon the roots. If the soil be found dryish, a heavy application of water may be afforded, and afterwards one of manure-water mixed with clear water. How often a border may be afforded water will depend upon its porosity, its width and depth, narrow and shallow borders and porous soils requiring water oftener than wide and deep ones, and stiff loams. As the Grape-vine contains much lime in its composition, this substance, either as superphosphate or quicklime, may be sprinkled on the border before applying water, that is, suppose the soil to be deficient in lime. The quantity applied need not exceed $\frac{1}{4}$ lb. of the former or 1 lb. of the latter per square yard. As the Grapes ripen, reduce the humidity of the air of theinery, and when quite ripe, damp the paths occasionally only on fine mornings. Let warmth be maintained in the heating apparatus, in order to keep the temperature at night at about 65°, and by day at 70°, or with sun-heat to 80° or 85°. Afford air early in the day, and increase the quantity, weather permitting, till noon, when a reduction should begin. A slight amount may remain on throughout the night in fine weather. Denude the Vines with ripening fruit on them of lateral shoots, excepting those of Madresfield Court; of this variety, only a few of the strongest may be removed. Let ripening Grapes be looked over, removing superfluous and shawked berries. Ripe Grapes which must hang on the Vines in good condition for as long a period of time as possible, must be afforded free ventilation on dry days, closing the top ventilators during rain, and the front ones when there is fog or much humidity in the air. In damp weather use the heating apparatus. If the soil at the roots is approaching dryness, afford water plentifully once. If there is a strawy mulch on the border, remove it before applying water, and replace it directly afterwards. Do not omit to examine the bunches for decayed berries at short intervals. Wasps must be kept out of all vineries where ripe Grapes are hanging, otherwise the loss of fruit will be serious. Hexagon netting is the best kind of material to use as an excluder. The foliage of early Vines should be kept in a healthy state, applying water at the root if the border is dry, and syringing it on fine days, using considerable force, but not so much as to tear the leaves. Keep theinery cool.

Early Pot Vines.—The pruning of Vines that will carry the earliest crop next year will depend upon

the date at which they will be started, and the least amount of time that should elapse between pruning and starting is six weeks. The canes of pot-Vines need not be left of greater length than 5, 6, or 7 feet, and all side-shoots should be cut back to within half an inch of their base. The dressing of these Vines with the usual mixture should not be done before forcing begins.

Early Permanent Vines.—The side-shoots may now be cut back to the lowest most prominent bud, and where two shoots come from one spur, and one is sufficient, the foremost shoot may be removed, as by retaining the other shoot the spur is kept short. The canes themselves may be shortened to within 1 yard of their proper length.

THE FLOWER GARDEN.

By H. WALTERS, Gardener to Lord GERARD, Eastwell Park, Ashford.

Propagation of Bedding Plants.—It is now quite time that a commencement be made to propagate a stock of bedding-plants for next season. Cuttings should first be taken of the more tender species, such as Alternantheras, Mesembryanthemums, Iresines, Heliotropes and Coleus. Place the cuttings of these plants around the sides of $\frac{1}{2}$ -inch pots, which have been previously filled with leaf-soil and sand. The pots had afterwards be best plunged in the propagating-pit until the cuttings have made roots, when they may be placed on shelves near the glass in a house or pit where the temperature does not fall below 55°. Avoid over-watering, or the cuttings will be liable to damp-off. Cuttings of Pentstemon, Pansies, Violas, and other hardier plants need very different treatment, and may be dibbled into prepared sandy-soil, in cold frames or under hand lights placed at the foot of a north wall. Such plants as Lobelias, Verbenas, and Petunias may be had so comparatively true from seed that I do not consider it advisable to propagate them from cuttings, but to sow seeds in the spring. Continue to take cuttings of all varieties of bedding Pelargoniums and Fuchsias where these are used for bedding purposes.

General Remarks.—Seeds should be sown during September of any hardy annuals required to bloom early next summer. Pay strict attention to plants which will be required to fill up the beds in the autumn. They will probably need liberal and frequent root waterings to keep them in a growing and healthy condition. Roses and most other plants are suffering greatly from the drought, and need to be watered. The layering of Carnations, if not already done, should be completed as soon as possible, and any new varieties of Carnations it is proposed to purchase should be ordered as soon as convenient. During the present month all hedges should be given their last clipping for the season.

VARIORUM.

CETRARIA ISLANDICA.—This is one of the best materials for planting in shady courtyards where no direct sunlight penetrates. Under trees and similar places, this plant, the so-called Iceland Moss, affords good results when properly used. It has a good effect when in contrast with turf and gravel.

CHACUN A SON GOÛT.—It has been stated of the commander of an early Polar expedition that he tested the capacity of an Esquimaux for a fatty diet to the extent of a gross of what are termed "purser's dips," or short candles. The red Indian with untutored taste, is not to be outdone by his northern relative—this on the authority of Mr. F. Funston, a collector for the Washington (U.S.) Herbarium, whilst engaged in getting out specimens in the neighbourhood of Yakutat Bay, Alaska. Mr. Funston came upon large tracts of Cranberry, Blueberry, Black Currant (not eaten), and the Strawberry. Of this latter he writes:—"The vegetation of these sandunes includes many acres of Strawberry (*Fragaria chiloensis*). . . . This plant is found in immense quantities. . . . The fruit is about half an inch long, somewhat Pear-shaped, and of a light pink colour. The berries have an excellent flavour, and are eaten in large quantities by the natives who first cover them with seal oil, as they do all fruit." After all, there is no accounting for taste.

EDITORIAL NOTICES.

ADVERTISEMENTS should be sent to the PUBLISHER.

Letters for Publication, as well as specimens and plants for naming, should be addressed to the EDITOR, 41, Wellington Street, Covent Garden, London. Communications should be WRITTEN ON ONE SIDE ONLY OF THE PAPER, sent as early in the week as possible, and duly signed by the writer. If desired, the signature will not be printed, but kept as a guarantee of good faith. The Editor does not undertake to pay for any contributions, or to return unused communications or illustrations, unless by special arrangement.

APPOINTMENTS FOR THE ENSUING WEEK.

TUESDAY, SEPT. 6. Royal Horticultural Society's Committees.
National Chrysanthemum Society's Exhibition of Dahlias, Gladioli, &c. (3 days).
Scottish Horticultural Association, Meeting.

SALES.

MONDAY, SEPT. 5. Important Sale of Orchids and General Stock, at the Nurseries, Bush Hill Park, Middlesex, by order of Messrs. Hugh Low & Co., by Protheroe & Morris (2 days).
Dutch Bulbs, at Protheroe & Morris' Rooms.

TUESDAY, SEPT. 6. Dutch Bulbs, at Protheroe & Morris' Rooms.
Dutch Bulbs, at Protheroe & Morris' Rooms.
Seventeenth Great Annual Trade Sale of Winter-blooming Heaths, at the Longlands Nursery, Sidcup, by order of Messrs. Gregory & Evans, by Protheroe & Morris (First Sale).

WEDNESDAY, SEPT. 7. Dutch Bulbs at Protheroe & Morris' Rooms.

THURSDAY, SEPT. 8. Third Annual Trade Sale of well-grown Ericas, Roses, &c., at the Mill Lane Nursery, Cheshunt, Herts, by order of Mr. E. Rochford, by Protheroe & Morris.

FRIDAY, SEPT. 9. Dutch Bulbs at Protheroe & Morris' Rooms.
Imported and Established Orchids at Protheroe & Morris' Rooms.

AVERAGE TEMPERATURE for the ensuing week, deduced from Observations of Forty-three Years, at Chiswick.—59° 3'.

ACTUAL TEMPERATURES:—

LONDON.—September 1 (6 P.M.): Max., 69°; Min., 55°.
PROVINCES.—September 1 (6 P.M.): Max., 64°; Weymouth; Min., 50°; Off Shetland Isles.

Gardening Charities.

THE discussion that has been going on in our columns for some time as to the gardening charities cannot be considered as a satisfactory one, and we hope we shall be spared from a further extension of it. The disputants argue from two different points of view. Although each may be right from his own standpoint, unless each will elect to yield a little there is no chance of their coming to a conclusion. We cannot help looking on Mr. FLETCHER as the aggressor in this case. Most assuredly he was so in the implication that the gardening charities were housed in palatial mansions, and that their salaried officials were richly endowed.

To those who know, such implications are ludicrous, but though Mr. FLETCHER has been set right on this point, he has never withdrawn the insinuation. Undoubtedly he made a great mistake in that matter, and that circumstance will, rightly or wrongly, cause his readers to discredit some of his other statements and arguments. In his remarks on the Gardeners' Royal Benevolent Institution, Mr. FLETCHER, as it appears to us, goes out of his way to disparage the institution for not doing that which its constitution does not allow it to do. It is not a Benefit Society, nor was it intended to be so; it was called a "Benevolent" Society, and so it remains. Mr. FLETCHER seems to think that every member or his representative should *de jure* receive an amount

representing the amount he has paid plus compound interest? Where does the benevolence come in, in such a scheme? Every subscriber who is actually in need does receive something more than a vote. He gets substantial relief, and it may be that he or his widow may get much more than the amount that Mr. FLETCHER says they ought to get. This could not be done if every member, whether he were in need or not, were to be pensioned off at a certain age. Gardeners, like other members of the community, are called on to exercise self-help and thrift, but the duty of helping their neighbour in his need is at least equally incumbent on them according to the measure of their capabilities.

There is room for both the Benefit Society, which is, we believe, in a flourishing state; and there is room for the Benevolent Society, which has rendered such great services to distressed gardeners and their widows. Its rules have been re-cast of late years, new regulations have been enacted, all with the object of rendering assistance to those who need it swifter and more certain. To us who have been cognisant with the Society for more than a quarter of a century, the wonder is that it is not more generally supported by the gardeners than it is. For ourselves we believe the main reason is the want of local secretaries and local branches in the various counties. Gardeners are isolated, and there is a difficulty in getting at them. Local secretaries might be appointed in various districts all over the country, and their duties should consist not merely in sitting in their garden-office and writing a few letters, but in personal visits to every gardener in the neighbourhood. Much more use might be made of local flower shows in promoting the cause of the Gardeners' Benevolent and of the Gardeners' Orphan Fund. We know that the gardener as a skilled workman is too often paid a much lower wage than is warranted by the foresight and experience he has to exercise, but after making every allowance, there still remains a large body of gardeners who could, but do not help. It is this class who make such communications as those of Mr. FLETCHER an excuse for not doing what they could well afford to do. Rather should they note what their fellows are doing in sacrificing their time, their energy, their money, for the benefit of the needy and the orphan; rather should they not feel some qualms of remorse when they see the donations that are yearly made by persons unconnected with the craft, and who cannot—be their future need what it may, receive the slightest aid in return. There are matters of detail in the working of the societies which are open to objection, no doubt. For ourselves we think the voting system bad and cruel to the candidate; but the majority of subscribers at present think otherwise, and we must wait for the light to diffuse itself. Meanwhile, all honour to the committees and the officials. They do their work excellently well. May their example stimulate the sluggishness of those who can but do not help.

Value of Moss-litter.

Moss-litter has for several years been largely used for stable-bedding purposes, it being particularly valuable on account of its high absorptive capacity for fluids and gases. A considerable quantity of moss-litter is exported from Holland, and more recently from Canada, where the supply is said to be well-nigh unlimited. Two samples obtained from Big Plain Bog and Weldon Bog, Nova Scotia, which were clean bright samples, consisting of fine straight fibres,

and free from all foreign matter, have been submitted to chemical analysis, with the following result:—

Composition of Moss-litter (air dried).

Constituents.	Big Plain Bog.	Weldon Bog.
Moisture	15.70	16.20
Organic Matter	82.50	81.75
Ash	1.80	2.05
Nitrogen	100.00	100.00
Absorptive Capacity	0.527	0.596
	1395	1533

As regards composition these samples are very similar. Their absorptive capacity is very satisfactory; their low "ash" shows absence of earth, and their nitrogen content indicates that the resulting manure would be materially enriched in this valuable constituent of plant-food.

A further and most important use for moss-litter has recently been found. It has been used with good success as a packing material for fruits and other perishable articles in transit. Its absorbent power keeps the fruit dry, and thus assists in arresting or preventing that decomposition which always follows "sweating," due to imperfect ventilation and other causes. From a hygienic, as well as a mechanical standpoint, moss-litter should commend itself as a packing medium.

ROYAL HORTICULTURAL SOCIETY.—The next meeting of the Fruit and Floral Committees will be held on Tuesday, September 6, in the Drill Hall, James Street, Westminster, from 1 to 5 P.M. On this occasion a lecture on the Diosa will be given by Mr. T. W. BIRKINSHAW, beginning at 3 o'clock.

"KEW BULLETIN."—The contents of the August number consist of articles upon the Coagulation of Rubber-milk; Kendir Fibre (*Apocynum venetum*, Lin.), a fibre-plant successfully used in the manufacture of Russian paper-money; Carob-tree (*Ceratonia siliqua*, L.), including a report on the cultivation of the Carob as a shade-tree, and its seeds as forage for horses when on long journeys; Shinia in Cyprus (*Pistacia Lentiscus*), used in the adulteration of Sumach (*Rhus coriaria*). Shinia is the Cyprian name of the plant. The number contains descriptions of a number of new Orchids, and short notices of Bamboo vulgaris, *Artemisia pallens*, Lemon grass-oil, hybrid Coffee, Florida Velvet Beans, now identified by Mr. F. M. BAILEY, F.L.S., the Colonial Botanist, Queensland, as *Mucuna pruriens* var. *utilis*. It is probably *M. utilis* of Wallich, described in the *Flora of British India*, vol. i., t. 280, "a cultivated variety," with velvety not hairy pods.

THE BOTANIC GARDENS, SYDNEY, NEW SOUTH WALES.—The first report of these gardens and public domains by the new Director, Mr. J. H. MAIDEN, F.L.S., is now before us in the form of a twenty-one page folio. It deals with the work in the gardens from June 1, 1896, that is from a date one month later than the Director's appointment to the post in succession to Mr. CHARLES MOORE, to December 31, 1897. It is incidentally stated that, since the establishment of responsible government in the Colony of New South Wales, reports of the gardens have been made only intermittently, and since 1878, it is believed that not any have been issued. Much new work, including improvements of the old features of the botanic garden, appears to have been undertaken. That part of the garden devoted to certain natural orders of Decotyledons has been largely remodelled, and orders of lesser replaced by others of greater importance. The space set apart for medicinal plants has been rearranged, and non-medicinal plants excluded. This portion of the grounds is much appreciated by students, and the Council of the Pharmaceutical Society of the colony has promised co-operation. A fine collection of Aus-

tralian" grasses has been planted out, whilst the non-Australian ones have received noteworthy additions. Mr. HUGH DIXON has generously made an offer of his collection of Australasian Orchids to the gardens, provided suitable provision can be made for the plants; and Parliament having granted a sum of money for this purpose, the offer will be accepted during the present year. Displays of native flowers in the cut state are being continued as heretofore, each bunch being furnished with its vernacular (where it possesses one) and botanical name, and the natural order to which it belongs. The various Government Domains come in for a considerable amount of attention, and consist of extensive areas, viz., Centennial Park, 763 acres; Garden Palace-grounds, 19

flowering; 2, whether the plants die after seeding; 3, whether the seed ripens and germinates.

MR. EDOUARD LUJA has been appointed by the Government of the Congo Free State as Botanical and Entomological Collector in the upper regions of that country. He was a member of the gardening staff of the Royal Gardens, Kew. He left this country for Africa in August.

A STANDARD APPLE-BARREL.—In view of the importance of having a barrel of a definite and uniform capacity in use in the exportation of Apples, the dealers and shippers are once more taking up the question in earnest. The advantages of the

lowing Orchids:—*Cattleya Trianaei* var. *Dutremblay*, Bert.; *Cypripedium Parksianum*, Hort.; *C. Annie Measures*, Hort.; *Dendrobium chrysotoxum*, Ldl.; *Epidendrum Brassavolæ*, Rehb. f.; *Lælia autumnalis* var. *atrorubens*, Backh.; *Odontoglossum crispum* var. *Capartianum*, O. *Cervantesii*, La Llav. et Lex.; *O. pulchellum*, Batem.; *Pescatorea cerina*, Rehb. f.; *Phaius Humbloti*, Rehb. f.; *P. Norman*, Hort.; *P. N.* var. *aureus* Hort.

THE FAILURE OF PEACHES TO SET THEIR FRUITS.—Dr. UDO DAMMER writes in a Chicago contemporary:—"Last spring I was rather surprised with the behaviour of a young Amsden Peach-tree in

FIG. 48.—VIEW OF A LAKE IN EARL WEMYSS' GARDEN AT GOSFORD, EAST LOTHIAN. (SEE P. 182.)

acres; Outer Government Domain, 90 acres; Inner Government Domain, 40 acres; State Nursery, 20 acres; and the gardens and grounds of the country residence of His Excellency the Governor, at Hill View, 300 acres. Mr. MAIDEN has more than enough wherewith to employ his time and energy.

THE FLOWERING OF *ARUNDINARIA AURICOMA*.—It may interest your readers, writes Mr. A. B. FREEMAN-MITFORD, to know that the rare event of a Bamboo flowering in the British Isles is at present occurring. *Arundinaria auricoma* is flowering at Castlewella, in Ireland, and at Batsford, in Gloucestershire. It is probably showing flower gregariously wherever it is grown, and it will be important that those in whose garden it grows should note—1, any exceptions to this gregarious

adoption of a barrel of uniform capacity are obvious to customer and dealer alike, and it will help to impart confidence to consumers, who have often been cheated in the short measure barrel. The National Apple Shipper Association and the National League of Commission Merchants in the U.S.A., have already adopted the following dimensions:—Head, 17½ inches; stave, 28½ inches between crozins; bulge not less than 64 inches outside measurement. These are the measurements of the Minneapolis flour-barrel. If this barrel be adopted in the U.S.A., the Canadians will be obliged to follow suit.

"DICTIONNAIRE ICONOGRAPHIQUE DES ORCHIDÉES."—The number of this publication for April last has just reached us. It contains coloured plates and letterpress descriptive of the fol-

the grounds here. The tree flowered well, but it did not set a single fruit. On investigation, it was found that there is no other Peach-tree in the neighbourhood, and all the flowers of the tree in question proved on examination to be what botanists term proterandrous, that is, the anthers ripen and shed their pollen long before the stigma of the pistil is ready for fertilisation, and thus fruits are impossible, unless pollen from some other source alights upon the reproductive organs at the proper time. But all the flowers of this tree developed at about the same time, and there was no pollen available when it was needed."

THE TRIUMPH PEACH.—This is an American variety, said to be one of the best yellow-fleshed, late Peaches, of large size, and good colour, and almost a

free-stone. The fruit ripens at the same time as Alexander, and its flavour is said to be fine, and the stone small. The fruit does not readily rot, as do the early varieties, and it hangs on the tree with great tenacity.

FLOWERS IN SEASON.—We have recently received from Mr. THOMAS WARE, of the Hale Farm Nurseries, Tottenham, a pure white form of *Gladiolus gandavensis*, the spike of which is of moderate proportions, and possessing a dozen open flowers and flower-buds. A variety valuable for obtaining marked contrast with coloured varieties, or with dark-leaved plants, as *Lobelia cardinalis*, some of the *Cannas*, *Ricinus Gibsoni*, &c.

—We have received from Mr. H. LISTER, of Rothsay, blooms of a number of named varieties of fancy Pansies. Some of these are novelties, and we judge them to be of considerable merit; but the blooms were not sufficiently fresh upon arrival to describe any of them perfectly.

"JOURNAL OF THE SOCIETY OF ARTS."—Articles of interest to cultivators of the land are found in the last issue of this publication in "Wine Ferment Experiments in France" (see p. 174), the "Straw Industry in Germany," and the "Manufacture of Paper from Bamboo."

CRIMSON RAMBLER ROSE IN AMERICA.—It is stated by a correspondent in *Gardening* (Chicago) for August 18, that the Rose Crimson Rambler, as seen here in the nursery of Messrs. ELLWANGER & BARRY, is a magnificent sight just now. For several weeks it has been in full bloom, and in spite of hot and extremely dry weather, is still in first-class condition. The plants were put out a few feet apart twelve months ago last spring, and they have made a splendid growth. A trellis had to be erected to support the many strong canes which spring from the base of each plant, and this summer the breaks on these canes are so numerous that the whole forms a perfect hedge. Mr. A. G. JACOBS, of Springfield, Mass., has a Crimson Rambler Rose upon which there have been at one time 5000 buds and blossoms.

ACREAGE OF HOPS.—The following preliminary statement is compiled from the returns collected on June 4, 1898, showing the acreage under Hops in each county of England in which Hops were grown, with a comparative statement for the years 1897, 1896, and 1895:—

Counties.	1898.	1897.	1896.	1895.
	Acres.	Acres.	Acres.	Acres.
Berks	4	...
Gloucester	40	40	49	38
Hants	2,263	2,306	2,494	2,875
Hereford	6,651	6,542	6,895	7,553
Kent	30,941	31,661	33,300	35,018
Monmouth	2	2
Salop	126	129	140	150
Suffolk	3	2	4	10
Surrey	1,313	1,416	1,023	1,783
Sussex	4,829	5,174	5,908	7,489
Worcester	3,567	3,591	3,800	4,024
Total	49,735	50,863	54,217	58,940

Board of Agriculture, 4, Whitehall Place, S.W., August 27, 1898.

GOLDEN-WEDDING FESTIVITIES were celebrated at Stoneleigh Abbey on the 22nd ult., there being much rejoicing manifested on the fiftieth anniversary of the marriage of Lord and Lady LEIGH. In the afternoon was held a large garden-party, to which, in addition to the many relatives of Lord and Lady LEIGH, at the time visitors to the Abbey, invitations were extended to the tenantry and cottagers. Mr. MARTIN, his lordship's gardener, made the Abbey as gay as possible by freely decorating the rooms with plants and flowers, and at the garden-party the tables were tastefully decorated. Among the many presents submitted to Lord and Lady LEIGH's acceptance, were several from the tenantry, and one from the household servants.

CHRYSANTHEMUM FLOWERS WHEN CUT are kept fresh for a considerable length of time by the Japanese by charring the end of the stem with a splint of lighted wood, and then often changing the water.

CONVENTION OF AMERICAN FLORISTS.—The fourteenth annual convention of the Society of American Florists opened at Omaha on Tuesday morning, August 16, 1898, with an attendance larger than was anticipated. The delegations from western sections were more numerous than early correspondence had led the committees to expect. The east did not turn out as in former years, but was, nevertheless, well represented. There were many ladies present. Mr. FRANK E. MOORE, Mayor of Omaha, welcomed the convention in a ringing address. The President elect of the Society of American Florists, Mr. WILLIS N. RUDD, is young, energetic, and a native of Chicago. As president of the American Carnation Society he gained an enviable reputation for his prudent and conscientious policy.

PUBLICATIONS RECEIVED.—*The Botanical Magazine of Japan*: notes on Liukin and Formosan Plants, in the English language; contributions to the Study of the Flora of Japan, by T. MAKINO, in the Japanese and German languages, and lastly, contributions on a variety of matters in Japanese.—*Description of Four New Species of New South Wales Plants*, by J. H. MAIDEN, F.L.S. and E. BETCHE.—*Notes from the Botanic Garden, Sydney*, by the same.—*Notes of a Trip to Mount Seaview, Upper Hastings River*, by J. H. MAIDEN.—*Observations on the Eucalypts of N.S.W.*, Part III., by HENRY DEANE, M.A., F.L.S., and J. H. MAIDEN.—*On a New Species of Eucalyptus from the Sydney District of New South Wales*, by H. DEANE and J. H. MAIDEN.—*Fourth Annual Report of the Fruit Experimental Station of Ontario*. Published by the Ontario Department of Agriculture, Toronto.

A LAKE AT GOSFORD.

THE Royal Scottish Arboricultural Society indulges, as most of our readers are aware, in the laudable practice of visiting some domain in these islands or on the continent which is famed for its fine timber, or the excellence of the forest management. This year Gosford, the seat of Lord Wemyss, near Longniddry, was chosen, and a very pleasant and doubtless instructive day was passed in its woods, pleasure-grounds, gardens, and house. Gosford has the inestimable advantage as regards its mansion, woods, and gardens, of having been the property of nine Lord Wemysses in direct succession. This means much if the owners are wealthy, and inclined to use their wealth in beautifying the ancestral home and surroundings, and cultivating in a suitable way the ancestral acres, and incidentally in finding employment for their poor neighbours the tillers of the soil, &c. Such would appear to have been the case at Gosford, upon which considerable sums must have been expended by the various possessors. The effect on the landscape has been exceedingly pleasing on the whole, Nature having a happy way of hiding blemishes in design, toning down here, and heightening there; shutting out views that are undesirable, as well as those which the owner might wish to maintain, so that in the course of a century or two a place grows into a kind of beauty undreamt of by its early designers. Gosford is beautified by several lakes, or ornamental sheets of water, and the one we give this week (fig. 48, p. 181) is of a character that will appeal to such of our readers as find a delight in symmetrical growth in tree and shrub, in smooth, level, well-kept paths and turf, and the quiet beauty of still water in which the trees and shrubs on the margin picture themselves on a windless day as in a mirror.

Another lake has less of the finished tameness of this one, seeing that it has gnarled old pollards of Oak and Elm at one end, and big Birches at the other, the necessary connecting link between the groups consisting of trees of lesser height. A third

lake possesses more variety in its planting and surroundings, although the materials on which pictorial effects depend are severely simple, viz., Scots Fir, Weeping Willows, Italian Cypress, and Lombardy Poplar, the rest consisting of low masses of shrubs and brushwood. The effect as a whole is extremely satisfying. We do not know anything in a garden which is so readily spoiled by improper planting as a piece of still water, and the smaller the area the readier. For instance, the beauty of water of this kind, lies in its glistening sunlit rippling surface, and let it be closed on its S., S.E., and S.W. sides by close planting, and these effects disappear more or less according as the planting is near or further removed. Then, instead of light, there are long black shadows shot across the surface excepting at about noon.

Again, not much of the water should be hidden from the view of the pedestrian, as is sometimes done by planting wide masses of tall shrubs. Here and there small clumps of such are admissible for variety sake, as are Conifers and deciduous trees of similar growth, which have a good effect by the contrast they afford to the horizontal water-line; and some of these, singly or in small groups, ought to approach the water-side closely where their shadows will fall only in early morning or evening. If a lake have promontories or abrupt points, these may be raised in some cases, and planted close up to the water with striking-looking trees, Bamboos, dark Firs, as *Pinus Strobus*, the Weymouth Pine, &c., being good ones to use. Planting of this kind affords surprises, as the stranger is unexpectedly brought into what may be made a totally different sort of landscape.

Mr. Fish, who kindly sent the photograph from which the figure was prepared, sent others, but these were less suited to our purpose; and we are indebted to him for a lengthy account of Gosford, for which, however, at the present time we have no space.

FLOWER-GARDENING AT THE "ZOO."

IN our issue for last week, we gave in the words of a correspondent hailing from Northern Britain, his enthusiastic impressions of what he was pleased to call the new flower-gardening, but which is really not so very new either, as witness the methods pursued at Battersea Park, where the first example was set by the late Mr. Gibson, and perfected, as far as materials then allowed, by his successor, the late Mr. Rogers. From this point in South-west London the fashion spread to other public parks, and to private gardens, one of the best examples of the latter being Blickling Park, near Aylsham, in Norfolk.

The method of mixing plants of differing heights, habit of growth, colour of leaf and flower, in more or less profusion, over beds filled with dwarfier plants, was not long in finding admirers among those owners of gardens who had grown dissatisfied with bedding-out in the ordinary sense; and gardeners, too, were not long in perceiving its advantages in the lessening of the labour involved in propagating and storing the innumerable hosts of plants that the old method demanded, and they also appreciated the beauties of the new method. The head gardener of the Zoological Gardens, Regent's Park, Mr. Young, is a Scot whose younger days were spent in some excellent schools of gardening in his native country, and who entered on his duties about eighteen years ago, just, therefore, at the period when people generally were looking about for a change in flower gardening. We found him at home busily engaged with preparations for the recent Zoological Conference, but not so much so, but that he could spend an hour in looking round the best parts of the gardens. The first parterre visited adjoins the main entrance where pink and purple-flowered East Lothian Stocks were arranged in lines on opposite borders, among them being numerous plants disposed in rows of his particularly dwarf strain of *Celosia pyramidalis*, beautiful in their colours of crimson, golden yellow, and orange. These *Celosias* impart effects different from any other plant with which we are acquainted.

In another border in this part, to the right hand,

we noted as a ground-work plant, and a very charming one too, *Pilea muscosa*, the old Artillery plant of our stoves; also *Asparagus plumosus*. The former has a cool, restful effect, clothes the ground without any labour on the part of the gardener in pegging

musaica, valued for its handsome leaf-colouring. As back-ground plants, we remarked huge plants of *Phormium tenax* and *Dracæna australis*, which, we believe, are not housed in the winter. Fuchsias are freely used in other beds, sometimes mixed with

15-inch bands of the yellow-foliaged Moneywort, and others with the abundant-flowering *Königa maritima*. *Pelargoniums* Henri Jacoby, and *Omphale*, a pink nosegay, mixed with *Celosias*, are used here; and as an edging, *P. Princess Alexandra*, which has a purer variegated leaf than *Flower of the Day*, although it is in the same way. *Begonia rosea* shows capitally when *Celosias* are used among the plants, and a bed of this kind edged with some scarlet *Pelargoniums* was telling. An excellent dark blue *Lobelia magnifica* was largely used as an edging to beds of mixed *Pelargoniums*. Four of the beds in this parterre were planted with *Firefly Lobelia*, *Abutilon Souvenir de Bonn*, and *A. Thompsoni variegata*, the former having the clearer variegation. Underneath a whitish flowered *Begonia* was planted.

A nice effect was made near the Monkey-house with *Canna Alphonse Bouvier* on a ground-work of *Mrs. Pollock*, the bed having a blue *Lobelia* edging. A bed of *Coreopsis tinctoria* mixed with white-flowered *Marguerites* was an agreeable change, as was a border of *Ricinus Gibsoni* mixed with *Nicotiana affinis*, the white flowers of the latter making an effective contrast with the coppery leaves of the latter—and then the fragrance of an evening!

The parterre near the bear's dens was gay with new *Cannas* planted among *Iresine Brilliant*; and along the border was a long line of *Marigold*, Purple and Gold—a pretty floriferous dwarf-growing variety. In a bed near the lion's house standards of *Hydrangea paniculata* 4 feet high are employed, with some zonal *Pelargoniums* underneath them, *Viola Bluebell* and *Centaurea* forming the edging.

The flower garden proper contains a good many beds, in which the same method of planting is followed as that previously alluded to. We give a few examples. *Begonia Corbeille de Feu* mixed with *Chlorophytum aureum variegatum*, with a *Lobelia* edging. Another had *Violet Hill* nosegay *Pelargonium*, *Cannas*, and *Dracæna australis*, with an *Araucaria excelsa* in the centre. One was filled with *Madame Cornellissen* *Fuchsia*, with mixed *Salpiglossis*, and *Viola The Mearns*. This kind of bed was repeated with slight alterations in the constituents. *Erigeron*, with pale blue blossoms, *Hydrangea paniculata*, *Lobelia cardinalis*, and golden-leaved *Privet*, were employed together. The most pleasing *Fuchsia*-bed, to our idea was, perhaps, the one filled with *Abd el Kader Fuchsia* and *Viola W. Mee*.

Our readers will readily believe that Mr. Young's endeavours to impart novelty to the furnishing of the beds and borders at these gardens have been eminently successful from whatever standpoint we regard them, and his handiwork is well worthy the attention of alike the amateur and professional gardener.

MOVEMENTS OF PLANT-FOOD BEFORE THE FALL OF THE LEAF.

ONE of the more recent contributions to this subject appeared in the March number of the *Zeitschrift für Forst und Jagdwesen*, from the pen of Dr. Romann. The author comments on the fact that previous investigations have been usually undertaken with *Beech* leaves, which, owing to their liability to variation in structure and composition with the amount of light they receive, can hardly be considered the most suitable for the purpose; nevertheless, in order to obtain results which admitted of comparison with those of other investigators, the leaves of that species were chosen in the present instance, together with those of *Oak*, *Hornbeam*, and *Hazel*. A given quantity of leaves of these species, gathered from carefully selected branches, was obtained monthly from the beginning of June to the end of August, and at the middle and end of September. These were weighed, counted, and their superficial area and average size and weight ascertained, and their composition carefully ascertained by analysis, so far as the ash was concerned, and the proportion of nitrogenous matter. An analysis was also made of the ash of 100,000 square

FIG. 49.—A VIEW IN THE GROUNDS, BICTON. (SEE P. 177.)

FIG. 50.—POND BELOW THE FLOWER GARDEN, BICTON. (SEE P. 177.)

down, and forms a capital setting for bright flowers; the latter grows about 1½ foot high, and is of a darker shade of green. Growing among these, and creeping close to the earth, was our old conservatory friend the *Abutilon megapotamicum igneum*, then more *Celosias*, interspersed with *Acalypha*

Phlox Drummondii, and edged neatly with *F. Golden Treasure*; the taller being *Bountiful*, a free-flowering, dark-flowered variety.

In an oblong parterre of turf the beds were diamonds and triangles, and here *Celosias* were extensively employed, some of the beds being edged with

centimetres of leaf-area. From this it was ascertained that about the beginning of June the soluble mineral substances reached an average proportion, which remained unaltered until the autumn. This held good for potash and nitrogenous matter, almost without exception. Phosphoric acid appeared to show a slight increase towards the autumn, perhaps a result of the separation of insoluble compounds. On the other hand, those substances which are partly separated in an insoluble form, such as lime, either increase until the period of assimilation is finished, or they attain a maximum proportion and then remain stationary, as in the case of silicic acid. In any case, no return movement of material could be noticed up to the end of September, and for so long a time as assimilation went on, the occasion for such a movement would not arise. This could only be expected to take place upon the death of the leaf; and the climatic conditions of last autumn were particularly favourable for observing this point, partly green leaves being plentiful in the middle of November, after a period of dry weather. About this time, green and autumn-tinted leaves were gathered from the same branches, the tinted leaves being still turgid, and showing traces of chlorophyll. There was, therefore, little probability that dew or rain had washed any substance out of the leaves, and only those of the Hazel showed any signs of injury from frost.

Testing with iodine proved that all the green leaves were rich in starch, with the exception of those of the Hornbeam, which were taken from shaded under-wood. The yellow leaves, on the other hand, showed little trace of starch when tested. Analyses of the leaves were made as before, with the following results:—

Beech.—The tinted leaves showed a decrease in phosphoric acid and nitrogenous substances, and a strong increase in silicic acid and potash, and moderate increase in lime.

Oak.—Phosphoric acid and nitrogenous matter considerably decreased in the tinted leaves, potash remained about the same, and lime and silicic acid were nearly the double of quantities found in the green leaves.

Hornbeam.—A decrease of potash, phosphoric acid, and nitrogenous substances, and a moderate increase in silicic acid.

Hazel.—Nitrogenous matter showed a strong decrease, and potash was slightly reduced in quantity, while phosphoric acid remained about the same. Lime and silicic acid had greatly increased. The author discusses the possibility of other causes having brought about the observed results, the most probable of which would be the washing out by rain of the substances in question, especially the alkalies. The conditions under which the material was collected, however, rendered such a contingency extremely unlikely in the present investigation. The difference in the proportion of mineral matters in the leaves must be attributed to physiological influences, and is connected with the death of the leaves.

Dealing with each of the most important constituents of plant-food individually, the percentage of these substances in the dead leaves, compared with those contained in the green ones, which are given as 100, are:—

Leaves.	Nitro- genous matter.	Phos- phoric acid.	Lime.	Potash.	Silicic acid.
	Per cent.	Per cent.	Per cent.	Per cent.	Per cent.
Beech ...	85	25.6	109	135	123
Oak ...	25.6	31.9	209	94	213
Hornbeam ...	25.6	33.9	—	69	134
Hazel ...	26.8	0	133	89	173

Summing up the results of the whole investigation, the following conclusions are arrived at—

1. During the period of growth in the Beech (and probably in other trees), the proportions of mineral substances in the stem and leaves become equal early in the season, and remain unaltered until the growing season is finished so far as the soluble substances are concerned; and substances which are partly separated in an insoluble form gradually increase in the leaves.

2. With the death of the leaves, probably upon the cessation of chlorophyll functions, until the drying-up or death of the leaves, considerable movements of mineral substances take place as follows:—

a. Nitrogenous substances and phosphoric acid return into the shoots of the tree, this movement probably being in connection with the separation of insoluble albuminoids.

b. Lime and silicic acid move into the leaves, that of the former probably being connected with increased oxidation in the leaf organs.

c. Potash may either remain stationary or return into the stem, or move out into the leaves, according to circumstances. *A. C. Forbes.*

A FINE PLANT OF DENDROBIUM DENSIFLORUM.

WE have on many previous occasions presented our readers with illustrations of finely-cultivated specimen plants, and among them many species of the popular *Dendrobium*. In fig. 51 is represented a plant of *D. densiflorum*, cultivated in the gardens of C. L. Wood, Esq., Freeland House, Perthshire (gr., Mr. Sharp). The specimen has, says our correspondent, 265 pseudo-bulbs, and the width of the plant is 5 feet. The species, being common, most of our readers are doubtless familiar with its pendulous amber-coloured flowers, with orange-coloured lip, beautifully fringed. It is an erect-growing evergreen species that flowers in April and May, and at the present date plants should be making active growth.

HOME CORRESPONDENCE.

DAHLIAS.—Objections have been raised of late to new Dahlias, owing to the foliage obscuring the flowers. I am not sure that the varieties are altogether at fault in this respect, but am inclined to look upon it as a result of heavy watering at the wrong period. The Dahlia, in its native country of Mexico, makes its growth during the period of heavy torrential rains, flowering when they are practically over. With this fact in my mind, I water my Dahlias heavily (occasionally with manure-water), literally soddening the ground till the first flower appears, with the result of producing thick succulent stems in robust health, bearing fine large leaves of the dark green hue so much prized. I then withhold watering altogether, unless the plants flag considerably, when I give one or two good waterings to tide them over a very dry time, the heavy dews which fall in August and September, refreshing them under ordinary conditions. The results of this treatment are flowers well set up among the foliage, a greater number of flowers on each plant, the colours intensified, and flowers perfectly regular, the subsidiary growths being to a certain extent smaller, but still healthy, bearing flowers equally as fine as the first flowers produced. The tubers, when lifted, do not show any shrivelling from this treatment, are not quite so large as those watered throughout the season, but they have much tougher skins which do not bruise readily, and if stored on a dry cellar floor, come up in the spring as plump as when they were put away; no sweating of the tubers occurred during storage, and there was a consequent absence of fungus and rot. I gather from this that the plants draw from the tubers all superfluous moisture, and that a long and thorough process of ripening of the tubers takes place prior to lifting. In support of this process, I have noticed that Dahlias this season have exposed their flowers better than in previous years, owing to a practically rainless August in this county (Middlesex). *Geo. B. Mallett.*

THE SCHOOLMASTER ABROAD AT ABERDEEN.—At the flower show held in the Duthie Park recently by the Aberdeen Royal Horticultural Society, a visitor observed that "the idiotic wording of the prize schedule passes the comprehension of any sane man, and it would tax the ingenuity of an Aberdeen professor of metaphysics to make sense out of it." The following couple of examples, quoted from the schedule of prizes for the present season, are enough to enable readers to judge of the justness of the irate visitor's comment. In the cut flowers section of the schedule, class 37 is defined as follows:—"One col-

lection of twenty varieties cut flowers, and fine foliage bedding plants, including annuals best adapted for flower garden decoration, each sort to be in bunches and in pots, on a space not exceeding 2 feet by 3 feet." The second example of Aberdeen perspicuity is quoted from the fruit section, where class 56 is defined as being, "One collection of fruit, nine dishes, distinct varieties, but not more than two dishes of any species or kind of fruit. Pine-apple excluded." The result of the latter obfuscated definition was the disqualification by the judges of what was decidedly the best collection of fruit, because the exhibitor had set up two dishes of distinct varieties of Peaches, and one dish of Nectarines. In the drafting of the schedule the "Royal" of Aberdeen had got muddled over "species" and "kind," and a course of study of the *Rules for Judging, &c.*, published by the Royal Horticultural Society, London (post-free for 1s. 1d.), would be a benefit to the Society, and to the competitors at its shows. *M.*

IDIOSYNCRASIES OF JUDGING.—Were it possible for any industrious person to collect all the odd things one hears and sees from time to time done by judges at flower-shows, a very interesting and curious volume would result. Your correspondent, "Vitis," told last week of two very funny things, so singularly contradictory, for in the one case the exhibitor who did show in accordance with the terms of the schedule was disqualified, whilst elsewhere the man who did not do so obtained a prize. When I reflect on the time, as well as labour, expended in preparing the *Code of judging-rules* for the Royal Horticultural Society, it is lamentable to find, after all, how little the valuable work of that committee seems to be understood or appreciated. Very recently, at an important southern show, an exhibitor who put into a collection a few foliage plants, was disqualified because the judges said the exhibit was not in accordance with the terms of the schedule. The class included fruits, cut flowers, (note the comma) and foliage, but did not say cut foliage. On what grounds, therefore, was the exhibit disqualified? But a singularly odd judgment occurred at the same show in the class for "any other white Grape, Muscat of Alexandria excluded." One competitor showed bunches labelled Canon Hall Muscat; these the judges (ducal ones too) declared to be Muscat of Alexandria! and then proceeded, in complete defiance of the conditions of the class, to give them the 2nd prize. Could anything be more absurd? Really, the Grapes were disqualified, the 3rd prize competitor was defrauded out of the 2nd prize, and the man who should have been 3rd was robbed of his prize absolutely. *D.*

BRITISH BLACKBERRIES.—I referred recently to the garden culture of *Rubus laciniatus*, the Cut-leaved Bramble. A few days since I saw the finest fruiting-breadths of the common Bramble I have met with anywhere in enclosed grounds, and almost in London. This was at Tewkesbury Lodge, Forest Hill, the residence of C. Bayer, Esq., so famous for the excellent Grapes which come from the vineries. The grounds cover the apex of a very lofty mound of almost solid clay. So lofty is the mound, that some of the finest views conceivable can be obtained from it; indeed, on a clear day, all the world seems to be at one's feet. On the London or north-westerly side of this huge mound is some semi-wild ground, probably the last vestiges of the forest from which the locality takes its name. This area of several acres in extent is literally covered with Brambles, growing luxuriantly, and fruiting abundantly. Although so lofty, so exposed to winds, yet the Brambles were not only fruiting heavily, but early, for there were bunches of fruits ripe, and fit for eating. Now it is notorious that in towns, and in London in particular, good Blackberries find a profitable sale—indeed, are in great demand. Seeing, therefore, how well the Bramble thrives on this heavy clay soil, and in so elevated a position, the question arises—could not similar areas of stiff clay, now practically valueless, be sown or planted with Brambles, and thus made productive? Would not many of the Essex fields, reputedly given over to weeds, well repay for utilisation in this manner? The ground should be planted in long ridges of 10 feet wide, with narrow paths running between, and the plants kept trimmed, to enable free access to be obtained, and the fruits carefully gathered. *A. D.*

THE HARDINESS OF HYBRID TEA ROSES.—The fact that Teas make late growth and flower late in the year is taken as proof by some that these Roses are by nature too tender for the generality of gar-

gardens. But is that so—is it not more a question of proper ripening of the growth? Some years ago numerous Oak-trees which had weathered many a zero winter, were killed by a late summer frost of 10° severity. That did not prove that the Oak is a tender plant; it merely showed that its young leaves and shoots are not proof against so much cold as then prevailed. Admitting that late blooming favours tenderness in Hybrid Tea Roses, and that the Teas and Hybrid Teas are still our best Roses, if not our most trustworthy "perpetuals," we have only our capricious climate to thank for occasional losses. One of the ablest authorities on this subject writes in a contemporary, and the writer and the place from which the letter was written give special value to the statement. This is what Mr. Simpson, the manager to Messrs. D. & W. Croll, of Broughty Ferry, N.B., says:—"We find that Teas and hybrid Teas are invariably the earliest to flower, and also the latest. We find also that they are quite as hardy as the hybrid Perpetuals (the italics are mine), and much freer in blooming, and are the favourite class in this district. Some seasons we have had 12° of frost during the third week in May, and in some winters the temperature has gone as low

these statistics of dates of first blooms: they are hardly reliable as safe statistics to guide the exhibitor. For instance, the first blooms of 1898 are little or at all behind those of 1897, and yet the average of Roses for showing this season lagged about a fortnight behind those of 1897. D. T. F.

THE TRADE IN GRAPES, AND OTHER MATTERS.
—I want to suggest to the growers of Grapes in this country that it would be well worth their while to adopt the plan which has been found to work so well with Strawberries, viz., packing up a certain quantity in a punnet, and then packing these punnets into a case. The punnets, or baskets, whichever may be most convenient, would arrive at the shops ready for sale, without any handling, or necessity for disturbing the fruit. A basket that can be sold at 1s., 1s. 6d., or 2s. is what is required. It is well known that there are about 65,000 people who visit the metropolis daily who are in a position to buy this quantity of fruit, and if they can walk into a shop and see a basket that is quite ready for their hand, they put down their money and take it away. As Grapes are now sent to the market in baskets weighing from 8 to

at the one through charge. This is another great advantage people have, especially in the country, of sending food to the metropolis, and other large cities. As I would like to thrash out this subject, it is well to mention that owing to this combination of railways in the parcel system, there is no delay, comparatively speaking, in regard to live poultry and garden produce. I last week received some live poultry from Cornwall, and it was delivered in Surrey just as quickly as it would have been delivered in London. If Grapes, which are such a luxury when travelling by rail, could be sold at the railway stations, all ready packed in little baskets with a handle, as they are on the continent, I am sure an enormous quantity would be sold, and the profits of the growers greatly augmented; but if the growers are content to go on as they have been, they must not be surprised if the price further declines for fine English Grapes. Thos. Christy.

MR. P. R. MORSE'S FRUIT FARMS.—In my note on p. 138, I inadvertently gave the name of Mr. Young as being manager of the Hatfield Peverel vinerias, instead of that of Mr. Strong, who has ably filled that post during the last seven or eight years. H. W. Ward.

VERONICA PARVIFLORA (Hooker).—The portrait of Veronica Dieffenbachii on p. 155, suggests to me to recommend again for gardens a most useful and admirable shrub in this class—*V. parviflora*—described and figured in the *Botanical Magazine*, t. 5965. I draw attention to it because it is the hardiest, most free-flowering, and quickest-growing, of all that I have tried, and invaluable for cutting. Self-sown seedlings come up in great abundance, and if these are planted in any spare warm corner, they produce flowering shrubs a foot high when two years old. The flowering season lasts from July to October, different individuals flowering at different times, according to age and situation. At four or five years old they are 4 or 5 feet high, and if they do not die in the winter, become ragged, and are better replaced by younger plants. At Edge it is as hardy as *V. Traversii*, which is generally spoken of as the hardiest of the genus. It is true that a severe winter will kill all the large bushes of it, and many of the smaller ones; but a potful of two-year-old shrubs is so easily kept in a frame, and they root so readily when planted out, that there is no excuse for losing it. It is now several years since young plants have been killed here in the open air by winter, yet this garden has by no means a favourable soil for tender shrubs to winter in. C. Wolley Dod, Edge Hall.

WASPS AND WASP STINGS.—The very serious consequences, almost sudden death, following the sting of a wasp at the root of the tongue noted in your last issue, p. 164, shows that extreme care should be exercised when picking and eating fruits of any kind during a season when these pests are so uncommonly numerous as they are this year. It may be of use to make it known that common salt applied freely in cases similar to the above has been known to act efficaciously, by reducing the swelling, and probably saving the life of the patient. A case has come under my notice here within the past few days, where a woman on this estate was stung in the throat by a wasp which she had swallowed with some jam. Salt was promptly applied both inwardly alone and in mixture with vinegar, and also rubbed on outwardly, and this in all probability saved her life. No doubt prompt application is desirable; but as this homely remedy is nearly always at hand, the fact of its usefulness should be made known. C. Herrin, Dropmore, Maidenhead.

SEVERE STORM IN OXFORDSHIRE.—On the evening of Sunday, August 21, a violent thunder-storm raged in this district, accompanied by a high wind, the lightning being more vivid and continuous than I have ever witnessed in this country. It passed over the district in a N.N.E. direction about 8 P.M., and at that time three distinct storms were evident, one far away, bearing N.N.W., another to the W., probably following the course of the Severn, the lightning striking a Sequoia gigantea 45 feet in height, growing on Lord Moreton's home farm (Fairgreen), cutting off the top intact for a space of 15 feet, tearing the bole into splinters to within 6 feet of the ground, where the tree girths 13 feet, and scattering them in all directions within a radius of 80 yards, one alighting on the roof of the farm-house, 35 yards distant, being forced in between the tiles, at a considerably higher elevation than the struck tree. So far as I am aware, this is the first instance of a tree of this species being wrecked by lightning. The

FIG. 51.—A FINE PLANT OF DENDROBIUM DENSIFLORUM, HAVING 265 PSEUDO-BULBS.
(SEE P. 184.)

as 0 Fahrenheit; and though entirely unprotected, still these Roses live, and subsequently grow and flower abundantly. This year they are exceptionally strong, many of our dwarf Teas having, on June 28, shoots over 2 feet long, and all with strong flower-buds, which checked the short growths weeks ago. We rather like a cool season here, as it suits hybrid perpetuals so much better than a hot one." Having seen the Broughty Ferry Roses in 1896, and again in 1897, I can testify to the truth of this statement. From the middle of July to the middle of August was the time of their greatest beauty. The following is a list of first blooms cut in the Dalhousie nursery, Broughty Ferry:—1893: Cut-back, May 30, Rubens variety; Maidens, June 7, Distinction. 1894: C.-b., June 6, Rubens; M., June 15, Marie Van Houtte. 1895: C.-b., June 10, Rubens; M., June 4, Grace Darling. 1896: C.-b., May 26, Grace Darling; M., June 1, Gloire de Dijon. 1897: C.-b., June 9, Bardon Job; M., June 25, Grace Darling. 1898: C.-b., June 7, Bardon Job; M., June 15, Bardon Job. These two last entries seem to be the most satisfactory of the series, the maidens and cut-backs being of one variety. The difference in date of blooming may be all credited to the differences in the ages and character of the plants. Another point occurs to me, in reference to

15 lb. each, it necessitates the handling, weighing, and re-packing of the Grapes. The consequence is that they are neglected, with the result that anyone looking at your scale of prices in the wholesale market of London will find 8d. to 9d. per lb. is the price for good English Grapes. There was found some plan of obtaining small baskets with handles for Strawberries; and the shops did not charge for the baskets this year. These same kind of basket could be filled with Grapes. I noticed that on many of the baskets was the name of the grower of the fruit. If this plan were adopted in the case of Grapes, it would be a splendid advertisement for the grower, and it would very soon be known that a fruiterer could order twelve or fourteen baskets of Grapes packed in a crate or case. I am led to make another suggestion which may have been lost sight of by growers. The Post-office began to carry parcels and greatly assisted trade and commerce, but the railway companies then found that their business in parcels was slipping away from them, so they combined, and now parcels brought to any railway station on any line will be delivered at the one through fixed price, instead of having to pay separate charges, one for each railway; and, further, the railway companies deliver within a certain radius of their railway stations

lightning also struck an Oak and Elm on the Sarsden estate, which is of frequent occurrence. Rain to the depth of .22 of an inch fell. *James A. Smith, Sarsden Gardens, August 29.*

ROSE, CRIMSON RAMBLER.—I am pleased to see your correspondent, "E. S. Woking," holding the same opinion as myself as regards the pruning of this Rose. At Bicton this variety has its shoots pegged down on a bed 8 yards long by 2½ yards wide, and these flowered well last year, and threw up several very strong growths, which we bent over on either side to check the flow of sap a bit, leaving last year's flowering growths on the bed. The only pruning afforded the plants was to shorten the side growths which had borne flowers, and these started away strongly in the spring, nearly every growth carrying a truss of flower. Early in July we were rewarded with such a blaze of colour that it will not soon be forgotten, the whole plant carrying nearly 700 trusses. *J. Mayne, Bicton.*

SCOTTISH MANSE GARDEN.

MINE may be described as an old-fashioned garden, somewhat modernised. It is environed on almost every side, at a convenient distance, by lofty trees, for the most part Sycamores, Ashes, and Beeches, which defend its cherished treasures of fruit and flower from the devastating winds. Towering above the north wall (which chiefly gives protection to my half-standard and climbing Roses and Oriental Lilies) is a lofty Hawthorn hedge, which looked last May, when in full blossom, as if it had been covered with a shower of snow, through which that loveliest of climbing-plants—*Tropæolum speciosum*—which there finds the coolness and freshness its nature demands, grows and flowers during the months of summer, to a height of 15 feet. It is at present the noblest floral picture in my garden. I have never seen it half so picturesque elsewhere. No doubt its effect is greatly enhanced by the dense environment of dark leaves, an artistic contrast which I anticipated before planting it there. Its requirements are chiefly these:—(1), deep planting of the roots; (2), a half-shady situation; (3), abundant moisture, to keep it fresh and green. It is not in every region or climate that this superbly endowed plant perfectly succeeds. "Ah, that lovely *Tropæolum*!" says the Dean of Rochester, in one of his many charming letters to myself, "which will not thrive in the south of England, but clothes your Scottish cottage-walls with such abundant glory! I plant, and plant, and find feeble acknowledgment, and then, farewell!" If it does not succeed at Rochester Deanery, it is not for lack of loving attention. Some years ago, the Rev. H. H. D'Ombraïn, another accomplished horticulturist, when writing to me for strong roots of this exquisite climber, told me he did not altogether despair of making it a success in a shady corner of his garden. I can only trust that his hopes have been fulfilled. *Tropæolum speciosum* is valuable for more than its flowers, for after they have faded they pass into other fascinating forms of beauty; they are succeeded by pretty berries which, after passing through various shades of colour, find their culminating grace in turquoise blue. I have many other climbers which grow up old Apple-trees veneratively preserved, and produce at this period very striking effects: chief among these are Mr. Eckford's Sweet Peas, whose colour and fragrance are alike delightful; *Tropæolum majus*, the great Nasturtium; *Linaria cymbalaria*, with exquisite miniature lilac and white flowers; and *Tropæolum canariense*. These give to any garden, where they can be grown artistically, quite a tropical aspect.

Roses I also grow very extensively, and with gratifying success; I have at present 185 distinct varieties of the queen of flowers. These extend, chronologically, from the Austrian Copper (Gerard, 1596), to Empress Alexandra, 1897. One of my finest Roses, Mrs. James Cocker, a variety which recently gained the Gold Medal of the National Rose Society, has not yet been introduced, and I greatly question if any other cultivator, apart from the raisers, has yet had the privilege—unless at exhibitions—of seeing it in bloom. I have always devoted great attention to the parentage, the characteristics, and what may

be termed the eccentricities of Roses, and find those studies exceedingly attractive. The present summer has been somewhat too sultry for certain varieties, especially for Turner's far-famed Crimson Rambler, whose flowers soon lost their rich and vivid colour on my warm west wall. In shadier situations it is a more assured success, its blooms manifestly requiring such a position for the preservation of their freshness.

My Carnations are for the most part border varieties, which, in addition to their hardiness and floriferousness, have mostly the valuable attribute of fragrance. Among the best of these are Uriah Pike, which has finer petals and opens more smoothly than any dark crimson variety with which I am acquainted; Adonis, a beautiful new, pure white Carnation, raised by the Messrs. Turner, of the Royal Nurseries, Slough; Germania, a refined, yellow bloomer, still the finest of its colour; King of the Scarlets, Salamander, and Desdemona, which is an unusually strong grower, of a beautiful pink complexion, possessing a perfume rivalling that of the Old Crimson Clove.

Among other favourite flowers in my garden are Irises, Aquilegias, Violas, Delphiniums, Dahlias, Chrysanthemums, and Montbretias. Spanish and English Irises grown picturesquely among the Roses have a charming effect. Iris stylosa, and the Crocus-like Iris reticulata, which I first introduced on the recommendation of my friend, Mr. F. W. Burbidge, are valuable varieties. I have a large and most interesting collection of Asiatic, European, and American Lilies, among my latest acquisitions being Liliun Henryi, which grows stronger, like some of the Martagons, every year; L. longiflorum Takesima, and L. formosum; and the extremely graceful and richly fragrant L. Washingtonianum rubescens, which is a native of California. I think it is likely, from what I have learned from Dr. Wallace and Mr. J. G. Baker of its floral capabilities, that the recently introduced Liliun rubellum (described by the latter authority on Lilies' in a previous issue of the *Gardeners' Chronicle*) will prove much more reliable than its handsome predecessor, L. Krameri, which was originally discovered by Mr. Kramer, growing at a great altitude among the mountains of Japan. *David R. Williamson.*

SOCIETIES.

ROYAL HORTICULTURAL.

Meeting of the Committees at Chiswick.

FRUIT AND VEGETABLE COMMITTEE.

AUGUST 30.—A meeting of the Fruit and Vegetable Committee was held on this date. Present: the Rev. W. Wilks, and Messrs. J. Cheal, A. F. Barron, W. Pope, A. Dean, C. Herrin, R. Fyfe, and W. Poupart.

A very extensive collection of Onions was first examined. The varieties were represented by plants raised from sowings made in the autumn of last year; one row transplanted from the autumn sowing, and one of a spring sowing. During the winter, although the original plant was an excellent one, many of the varieties, and notably the Tripolis, usually so universally sown at that season, suffered very much from frosts, being in several cases almost decimated. The best results in almost every case were found in varieties commonly grown as summer Onions. Some of these gave capital bulbs. The following were eventually selected for three marks each:—Banbury Cross, Nuneham Park, Wroxton, a fine globe-shaped stock; Rousham Park Hero, Sutton's A1, very fine indeed; and Cocoa-nut, also first-rate, had previously received awards. Giant Zittau, Golden Rocca, Cranston's Excelsior, Trebons, and Eclipse were very good.

Next an extensive collection of Potatoes was examined, several roots of each being lifted. The earliest varieties, whilst very nice, were rather small; but of the later ones, some gave superb crops of fine handsome tubers. Very little disease was seen, but some very coarse tops had induced spearing or growing-out, or else only a mass of root-stolons. Thirteen of the most promising croppers were selected for cooking, and when later tested, all being admirably cooked, three marks were awarded to Challenge, a white round, great crop of handsome tubers, and of capital quality; The Major, a medium-growing variety, tubers flattish-oval, white, and abundantly produced; The Queen, white, flattish-round, very abundant cropper; The Devonian, white kidney, capital cropper, top upright, moderate tubers of special excellence in flavour; Ellen Terry, tubers longish, white, a great cropper; Fishtoft Seedling, a grand field variety, tubers large, white, rough in skin, and excellent; and Ivotop, medium tubers, semi-kidney form, good cropper,

selected for excellence last year; this is from the Canary Islands. The new varieties this year were late ones, an unusually good lot.

Tomatos were next examined, but there was not a great deal of novelty in them; the best were St. Simon, fruit medium round, very rich colour, and a good cropper. Stirling Castle, a great cropper, fruits of moderate size, and of capital quality. Peach Yellow, skin primrose colour, flesh of delicious flavour; and Semperfructifera, a variety that produces in wonderful abundance small, red, pear-shaped fruits. This received two marks as a decorative variety, and the others had three marks.

A collection of Beets was seen, and Cheltenham Greentop W. Good was recommended for a First-class Certificate; and three marks were given to a capital stock of the Blood-red Globe, which is now so much improved in form and colour of flesh.

BATTLE FLOWER SHOW.

AUGUST 24.—The day opened dull and cloudy, and pessimists were foretelling a wet time as disastrous as that of last year; but by noon an east wind set in, and all doubts as to a fine day were set at rest.

The committee may be again congratulated on bringing together an admirable display, while the exhibits were so even in excellence, that it would be invidious to particularise; though to the fruit, as usual, must be given the premier position. This was no doubt in a great measure due to the period of the exhibition, and to the acknowledged excellence of the skill used in its production. The almost perennial success of the show is due greatly to the individual help given by the committee, to their indefatigable secretary, Mr. R. B. Allwork, and to the fact that by the gracious permission of Her Grace the Duchess of Cleveland, the exhibition was held in the historic and beautiful grounds of Battle Abbey.

KINGSWOOD AND WEST GLOUCESTERSHIRE HORTICULTURAL.

AUGUST 24.—This popular flower-show was held on the above date, and was one of the most successful ever experienced. Kingswood is a great industrial centre, and many of the working-men are keen florists and plant-growers, having small greenhouses, in which they grow excellent specimen-plants. It is unusual to see a working-man exhibit a well coloured Croton, an Allamanda, or Clerodendron. But it can be seen at Kingswood.

Plants.—Mr. JAMES CYPHER was there with sixteen very fine specimen-plants, six of foliage, and ten in flower. He made a background of splendid Palms, having in the front a line of the fine flowering-plants he is accustomed to exhibit; Mr. W. VAUSE, Leamington, was 2nd.

In the various classes for flowering-plants, Begonias, single and double, were represented by well-grown and flowered specimens, the best eight single varieties being staged by Mr. J. ROGERS; and the best eight double by Mr. C. Cornish, gr. to F. J. FARR, Esq.

Well grown plants of zonal Pelargoniums were also to be seen. Petunias in pots, which are well done in several districts in the west of England, were good here, especially the double varieties; one singular feature is the huge pots in which they are grown. Gloxinias, Japan Lilies, Coleus, and a few other plants find places in the schedule, and though good, they were not of a character to call for special remark.

Groups of eight exotic Ferns brought medium-sized well-grown specimens, one collection had *Todea pellucida* and *superba*. Mr. GEO. TUCKER, Helperton, Trowbridge, took the 1st prize.

There were some pretty groups of plants arranged for effect, and Mr. JAMES CYPHER took the 1st prize.

There were classes for stove and greenhouse plants shown by amateurs, Mr. W. Rye, gr. to Capt. BELFORD, taking some of the leading prizes. With six specimens Mr. Rye took the 1st prize. Mr. Rye had the best six exotic Ferns, and here also could be seen specimens of *Todea pellucida* and *T. superba*. Mr. Rye also had the best half dozen fine foliaged plants.

Cut Flowers are always a leading feature at Kingswood. Dr. BUDD, Bath, was 1st with twenty-four varieties of Roses, three blooms of each.

Mr. THOMAS HOBBS, a veteran amateur grower of Bristol, was 1st with twelve varieties, three blooms of each, and though the stand was largely composed of high-coloured varieties, they were fresh and clean. In the amateurs' classes for Roses, Mr. HOBBS was one of the principal prize-winners.

Mr. W. TRESEDER, Cardiff, had the best twenty-four blooms of Dahlias, all good flowers, but the effect of the stand was heightened by the introduction of a few fancy varieties; the leading blooms were Colonist, Earl of Ravensworth, Dr. Keynes, John Ashby, Willie Garratt, Mr. J. Downie, Comedian, Prince Bismarck, John Hickling, &c. Mr. G. HUMPHRIES, Langley, Chippenham, was 2nd. The latter came 1st with twelve fancy Dahlias, having in good character Mr. Saunders, Comedian, Frank Pearce, Dazzler, George Barnes, Lottie Eckford, &c.

The best twelve bunches of single Dahlias were rather large, but even and fresh; the best came from Mr. J. BURGESS. Mr. TRESEDER had the best six bunches of Cactus varieties.

No quilled Asters shown in the West of England have been

yet seen in their best character, owing to the drought. Mr. C. H. VICKERY, Bath, who is a noted Aster grower, had the best twenty-four quilled varieties, and the same number of flat-petalled; Mr. F. HOOPER, Bath, took the 2nd prize, with quilled varieties; and Mr. G. HUMPHRIES with flat-petalled.

Hollyhocks were very good. Mr. W. SMITH, Kingswood, an enthusiastic amateur grower, had the best twelve, some of the varieties so good as to recall the best days of Hollyhock showing. Stands of Phlox Drummondii were very good, and they are fast taking the place of Verbenas in the West of England. There were collections of twelve spikes of herbaceous Phloxes; Mr. W. SMITH was awarded the 1st prize.

Begonias are largely shown as cut blooms in the West, and when large in size and fresh they are decidedly effective. There were good stands of bunches of hardy flowers, and they were shown in bunches, twelve distinct being required. Mr. W. SMITH was 1st, having Senecio pulcher in very fine character; a large, pure white Everlasting Pea, Zauschneria californica, superb; a good Erigeron, Montbretia, Harpalium rigidum, &c.

Fruit.—Some good fruit was staged. The best collection of eight dishes came from Mr. W. Strugnell, gr. to Col. DREXEL, Rood Ashton, Trowbridge. He had Muscat of Alexandria and Madresfield Court Grapes, Sea Eagle Peach, Pine-apple Nectarine, Apricots, &c.; Mr. W. Allen, gr. to W. MARSH, Esq., took the 2nd prize. Grapes were shown in a few classes, also stone fruits. There were some fine culinary Apples, and in the class for dessert fruits, Irish Peach took the lead. Jargonelle was the best dessert Pear.

Vegetables were shown in a great many classes.

Stove and greenhouse cut-flowers were invited in bunches of six, Mr. J. COPER staging some very striking ones.

AYRSHIRE HORTICULTURAL.

AUGUST 25.—The annual show of flowers, fruit, and vegetables in connection with the Ayrshire Horticultural and Agricultural Society was held in Dam Park on the above date.

The entries showed an increase of about 200 as compared with last year, and the quality of the exhibits was high. The specimen plants and the fruit were the features of the exhibition. Amongst the nurserymen represented were Messrs. Cocker & Son, Aberdeen; Kennedy & Co., Dumfries; Fotheringham & King, Dumfries; Mr. Campbell, Blantyre; Messrs. Carnegie & Baxter, Ayr; Imrie & Co., Ayr; Mr. Hugh Dickson, Belfast; Messrs. Thomas Smith & Sons, Stranraer; Thomas Bryden, Ayr; Thomas Imrie & Sons, Ayr; Buick & Sons, Alloa Potteries; A. Lister & Son, Rothsay; and Mr. W. R. Walker, Poundland, Maybole. The arrangements of the Secretary, Mr. Durward, were perfect.

In the open classes, the best collection of six stove or greenhouse plants was from Mr. A. H. Scott, gr. to Mrs. BAIRD, Cambusdoon; 2nd, Mr. M. GANLY, Glendoune. Mr. A. H. SCOTT was also 1st for six table decorative plants.

For a collection of fruit, six distinct dishes, Mr. D. Murray, gr. to the Marquis of AILSA, Culzean Castle, Maybole, was 1st; and Mr. Thos. Gordon, gr. to WALTER NEILSON, Esq., Ewanfield, Ayr, 2nd.

SANDY AND DISTRICT HORTICULTURAL.

AUGUST 15.—The thirtieth annual show was held on the above date, and was a complete success.

Plants.—Mr. J. CYPHER, from Cheltenham, showed ten of his superb plants in flower, and was placed 1st. 2nd, Mr. W. FINCH, Coventry.

Zonal Pelargoniums were shown in good character by Mr. T. LOCKIE, The Gardens, Diddington Hall, Huntingdon, the 1st prize being awarded to him; and plants for table decoration made a good feature.

Groups of plants arranged along one of the tents formed an attractive feature. The schedule states that the groups are not to exceed 50 square feet, but it did seem as if one or two had exceeded that space. Mr. EMPSON, gr. to Mrs. WINGFIELD, Amptill, was a decided 1st in this competition. Orchids, Pitcher-plants, Nerines, &c., were nicely alternated with Palms, brilliant Crotons, &c.; Mrs. AXTELL, Woodbury Hall, was 2nd.

In the amateur's division Mr. EMPSON was the principal prizetaker for plants. He was 1st with six fine-foliaged plants; and Mrs. AXTELL was 2nd. Quite a sensation was created in the class for four Cockscombs by Mr. LOCKIE staging such specimens that the combs measured nearly 18 inches in length from end to end, and they were some 10 inches across. They were marvels of high-class culture, especially as the four matched so well; Mrs. AXTELL was 2nd, her gardener, whose name was not stated, staging some very fine examples also. Other flowering plants comprised Begonias, Balsams, Fuchsias, Pelargoniums.

Cut flowers.—In the "open to all" cut-flower classes a leading feature was the splendid exhibits of twenty-four bunches of herbaceous and bulbous plants. Messrs. HARKNESS & SONS, Bedale and Hitchin, were 1st; and Messrs. LAXTON BROS., Bedford, 2nd. In the amateur's division, smaller but scarcely less interesting bunches were staged.

Roses were good for the date of season. Messrs. HARKNESS & SONS were 1st, with forty-eight blooms, having these in excellent character; and Mr. J. MATTOCK, Headington,

Oxford, 2nd. Mr. MATTOCK, who usually shows excellent Teas at this season of the year, was 1st with eighteen blooms.

Collections of twenty-four spikes of Gladioli were good. Messrs. HARKNESS & SONS taking the 1st prize, with fine examples, including some promising seedlings of their own. Mr. C. BRIGHT, Huntingdon, was 2nd. Messrs. KEYNES & Co., Salisbury, had the best twenty-four blooms of show Dahlias; Mr. JOHN WALKER, Thame, was 2nd; the competition was very close. Messrs. KEYNES & Co. also had the best twelve fancy varieties; Mr. GEO. HUMPHRIES being 2nd. Mr. C. BRIGHT was placed 1st with twelve bunches of Pompon Dahlias, but we greatly preferred Mr. G. HUMPHRIES' smaller flowers, which were placed 2nd.

Some very fine bunches of Cactus Dahlias won for Messrs. KEYNES & Co. the 1st prize for twelve, and they included some highly promising new varieties, such as Wallace, Viscountess Sherbrooke, and Countess of Lonsdale. Keynes' White was in good character, which it is to be hoped it will maintain throughout the season. Mr. C. BRIGHT was 2nd. A delightful stand of twelve bunches of single Dahlias was staged by T. W. GIRDLESTONE, Esq., Sunningdale, as perfect as one could well desire to see them, and the collection contained some of this grower's charming new fancy varieties. Dahlias were shown in the amateurs' division, Mr. R. BURGIN, St. Neots, being the principal prizewinner.

A tent filled with pretty decorations was crowded during the day.

Fruit, &c.—There was not a great deal in the way of fruit. The best collection of eight dishes came from Mr. EMPSON; and Mr. T. LOCKIE had the best six dishes. Hardy fruits were fairly well shown.

There were vegetables in plenty and some of the collections were remarkably good.

Non-competitive Exhibits.—Messrs. CUTAUSH & SON staged a fine group of plants, not for competition, prominent among them being a good flowering plant of Chironia baccifera, now seldom seen. Mr. J. MATTOCK also staged a highly attractive collection of bunches of garden Roses.

SWANSEA HORTICULTURAL.

AUGUST 25.—The second annual exhibition took place on the above date, and was a great success. The entries numbered nearly a thousand, and the quality of the exhibits generally was exceptionally good. The prize schedule this year was considerably increased, about £20 being offered.

Five exhibitors competed for the prize of £10 offered by the Association for the best group of miscellaneous plants covering a space of 200 feet. In the end it was won by Mr. W. FARRANT, Florist, Swansea, who was very closely followed by Miss TALBOT, Penrice Castle (gr., Mr. R. Milner), who was awarded the £5 given by Sir J. D. Llewellyn, M.P.

In the class for six bunches of Grapes (three varieties), Mr. R. MILNER was 1st, having six fine even well-coloured bunches, and Mrs. PICTON, Turberville, Hendrefoilan, was 2nd. Mr. MILNER also won 1st prize for three bunches of Black Hamburg Grapes, showing magnificent bunches of well-coloured berries.

The class for a collection of fruit, eight varieties (distinct), drew several competitors, the 1st prize being won by Mrs. PICTON, Turberville (gr., G. Hawkins); Mr. R. MILNER was 2nd in this class; and Mr. H. PITT, Abergavenny, 3rd.

In the open class for a collection of vegetables, nine varieties (distinct), Mr. H. PITT, Abergavenny, was 1st, and Mr. MILNER 2nd.

The valuable Silver Cup offered by Messrs. PARSONS & Co., seedsmen, Bristol and Swansea, for the best collection of vegetables (eight varieties) was won by Mr. R. MILNER, with a very fine collection.

Messrs. KELWAY & SONS, of Langport, staged a magnificent collection of Gladioli, including several new and meritorious varieties. Other fine trade exhibits were from Messrs. CLIBRAN, Manchester; W. TRESEDER, Cardiff; and JAMES HARRIS, Blackgale, Swansea.

ROYAL HORTICULTURAL OF IRELAND.

AUGUST 26.—The autumn show of flowers and fruit, held under the auspices of the Royal Horticultural Society, was opened on Friday afternoon in Merrion Square, Dublin. The weather was sultry, and rain fell from 3 o'clock, slightly marring the attendance, which, however, was large and fashionable, and was composed principally of ladies. In every respect the show was a success.

The entries exceeded those of last year (which at the time were regarded as a record), and the quality of both fruit and flowers was universally admitted to be exceptionally good. Five large tents accommodated the exhibits, and of these one was set apart entirely for plants, three for cut blooms, and one for fruit. Amongst the cut blooms Begonias constituted the largest and most important class. The collection exhibited by Lord ASHBROOK (gr., Mr. McKeller) was the most attractive, and by amateurs, if not by the more experienced horticulturists, it was regarded as the feature of the show.

In Roses Messrs. ALEXANDER DICKSON & Co., Newtownards, maintained their high standard of merit, the forty-eight blooms, for which they received 1st prize, being undoubtedly very fine. In addition to awarding Messrs. Dickson the prize, the judges recommended their collection for the Certificate of the Council, which is in itself a special mark of merit.

The Messrs. MCGREADY & SONS, Portadown, were among the successful exhibitors in Begonias, having been awarded the Silver Medal and other prizes in this class. Carnations were well represented, and a pretty and effective display they made. Mr. FORBES, of Hawick, carried off the Silver Medal for his collection, which certainly deserved the judges' fiat.

Messrs. RICHARD HARTLAND & SONS, Lough Nurseries, Cork, were strong in Begonias, and, as might have been anticipated from their high reputation in the past they secured a large proportion of the prizes. Their Lady Ashbrook, Lord Ashbrook, and H. R. O'Kearney varieties won the Gold Medal at Shrewsbury show last week, and were much admired by judges and visitors here. In plants, the fine group sent in by Mr. MOORE, of the Botanic Gardens, Glasnevin, for exhibition, but not for competition, frequently drew from visitors observations expressive of unqualified admiration. Messrs. RAMSAY & SON, of Ball's Bridge Nurseries, also staged some remarkably fine specimens of plants. The cut blooms, embracing Dahlias, Roses, Gladioli, Begonias, and Asters, made a brilliant display of beautiful colours. The show of fruit, as already indicated, was excellent. There were eighty-two bunches of Grapes exhibited, and they presented an appropriate background to the Peaches, Nectarines, and Figs which were placed on plates on the front of the stage. There was a small but creditable show of vegetables.

A pleasing feature of the show was the number of new exhibitors who entered this year. This speaks well for the prospects of the society, whose friends seem to be annually increasing. In connection with the judging, a slight but important innovation has been made. For the first time in the history of the society a lady judge has been appointed—Miss CURRY, of Lismore, county Waterford—who discharged her duties with unqualified satisfaction. In the afternoon their Excellencies the Lord Lieutenant and Countess Cadogan, accompanied by a distinguished company, visited the show. The band of the 1st King's Dragoon Guards supplied the music during the afternoon, and played the National Anthem on the arrival and departure of the Viceregal party. The following were the judges: Plants—Messrs. P. J. Gray, A. Morton, and P. Brock. Cut Blooms—Miss CURRY (Lismore), Mr. W. E. Gumbleton, and Mr. A. Black. Fruit—Messrs. Charles R. Hamilton, P. Gray, and F. Bedford.

HORTICULTURE IN NEW SOUTH WALES.

PERHAPS no portion of the world (observes an experienced writer) of the same area is better favoured than New South Wales, with its varied climates and soils, for the production of fruits, vegetables, and flowers. It is really surprising how great a variety can be grown to perfection, and at a minimum expenditure of labour. Exotics from cold, temperate, and even tropical countries, thrive equally well within the limits of this comparatively small area; and still more remarkable is the fact that so many of these plants from different climates will grow side by side in many favoured localities. With all these advantages, it seems strange that comparatively little attention should be devoted to the raising of vegetables for home use, or to the cultivation of flowering and ornamental plants for the adornment of the homes of the settlers in the country districts. Occasionally one may meet with a well-cared-for beautiful garden, like an oasis in the wilderness; but, as a rule, few attempts are made even to grow the commonest vegetables for family requirements, and dependence for supplies is placed on Chinese gardeners, whose gardens are generally to be found dotted about the country, especially in the more thickly populated districts. The raising of vegetables, the selling of fruit, and the hawking of goods, would seem to be almost entirely in the hands of the Chinaman, the Italian, the Syrian, and the Indian, despite the fact that a considerable proportion of the white colonial population consists of unemployed men tramping through the country in search of work, and dependent upon the hospitality of the settlers. Considering the little difficulty there is, in most seasons, in producing a sufficiency of fruits and vegetables for a family's requirements in most parts of the colony, it is incomprehensible that the settlers or farmers do not grow everything they need. Instances have been known where vegetables were brought hundreds of miles to localities in which the same kinds of vegetable could be grown to perfection with but little trouble. In some places Chinamen will travel from 40 to 50 miles carting vegetables to settlers who have soil sufficiently rich to grow all they need, if they took the trouble to devote but an hour or two each day to

the work. In the neighbourhood of Sydney, flower-gardening has been made a remunerative occupation by reason of the growing demand for bouquets, wreaths, and floral ornaments, but the continual expansion of the metropolitan suburbs is driving the older nurseries further afield.

A considerable business is done by nurserymen and florists in Palms of various kinds, especially that known as *Kentia Belmoreana*, which is indigenous to Lord Howe's Island, and succeeds admirably in gardens about Sydney, and when planted with Tree-Ferns grows freely and quickly, and is wonderfully effective.

The "bush-house" is one of the most useful of structures in connection with the garden in all the warm parts of New South Wales. In it a multitude of plants can be grown which would be liable to perish in the hot sun. It can be, and is, constructed of all sorts of material, sometimes Tea-tree brush, laths, Bamboo blinds, and, indeed, anything that will break the rays of the sun without altogether obstructing them. In numerous gardens about the metropolis and large towns there are glass buildings where tender exotics of climates warmer than that of New South Wales are grown as successfully as in any part of the world.

Everything indicates that the colonial taste for floriculture is improving rapidly, and will continue to improve, a result due in some measure to the fact that there are many excellent gardeners, professional and amateur, in the colony. A large proportion of the Potatoes and other vegetables consumed in New South Wales is imported from Victoria, where market-gardening is more largely in the hands of white men than in the older colony. The vegetable products of Chinese gardens are mostly of poor quality, insipid and watery, owing to the methods of over-watering and over-manuring adopted. Although these vegetables are of such inferior character, they are absolute blessings in many places where the colonists either will not or cannot grow those they need. Vegetables of excellent quality can be produced, even in dry districts, with but little irrigation, if they be properly managed; but unless a Chinaman has a superabundance of water he is lost. With a fair supply of water and experienced labour, almost every description of vegetable known in Europe or America can be grown with ease, generally yielding abundant crops. *John Plummer, Sydney, New South Wales.*

Obituary.

DEATH OF AN OLD GARDENER.—The death is announced of Mr. JOHN KNIGHT who retired in 1887 from the superintendence of the private gardens at Hampton Court Palace, to which he was appointed in 1861. More than seventy years ago Mr. Knight was foreman of the Pleasure Grounds at Frogmore, and later he was for many years gardener to the late Duchess of Kent.

ENQUIRY.

"He that questioneth much shall learn much."—BACON.

TOMATOS.—A correspondent, "C. J. P.," living near Bristol, writes, in the hope of some of our correspondents who may see this note, answering the following questions: "I grow a good many Tomatos, in unheated houses, and have one heated house for bringing on the young plants. When the young plants were turned out we kept a dozen plants in 10-inch pots in the hot-house to come on early. Afterwards, we filled the house with Melons. As the Melons came on I determined to sacrifice what was left of the Tomatos for the sake of the Melons. So the ventilation was reduced, considerable heat maintained, with an atmosphere more or less moist and stagnant. Now according to all rules the Tomatos ought to have promptly become diseased, and gone off in different ways. But as a matter of fact they are doing remarkably well, and not a spot or a speck is visible on the leaves. How is this to be explained?"

BOOKS: *G. W. G.* So far as we know of, there is no recent work on table decorations, and Miss Annie Hassard's manual is long since out of print, as well as being old-fashioned in method and material. Ask Mr. Upcott Gill, 170, Strand, W.C.

CHRYSANTHEMUM LEAVES WITH FUNGUS: *B. W.* The leaf is badly affected with a "rust" fungus, which you may find fully described by turning to *Gardeners' Chronicle*, October 9, 1897, p. 256. If but few of the plants are affected your wisest course will be to burn those, and should any further plants show signs of the "rust," remove the leaves affected as soon as they be observed and burn them. It might be useful to syringe all the plants with Condy's Fluid or a copper solution, especially wetting the underneath side of the foliage.

CORRECTION.—Page 158 in previous issue, col. 3, top line, for *Filacea* read *Placea*.

CUCUMBERS WITH FUNGUS: *R. F.* Syringe the plants with a solution of sulphide of potassium, mixing about $\frac{1}{2}$ -oz. to each gallon of water.

FUNGUS: *X. Y. Z.* *Polyporus sulfureus.* *M. C. Cooke.*

GARDENER AT AN INSTITUTION: *W. P.* You have been very hardly treated, and according to your showing, for a very trifling offence. You should certainly sue the superintendent or the chairman of the Committee for three weeks' wages, and four weeks in lieu of proper notice to leave the service. If you have house, coal, &c., in addition, sue for these likewise.

GRAPES: *G. S.* Your Grapes are mostly split and covered with mould. If these be a sample of the crop, no means can now be taken to render the fruit valuable. You had best cut the fruit, and thus relieve the Vines of the worthless produce. In the winter cut the canes well back; thoroughly cleanse them with a fungicide, and examine the border. Probably you will find it badly drained. If ordinary mildew shows itself next season, apply a little sulphur to the leaves as soon as it be noticed.

INSECTS: *J. W. C.* The mites sent are a species of *Bryobia*, I think *nobilis* or *pratensis*, Koch, if these two species be really distinct, which I doubt; but the species of *Bryobia* are not well settled. It is related to, but by no means identical with, the common so-called "red-spider" of our greenhouses, &c. *Bryobia* swarms in gardens, and infests numerous plants; it is often very abundant on the Gooseberry; but, as far as my observations go, it is generally found in the greatest numbers on Ivy; if there be any Ivy near the windows they probably might be beaten off it in thousands. I scarcely think that they are likely to be on the Clover, but it is difficult to say what plant they will not get upon. It will, I fear, be a troublesome matter to get rid of them; probably by beating the plants infested with them over a vessel of hot water, and then syringing the plants with paraffin emulsion or quassia-wood solution, something might be done—but it would probably be rather a serious undertaking, on account of the extent of vegetation they generally spread over, and the necessity of getting at the under-surfaces of the leaves. They are not destructive inside a house, and unless you are very much annoyed by them, you may perhaps be wise in letting them alone. *Albert D. Michak.*—*Mrs. S., Cheltenham.* Your Pear-trees are attacked by the slug-worm of the Pear and Cherry saw-fly (*Selandria atra*). Among the remedies recommended is that of dusting some dry quicklime or gas-lime over the caterpillars. By exudation they will be able to throw this off the first time, but if a second application be made it will kill them. Syringe the trees powerfully with strong soap-suds or tobacco-water. By trying these and similar remedies you will no doubt minimise the mischief they will make.

MAGGOTS IN MUSHROOMS, WOODLICE, &c.: *Coventry.* The mischief will disappear as the season advances, little or no harm from this cause occurring in the winter and spring. We should advise the clearing out of all affected Mushroom, and keeping the house or cellar at a maximum temperature of 60°. Vaporising the place with Richards' XL All Compound would clear off the flies that are the cause of the mis-

chief. Good Mushrooms cannot be grown in a vinery at this season, although a crop might be obtained when a vinery is started in winter. Woodlice gnaw the Mushrooms, and do much damage if they are numerous. Try pouring boiling water into the cracks between the beds and the walls and sides, and leave nothing about under which they can hide. If your beds have a covering of hay or damp litter, clear this out and burn, as it forms just the sort of resort for the marauders that they prefer. If the beds are dry, afford them an application of warm water with a table spoonful of salt to 3 gallons of it. Keep the air humid by damping-down; this will prevent the drying of the beds.

NAMES OF FRUIT: *A. C.* Golden Champion, probably; send leaves. It is rather difficult to manage, and uncertain.—*C. R.* Apple Irish Peach.—*A. J.* Plums: 1, Gisborne's; 2, Jefferson; 3, Michelson's; 4, Kirke's.

NAMES OF PLANTS: *Correspondents not answered in this issue are requested to be so good as to consult the following number.*—*G. F. B.* *Erysimum Perofskyanum.*—*K. W. G.* 1, *Lythrum Salicaria*; 2, *Epilobium hirsutum*; 5, we do not recognise it, and it arrived in too rotten a state to admit of dissection.—*W. T., Barnet.* 1, *Adiantum capillus-veneris*; 2, *Gongora galeata*; 3, *Pteris quadri-aurita*; 4, *P. longifolia*; 5, *Blechnum corcovadense*; 6, *Doryopteris palmata*; 7, *Dracena (Cordylina) australis*; 8, *Carex japonica.*—*No Name:* *Woodbox—French.* 1, *Dendrobium formosum giganteum*—very good; 2, *Selaginella caesia*; 3, *S. apoda*; 4, *Begonia Prince Wallenstein*; 5, send specimen in flower; 6, *Stenotaphrum americanum variegatum.*—*No name: in Lady's Belt-box.* 1, *Asplenium lucidum*; 2, *Polypodium sub-auriculatum*; 3, *Gesnera elongata*; 4, *Asplenium bulbiferum*; 5, *Lathyrus cyaneus*; 6, send in flower (probably *Weigela*); 7, *Rhus Cotinus.*—*C. B. C.* *Ononis arvensis.*—*E. R.* 1, *Rhus Cotinus*, Wig-tree; 2, *Agrostemma coronaria.*—*J. B., Wilts.* *Odontoglossum crispum*; rather pretty, but not out of the common run.—*C. S. B. (Conifers).* 1, *Cupressus Lawsoniana*; 2, *Thuja orientalis*; 3, *Cupressus nootkatensis*; 4, *Thuja occidentalis.*—*H. M. L. (Green Rose).* The so-called *Rosa viridiflora.*—*W. S.* *Bignonia radicans.*—*Z. North.* *Impatiens glandulifera.*—*A. B.* *Lycium barbarum*, sometimes called the "Tea" plant.—*J. Sparrow.* 1, next week; 2, *Rhus Cotinus*; 3, *Datura Stramonium.*—*Cydonia.* 1, Shirley Poppy; 2, *Clematis flammula*; 3, a mere scrap, send in flower.

PASSIFLORA FRUITS: *W. T., Radyr.* The variety you send is *P. edulis*, and your crop in a cool-house of one half bushel of fruits is a good one. They may certainly be used for dessert purposes, but whether they may prove palatable to you or not we cannot say. Only the pulp is eatable, and it has a mild orange-like flavour. To ourselves it is by no means ungrateful.

ROYAL HORTICULTURAL SOCIETY: *A. C.* The office of the Society is at 117, Victoria Street, Westminster, S.W. Address the Secretary, Rev. W. Wilks.

THE KIND OF HOUSE BEST SUITED FOR RAISING FERNS FROM SPORES: *E. J. S. & Co.* A lean-to, or hip-roofed house, facing north, sunk a couple of feet in the earth, and fitted with a heating apparatus equal to maintaining a temperature of 60° to 70°. The glass of the roof may consist of rough plate.

THE PLUM: *C. W. H.* The ideal soil would be a heavy loam overlying limestone, chalk, or greensand. Failing these formations, almost any kind of soil not a sandy thin peat can, by means of a suitable admixture of pasture-loam, mortar-rubble, quicklime, superphosphate of lime, and potash, be made to carry healthy Plum-trees, from which crops, more or less plentiful, according to the weather in the flowering season, may be obtained.

TOMATOS: *Potter's Bar.* The fruits are affected by a fungus, *Cladosporium lycopersici*. Cut off all affected fruits, and burn forthwith, and spray the plants with liver-of-sulphur at the rate of half an ounce to one gallon of water. Avoid spraying ripening fruits.

Gardeners' Chronicle.

SATURDAY, SEPTEMBER 10, 1898.

BOUTCHER'S "TREATISE ON FOREST TREES."

THE above-named treatise, very popular at one time, and well known to earlier generations of gardeners, was published in 1775, a second edition appearing in 1778, and the author was one of Philip Miller's old pupils, who had settled near Edinburgh as a nurseryman. The nursery was not far distant from Holyrood, the exact locality being known as Comely Gardens, built over long ago, and close to which the Waverley and East Coast lines to the South now pass. Boutcher's success in business, it would appear, was not equal to his expectations, and at least one reason for launching his book was, that he might be well remunerated by its sale. We may conclude his expectations were to a large extent realised, because at least 500 copies were sold to subscribers; and the remainder, as the date of the issue of a second edition shows, was not long left on his hands. John Murray the First was his London publisher.

Like Switzer's *Ichnographia Rustica* of the early part of the same century, the book is peculiarly interesting on account of the glimpses it incidentally reveals of matters connected with gardening at the period it was written. For example, we find the wage paid to the British gardener ranged from £20 to £40 a year; but another sentence leads us to infer the usual wage to have been from £15 to £20, and the first-named amounts to have been secured only under uncommonly favourable circumstances. This, however, was an increase on fifty years earlier, because Batly Langley, in 1728, names £15 as a gardener's remuneration for the twelvemonth.

In 1766, the third edition of the *Scots' Gardener* names 1s. per diem as the wage of a labourer, and a gardener must have been better paid than appears from the above-quoted figures. For one thing he had "House and Eldin" (fuel); also a bit of ground on which to grow Flax and vegetables; also a cow—or, rather, feed for a cow; and in some instances it would appear that he made for himself a little out of the sale of surplus produce. Scott refers to this very old custom in *Rob Roy*, where the sagacious Andrew Fairservice mentions having been "doun about a wee bit business o' my ain wi' Mattie Simpson, that wants a forpit or twa o' Peers that will never be missed in the Ha'-house."

The gardener of 1775, moreover, occupied a position, and had a larger degree of responsibility than his successor of 1898. This is apparent from the advice Boutcher proffers to "men of plentiful fortunes" to provide "two gardeners," the one to have the charge of the gardens proper; the other to manage the woods. Nor are we allowed to suppose that Scotland

is alone referred to, for we are informed he had "visited with attention many of the most elegant and magnificent seats in Great Britain, but never once in my life have seen all the different branches of the business properly executed under the management of one man."

In another part of the book the great scarcity of hardy fruit in Scotland, and the exorbitant prices it brought, is mentioned, and the curious reason he proposes to account for this, was the "new fashion" of laying-out lawns round the house, with the consequent removal of the kitchen and fruit gardens to another site at a distance. The style of landscape gardening just alluded to was introduced into Scotland between 1750 and 1760, about which time many extensive policies were laid out, new kitchen gardens formed, and fields, formerly cultivated, laid down in grass parks. However, judging from the many references to "wilderness quarters" which occur throughout the book, there still must have remained in 1775 many estates in which the garden, with its fruit-trees and its narrow flower-borders, and the wilderness, replete with Roses, shrubs, semi-wild plants, tall perennials, and the more rare trees lay nestling close to the sheltering walls of the "big" house.

Our progress through Boutcher is not great before discovering that the goose-quill he wielded was in its nature largely caustic. Among other practices condemned in language best indicated by this word was that of supplying trees untrue to name, and more particularly fruit trees, which, if we credit the writer's statement, was habitually done in his day. Another of the customs he attacked with uncompromising hostility was the practice of sowing the seeds of Firs very thickly, and selling the seedlings direct from the seed-bed. This method was first pursued about sixty years previously by the Earl of Haddington, and the results were so splendidly successful that, as appears from Boutcher's declaration, it was then usual to purchase two-year-old seedlings, bring them a distance, and plant them in permanent situations, with the not unnatural consequence of losing nearly the whole of a consignment. The great pioneer of Scotch forestry raised his own seedlings, "puddled" their roots when lifted, and had them planted at once in sandy soil—little matters that nurserymen seem to have ignored altogether.

Another distressful custom was that pursued by some nurserymen of issuing lists of trees and nursery stuff with prices attached. Intending purchasers are warned to beware of these men, who, he cannot help insinuating, must be possessed of a bias towards dishonesty. None of these lists are likely to exist now, but the *Edinburgh Courant* for February 4, 1767, contains an advertisement of shrubs which are priced in hundred lots, or "classes," as the advertiser calls them. Prices are very low—e.g., class 1, 40 varieties, at 10s. per 100; class 2, 60 vars., at £1 per 100; class 3, consisting of above 100, at £1 10s.; class 4, of 50 vars., at £2 10s.; and class 5, of 50 vars., at £5 per 100. The list, with the names of the shrubs in the several classes, was kept by the vendor; those in the last-named being so rare that not more than two of one sort could be selected of classes two, three, and four. An "N.B." states, of the five classes of shrubs no more than five score are given for the hundred.

That Boutcher practised what he wrote is proved from an advertisement of his own in the same paper, but ten years later than the above, or on Feb. 10, 1777. It may be worth

extracting in extenso, as it is not very lengthy:—

"To be sold by William Boutcher, nurseryman at Comely Gardens, a collection of all the valuable kinds of fruit and forest-trees, flowering shrubs, evergreens, and hedge plants, cultivated after the manner directed in his late *Treatise on Forest Trees*.

"There are, particularly, considerable numbers of the following sorts:—English Elm, grafted on Scots and Dutch stocks; ditto on their own bottom, from four to eight feet high; Scots Elm, same size; Limes do.; Beech, from one to four feet high; Balsam and Berry-bearing Poplar, from three to six feet high; Lombardy do., same sizes; Planes, from two to eight feet; Horse-Chestnut, from three to six feet; Laburnums, same sizes; a large quantity of two-year seedling Hollies; ditto, two years transplanted; Yews, one and two feet; Thorns, from two to seven years old, transplanted; Scots Fir, three and four years old; Spruce Firs, from six inches to two feet Silver Firs, same sizes.

"All the finest kinds of Roses known in Europe, with a numerous and elegant assortment of the other flowering shrubs, deciduous and evergreen.

"P.S.—The Scots Fir, Thorns, Plane trees, and Lombardy Poplars, which are plants of the best quality, will be sold below the usual rate."

How interesting it would have been to us now had Boutcher been inconsistent for only that once, and appended prices to his goods! That he possessed an efficient knowledge of his business the pages of his book abundantly testify. He advocated growing trees to a large size in the nursery, and then transplanting them to their permanent positions. The treatment recommended is so practical, that one can have no hesitation in accepting his assurance that if intelligently pursued, trees up to 24 feet in height, "with large bulks of soil," may be carried any distance and transplanted with safety. For estate work, nothing indeed could be more suitable; but for a nurseryman, it is impossible to see how he could make it pay. As showing the extreme lengths to which he carried his pet views, he actually proposed a method of growing the common Whitethorn for hedging purposes to a height of 6 feet in the nursery, meanwhile keeping the plants trimmed to shape, and finally transferring the full-grown hedge to its position. Regarding the trimming of thorn hedges, his advice is in line with the method pursued at the present day, of cutting them tapering from base to apex. Strange as it may appear to us now, he proposed this as an improvement on the practice common at that time of fashioning thorn hedges with a broadened flat top, and sides inclining inwards to the bottom. A few Thorns, on account of their beauty, are commended for the park and wilderness, and he takes care to say they are to be left to grow in unrestricted freedom.

He, however, considered the common Holly as unsurpassed for a hedge. His method of preparing Hollies for this purpose is original, perhaps unique. Two-year-old seedlings were selected from the seed-bed, and planted in lines 3 feet apart, and half that space in the lines; the soil to be fertile. Here they were to remain till the third spring after planting, at which time a trench was cast out, and all the roots shortened. The year following the plants were cut down, and the next they were in a fit condition to plant. The best time to plant was April, when they were lifted with "bulks of earth about their roots," and set in the line of the hedge at 18 inches apart. The crop of young shoots, the result of cutting over, were trimmed level at the same time. He notices "a very wrong, though prevailing custom, which is clipping the beginning of winter," and instead recommends hedges to be trimmed in July.

The Tynninghame hedges are mentioned as illustrating "the incomparable beauty, lasting strength, and magnificence of Holly hedges." For the long period of 140 years or more, these remarks of Boutcher's were at any time applicable. In 1775 they were, however, "not lofty in proportion to their thickness and strength," and he recommends they should be "run up to 25 or 30 feet in height, cut thinner and thinner as they approach the top, which in a few years would make them the most glorious sight of the kind that can be conceived." The advice was not accepted, nor did the Hollies lose their glory.

Of trees, a list, fairly full without being exhaustive, is treated in detail. The writer gives common names only, because "their botanical characters being universally known to the learned, and of no use to the young and illiterate gardener, &c., &c." It is possible there was another reason, because, after treating of Poplars in one chapter, he, in a later one, describes the "Tacamahacca" tree as of a distinct genera, and "good for wildernesses."

The chapter on Oaks contains the curious information that it was the common practice not to plant young Oaks with a spade, but to dibble them into the ground, like Cabbages. He very properly condemns this custom. He advises cutting with a sharpened spade the roots of one-year-old seedling Oaks and Beeches in the same manner. Two-year-old trees of the former that are "crooked or bushy, must be cut over by the ground and remain two years longer." One shoot to each was of course all that was allowed to remain. Cutting off large limbs of old trees is condemned, and the pair of Cedars of Lebanon cut back by Miller from off the greenhouse at the Chelsea Physic-gardens, are held up as warning examples. Pruning in itself he has nothing to say against, and as a matter of fact, pruning when young formed part of his management of trees.

In a lengthy argument, the employment of Planes and Poplars instead of Firs as nurse-plants is proposed.

In a postscript the author conditionally promises a *Treatise on the Culture of Hardy Fruits*. The manuscript was in his possession, but so far as I know of, it never took the book form. A method of cultivation was to be revealed by means of which as good hardy fruit would be produced in Scotland as was then grown about London, while London in this respect would be on an equality with Paris.

We have no reason for supposing that hardy fruits were less well cultivated at that period than at present. Here, for instance, there is a Ribston Pippin Apple-tree planted in 1759 which bears the marks of having been treated well in its younger days. Forsyth in 1803 published a list of Scottish Pears, some of which are still esteemed highly, and altogether we have no reason to think that the people a century ago lost much by the nonappearance of Boutcher on *Fruit-trees*. R. P. Brotherston.

NEW OR NOTEWORTHY PLANTS.

HYACINTHUS AZUREUS VAR. GIGANTEUS, *Baker.*

This gigantic variety of *Hyacinthus azureus* was found by Mr. Siehe on the Mount Muris, in Northern Cilicia, at 1000 mètres above sea-level. It attains a height of 30 cm., or almost 1 foot. The flowers are of a delightful shade of azure-blue, and very fragrant. The plant grows in moist soil, and in swampy ground, and needs therefore, when grown in gardens, very much water at the root when in active growth. It

flowers at the end of the month of March. At the left side of our illustration (fig. 52, p. 191), taken from a photograph of the plant by Mr. Siehe in its natural locality, there is a specimen of *Muscari botryoides*, which shows the difference in the size of the two species.

ORCHID NOTES AND GLEANINGS.

CIRRHÆA VIRIDI-PURPUREA.

THE plant, of which I send a photograph, has been grown among a mixed collection of Orchids in a plant stove in these gardens for a period of about nine months of the year. The remaining three months it is rested in a cooler house. It commences to grow about April, and when the young growths are about 3 inches long, it begins to show its flower spikes, the latter, as a rule, being fully developed about the middle of July, but the pseudo-bulb continues to grow till late in the autumn, when water is gradually withheld, but not entirely dispensed with till nearly the end of the year.

When in full growth the plant likes abundance of water, but great care must be exercised in affording it when the young growths first appear, as any excess at that time causes them to damp off.

In the growing season the usual stove temperature suits it, and when at rest a temperature of about 45° to 50°, but it should not be kept dry enough to cause the pseudo-bulbs to shrivel. *Ed. Wrighton, Garthynghaved, Dolgelly.* [The plant had sixty-eight blooms on six spikes, but unfortunately the photograph was unsuited for reproduction. *Ed.*]

TREES AND SHRUBS.

THE PLANE.

PLATANUS orientalis has long been cultivated in this country as a decorative tree, having been introduced from the Levant about the middle of the sixteenth century. This species and its variety, *P. acerifolia*, are the most common in cultivation, the latter variety, probably known to many as the London Plane, having been extensively planted in the parks and streets of the metropolis.

P. orientalis variegata is another variegated form with silvery leaves, but is not nearly so fine in effect as the former variety; it is, however, useful and ornamental.

P. orientalis laciniata is well worth growing for decorative effect, on account of its very deep and much-divided leaves; these are deep green in colour; and its growth is vigorous and free. The tree varies in height from 50 to 60 feet. This was introduced about the year 1815, but its origin is unknown.

P. orientalis cuneata is distinct in general appearance from all others. It is dwarfer in habit, scarcely ever exceeding 20 feet in height. The leaves are dentate, wedge-shaped at the base, and smaller than those of the type, also glabrous. There are but few trees of this variety in cultivation, and it is not nearly so fine in effect as the others. It was introduced from the Levant in 1739.

P. orientalis hispanica.—This is the Spanish form of the type, and differs but slightly from the species in having longer leaves. It is frequently seen in private gardens and nurseries under the name of *P. macrophylla*.

Of the lesser-known varieties there are several that have very handsome and ornamental foliage.

Chief among this latter class is the variety *P. Luttneri*, recently introduced, and which, when better known, will be appreciated as very valuable. It is distinct both in habit and growth, being upright and compact, but it is in the striking beauty of its leaves that its value consists. The leaves are palmate in shape, five-lobed, and deeply cut or serrated along the margins, and in colour are creamy-white, more or less splashed or streaked with green. Its variegation is constant from the development to the fall of the leaf. A specimen tree I noticed recently about 20 feet high, with a stem girth of 18 inches, created a fine effect, the striking foliage being visible for a consider-

able distance. [Some leaves and shoots kindly sent by our correspondent, bear out his description fully. *Ed.*]

All the Planes delight in a free, moist, loamy soil, but will not succeed in heavy clay, nor in an elevated or exposed situation. They may be increased by seeds, layers, or cuttings. *E. S., Woking.*

BICTON.

(Concluded from p. 178.)

LEAVING the arboretum and entering the kitchen garden, the nursery plot is remarked, a handy piece of ground for the rearing of out-of-door plants. And here were specimens of Turner's Crimson Rambler Rose in full bloom, one plant carrying no fewer than 700 clusters—a glorious picture. The old growths of last year were pegged down to the soil, and the new shoots loosely tied to stakes, so that now the whole forms a dense mass. A couple of Oaks are at this spot, each measuring exactly 13 feet in circumference.

THE KITCHEN GARDEN.

The kitchen garden is undoubtedly one of the finest in the country, and it is managed in an intelligent manner. Capital trees of the Plum, Peach, Pear, &c., furnish the walls, with pyramids and espaliers on the quarters, and with others of vase-like shape, having short stems. The crop of Plums on trees of Washington, Early Orleans, Czar, Pond's Seedling, Rivers' Prolific, Victoria, Magnum Bonum, Green July and Transparent Gages was a very good one. The Cherry-trees had likewise borne good crops. Fruits of the Moorpark and Kaisha Apricots then ripening were very fine. The Peach-trees on the east wall were not very well cropped; but the crop on the south wall was a very heavy one.

The two Peach-houses here are each 80 feet long, unheated, and filled with capital trees, one house being that already mentioned. The varieties Royal George, Sea Eagle, Crimson Galande Peaches, and Violette Hâtive Nectarines were capital; and the other house was furnished with trees of Goshawk, Dymond, Violette Hâtive and Grosse Mignonne Peaches, and Violette Hâtive Nectarines, with large Cherry-trees on the back wall. A Fig-house 75 feet long and 15 feet wide, divides these two peacheries. The Figs are planted at the back, and trained downwards to the front, and the trellis being rather low makes it an easy matter to gather the fruit and manipulate the shoots. The whole of the surface of the border is paved with cobble stones, and this hard border seems to suit the trees, as a grand crop of Brown Turkey was ripening. Against the front, plants of the Early Ruby Tomato were planted.

In the vegetable quarters, Carrots, Onions, Peas, and Beans showed splendid crops; Currants were abundant, and Raspberries a heavy crop. Mr. Mayne prefers Raspberry Superlative to any other he has tried. The Strawberries were over, but I perceived that Royal Sovereign, Sir Joseph Paxton, and President furnished the main supplies; although Leader and Monarch were grown and gave satisfaction. Early Potatoes were very fine, and a heavy crop. To describe pits, frames, &c., would take too much space, and it must suffice for me to say that this part of the garden was extensive and very interesting.

We passed a large Tulip-tree in flower on the way to the orangery. In this large building specimens were noted of *Luculia Pinceana*, and *L. gratissima*, which will be glorious later on; large plants of *Bougainvillea glabra*, of *Datura arborea*, and climbers on columns and roof, such as *Bignonia*s, *Lapageria*s, *Passiflora*s, *Cassia corymbosa*, *Jasminum azoricum*, white flowers, very fragrant; *Habrothamnus*, *Acacia*, and *Trachelospermum* were remarked.

Passing away down the wide lawn, we leave a lake of some 5 acres in extent, beautifully embosomed amidst grand trees, under the shade of which a capital boat-house is erected; and two islands afford variety, as do a number of black swans and other exotic aquatic birds.

Before closing my notes, I must bear testimony to the kindness of Mr. Mayne, and express a hope that he will for many years to come remain in charge of

these notable gardens, and that the happy relations existing between master and man will continue.
W. Swan, Exmouth.

HIPPEASTRUMS AS BEDDING PLANTS.

WHERE Hippeastrums are raised in numbers from seed every year, a novelty in bedding can be obtained by planting those bulbs the form of whose flowers falls short of the hybridist's standard of excellence, but which are good enough to make a show out-of-doors; they would look exceedingly well as occasional plants in a mixed border with other bulbs, such as *Lycoris*,

retarding or bringing forward those that incline to flower outside at that period, a race of *Hippeastrums* could be obtained of great value for bedding purposes.

Some bulbs of *H. vittatum* which were left out all the winter, buried 3 inches below the surface to protect them from severe frosts, were very late in starting into growth, and have made but little progress as yet; they can hardly be expected to flower before October or November, with a possibility of being cut down by an early frost. This tends to show the necessity of starting them into growth early in the year if they are to flower at a suitable season. Although they would fall short of the characteristics

rect name, *E. pulverulenta*, implies, the plants have a powdery appearance, and under the influence of this year's tropical sun-heat this characteristic is more than usually developed. *E. cordata* branches freely, and frequently quite horizontally, forming a perfect pyramid. At Finsbury Park, Mr. Melville has used this species with good effect in some beds of tuberous-rooted *Begonias*, the luxuriant foliage and brightly-coloured flowers affording evidence of the grateful shade furnished by the taller plants. In common with most of the members of the genus, this species is a quick grower, and plants raised from seed sown in the early spring attain a height of quite 3 feet during the course of the summer. When the season is over, these plants should be thrown away, and new ones raised for the following summer, as lifted plants rarely recover from the check due to transplanting. In order to properly develop the plants, they should be planted 3 feet apart, and as the apex is pendulous in nature, a neat stake should be given to each. When large plants are required, seed should be sown in the autumn, and the plants kept gently growing throughout the winter. As a pot-plant, it is a great acquisition in the cool or warm greenhouse. Seed, which germinates freely, should be sown thinly in a well-drained compost of light sandy soil. After the plants have passed the seedling stage, they grow freely in almost any kind of soil. A. C. B.

TEMPLE HOUSE, GREAT MARLOW.

THE riverside residence of General and Mrs. Owen Williams is charmingly situated a few yards distant from the "Royal River," on the Berkshire side, a couple of miles from the above-mentioned town, and in the midst of beautiful scenery on either side. The mansion itself is of considerable size and importance, and stands in pleasure-grounds admirably laid out and of large area, the estate being one of the largest in this district. My visit recently was made chiefly with a view to an inspection of the large collection of *Malmaison* Carnations grown here, and which I had seen in a young state, and noted that they were remarkably healthy and promising. Mr. Groves, the able gardener, has more than a local reputation for his culture of this now popular variety of *Carnation*, and the quality of the flowers I saw on this occasion fully confirms all I had previously heard on this point. At the time of my visit there were some 2000 blooms, the majority fully open, and others in course of development, which made an imposing sight, vieing both in size and colour with those staged at the Royal Horticultural Society's meetings and the Temple Show. About one hundred of the plants were two years old, but the most of them one year from the layer. Mr. Groves does not believe in keeping his plants after the second year, at which age they are layered, and about 100 of the first year's flowering-plants are potted-on each season for the second year, as these produce their blooms somewhat earlier than the young plants. Large pots are not used, although Mr. Groves favours the one-shift system, and his layers, being always strong, are potted direct into their flowering-pots, which are 7-inch size, and the two-year plants are given 10-inch pots. The loam used for the potting is subjected to heat for the destruction of wireworm and grubs.

During dull weather, and especially throughout the winter months, the atmosphere of the house is kept particularly dry, and little water used, any spilled being dried up as soon as possible, and the plants are never wetted overhead. Should any attack of rust appear, the foliage is rubbed with flowers-of-sulphur held between the thumb and finger, and this simple remedy has been found very effectual.

The pink variety is chiefly grown with a few of the blush-white ones, and most of the newer varieties are given a trial. Of these I noticed Mrs. Everard Hambro, Churchwarden, Sir Charles Freemantle, Prime Minister, and Princess May. A slight shade is afforded by coating the glass with whiting properly prepared, so that it does not wash off, just sufficient being applied to break the strong rays of

FIG. 52.—HYACINTHUS AZUREUS (BAKER) VAR. GIGANTEUS:
COLOUR OF FLOWERS AZURE-BLUE. (SEE P. 190.)
(Half natural size.)

Amaryllis, *Calochortus*, &c., or planted closely together in a bed by themselves. I have a number of bulbs which were weeded out from the collection in the spring, planted in an open, sunny border with seedling *Begonias* as a carpet to afford colour and interest till the *Hippeastrums* flower; many of them are now showing particularly strong scapes, and promise to be very effective. Other bulbs have been planted out for two seasons in the same manner, and these are showing the strongest scapes, with the additional merit (in both instances) of flowering with the foliage in perfect condition. They were lifted late in the autumn, and planted closely together in boxes, passing the winter in a vinery in a dry state; and started into growth before planting them out in June. I believe, if a little trouble would be taken to select bulbs flowering naturally in August and September,

of a typical "bedding" plant by only flowering once in a season, they possess an advantage in the manner in which they luxuriate in hot, dry soils, such as is usually found in the borders of terraces, at the foot of south walls, &c., under which conditions plants less capable of resisting drought speedily dry out. The species succeeding under the planting-out system are *H. aulicum*, *H. sub-barbatum* (*rutilum*), *H. vittatum* and vars., and hybrids of *vittatum*-equestre parentage. Geo. B. Mallett.

EUCALYPTUS CORDATA.

WHILE *Eucalyptus globulus* is almost universally employed with good effect in sub-tropical and other kinds of bedding, the more graceful *E. cordata* is but rarely seen in this or any other capacity. As the cor-

the sun, and not exclude light. Other houses are devoted—one to *Streptocarpus*, a very excellent strain; another to a large collection of scented-leaved *Pelargoniums*, another to *Pancreatums*. Two houses only are devoted to fruit, one to Peaches and one to Grapes; and of the latter but one variety is grown, and that one not often seen, viz., the Strawberry-Grape. Tomatos are a specialty, several houses being devoted to their culture, and Mr. Groves grows principally a variety of his own raising, a free-setting and medium-sized fruit of excellent flavour.

The pleasure-grounds surrounding the mansion on three sides are extensive, and well furnished with nice specimen coniferous and other trees. A Cedar of Lebanon on the south-west side of the house is remarkable for the manner in which the lower branches have extended while resting on the surface of the lawn to a distance of 100 feet or more in one direction, giving the tree a distinct character. A short distance from the dwelling is a capital herbaceous garden, set out in a square, with marginal grass paths between the beds. A very choice collection of all the best herbaceous subjects are grown here, and also a quantity of a selected strain of Sweet Williams. A short distance to the south is the kitchen garden unenclosed by a wall, where also all the paths are bordered with herbaceous and other flowers for about a space of 6 feet on either side, and backed up with a very narrow and closely-out Yew hedge, which effectually shuts out the vegetable quarters. Here the central borders were especially attractive, standard Roses, and among others, *La France* being extra fine, *Delphiniums* in variety, *Thalictrums*, *Lysimachia thyrsiflora*, and many other subjects being at their best. The pleasure-grounds surround the kitchen garden, and in the shrubbery borders numerous specimens of *Berberis vulgaris* with coppery-bronze leafage, were very telling among others. The presence of water lends a charm to the grounds and rustic bridges over backwaters of the Thames, festooned with *Clematis*, *Roses*, and other climbers, were, indeed, charming. A special feature is also made of pillar *Roses*, covering stout poles some 15 feet in height, on which several old varieties, and the somewhat new *Crimson Rambler* were conspicuous. A large collection of *Violas* is also grown, one of the most showy at the time of my visit being *Harlequin*, and a quantity of *Sutton's Yellow Prince*. An *Antirrhinum* is used in both beds and borders—a fine yellow-flowered, dwarf variety.

As a quiet retreat opposite the mansion, and in about mid-stream, is an island of considerable size, nicely wooded, and also furnished with a few effective flower-beds—a favourite summer resort; while on the lawn I noticed a fine flowering specimen of *Elymus glaucifolius*, a very ornamental grass, which grows freely in moist situations. Mr. Groves is deserving of praise for the admirable keeping of this beautiful estate with the limited staff at his disposal. C. H.

MARKET GARDENING.

HARDY FRUITS.

(Continued from p. 140.)

APPLES.—Being of primary importance, we will first take the orchard sorts, that are best gathered and sold direct from the tree. A somewhat modern purchaser of such fruits is interesting, he caters for the vendors of cheap "Fruit Preserve." Much scandal is talked about this individual, some of it utterly ridiculous, and some absurdly false. His connection with the fruit industry is most beneficial, either from a producer's or consumer's point of view, his business being to buy up all the wind-falls, thinnings, unripe, and otherwise unsaleable fruit, and to boil it with sugar, or without, to make what is termed "Smash," the principal ingredient and foundation of all cheap jams. This, with the addition of "Gold of Pleasure," *Camelinasativa* seed, or other harmless seeds cultivated for that purpose, are added in varying quantities to the mixed pulp. At a casual glance, the stuff afterwards simulates Strawberry or Raspberry-jam, while Plum-stones are put in to make Plum or Greengage-jam.

This unfair, though perhaps harmless, adulteration of the "Smash" enables the trade to sell at such prices as to reach the very poorest consumer, and there is little harm in it so long as the fruit used is not fermented or decayed as to be unfit for human food, and the manufactured article is not sold under a false name. It also allows the grower to make something out of the thinnings from his fruit-trees.

The sorts I have found best for this marketing from the trees, are selected, because they quickly attain to a fair size. The letter "s." indicates their fitness for standards in orchards; "B." for bushes or free pyramids in plantations, and where both letters are used, the varieties will be found useful in either or both positions.

A. *Lord Suffield*, B.—A large conical Apple, and a great favourite with the costers, because, as Albert Chevalier would put it, "they sots well on the barrer." Being somewhat tender, give it a sheltered position, and do not plant it if the soil of your orchard be at all wet or cold, but substitute letter D., E., or the newer varieties, *Gold Medal* or *Potts' Seedling*.

B. *Pomona* (Cox), s.B.—Highly coloured, deeply divided into five segments; most profitable, and useful either as a kitchen or dessert fruit.

C. *Early Julian*, s.—Pale yellow with patches of russet, heavy bearer, cooks well when immature; a market favourite.

D. *Ecklinville*, B.S.—Of the *Codlin* race, early and very prolific; deficient in colour, but of good shape.

E. *Grenadier*, s.—Sent out by G. Bunyard & Sons in the Apple Congress year, and took First-class Certificate; the best early *Codlin*, a reliable cropper.

F. *Hawthornden*, New or Winter, B.—Large, and very handsome; the fruit from old trees on *Paradise* stock often highly coloured and wax-like, making it fine for exhibition.

G. *Stone's or Loddington Seedling*, B.—A fruit of Kent origin, which is very large, heavy, and prolific. Does admirably when grafted on old trees, especially on the "Orange Goff" or *Pork Apple*; most useful for sauce.

H. *Warner's King*, B.S.—Enormous fruit; I have staged it at 30 oz., and it has been exhibited at a local show weighing 2 lb. On *Paradise* stock and well thinned, it gives fruit certain to take honours.

I. *Cellini Pippin*, s.B.—Very prolific, but of poor quality, the tree apt to canker on cold or wet soils; shape very handsome.

J. *Manx Codlin*, B.—Handsome conical fruit, in hot, dry seasons richly coloured; prolific, hardy.

K. *Dominie*, s.B.—Another free-cropping *Codlin*, suitable for cold positions and soils; good marketer.

Of recent introduction, *Improved Keswick Codlin* (Pearson), *Lord Grosvenor*, *Mrs. Barron*, are all worthy of a trial as bushes or free-growing pyramids.

Since the grand Apple-show and Conference held at Chiswick in 1885, a great many new kinds have been sent out, both here and in America, as well as on the Continent, Russia being a leading contributor; but I shall merely give a list of these, as it would be premature to recommend many of them to growers for profit till they have had a long trial under all conditions of position and climate, while most of them at present are too dear for market purposes, but in due time they will come to the front.

Where possible, I have given the name of the raiser or introducer; but for full descriptions, consult the catalogues of leading pomologists. Those that have First-class Certificates from the Royal Horticultural Society are indicated by F.C.

Bow Hill Pippin, A.S. White; *Ohelmsford Wonder*, F.C.; *Domino*, F. Holmes; *Hambling's Seedling*, Bunyard; *Royal Late Cooking*, Veitch, A.M.; *Wealthy* (American).

The position of the trees must always be determined by the site of the orchard, but let the rows run as nearly as practicable N.E. and S.W., which will give the trees a chance to get the maximum of sunlight; while this position minimises, to a great extent, damage by rough winds and gales when the trees are carrying foliage and fruit in summer, or when leafless in winter.

As a rule, the young trees, when received from

the nursery, already show their habit, as it is called, i.e., whether they grow erect and stiff, or pendulous and diffuse. Plant therefore those that conform to the growth of the Lombardy Poplar; as *Pomona* (Cox) outside, and the others which form rounded or weeping heads in the inside of our orchard, the former, as a rule, making their fruiting-spurs on the main branches, and the others more frequently on the points of the same, the latter requiring more attention in pruning than the first.

Now follow those sorts which produce large and tender-fleshed fruits, too liable to be blown down by rough weather and spoiled if produced on standards, and so they should be cultivated as bushes or free pyramids. I use the word free in contradistinction to those very artificial trees, beloved of some amateurs, but as a rule hated by gardeners and fruit growers. These are what I perforce term teased into fruiting by nipping, pinching, and other torture very admirable in a garden of a few perches, but involving the expenditure of too much valuable time in gardens of some extent or on fruit-farms.

This form of tree gives grand results, both in regard to the size, colour, and finish of the fruits, particularly when the trees begin to bear. Also it is the best-shaped tree for plantations, where, till the Apple-trees get large enough to occupy all the space available, bush-fruits, Gooseberries, Currants, or even Strawberries, may be grown between the rows, taking care to avoid crowding the permanent trees or cultivating too near to them, so as to injure the indispensable surface-roots. The number of varieties available for this kind of work is much greater than in the first section, and the usual distance from tree to tree is 12 feet, but on poor land 10 feet apart is enough; and many of the varieties scheduled are useful in both forms, but those with B. attached to their names are strongly recommended as bushes. Remember, the majority of these are best on the *Paradise* stock, as they not only fruit much sooner, but the fine fibrous roots of this stock ramify just below the surface, and are therefore in the position to take all the benefit of mulchings of farmyard manure or artificial compounds, the most lasting and satisfactory among the latter being wool-waste, or shoddy as it is called in Kent.

If maiden trees are planted, and the work be done in October, the following March the leading shoots may be just stopped, and any weakly or crossing branches removed. Never prune Apple-trees at time of planting, and, with the exception of a few varieties, after three years, Nature may be relied upon to do this with very little aid from the cultivator, the primary object being to afford the growing tree the very utmost amount of air and sunlight possible. It is marvellous how this checks the growth of lichens and moss, and keeps the trees in robust health, preventing attacks from injurious insects of all classes. Continuing varieties best to gather and sell direct from the trees, let the bushes and pyramids consist of the following, which are early in maturing and getting to full size, but though many good varieties are unavoidably omitted they are either uncertain or biennial croppers, or too small for profit:—

A. *Astrachan, Red*, B.—Very handsome and highly coloured, with Peach-like bloom; a great market favourite.

B. *Castle Major*, B.—Large, handsome and heavy.

C. *Hornead's Pearmain*, B.—Large, deep lemon coloured; often carries a crop when others fail.

D. *Lane's Prince Albert*, B.S.—Fine shape, large and handsome; a prodigious bearer, F.C.

E. *Stirling Castle*, B.—Of the Hawthornden race, fruiting abundantly; fine for exhibition when taken from young trees.

F. *Emperor Alexander*, B.—An old and well-known variety from Russia; large and beautiful in form and colour.

G. *Frogmore Prolific*, B.S.—A most reliable cropper in great favour with suburban market growers.

H. *Wadhurst Pippin*, B.S.—Large and handsome off young trees; very reliable cropper.

I. *Sandringham*, F.C., R.H.S., B.S.—A fine variety originating in the Prince of Wales' gardens; hardy, free-growing, and prolific.

J. Blenheim Orange, B.S.—A well-known favourite, but an uncertain cropper till the trees get old. One of the best to bake.

New varieties are *Christmas Pearmain*, B. (Bunyard), a heavy cropper, with fine colour; very attractive, and fit for kitchen use or dessert.

Mrs. Barron, B.—Large, very handsome, and of excellent quality, either for cooking or dessert.

Atalanta (Ross), A.M., R.H.S., B.—Heavy cropper.

Belle de Pontoise, B.—Of Blenheim race, very fine and heavy; a fine exhibition-fruit.

Belle Borodowka, B.—An extremely handsome Russian variety. An improved "Alexander," and good cropper. Come to stay!

Duke of York (McIndoe), S.B.—Good where it does well, but uncertain.

Foster's Seedling, B.—An improved Cellini, which appears to be free from canker.

Gospatrik (Ross), S.B.—Another good thing from this raiser; free-bearing, and free-grower.

Keswick Improved (Pearson), S.B.—Like the old well-known variety, but keeps well to December.

in shape, colour, and aroma; should be promptly marketed.

Williams' Favourite (American), A.M., R.H.S., B.—A very handsome conical fruit from Canada.

Ribston Pippin, B.S.—An universal favourite, subject to canker; but if care is taken to select clean stocks and scions, and to plant it only in well-drained fresh soil, it will maintain good health and vigour, and amply repay the grower.

Cox's Orange Pippin, S.B.—Next to the above, the finest dessert Apple in its season, very handsome, with Ribston flavour.

King of the Pippins, or *Kentish*, S.B.—A well-appreciated Kentish fruit, free-bearing, and most saleable when finished well.

Worcester Pearmain (R. Smith), S.B.—Free bearer, and very pretty, capital market fruit.

Yellow Ingestre, *Golden Pippin* of *London Markets*, S.B.—Small, but most prolific and marketable.

King of Tompkin's County, or *King* (American), B.—Very large, and exceedingly handsome; flesh tender, and of fine flavour. Requires a warm situation.

crisp and fresh till the early Apples ripened, must be merely mentioned, as it is too insignificant and unattractive to sell. *Experience*.

(To be continued.)

DENDROBIUM DEAREI.

ON July 12 last there was exhibited before the Orchid Committee of the Royal Horticultural Society a magnificent specimen plant of this exceptionally useful white-flowering Orchid. It came from the gardens of Herbert Hicks, Esq., Bramwoods, Chelmsford (gr., Mr. Jas. Machar), and had been grown there for a period of four years. Some of the leafy pseudo-bulbs were over 3 feet in length. The plant bore thirteen spikes, the largest pseudo-bulb having three large racemes of flowers to the number of thirty-three. Four spikes had already been cut. When it flowered previously the plant was more or less in bloom from April until the following February. Most of our readers are doubtless aware that the flowers of *D. Dearei* are capable of lasting a very long period. In fig. 53 we have pleasure in presenting an illustration of this fine plant, which is certainly a testimonial to the skill of the grower under whose care it has so well succeeded.

NURSERY NOTES.

DICKSONS, CHESTER.

THE extensive establishment of Messrs. Dicksons is known to be one of the largest and best equipped of provincial nurseries. A trip there may consequently be made an event to be pleasantly remembered, especially as the ancient and picturesque city of Chester itself is uncommonly attractive. We are able to write thus from the fact that we were recently there; and if the chronicle of certain features of the nursery will lead any horticulturists who were never in Chester to make such a pilgrimage, we will assure them against disappointment. In the first place it may be remarked, that though the grounds are several hundreds of acres in extent, order is maintained everywhere. In the planting it will be observed there is system; and so far as our experience went, there was most convincing evidence of frequent and effective cultivation of the surface-soil, there being almost perfect absence of weeds—the lazy gardener's sign-post.

Not more than five minutes' walk from one of the entrances to the Central Railway Station, and the nursery may be reached. The broad drive from the road to the offices, through wide and well-kept flower-borders, at once impresses a visitor with the neatness of the place—neatness that he will later discover is carried to the very extremities of the plantations.

THE GLASS-HOUSES.

From the offices our steps were first directed to the glasshouses, where we saw a good stock of very miscellaneous plants, such as are required in most gardens. Several of the structures contained Palms, others were devoted to Ferns, Aspidistras, Camellias, Pelargoniums of all sections, Caladiums, Gardenias, Streptocarpus, Lapagerias, tuberous-rooted Begonias, which made a first-rate display, a few species of Orchids, and several species of greenhouse plants, including a quantity of Fuchsias and Carnations. Of Pot-Roses there are some 10,000 of them cultivated each season. These were growing apace, and possibly have since been turned out of door. There are 2,500 Vines in pots, and they represent all of the popular varieties. Such is the number raised every season. There is a span-roofed orchard-house, measuring about 50 yards long and 20 feet wide. In this there are Peach, Apple, Pear, Plum, and other fruit-trees in pots. Some of the Apple-trees carried fine crops of fruit, especially the varieties Bismarck, Stirling Castle, and Warner's King. In other houses were young plants of Ampelopsis, Clematis, Codiaums (Crotons), &c., and we may mention the new Cordyline (*Dracena*) *Kippisii*, which was exhibited by the firm at the Temple Show this year. *D. Kippisii* is a singular variety, by reason of its purple leaves being incurved longitudinally. The leaves thus narrowed (not unlike some of the *Codiaums*), give the plant an especially light appearance, and it is very suitable

FIG. 53.—AN EXCEEDINGLY FINE PLANT OF DENDROBIUM DEAREI.

Rambour Papelin (Le Roy), B.—Very large, fine, for late use.

Rivers' Codlin, S.B.—A variety which cooks without falling, and so is bound to please the cook.

Gold Medal, B.S.—Of the Codlin race; a hardy free-bearer, and handsome.

DESSERT APPLES.—This, though a necessary class, is of minor importance compared with the last; nevertheless, it cannot be altogether passed over by the most utilitarian. Many of the e are best put on the market direct from the orchard, but others pay to store. Let us take the first now in their order of ripening. For standards:—

Beauty of Bath, F.C., R.H.S., B.S.—Most attractive in colour and form, regular and heavy cropper.

Mr. Gladstone, F.C., R.H.S., B.S.—One of the earliest, beautiful in colour, and carrying a bloom like a Plum; most agreeably scented and flavoured.

Devonshire Quarrenden (Quarantine of the fruit-shops), B.S.—Well-known; best in a warm situation, and on good dry soil.

Irish Peach, B.S.—now supplanted by *Lady Sudeley* and *Rivers' Early Peach*.

Juneating, Red, S.B.—Forms a good fertile standard on the Crab; colour and shape attractive.

Kerry Pippin, S.B.—Though small, if left to ripen on the tree, it is the best-flavoured fruit in its season. Prolific, and regular cropper.

Benoni (American), B.—Highly recommended by Mr. T. Rivers.

Lady Sudeley (Bunyard), F.C., R.H.S., B.—Fine

Braddick's Nonpareil (Kentish), S.B.—Perhaps the finest of the race; too small, as a rule, for market, but indispensable in the private garden.

Mannington Pearmain, S.B.—A very conical highly-coloured Apple, and of medium size where from young trees or thinned.

Anna Elizabeth, B.—Large and handsome, stores and carries well. A market favourite.

Claygate Pearmain, S.B.—Not large, but fairly prolific, often sold as "Ribstons."

Sturmer Pippin, S.B.—Very late, but in its season, a valuable dessert fruit.

Court Pendu Plat, S.B.—A heavy cropper, even in scarce years, highly coloured and rich in flavour.

Fearn's Pippin, S.B.—A very pretty fruit, but too flat to find favour in the market.

Boston Russet, B.—A useful dessert Apple, for late use; and lastly—

Lord Burleigh, S.B.—Very fine, of Pine-apple flavour. A valuable late fruit.

I am painfully aware that my list is very incomplete, though too lengthy, and that I have been obliged to omit many good Apples; the only objection to which is they are not free croppers, they are deficient in size, or wanting in attractiveness through lack of colour or form. As an example may be cited "Alexandra Nonpareil," sent out by Bunyard in the 60's as an early dessert fruit, perhaps unequalled, but too small, even when from young trees; while among old established varieties, *Guernsey Pippin*, a green-fleshed fruit, covered with brown russet, and keeping

for dinner-table ornamentation. Our attention was directed to a new Tomato, known as Scarlet Queen. The fruits produce a little nipple-like excrescence in place of the eye, similar to that in some Peaches. Whether this be an advantage or not our readers may decide. It is certainly better than an open eye. There is a new yellow-fruited variety named Royal Sovereign, but fruits were not then ripe. A new Carnation deserves mention, though we were not fortunate enough to see plants in bloom on the occasion under notice. It is a yellow-flowered Tree Carnation, named Duchess Consuelo, and was shown at a meeting of the Royal Horticultural Society, in London, in June, 1896, by the raiser, Mr. T. Whillans, gardener to the Duke of Marlborough, at Blenheim Palace. Its canary-yellow coloured flowers are very large, and the petals smooth. Messrs. Dicksons say that the variety flowers very freely, and may be had in bloom throughout the year. The stock of plants we saw appeared of strong growing habit, and very healthy. Close to these houses and to the offices is a flower-garden, which, being planted with good bedding-plants of the ordinary species, and tended with care, is a gay feature. Not far distant is what is known as the

HERBACEOUS DEPARTMENT,

where there may be seen an endless variety of hardy flowering perennial plants. The border Carnations made a splendid show of bloom, a large space of land being devoted to these. AM the choicest varieties to date are in this collection, including those raised by Mr. Douglas and other specialists. Miss Audrey Campbell is the best yellow-flowered variety, and there were Her Grace, blush white; Braw Lass, Bendigo, deep purple; Mr. Nigel, a very fine yellow-ground Picotee; indeed, sufficient variety for everyone. The work of layering these was being pushed forward to completion. The large-flowering hybrid Pentstemons in named varieties of various colours gave also a wealth of fair blossom. The Hollyhocks were approaching the blooming stage, and in addition to being named varieties, they appeared free from the mischievous disease that for a time rendered the cultivation of these plants in Britain almost an impossibility.

The bold handsome red-hot poker (*Tritoma Uvaria*) were already in bloom, and among the numerous varieties was *Lachesis*, a most distinct and pretty flower, with rich apricot-coloured blooms. A large breadth adjacent was aglow with the several sections of *Gladiolus*. First were the *G. gandavensis* hybrids, next the fewer but larger flowered varieties known as *Lenhoutei* hybrids, in which the markings of the flowers are so intense and distinct, and lastly the *Nanceianus* varieties. All of these were to name, and being in full flower a purchaser could conveniently choose by comparison those desirable for his own collection. Next we noticed a considerable mass of the grandiflorum variety of the white-flowered *Chrysanthemum maximum*; the blooms of this form sometimes measure as much as 4½ inches across, and whether extra large or not, they are effective, in the garden or in a vase. The fine *Helenium grandicephalum striatum*, and *Clematis Davidiana*, were interesting plants in the extensive collection of herbaceous perennials.

The herbaceous Phloxes were in bloom, and a large breadth of *Montbretias* in variety had lately made a fine show. These useful flowering bulbous plants increase most rapidly, and require to be lifted and divided before the soil has become exhausted. Thus are the best results obtained. Beside the larger-habited herbaceous plants, there are many alpine species growing in suitable situations, and in a tank of water, among a few of the choicer species of aquatic plants, the *Water-Lilies* were in bloom. The more popular species of *Nymphaea*, and several of the beautiful hybrids of *M. Marliac*, could be observed here.

We have already referred to the quantity of

ROSES

grown annually in pots by Messrs. Dicksons. The outdoor Roses are also a most important feature of this nursery, and they occupy a piece of ground 25 acres in extent. About 125,000 dwarfs and 40,000 standard Briars are budded each season. The

standards were already done, and the dwarfs commenced before our visit was made. Roses grow and flower very well in the Chester district. All of the plants had made a satisfactory growth this season, and the mildew that was present in places could be easily explained by the very cold winds that had recently prevailed. The season is naturally later than that in the London district, and there were consequently plenty of good blooms still upon the plants. A considerable number of visitors to the rosary showed that at Chester, as elsewhere, the attractions the queen of flowers possess are felt and acknowledged. The collection includes most of the very latest acquisitions, all, indeed, that are known to possess advantages over existing varieties, whether of British or foreign origin. From the Roses we naturally turned to the—

FRUIT GARDEN,

and in this section also the scale is a large one. There are some 80 acres covered with fruit-trees, and these include very large stocks of Pear and Apple-trees of the more popular varieties, and that are known to succeed best in the Midlands and the northern counties. Cherries, Peaches, Nectarines, Plums, Figs, and Strawberries, as well as bush-fruits and Nuts, are all in stock, and there are fine specimens of each. The present season is not remarkable for an abundance of hardy fruits, and in the Chester district there are no very heavy crops. Pears are very few. Apples, though comparatively thin, are not so scarce. Plums, Damsons, and Cherries have been considerably below the average yield. Leaving the fruit section, we inspected the immense collection of—

FOREST AND ORNAMENTAL TREES.

If such general nurserymen as Messrs. Dicksons may be said to have a *spécialité*, it certainly is that of trees and shrubs. The grounds are so extensive that we found it to be exceedingly convenient to accept the suggestion that progression from one section to another should be made by other means than pedestrianism. Throughout the entire collection could be seen thorough cultivation, and hence prepared trees of every kind are in stock, which may be transferred a considerable distance, and replanted with comparatively little check. Conifers abound in large numbers, and little difficulty is experienced in their cultivation at Chester, if we except *Picea Webbiana*, *P. Pindrow*, and several Mexican species. Most of the ornamental varieties of the species of Conifers might be seen, including a nice batch of young plants of *Cupressus macrocarpa lutea*, a golden form introduced to commerce several years ago by Messrs. Dicksons. There are beautiful specimens of the Weeping Beech, the purple-leaved Beech, and of the type. The Oak thrives with almost equal vigour to those in the neighbouring county of Staffordshire, and the more ornamental species and varieties are specially cultivated. Magnificent trees of the white Birch were noticed, and the Golden Elder, the variegated *Sycamore*, the golden-leaved Yew, and Hollies created patches of brilliant colour among the general stock of ornamental and flowering trees and shrubs. Speaking of flowering shrubs, we are reminded of the *Rhododendrons*. A fine collection of these grand plants was seen, and apparently with the exceptions of *R. Manglesii*, *R. × Mrs. Geo. Hardy*, and possibly a few others, they grow and flower well. Of the *Weigelas* a very fine form is the variety *Edith Rathke* (Späth), a purple-flowered plant of much distinctness. The numerous varieties of Japanese Maples are said to be tender at Chester. They are apt to shoot early in spring and be nipped by late frosts, just as the Tree Peonies are served in the same district. The Maples were consequently in a large house. They are cultivated in pots, and all the plants are "worked" specimens. The *Magnolias*, on the other hand, are said to succeed satisfactorily. We saw one of the best collections of *Romneya Coulteri* we have ever observed. The plants were in pots, and appeared in excellent condition. Some of them carried a few of the large, single, somewhat tender flowers, which are sometimes as much as 7 inches across. A large plant in flower is a most effective feature in the best pleasure-grounds.

In a large, span-roofed, cold-house was a number of shrubby plants that are considered tender in the district, or from being novelties are at present but small specimens. There we observed what will be sure to become a very popular plant, viz., *Sambucus racemosa plumosa aurea*, also *Cornus aurea* *Spathulifolia*, *Ulmus Dampieri aurea*, *Ilex insignis*, *Lonicera Hildebrandti*, the perfectly hardy and very ornamental *Elæagnus japonicus macrophyllus*; *Eucalyptus Gunni*, with roundish leaves; *Ginkgo biloba* (Maidenhair-tree), and the Japanese Oak (*Quercus cuspidata*); also *Abutilon vitifolium*, of which there is a collection of 1000 one-year-old seedlings; *Rhododendron × Kewensis* finds a place there, and *Amorpha canescens*, a useful plant for the rockery. There is a large collection of young plants of *Vitis Coignetia* and the perfectly hardy and pretty *Rhus glabra laciniatus* was noticed.

But we must lay our pen aside for the present. This note will possibly convey an idea of the principal features of Messrs. Dicksons nursery. The firm possess two other and smaller nurseries in Wales, where seaside plants and the dwarf shrubs principally are cultivated. The general offices and seed-warehouses, including those for agricultural seeds, are in the main street of the city of Chester.

At the risk of repeating ourselves, we will close by recommending gardeners who from any cause happen to be in the locality, to make a point of visiting "Dicksons, Chester."

REMINISCENCES OF COVENT GARDEN MARKET.

(Concluded from p. 174.)

GRAPES, hothouse home-grown, were usually brought in punnets that contained 2, 3, or 4 lb., the former being the more saleable size. Pines consisted of the Queen and Providence, and the ordinary price was 8s. to 10s. per lb., so that quite an ordinary-sized fruit would cost 20s. Strawberries have undergone a wonderful change—they used to come in pottle-baskets, very narrow at the bottom, and deep, with a handle across the top. One big Strawberry was sufficient to half-fill the pottle, or rather prevent its being filled, and the form caused the fruits to crush each other, and it moreover was most unsuitable. Two pottles were called a gallon. In bringing them to market, they were packed in round baskets called "rounds," and the usual size held 36 pottles, which was called 18 gallons. The varieties chiefly grown were Keen's Seedling, Scarlet, and Elton Pines. Even at that date the flat punnets were in use by some of the gardeners for British Queen and Sir Charles Napier, the former being called "Queens." These punnets held 1 lb., and were carried on the head by women direct from the gardens to the market, packed in a light round basket, and tied over with a clean white cloth, and fine in condition they came, and as the cultivation increased, punnets became the rule, and light vans were built for rapid delivery. Then, as time went on, baskets holding one peck became the rule.

Cucumbers used to fetch long prices in those days. The late Mr. Kemp, gardener at Albury Park, Surrey, once told me he used to force Nettles in the glass-houses wherewith to pack Cucumbers, and had had returned by the late Mr. Jno. Black, of South Row, as much as 15s. a brace. Our growers used to pack them to the number of six in a flat, very shallow punnet, and prices varied considerably, according to size and quality. Each succeeding year brought many more fruits, and prices naturally got lower. In the sixties large quantities were grown outdoors, about Biggleswade and Sandy; but that is almost a thing of the past.

Of Radishes, the long-rooted varieties came to market, at first washed and packed, not tied.

hands, six hands in a punnet, and they usually made 1s. to 1s. 3d. Later in the season they would be packed, unwashed, in hands, in baskets called junks, oval baskets, with four handles, holding about a bushel, certainly not more. Another similar basket, called a half load, holding double the junk, was also used; the junk seems to have died out, but the half load and load basket are still in use. Of Peas, the earliest to arrive were Daniel O'Rourke, Scimitar, Champion of England, and a few of the Marrowfats as Veitch's and Knight's Perfection, and Ne-plus-ultra; the last named Pea coming in bushel baskets, as now. As a substitute for early new Potatos, Kidneys of the Ashleaf type were grown late, and taken care of for marketing very early. They would be washed and packed in paper-lined deep punnets holding 2 lbs., and they commanded a ready sale from 6d. to 8d. per punnet.

The purple Cape Broccoli was well to the fore, and it was well grown, and had compact, solid heads. It was skilfully tied in bundles, so as to show 6, 8, or 12 heads, according to size, and these commanded good prices. The white Broccoli, from the Enfield district, used to be similarly bundled. Rhubarb was only grown by a few men, viz., Myatt, Mitchell, Hawke, and others; but as time went on the cultivation of Rhubarb went on apace, and was at last overdone.

The principal varieties of Potatos then coming to the market were Ashleaf, Shaw's, Fortyfolys, Regents, Dalmahoy, and Rocks; the Regents were then, I fancy, of better quality than now; and large quantities were sold about the streets—the baked Potato-can being common about town. Evans' was noted for its chop and baked Potato; I refer to the time when Herr Von Joel was a well-known character connected with the place.

Asparagus was grown in very much larger quantities than now, and I have seen a grower, Jessop by name, have a van-load of Asparagus in bundles packed in loosely without any baskets.

Lastly—a most important thing, showing how customs have changed in fifty years, the custom was for growers and salesmen to lend empties free of charge, and in the busy season the salesman would send a man with horse and cart round three times a week, collecting empties from his customers. Now that is entirely changed; the rule is to charge on all returnable empties, and there are very few exceptions. T. P.

SHORT NOTES ON BULBOUS PLANTS.

(Continued from p. 159.)

HEMANTHUS PUNICEUS.—The flower-head of this species is borne on a short, stout scape, and consists of a dense umbel of flowers about 4 inches across; the mass of segments and filaments are bright coral-red in colour, the richness being heightened by multitudinous bright yellow anthers. It will pass the winter safely if planted about 4 inches deep in a fairly dry spot in the rock-garden under the shelter of a ledge of stone, covering it with ashes or other protecting material during severe frosts. Several bulbs planted together in a small recess would make a brilliant blaze of colour, which would be effective at a considerable distance away. It flowers during the summer months, lasting in perfection for several weeks.

Lycoris squamigera.—This pretty subject claims the attention of cultivators from the fact that it is the only plant of the genus *Lycoris* that may be called quite hardy—in fact, bulbs in pots outside have been frozen through, and have not shown the slightest

injury. By reason of its hardiness, it makes an excellent plant for a warm-border or rock-garden. The leaves, which appear early in the spring, and die down before the scapes appear, are 1½ feet long, glaucous-green in colour, strap-shaped, average an inch in width, and are eight to ten in number. The flowers are about 3½ inches long, and 3½ inches across, six to eight in number, and they are borne on a scape 2 feet long, after the manner of *Vallota*; each flower consists of six slightly recurved segments, half-an-inch wide at the middle, which are united near the base by the vestige of a corona, the colour being a soft shade of rose, with a blue tinge at the tips, and a yellow base; the prominent crimson style and paler filaments are depressed, so as to break through the perianth, recurving at the tips. If cold weather prevails at the time of flowering, the blue tinge is suffused throughout the whole flower. The bulbs resemble those of *Narcissus*, but are distinctly "shouldered;" they should be planted 3 inches below the surface, preferably in a light soil, with a well-drained subsoil, and left undisturbed. Three and four scapes have been produced by a single bulb, bearing upwards of twenty fine flowers, which was planted on a Peach-border two years ago. Grown in pots for conservatory decoration, it far excels the Scarborough Lily in the delicacy of its colours, and unlike the *Vallota*, it does not mind the vitiated atmosphere of a London suburb. It appears not to be subject to bulb diseases; out of some hundreds of bulbs I have not found one affected, while *Vallotas* invariably succumb in the second or third year. It likes a fairly large pot, as it is a gross feeder during leaf-growth; and requires to be kept moderately dry when at rest. Feeding with manure-water is amply repaid by the fine flowers produced. It flowers in August, and is a native of Japan.

Pancratium canariense.—Although undoubtedly hardy if planted in a warm border with a little protection, this plant is seen at its best when grown in pots for the conservatory; the flowers are borne in the manner of *Eucharis*, usually upwards of twelve in number, and appears just as the leaves are starting into growth. They measure about 2 inches across, are pure white in colour, and deliciously fragrant, the segments are narrow, and the staminal cup has an acutely lobed or cleft margin; the short filaments are incurved so that the anthers touch. It is not an easy plant to flower, but it appears to do best when a decidedly dry rest is given it, plunging the pot in the full sun to ripen the bulb as soon as the leaves finish growth. It is a native of the dry rocky districts of the Canary Isles, and it flowers in August in this country.

Hymenocallis littoralis (H. adnata) is a very useful plant both for cut flower or for greenhouse decoration; the flowers are deliciously fragrant (I believe the sweetest in the whole genus), and it has the additional merit of being easy to grow in ordinary warm greenhouse temperature. It produces upwards of twelve strap-shaped, glabrous-green leaves, about 2 feet long, and a stout peduncle bearing from sixteen to twenty pure white flowers on long pedicels. The channelled and narrow segments are drooping, and are joined (adnate) to the staminal cup 1 inch upward from the tube; the staminal cup is membranous, 1 inch long, and 1 inch across, with an irregular margin; the style and free portions of the filaments are green. A botanical distinction is noticeable in *H. littoralis*, by the filaments being inserted near one end of the anthers, instead of the middle, as in other species. I do not find any remarks of this peculiarity in any description of this species that I have seen. It does well treated as a sub-aquatic during the growing season. I usually place the pots in about 4 inches of water in the full sun, in a temperature of 55° to 60° as a minimum; and keep the soil moderately damp while the bulbs are resting. It is easily raised from seed, which germinates freely in water alone; they are, however, better managed in small pots standing in shallow pans of water. It flowers with me in July and August, lasting in perfection several weeks if the plants are shaded while flowering. Geo. B. Mallett, Isleworth.

KEW NOTES.

FREESIA ARMSTRONGI.—I propose this name for a distinct new *Freesia*, which has been sent to Kew by Mr. W. Armstrong, of Port Elizabeth, who found it wild on a farm in Hamansdorp, and forwarded bulbs of it last March. It is in flower now at Kew, and although Mr. Baker considers it only a colour variety of *F. refracta*, it is so distinct from all the forms of that plant hitherto known, that for horticultural purposes, at any rate, it requires a distinctive name. Mr. Armstrong described the flowers as pink, but they are orange-yellow on the lower part of the corolla-tube, and purplish-pink on the segments. There are only half-a-dozen bulbs of it at Kew, but they are all flowering. In the hands of the hybridist this plant, with its richly-coloured flowers, ought to lead to the production of a race of *Freesias* as varied in colour as one could wish.

KAMPFERIA MACROSIPHON.

This has lately flowered at Kew, roots of it having been presented by Baron von St. Paul, who obtained them from Usambara, in German East Africa. It belongs to the large-flowered section of the genus, typified in *K. Kirkii*, previously known as a *Cein-kowskia*; the leaves are tufted, green, lanceolate, a foot long; flowers many, on a short peduncle, with oblong bracts, a cylindrical calyx, a long, slender corolla-tube, and a spreading limb, with lobes an inch long coloured blue, the lip rounded at the apex, and an inch wide. According to Baker, it was first found by Wakefield in the Nile country. It is an interesting plant, of easy culture in a moist stove. At Kew it is one of a large collection of small *Scitamineæ* and *Marantaceæ*, grown on a low rockery under the *Nepenthes*, in the new house recently built for these plants.

CRINUM FIMBRIATULUM.

This is now flowering in a stove at Kew, bulbs of it having been received from West Tropical Africa. It belongs to the same set as *C. Kirkii*, *C. Sanderianum*, and *C. yuccæfolium*, indeed I have a difficulty sometimes in deciding to which of these a given plant when in flower belongs. However, Mr. Baker's description fits the Kew plant, which has thin lorate, glaucous green, tapering leaves 2 feet long, and 2 inches wide near the base; a peduncle 2 feet high, bearing an umbel of five flowers with elegantly curved tube, narrow recurved petals 3 inches long, white, suffused and banded with dark crimson, as also, is the tube. All the *Crinums* of this set are most attractive in flower, but their flowers last only for a few days. They like plenty of water. W. W.

SCOTLAND.

CARNATIONS IN THE OPEN.

THOSE who, like myself, have a mild horror of leaving layers unplanted till late autumn, will find themselves comparatively busy during the whole of September in planting out their stock. After September is past, I think it preferable to reserve plants in cold frames till the spring, rather than plant them out in beds at a period when it is impossible that the roots can obtain a firm grip of the soil before the winter. The Carnation is undoubtedly a hardy plant; rather susceptible to damp, yet it successfully passes through a hard, dry frost; but none, save well-established plants, can be expected to prove hardy in a severe winter.

When preparing beds, I omit one or two items generally insisted on. For instance, the ground is not trenched; last year it was not even dug. The crop immediately preceding was Carrots, which, following Celery, left the soil sufficiently open. This year the Carnations will follow Onions, and the only attention the ground requires is a slight forking of the surface; I do not add any manure. Soil in good condition produces excellent Carnations, and the addition of manure is always followed by risk. As in the case of some crops which do not respond to manure as the cultivator would wish, its addition in

this instance is not solely negative, but, on the other hand, is often largely prejudicial. In the planting of the layers, the stems are covered only to the level of the divergence of the tongue. Many times I have noticed that weakly varieties attached to a sustaining stick, and with the roots merely covered, have attained vigour, and in the same way shallow-planted layers have invariably got on better than those with a portion of the stem covered.

Another practice, which, by the way, is of some antiquity, is that of raising the beds above the surrounding level. Much of the prejudicial wetness that gathers about the plants during winter is obviated by—firstly, not deeply loosening the soil at planting; and secondly, by raising the bed with a compost of equal parts leaf-soil and sand, and mixing the new material to a depth of a few inches. The layers are planted in this material, and do not suffer to any extent during spells of wet weather, as the water quickly drains away.

There is always a certain number of layers which require protection in winter. These may be left till October, but a good working rule is, the sooner the layers are planted the better. Carnations wintered either in pots or in the method to be described are never so strong as those planted in the open; but of the above, those planted in frames are always the stronger. The frame is set either on very hard ground, on the surface of which a thin layer of leaf-soil is spread, or the bottom is composed of coal-ashes firmly trampled down. On either of the bases chosen, the balls attached to the layers are placed, and the few open interspaces are filled up with sand and leaf-soil, and left till February without allowing any water to get into the frame. Ventilation is given on every favourable opportunity, and the result is, capital plants with a network of roots attached, ready in this district from the middle of March for planting.

There is, I think, a large number of bought-in layers lost every season. This occurs principally because they come to hand too late to do well if planted in the open. During many years my own losses have been scarcely any, and because I have not ventured them in the open unless early received. Generally, I flower all new sorts the first year in pots.

In Scotland, the Carnation blossoms a little later than in the South of England, where the flowers come with a spurt, and are soon over. Here they open more slowly, and blossom sometimes until the approach of winter. The value of Carnation blooms for the adornment of sitting-rooms or the dinner-table, in various styles of glasses or vases, can hardly be over-stated; and our Scottish homes are made gay by them at a season when there are few blooms obtainable in England.

DIERVILLAS (WEIGELAS) IN AUTUMN.

Diervillas, other than *D. rosea*, are hardly known in Scotland. They are perfectly hardy here, however, and make long and stout growths, many of the varieties having the desirable quality of flowering in early summer, and again in autumn. For the information of those who have not yet tried these very acceptable flowering shrubs, I add below the names of some of those which flower twice a year. A few of them grow somewhat close to the ground, and in order to raise them in some degree, I am training a few as standards. The only kind that I have found fail to pass a hard winter is *Diervilla præcox*; it is some satisfaction that this species is possessed of some little beauty. *Souvenir de Marie Van Houtte*, whitish; *Jean Mace*, very dark; *Congo*, crimson; and *John Standish*, crimson, may be recommended. *B., East Lothian.*

VARIORUM.

SPHAGNUM MOSS.—The issue of *Nature* for August 18, in an article entitled, "A Yorkshire Moor," gives an excellent sketch of the growth of a sphagnum swamp, accompanied by figures showing a leafy branch and a leaf, the latter much magnified; details of leaf, showing green cells with corpuscles, and water-cells, with spiral threads and pores. How little does the ordinary cultivator of Orchids know of the form and life-history of the "moss" which forms the basis of most of the composts he employs for his

plants! The minute plant growing upwards and furnished with unfolding leaves, which in time lose their living substances, and are transformed into water-holding cavities with transparent walls, is adapted so as to allow the water to creep upwards to supply the growing branches above. The lower parts of the film die, become detached, and sink to the bottom of the pool, forming, in course of time, peat, firm as regards its lower strata, but soft and spongy above, at length becoming a peat-bog, capable of supporting Heather, Bracken, and other herbage, but requiring ages to become firm enough to support the weight of a man.

THE WEEK'S WORK.

THE FLOWER GARDEN.

By H. WALTERS, Gardener to Lord GERARD, Eastwell Park, Ashford.

Bulbs.—The season has now arrived when consideration must be given to the question of bulbs for planting the coming season. It should be decided what number of each kind will be necessary, that the order for same may be despatched as early as possible. A flower-garden never looks brighter or more gay than in the spring of the year, when the beds are aglow with a nice collection of bulbs, carefully disposed with due appreciation to the necessary arrangement of colour, and in the case of mixed beds, to the suitability of the kinds for this purpose. The date for planting the bulbs has not yet arrived, but it is necessary to work out the system to be followed in the planting, so that one may know exactly what stock to acquire. Just as with seeds, the best bulbs are most likely to be used in the discharge of the orders earliest received.

Dahlias are now blooming freely, and to enable them to continue flowering until cut by frost, constant root waterings may be needed, and liquid-manure may be given every alternate watering. Remove all weak growths, and especially the seed-pods, from single-flowered varieties. See that the growths are made secure against wind and heavy rains. The best varieties for general purposes are those of the Cactus section; the flowers are less stiff and formal than the show and fancy varieties, and consequently the better adapted for use as cut flowers.

Lilium auratum and *L. longiflorum* just coming into bloom should be given occasional applications of water, which will greatly benefit the flowers.

General Remarks.—The plants in the herbaceous borders, as they pass out of flower, will require to be trimmed of all dead blooms and leaves, and in some cases partially cut down. Annuals which have done flowering should be removed before they present an untidy appearance. Later sown annuals may be afforded a good soaking of water to stimulate growth and help to develop the flowers. Very rarely at this season of the year is the ground so hard and dry as at the present time; and *Phloxes* in particular have suffered severely. Continue the mowing of lawns as they require it; clip all the verges frequently, and roll the walks where the gravel has become loosened.

FRUITS UNDER GLASS.

By G. NORMAN, Gardener to the Marquess of SALISBURY, Hatfield House, Herts.

Pot Vines.—The Vines that were raised from eyes in the winter months, may, if the canes are ripened throughout, be regarded as completely matured. Theinery in which they have been grown may be freely ventilated at all times, and artificial heat dispensed with. Although active growth in the Vine has ceased, as often as the soil exhibits signs of dryness, water must continue to be applied, and the foliage syringed with clean water daily in the afternoon in fine weather. In about three weeks the plants may be placed against a fence, hedge, or wall, or to stakes driven into the earth, making them secure in an upright position, and making sure that no worms can enter the pots from below.

Strawberry-plants.—The earliest potted of these having made rapid progress, filling the soil with roots, will require daily, copious applications of water, using the rose water-can or the syringe to wet the foliage on fine afternoons. Mildew is getting troublesome. If syringing, &c., fails to keep it in check, flowers-of-sulphur will have to be applied. For this purpose, first mix the sulphur as a thick paste, and mix it with water at the rate of half a pint to 2 gallons of the latter, stirring it well, and applying it to the undersides of the leaves with a syringe furnished with an elbow-jet. For a few days after-

wards the leaves should not be wetted. Remove runners as soon as they become apparent, and frequently turn the plants round, to prevent rooting into the bed of coal-ashes.

Peach and Nectarine Trees which have been growing against outside walls preparatory to being brought into the forcing-house, may soon be transplanted from their temporary to their permanent positions. By performing the operation thus early, the trees will get established while there is heat in the soil, and sufficient solar heat to influence the production of new roots. Provided the trees are of a fruiting age, the having suffered no appreciable check, will furnish a good quantity of fruit the following year, although it may be prudent not to force them very early. If a fresh tree is to take the place of one that is worn out, it will be advisable to remove the whole of the old soil, and clear out and rearrange the drainage materials. If the subsoil consists of clay, or is naturally retentive of water, a concrete-bottom may be considered necessary, but this is not essential if the drainage and outfall-drain be put in working order. The ground beneath the drainage should have a slope towards the front or towards the ends of the Peach house. I have dealt with the making and drainage of borders in previous articles, and I need not do more than refer the reader to them. The best kind of soil for the Peach is a heavy pasture-loam, cut in sods of 3 or 4 inches thick, and laid in stack for a year. With this may be incorporated considerable quantities of lime-rubble and charred soil, the whole being mixed well together before being wheeled into the house. Do not put a large mass together, and then try to make it firm, but put in layers of about 9 inches in thickness, trampling each layer evenly and firmly before putting in another. Having raised the border 6 to 8 inches above the general level, to allow for shrinking, and dug out a hole wider than the roots of the tree to be planted, and 9 inches deep, excepting at the spot where the base of the stem will rest, which may be 3 to 4 inches higher; and having levelled the bottom of the hole, and made it slant a little from the centre to the sides, planting may proceed. Having disengaged the tree from the wall, and bundled up the branches and shoots, dig out the roots very carefully with digging-forks, beginning at the furthest extremity of the roots, and gradually undermine and disentangle them. When quite loosened from the soil, proceed as speedily as possible to carry the tree to the house. If no very large and heavy one, a man should take the stem on his shoulder, and two men should support the branches; the roots will take care of themselves. Big trees should have their stems wrapped round with a bit of carpet or matting, and a stout stake passed under it, by which two men can readily carry it shoulder-high. Having placed the tree in position, with the stem at the base 6 inches distant from the wall, comb out the roots with the fingers, removing badly-wounded ones, and smoothing the broken ends of others, and proceed to fill in with the finer portions of the soil, laying the roots at various levels to within 4 inches of the top. The planting must be made very firm as it proceeds; and with this intent, a heavy watering may be afforded when the work is about half-finished, and at the conclusion of the job. The workman should see that the roots radiate fairly regularly round the stem, in order that they might draw nutriment from the whole mass of soil, and not from a portion of it only. On fine afternoons apply the syringe on the foliage twice and thrice daily, endeavouring to revive it as much as possible, and thus promote root-activity. The house should be kept rather close, and the roof closely shaded during the hours of strong sunshine, and the paths and border damped down.

THE ORCHID HOUSES.

By W. H. WHITE, Orchid Grower to Sir TREVOR LAWRENCE, Bart., Burford, Dorking.

Heat-loving species.—Examine these plants frequently, and any that have made up their growth sufficiently, but may appear likely to commence a secondary growth, should be removed to a lighter and more airy house. The late-growing species will need to be encouraged some time longer. As each batch of *Dendrobiums* is removed from the south side of the East Indian-house, the vacant space may be filled with the most forward of the deciduous *Calanthes*. Arrange the plants so that each new pseudo-bulb may obtain plenty of light, and elevate them as near to the roof-glass as possible. During full sun at mid-day, afford a thin shading only, and the plants should be exposed to the early morning sunshine, and again in the afternoon. After a few weeks, no shading whatever will be required. The

plants will require water more frequently than usual; and liquid manure, if afforded alternately, will be beneficial until the flower-spikes have become a few inches high. *Calanthes* of the *Regnieri* section now growing freely, would not be benefited by an extra amount of direct sunlight, but as the *C. vestita* section is moved out, these may be arranged more thinly in the same place. If there be but limited stage accommodation, the smaller plants may be temporarily suspended in baskets or pans. Plants of *Peristeria elata* (the Dove Orchid) may receive more sunlight.

Odontoglossums.—The present is the best season of the year to overhaul the cool-house *Odontoglossums*, and to repot those that are in need of more room or of fresh compost. Such plants as *Odontoglossum Halli*, *O. triumphans*, *O. luteo-purpureum*, *O. Pescatorei*, *O. nevadense*, *O. nœvium*, *O. polyxanthum*, *O. gloriosum*, *O. tripudians*, *O. cristallinum*, *O. excellens*, *O. Andersonianum*, *O. Ruckerianum*, *O. sceptum*, *O. Wilckeanum*, *O. hystrix*, *O. mulus*, *O. Wallisii*, *O. aspidorhinum*, *O. cuspidatum*, *O. elegans*, *O. cirrhosum*, *O. hebraicum*, *O. Coradinæi*, and the numerous varieties of *O. crispum* which flowered early in the year, are now growing freely, and the new breaks will soon be making a number of young roots, therefore the fresh rooting material is needed now. Previous to doing this, however, it is important that water should be withheld from the plants for a few days, that the roots may become drier, and less susceptible of injury. A suitable compost consists of freshly-gathered sphagnum-moss and good fibry peat in about equal proportions. Some growers use three-parts sphagnum to one of peat with equally good results. To either compost may be added a moderate quantity of small crocks and charcoal. If the sphagnum-moss is very wet, squeeze the water out of it, and thoroughly examine it for slugs and snails, or these creatures may do great injury. The pots used should be in proportion to the sizes of the plants, overpotting being in all cases guarded against. The usual crocks may be dispensed with in favour of the bracken rhizomes for drainage purposes. *Miltonia vexillaria* should be treated like the *Odontoglossums*. Pot moderately firmly, keeping the base of the bulbs just above the rim of the pots, and when the operation is completed, prick in a few living heads of sphagnum-moss over the surface. It is not necessary to repot large, healthy specimens annually, but if the soil has become sour and decomposed, remove the same down to the drainage, and supply fresh materials. Some old plants may be in bad health, and any such should be turned out of their pots, and when thoroughly cleansed, placed in pots as small as it is possible to get them into. Such weak plants, after potting, should be placed together at one end of the house, where they may be kept, not necessarily warmer, but rather closer than the other plants, and similarly treated to newly-imported pieces. A critical period with *Odontoglossums* is immediately after re-potting; as at that time it is an easy matter to afford too much water, thereby causing the roots to decay, and many leaves to be lost. For a month or six weeks afterwards the greatest care is needed. Syringe well between the pots morning and afternoon, and admit as much fresh air to the house as possible, especially when the outside temperature is about 50°. Until the plants have become re-established, protect them from strong sunshine.

THE KITCHEN GARDEN.

By J. W. McHATTIE, Gardener to the Duke of WELLINGTON, Strathfieldsaye, Hants.

Parsley.—In order that the plants of the spring and summer sowings may throw up fresh growth, a certain number of the rows or of the plants should be cut over at a point a little above the heart leaves. The latest sown Parsley in open borders, cold frames, and boxes should be thinned to about 1 inch from plant to plant. Let all beds of the herb be kept free from weeds and decaying and dead leaves.

Celery and Celeriac.—In many gardens on light porous soils it may be found necessary to afford the fully or partially earthed-up rows a copious watering. It is prudent before earthing-up rows of late Celery to allow the plants to grow nearly to their full size before any earthing-up is done, and then gradually to carry out the process. At all times avoid earthing Celery plants unless the leaves and stalks are dry. Beds of Celeriac should be cleaned and lightly hoed, and all suckers removed; and then copiously water the bed or whenever the soil is found to be getting dry. Celeriac, the growth of which was checked by lack of water at the beginning, frequently becomes useless

from the tubers bursting on water being applied, or from heavy rain; and the tuber is liable to become hollow if an excessive amount of nutriment be applied to the plants.

Sorrel.—Plants raised in the spring from seed may now be planted out in rows 18 inches apart, and 12 inches between the plants; good late crops being obtained from planting at this season. When Sorrel plants stop growing, and their leaves are mature, cut them off, and afford the plants a dressing of decayed manure, and the next crop of leaves will be large, succulent, and early. Remove the flower-stalks from old plants, and stir the soil between the rows with the hoe.

Carbiflowers.—When the young plants appear, dust them over with dry-soot or lime, to prevent slugs devouring them. Make another sowing on a south border, sowing in drills half-an-inch deep, and 8 inches apart; and afford the drills water before sowing. Early London or Dwarf Mammoth are good varieties for present sowing.

Vegetable-Marrows.—All plants that have produced fruits in quantity should be copiously afforded water, and if the plants show signs of exhaustion, guano-water will resuscitate them. Plants which are carrying a heavy crop may also be afforded liquid-manure. When the growth is very dense, thin it out, in order to let in the sunshine, or but few fruits will set.

General Work.—Let the hoe be in daily use amongst growing crops, a crumbly surface being the best mulch and conservator of moisture in the soil. Weeds now grow apace, and should be kept under at all costs. Prepare manure for the land, and get materials duly sweetened and prepared for the making of hot-beds.

PLANTS UNDER GLASS.

By W. MESSENGER, Gardener to H. C. BERNERS, Esq., Woolverstone Park, Ipswich.

Carnations.—If the layers of tree Carnations are found to be well rooted, pot them off at the earliest opportunity, using a compost consisting of good fibrous loam two parts, leaf-soil one part, and one part consisting of old mortar or plaster and coarse silver-sand. The pots may be 48's, which should be made quite clean and be well drained. After potting let the plants be put into a cold frame, and keep them close for a few days, applying water with the syringe morning and afternoon, and after the first application of water to the roots use the water-pot cautiously till the plants begin to grow freely; and should the plants show signs of distress during bright sunshine, apply a light shade during the hottest part of the day, rather than afford water.

Cyclamens.—Seed may now be sown in well-drained seed-pans, on a mixture of light loam, leaf-mould and sand in about equal proportions, pressing the soil moderately firmly, and affording water sufficient to wet it throughout some hours before sowing. Place the seed-pans in a house having a minimum degree of warmth of 58°, covering each with a sheet of glass and a sheet of dark-coloured paper. *Cyclamens* which are making good growth may be afforded frequent applications of clear stable or cow-stall manure-water, varying this with some approved artificial manure. These aids to growth should always be afforded in a very mild form. Keep the plants free from aphids and Thrips. Remove all flowers as they show, and admit plenty of air, but avoid cold draughts; and keep the materials moist upon which the plants stand, by syringing amongst the pots.

Zonal Pelargoniums.—Plants plunged outdoors should be removed to a light, airy house, and the nearer they are to the glass the better they will bloom, and the finer will be the colour of the blooms. The warm, bright weather has tended to give firmness to the growth, and stockiness to the plants, so that plenty of flowers may be reasonably expected. Water should be carefully afforded when the plants are housed, for if overdone at that time, growth will be too soft to flower satisfactorily. A batch of the latest plants may be stood in a cool frame, so as to form a succession to the earlier ones, admitting all the air possible to them when the weather permits, and never allowing the air to become stagnant or very humid.

Lilium longiflorum var. Harrisii.—These bulbs should be potted without delay, the larger-sized ones being placed in large 32's, and the smaller in small 32's, in a mixture of pasture-loam, leaf-mould, and sand, together with a fair portion of rotten-dung. Having potted the bulbs, that is, covered them with an inch of soil, place them in a cold frame, and cover the pots with cocoanut-fibre refuse. *L. longiflorum* and *L. candidum* may be treated in the same manner.

HARDY FRUIT GARDEN.

By W. H. DIVERS, Gardener to the Duke of Rutland, Belvoir Castle, Grantham.

Strawberries.—Old beds which it is proposed to retain for another season should be again relieved of any fresh runners that have formed, and afterwards hoed between the rows, to destroy the small weeds. A warm and dry day should be chosen for this kind of work, that the weeds may sooner perish. It may, however, be necessary to rake the beds over a few days afterwards, and thus prevent any of the weeds becoming re-established. A good dressing of farmyard-manure should then be given as a mulch. Strawberries form numerous surface-roots, and these must not be disturbed by digging among the plants; but the manure, if put on now, will decay, and its ingredients be washed into the soil by the autumn rains, and any rough portions that remain may be raked off in the spring. New plantations of Strawberries will also be much benefited if afforded a similar dressing, which, in addition to feeding the plants, will serve to keep warmth in the soil and the plants will be less liable to injury in a severe winter. Remove runners from young plants as soon as they are seen, or they will rob the chief crowns, and next season's crop will be the poorer.

Weeds.—Let the hoe be kept going in all plantations of fruit-bushes as by doing this the land will be kept moist, and free it from weeds of all kinds.

Wasps.—Traps baited with waste fruits should be set against the walls where Plums, Peaches, Figs, &c., are ripening. Nests should also be sought for towards evening, marked with a twig, and then destroyed when the insects are within, that is, about 8 p.m. at this date. If gas-tar be poured into the entrance or entrances to the nest, and these are then closed with earth, there will be no necessity to dig out the nest afterwards.

THE APIARY.

By EXPERT.

Feeding-up.—A good deal of care is sometimes needed when commencing to feed up those stocks which have been largely deprived of their store of honey, especially when a good number of very strong stocks and some weak ones are on hand. The excitement caused by feeding makes bees inclined to prowl about weaker hives, and robbing sometimes results. In starting to feed (especially with weak stocks), afford the first bottle of syrup at dusk, and reduce the width of the entrances to an inch or less. If the least sign of robbing is observed, on no account should precautions to check it be neglected. Let hives be opened no oftener than is really necessary; give the required amount of food rapidly, a quart or more at a time, so as to disturb the hive as seldom as possible, and get all feeding completed before starting to clean or straighten up any of the hives. The latter portion of the work should always be done last, and cool weather is a suitable time for doing it. The food at this time should not be of a watery kind, but let the syrup be well made, with 10 lb. of sugar to 5 pints of water, boiled gently for a couple of minutes. This quantity given after the second week of the present month will safely winter a stock that has 5 to 6 lb. of stores in hand when feeding begins. Carbolic acid will be found useful in helping to check robbing, if smeared on the front of the hives attacked.

Re-queening.—In a well-ordered apiary there will be no queenless hives on hand now, but there will be old queens or unsatisfactory ones which it is desirable to remove; and young queens at this season being generally plentiful (what with weak swarms and the driven bees of cottagers), it is easy to place them at the head of stocks in lieu of those that are removed. In re-queening hives, first take the precaution to secure the old queen and a few bees in a combed section, where she may be kept until the safety of the new queen is assured.

Preparing for Winter.—Bee-keepers who already possess the full number of stocks they desire, should not trouble themselves with nursing very weak hives. Let them see that all their stocks are strong, headed by young and vigorous queens, and that they have abundance of natural food. Should the latter not be available, well-made sugar-syrup should be given rapidly for a few days, or rather nights, during this month. For those who do not possess a "Rapid" feeder, a large screwtop jar holding 4 or 5 lb. makes a very good substitute, the lid being pierced with small holes, and inverted over the feed-hole. Even the screwtop jar may be dispensed with by using a 4 lb. glass jam-jar costing about 1d., if it is filled quite full, and a piece of muslin tied over its mouth.

EDITORIAL NOTICES.

ADVERTISEMENTS should be sent to the PUBLISHER.
Newspapers.—Correspondents sending newspapers should be careful to mark the paragraphs they wish the Editor to see.

APPOINTMENTS FOR THE ENSUING WEEK.

WEDNESDAY, SEPT. 14	Royal Caledonian Horticultural Society's Exhibition in the Waverley Market, Edinburgh (2 days).
MONDAY, SEPT. 12	SALES. Dutch Bulbs, at Protheroe & Morris' Rooms. Thirtieth Great Annual Unreserved Trade Sale of Pot-plants, at the Dyson's Lane Nurseries, Upper Edmonton, by order of Mr. H. B. May, by Protheroe & Morris.
TUESDAY, SEPT. 13	Great Annual Sale of Heaths and Greenhouse Plants, at the Burnt Ash Road Nurseries, Lee, S.E., by order of Messrs. B. Maller & Sons, by Protheroe & Morris. Dutch Bulbs, at Protheroe & Morris' Rooms.
WEDNESDAY, SEPT. 14	Dutch Bulbs, Liliun Harrisii, &c., at Protheroe & Morris' Rooms. Annual Sale of Winter-flowering and other Plants, at the Nurseries, South Woodford, by order of Mr. John Fraser, by Protheroe & Morris.
THURSDAY, SEPT. 15	Thirtieth Annual Trade Sale of Stove and Greenhouse Plants, at the Brimsdown Nurseries, Green Street, Enfield Highway, by order of Mr. John Maller, by Protheroe & Morris. Dutch Bulbs, at Protheroe & Morris' Rooms.
FRIDAY, SEPT. 16	Seventeenth Annual Trade Sale of Heaths, Roses, &c., at the Longlands Nursery, Sidcup, by order of Messrs. Gregory & Evans, by Protheroe & Morris. Imported and Established Orchids, at Protheroe & Morris' Rooms. Dutch Bulbs, at Protheroe & Morris' Rooms.

AVERAGE TEMPERATURE for the ensuing week, deduced from Observations of Forty-three Years, at Chiswick.—58°.

ACTUAL TEMPERATURES:—

LONDON.—September 7 (6 P.M.): Max., 78°; Min., 62°.
PROVINCES.—September 7 (6 P.M.): Max., 70°, York; Min., 60°, Peterhead, N.B.

The splitting of Fruits and Tubers.
THE cultivator has frequently to deplore the splitting of the fruit of the Pear, Plum, Melon, and occasionally of Grapes, Gooseberries, and Tomatos. It is also not rare in Cyclamen tubers. In the case of Melons and Cyclamens growing on hotbeds, the cause appears to be due to the great activity set up in a plant by means of heat, moisture, and abundant food. These cause the turgescence of the tissues, and when a check occurs from any cause, such as cold draughts of air, the removal of the plants in the case of Cyclamens from the hotbed to the glasshouse or potting-shed, the cellular tissues of the plant and tuber retain their abundance of sap, but are incapable, for the time being, of growing rapidly, and the cells at the circumference of the tuber not having the power, as heretofore, to stretch and increase in number, are burst asunder by the turgidity of the inner tissues. The same kind of mishap occurs in fruits. There has been, probably, rapid growth following a period of heat, with plenty of moisture at the root; but a cold period occurs, growth is checked, and splitting of the fruits takes place. It can be induced in the Melon by over-abundant water at the root, or the access of the roots to the materials of which the hotbed is made. The splitting of the stone in the case of the Plum and Peach may be due to similar causes, or to the plenteous application of water following a period of great dryness. And the evil would be accentuated were water afforded at a much lower temperature than the soil. The destruction of the tissues that follows the splitting of a

fruit or tuber, is occasioned by the ever-present parasitic fungi seizing upon the surfaces of the wound.

In the case of forced plants, it is very essential to maintain the bottom-heat at the proper temperature. In the case of the Grape, it is found that by allowing an outlet for the abounding sap in the Vine at the period when splitting has most to be apprehended, namely, at the final swelling, and just as the berries begin to colour, by not denuding the plant of its shoots and leafage, not affording much humidity in the air, or allowing a check to growth from any cause, the splitting of the berries is generally obviated. Analogously, if certain other fruit-trees show a liability to suffer from this malady, it would be good practice to permit almost unrestricted growth of shoots till the dangerous period is past. This need not be taken to mean that all foreright shoots, in the case of wall-trees, should be left unshortened till August, but that a goodly proportion of them be so left. And in the case of Melons, lesser restriction of growth would be a means of prevention.

National Dahlia Society.

THE exhibition at the Crystal Palace last week was generally satisfactory, and admirers of this showy garden-flower might have witnessed there a display of average extent and quality. But we were surprised to see so few visitors present on the opening day; either the date was an inconvenient one, or the Dahlia is not now regarded as an exhibition flower with the same enthusiasm as the multitude extend to the Chrysanthemum. The feature of the show most calling for remark, is the continued development of the "Cactus" section, as seen in the collections of flowers in the competitive classes. So numerous have the seedlings that give flowers of this type become, that the Society adopted a classification list, and to this are added novelties as they appear, providing they show the necessary degree of "Cactus-like" form or suggestiveness. Exhibitors in the competitive classes have to choose their varieties from this list, or they may supplement them by the addition of real novelties that the exhibitor is pretty sure will pass the criticism of the judges, but which up to date have not been officially classified. Thus the appearance of the collections as they are bunched into sprays of ten or six blooms each in the familiar fashion, has been changed to a wonderful degree in a few years. More and more have the flowers of this section become dissimilar in form to other Dahlias. The rounded petals have disappeared, the points of them are increasingly pointed and Cactus-like, whilst the form of some of them, such as Fantasy, Star-fish, Arachne, and others, is most extraordinary. Last year, the best new one of this section was Mr. WEST's Island Queen, and there were several newer ones certificated last week. The society has wisely discontinued the classes for "decorative" varieties. There was little competition in them, and they were not needed. The "show" varieties were perhaps less large than we have seen them, but in tint they were as attractive as ever. The Pompons, judged from any standpoint, are pretty and useful, and the show of them was good. The continued decline of the single-flowered varieties was again evident, notwithstanding Mr. GIRDLESTONE's praiseworthy and successful effort to raise varieties with greater attractions than any previous ones have possessed. A collection from this

exhibitor contained blooms of rich and beautiful colouring, in addition to having good form. If cultivators of single-flowered Dahlias would take care to have only the best varieties, and as Mr. MAWLEY remarked, be considerate enough to remove the seed-pods as they appear, we think they would be better pleased with them. As on previous occasions, many of the exhibitors had labelled their varieties in a very unsatisfactory manner. The names might easily be attached to each without fear of preventing a perfect view of the flower.

"BOTANICAL MAGAZINE."—The present issue, No. 645, of the new series, contains figures and letter-press descriptive of:—

Eulophiella Peetersiana, Kranzlin, already figured and described in our issue for April 2, 1898.

Rhododendron yunnanense, Franch., an erect-growing shrub; branches stout, terete, clothed with black-brown bark; subacute lanceolate leaves, 2 to 3 inches long, with mid-rib and margin covered with short sub-erect hairs; flowers corymbose terminal, white, with blood-red spots towards the base of the upper corolla-lobes.

Lobelia intertexta, a small-growing species, resembling *L. erinus* var. *bicolor*; a native of the Nyka plateau in British Central Africa.

Gallistephus hortensis, Cass., the indigenous form of the "China Aster," appears to be common in the rocky hills of northern China, in eastern Turkestan, western Tibet, and Afghanistan. The plant figured was raised from seeds supplied by Messrs. VILMOBIN, ANDRIEUX & CIE, which were obtained from the Abbé FARGES, who collected them in Sechuan. The heads are solitary, ray-florets numerous, linear, violet-blue; disc-florets numerous, of a golden yellow colour.

ST. PETERSBURG INTERNATIONAL HORTICULTURAL EXHIBITION, 1899.—We have been favoured with the following announcement with reference to the forthcoming exhibition at St. Petersburg, received by Mr. BAIFOUR from the Russian Chargé d'Affaires, and by him transmitted to the Director of Kew Gardens, from whom we received a copy:—

"LONDRES, le 19 Juillet, 1898.

MONSIEUR LE MARQUIS,

La Société Impériale Russe d'Horticulture prépare pour l'année prochaine, du 17 au 27 Mai, une exposition à St. Pétersbourg, sous le patronage direct de Sa Majesté l'Empereur, l'administration de la section étrangère étant confiée à Mr. Fisher, Directeur du Jardin Botanique de St. Pétersbourg, auquel les exposants des différents Pays sont priés de s'adresser directement pour les informations indispensables.

Les objets exposés passeront la frontière en franchise de douane.

Le Palais Impérial de la Tauride, où il y a plus de 2,000 mètres carrés de terrain couvert, a été mis à la disposition des exposants et, en outre, en cas de nécessité des tentes et autres locaux seront aménagés en leur faveur.

Le Gouvernement Impérial fera parvenir sous peu des renseignements plus précis sur les privilèges accordés aux exposants, ainsi que des programmes imprimés de l'exposition.

En portant ce qui précède à la connaissance de Votre Excellence, je m'adresse à son obligeance accoutumée, en la priant de bien vouloir faire prendre les mesures nécessaires en fin de propagée parmi les spécialistes anglais les nouvelles de ces préparatifs ainsi que, le cas échéant, de vouloir bien nommer des commissaires spéciaux qui seraient chargés de gérer la section britannique et de la mener à bonne fin.

J'ai l'honneur, &c.,

(Signé) P. LESSAR.

Son Excellence,
Monsieur le MARQUIS DE SALISBURY, &c."

Her Majesty's Government have decided not to be officially represented at the exhibition.

Mr. JAMES H. VEITCH has been appointed Commissioner for Great Britain and Ireland for the third International Exhibition of Horticulture, organised by the Russian Imperial Horticultural Society, to be held at St. Petersburg in May, 1899. Schedules may be obtained from him on application at the Royal Exotic Nursery, Chelsea.

DR. MORRIS, lately Assistant Director of the Royal Gardens at Kew, the newly-appointed Commissioner of Agriculture for the West Indies, leaves this country for Barbados by the Royal Mail steamer *Orinoco*, from Southampton, on the 21st inst.

[From a Photograph by K. H. Preston.]

THE MORRAL PUBLIC GARDENS, PENZANCE.

YORKSHIRE NATURALISTS' UNION.—The one hundred and forty-first meeting of this body of naturalists will be held at East Keswick for Harewood Park, for a fungus foray, on Saturday and Monday, September 10 and 12, 1898. The business arrangements for this meeting have been made by Mr. W. DENISON ROEBUCK, F.L.S., and Mr. J. WADDINGTON, of Leeds; and all communications respecting accommodation and conveyances must be addressed to Mr. ROEBUCK. Communications with regard to the scientific business of the Mycological Committee to be addressed to Mr. CROSSLAND, its Secretary. The district for investigation includes the magnificent woods on the Harewood estates, the avenue of fine trees which borders 2 miles of the road from Harewood to Collingham, and various smaller woods about Scarcroft, East Keswick, Woodhall Bridge, &c. Permission has been kindly granted by the Earl of HAREWOOD for his estates to be visited on Saturday and Monday. Mycologists are cordially invited to attend and take part in the investigations. It is expected that most of the members of the Yorkshire Mycological Committee will be present. Monday's proceedings will not be exclusively mycological, and it is hoped that naturalists in general will attend, the fauna and flora of Harewood Park being but imperfectly known. The Old Star Inn, East Keswick, will be head-quarters throughout. Members intending to stay the week-end must inform the Hon. Sec. at 259, Hyde Park Road, Leeds. The fungi collected will be arranged on tables in the large club-room of the Inn. Consignments of fungi from Lincolnshire and other parts of Yorkshire may be sent to Mr. CROSSLAND, at the Old Star Inn, East Keswick, *via* Leeds, if by post; or to Bardsey Station, if by rail. Consignments should be labelled with the name of the locality and that of the collector, and be packed with moss or grass (not paper).

THE ROYAL HORTICULTURAL SOCIETY'S FRUIT SHOW.—A correspondent, well versed in the duties of a judge at horticultural exhibitions, and necessarily with the difficult and doubtful points connected therewith that are constantly occurring, which might not occur were schedules as clear as they might be, writes in reference to the forthcoming Royal Horticultural Society's Fruit Show as follows:—

"The Schedule of Special District County Prizes for Fruit, recently issued by the Royal Horticultural Society follows upon the lines of the schedule of prizes prepared for the Great International Fruit Show which was to have been held in London in 1892, but which fell through for lack of support. Such a desirable division of the country into counties was carried out with decided success in the case of the fruit show held by the Fruiterers' Company in the Guildhall of the city of London a few years previously. In the case of the Special County Prizes recently issued by the Royal Horticultural Society it is not so definitely stated that the six dishes of Apples or Pears are to be the *bona fide* growth of one individual or representative of the grouped counties. I infer it is the former; still, this is not set forth as distinctly as it is desirable it should be, and it is likely to become one of those doubtful points which provoke a great deal of correspondence which might be avoided. Then, how many fruits are to form a dish? Possibly it may have been thought by the compilers that the number of fruits constituting a dish is to be the same as in the other classes in the schedule; but as many intending exhibitors may not see the Schedule of the Fruit Show it would have averted contention to have given the number constituting a "dish." Some other conditions are open to criticism, but the two points I have alluded to appear to me to be of importance; and I hope that my note will lead to some clearer statement on the part of the Society."

TEA, COFFEE, AND CINCHONA CULTIVATION IN INDIA.—From a volume of *Agricultural Statistics of British India* we learn that the number of acres under Tea has increased from 283,925, and a production of 71,525,977 lb. in 1885, to 433,280 acres, and a total production of 156,426,054 lb. in 1896. Coffee does not show the progressive cultivation of the former. In the year 1885 the acreage area under Coffee was 237,457, and the yield 34,959,902 lb.; and in 1896, 289,084 acres only produced 26,086,902 lb. As regards Cinchona, the number of trees under cultivation had decreased since 1885, the quantity of bark collected in 1896-97, viz., 1,491,566 lb., being the smallest obtained since 1889.

THE HARDINESS OF CYCLAMENS.—Most gardeners regard *Cyclamen persicum* and its varieties as being too tender to risk out-of-doors in cold frames after the end of the present month. We read, however, in the last issue of the *Deutsche Gärtner Zeitung*, of a nurseryman in Koswiz, in Saxony, who, owing to lack of space, left a quantity of young plants in a cold frame exposed to 25° to 30° of cold, Fahr., without any more protection than that afforded by the lights, and they were thus exposed the whole winter, being considered useless. In the spring these plants were, to the astonishment of the owner, fresh-looking and healthy, and the great proportion of them furnished small, saleable flowering stuff. Had these plants been brought into a glasshouse after freezing, the whole of the blossoms would have probably decayed, or been crippled.

THINNING FRUITS.—The following striking results of thinning the over-abundant fruits of seven trees of the Peach, and one each of a Pear and Apple, are recorded in the *Fourth Annual Report of the Fruit Experiment Station of Ontario*. They afford ample reasons for a practice now becoming greatly more common in our own country than was the case a quarter of a century ago:—

Results were obtained at Maplehurst in 1897 by Mr. L. Woolverton.

Variety.	Date.	Quantity removed from one tree.	Hours thinning one tree.	Tree thinned.	Tree not thinned.	Yield in 12 quart baskets.
<i>Peaches.</i>

* Loss from rot. † Increased size of fruit.
‡ Extra size and clean. § Thinned too late.

MR. H. DAVIES, until recently inspector of the Royal Botanic Garden, Calcutta, has been appointed by the Indian Government to the post of Superintendent of the Government Garden at Allahabad, in succession to Mr. J. PHILLIPS, who retires after thirty years' service. Mr. A. C. HARTLESS, Curator of the Government Cinchona plantations, Mungpoo, succeeds Mr. H. DAVIES at Calcutta.

A SINGULAR CAUSE OF THE DEATH OF A GARDENER.—An inquest was held at "The Chequers" inn, Horley, Surrey, last week, into the circumstances attending the death of RICHARD WORSFOLD, gardener, of Horley, lately in the employ of Dr. MUTER, of the Chatelet, Horley. The wife of deceased stated that a day or two previously, when he went home to dinner, he said he had run a nail into his foot. He had trodden on a board, and a rusty nail had run into his foot. He showed her the hole in his foot. He went back to work, but at 4 o'clock in the afternoon he returned to his home, and said his master had sent him back because his foot was so bad. He complained of pain extending to his ankle, and his foot was very much swollen. A few days afterwards he was taken with spasms and died. The medical evidence was to the effect that death had been caused through tetanus (lockjaw), owing to septic poisoning in the wound in the foot. Deceased's employer said the microbe of tetanus was often found in manured soil. The jury returned a verdict of death from misadventure.

PROFESSOR DR. BREFELD has been appointed Professor of Botany in the University of Breslau, in succession to the late Dr. FERDINAND COHN.

THE PEOPLE'S PALACE HORTICULTURAL (SEPTEMBER 1, 2, 3).—Time was when Dahlias were grown in front gardens in the Mile End, Whitechapel, and Bethnal Green Roads; when many a forecourt garden was gay with them, and florists who grew them for sale had little nurseries by the sides of these great highways. Much of that has passed away, but Dahlias are still grown, though not without difficulty, in many a back garden, and blooms appear which are sufficiently good to find a place on show-boards in the Queen's Hall of the People's Palace. The exhibition under notice was very largely a show of Dahlias; and blooms came both from the more open country beyond Bow and Stratford, from gardens in Clapton, Leyton, Forest Gate, and from Walthamstow, all of which neighbourhoods have year by year to sorrowfully resign tracts of grassland to the requirements of a growing population. But they are more open and breezy than the smoky parts west of Stratford, and so the cultivators of Dahlias show in classes set apart for them. The drought, added to the scarcity of water, had told upon the plants, and from lack of moisture the back petals were fading before the flowers could develop their centres. But despite the season, a very satisfactory progress in quality could be noted, and when the tables were filled with competitive exhibits, a very pretty show indeed resulted. The Cactus type appears to be the favourite flower with the East-ender, and he affords water when he can obtain it, and hunts for vermin without wearying. When one looks into some of these small back gardens, darkened by factory-walls and shut in by dwellings, only wonder can be experienced that such good blooms are produced. There were Lilies in pots, very satisfactory representatives of *L. auratum* and *L. speciosum*; there were Asters in pots, cut flowers in pretty bunches, and plants grown by children in plenty. One or two Fuchsias, grown in living-rooms, deserved a medal from the Royal Horticultural Society. Every well-wisher of his kind has reason to desire that a full measure of success may attend the work being done by the People's Palace Horticultural Society.

JOSHUA BROOKS, son of SAMUEL BROOKS, the oldest florist in Chicago, who, together with his father, built the first glasshouse for plant cultivation in that city, died on July 26, at the age of eighty years.

PUBLICATIONS RECEIVED.—*Die Natürlichen Pflanzenfamilien*, Nos. 178 and 179, and the contents of Parts II. to IV.—*Journal of Botany*, for September, 1898. The number contains an account of a new genus of Ericaceæ from Angola; critical notes on some species of Cerastium, and a list of the more remarkable discoveries of new and rare Hepaticæ in Inverness-shire.—*Nature Notes*.—*Journal of the Society of Arts*, No. 2,389, vol. xlv.

THE MORRAL GARDENS, PENZANCE.

[See supplementary illustration].

SITUATED on a slope facing Mount's Bay, and consequently having a southerly aspect, small in size, and the public property of a town which mainly subsists on its attractiveness to visitors, one would naturally expect this garden to be a little gem of beauty, full of luxuriantly-growing plants.

Instead of this, however, anyone visiting Penzance in July will find that the Morral Gardens consist mainly of free-growing Privet, numerous beds of small burnt-up Pelargonium, and—most obvious of all—infinite bare earth. As there are plenty of full-grown trees, and a considerable expanse of lawn, the comparative newness of the grounds affords no adequate explanation of the poor gardening displayed.

The most interesting sight in the gardens in the summer is that of the really splendid Hydrangeas.

Some of these occupy a part of the margin of a little pond, and are most effective. However, even this success is not allowed to be a complete one, for the rest of the pond is margined by rows of poorly-grown Pelargoniums and the like.

A very pretty and bright effect is given by a mass of dwarf Nasturtiums, bordered by Marguerite Carnations, in full flower. With these exceptions the gardens have little to show in July either of beauty or interest—for it is hard to apply either epithet to some large and apparently well-grown Palms and Tree Ferns in tube, as these are almost hidden from view by an enclosure of black netting.

A so-called Rose-bed—which consists mainly of almost leafless sticks and bare earth—called forth from my companion the remark that “it is enough to make one swear never to grow a Rose again.” A bed of Carnations is little better—bare earth occupying more than half the bed. Most of the herbaceous plants in the shrubbery-borders appeared but poorly grown. The very ugly building (library?), which occupies a prominent position in the grounds, should have its walls hidden and ornamented by climbers in variety as soon as possible. The gardens offer every facility for the proper cultivation of almost every description of open-air plants—water-lovers, bog-plants, rock-plants, florist's flowers, herbaceous perennials, climbers, &c.—and it is to be hoped that those in authority may recognise that the true uses of a public garden are to afford sensations of repose and successional beauty, and to serve as a model of gardening at its best. *Harry Roberts.*

BOOK NOTICE.

A YEAR'S WORK ON A KENTISH FRUIT FARM,
by a Practical Man. (Published by G. Bunyard & Co., The Royal Nurseries, Maidstone.)

THE horticultural reader might suppose that of works on fruit culture for market we have had of recent years more than enough; we can, however, cordially recommend this small work of 82 pp. to the vegetable and fruit cultivator on a large or small scale, as containing a great deal of useful information, combined with much worldly wisdom, and a thorough knowledge of the metropolitan markets.

The hints on marketing all kinds of produce are invaluable, and were cultivators in general, large as well as small, to take them to heart, we should hear greatly less of the complaints that produce fetches, as a rule, very low prices. The author has practical knowledge of the constantly changing and yet necessary work on a fruit-farm; a thorough acquaintance with vegetable cultivation on an extensive scale, combined with a close grasp of market ways and prices. At the end of each week's diary is appended a list of the prices obtained for hardy fruits, Potatoes, and the chief vegetables in season during the entire year 1897.

At the end of the book a list of the best-paying market fruits is added, giving the prices obtained by selling direct from the tree in the case of varieties that are not stored. The articles originally appeared weekly in *The South-Eastern Gazette*.

HOME CORRESPONDENCE.

HABENARIA CONOPSEA?—It was stated by Hausmann, in his *Flora von Tyrol*, 1854, that *Gymnadenia conopsea*, R. Brown, varies very much as well in form as in colour; even a form without a spur is mentioned. Should not the plant found near Arisaig be one of these forms of *Gymnadenia conopsea*? *O. F., Lehenhof.*

SUMMARY OF WEATHER-NOTES DURING AUGUST, 1898, AT THE ROYAL GARDENS, WINDSOR.—As showing the extraordinary drought of the present year up to date, and the phenomenal heat of the past month, I enclose a leaf from our weather register, where you will notice that the rainfall for the eight months ending with August 31 amounted to only 9.03 inches, the average here for eight months being about 16 inches—a little more than half the usual

quantity. The spring and summer crops in the vegetable quarters have fared fairly well; but as for autumn and winter crops, I scarcely know how we shall get on. Throughout the south of England there must, in any case, be great scarcity, and if rain do not soon fall, an absolute dearth of many things. The summary is as follows:—

A very hot and dry month, tropical weather prevailing; continuous and brilliant sunshine, 100° and over being registered in sun on 10 days, 80° and over in the shade on 9 days; very hot and sultry, occasionally with thunderstorms, but, as usual, this district escaped the full force of storms. Sunshine (more or less) was registered each day; a cold wave, with squally E. winds, passed on 6th, 7th, and 8th inst., with some rain: Sunday, 7th, very dull and cold, with drizzling rain; finer evening. Rain fell on 9 days during the month.

Max., in sun, 109° on 14th; ditto, Solar Ther. (in vacuo), 135° on 20th.
Max., in shade, 86° on 22nd; min., 38° on 31st.
Rainfall, August, 1898 ... 1.07 inches.
1897 ... 2.23 „
Average rainfall, August (Windsor) ... 2.50 „
Total rainfall, for 8 months ending Aug. 31, 1893 = 9.03 ins.
1897 = 16.24 „
Average „ „ „ „ „ about 16.00 „

—O. Thomas.

THE RAINFALL AND WELL-SPRINGS.—The rainfall for the month of August just ended, according to the rain-gauge of Sir John Lawes, at Rothamsted, Hertfordshire, is 1.21 inch, being the result of twelve rainy days. This is 1.74 inch less than the average fall for August extending over a period of twenty years, and is equal to a deficiency of 175 tons of water on each acre of land. The total rainfall for what is called the harvest-year, that is the twelve months from September 1, 1897, to August 31, 1898, is 19.5 inches, the average for twenty years at Rothamsted being 29.6 inches, consequently in this harvest-year the crops have experienced a deficiency of a little over 10 inches of rain, equal to 1020 tons of water per acre. In the previous harvest-year, 1896-7, there was measured at Rothamsted 37½ inches; this year, therefore, shows a deficiency of 17½ inches of rain compared with last year. In the present harvest-year the months of December, 1897, and May, 1898, are the only months that have recorded over-average rainfalls, each of the other ten months showing a deficiency. It is little to be wondered at, therefore, that the well-springs of water in this neighbourhood are low. A well near Sir John Lawes' laboratory, of which measurements of the depth of water are taken from time to time, and from which no water is drawn for use, has shown the following results:—

May, 1897,	11 feet 4 inches of water.
July „	7 „ 7 „
August „	6 „ 8 „
September „	6 „ 0 „
November „	4 „ 2 „
December „	4 „ 2 „
January, 1898,	3 „ 8 „
March „	3 „ 2 „
June „	2 „ 2 „
August „	1 „ 5½ „

Thus at the beginning of May, 1897, the depth of water was at its highest, viz., 11 feet 4 inches; from that time there has been a gradual decrease in the depth of water, and at the present time the depth of water is 17½ inches only, a drop of 62½ inches since August, 1897. *J. J. Willis, Harpenden.*

THE NEW FLOWER GARDENING.—The article on p. 156 on the “Flower Gardening at Regent's Park,” is of quite exceptional interest to folk in the North, who do not often get a chance of seeing London gardens. The difficulty which confronts all cultivators of herbaceous borders is an old one. If you are to include all your favourites you must include them not only in their beauty, but in their raggedness and decay; and the longer the season in which you wish to enjoy the border the greater the difficulty. So some arrange their borders to march more or less with the year, having one portion in full beauty, while the rest is either immature, in which case, however, it is often possessed of an interest which comes very near to beauty; or it is over, and frankly displeasing; others patch up with bedding-plants and annuals, and try to produce a thin sort of beauty over the whole. To do things in the radical way in which the Regent's Park people seem to do them is doubtless beyond the purse of most of us; but I am sure there are very many people who would be glad to have a small border in some favoured position always filled with the best things of the season, and never becoming ragged. I therefore hope that “B.” will give us details of the methods by which this desirable result is obtained. The point is, that we have generally believed that to get the best results with certain plants, *Eryngiums*, *Papavers*, almost all the

Boraginæ, and hosts of tap-rooted plants, deep-digging and deep-rooting were necessary, while the attempt to move not only these deep-rooting subjects, but tender-rooted plants like bulbs, just when they were coming into and going out of flower, and all through the summer months, would have been thought a most rash proceeding. How is it done? Are all the plants grown in pots, or are tap-roots and thong-like roots by some means prevented? Or is it possible to dig down 3 or 4 feet, and move such plants without their knowing it has been done? If “B.” will explain this matter, I, for one, shall be much obliged to him. *K.*

RUDBECKIA BICOLOR SUPERBA.—This, which was distributed this season as a novelty, has sometimes been shown in collections of hardy herbaceous perennials, though it is classed as an annual. Such forms as *R. amplexicaulis*, *bicolor*, and *texana* are found in German seed catalogues, and described as annuals; and the new form is a selection from *bicolor*, which has yellow florets with a black centre. In the case of *bicolor superba*, the disc is brown, the ray florets yellow, with large, dark brown spots round the disc. Anyone exhibiting the plant among hardy herbaceous perennials runs the risk of having his exhibit disqualified. It may be raised from seeds sown in the spring; it then blooms the same year, that being the apparent duration of its existence. What is *R. bicolor*? Does it represent a true species, or is it simply a garden variety? *R. D.* [According to *Index Kewensis*, *R. bicolor* is a species. *Ed.*]

SCHEDULE-MAKING AND JUDGING.—From the many complaints this season, it is clear that horticultural societies' committees have not yet availed themselves of the help they might obtain from the Royal Horticultural Society's code of rules. I always make a point of recommending this shilling pamphlet to any society I come in contact with, and find that some do not even know such a guide exists. The trouble often arises over the word “varieties” being really meant to signify “kinds.” The other day, when judging at a rather extensive exhibition, the schedule was much at fault, asking for distinct varieties (twelve bunches) of herbaceous flowers, ditto annuals, ditto with specimen plants, and so on. Strange as it may seem, in this same schedule the fruit classes specified distinct “kinds,” and here an exhibitor of a collection staged two varieties of Grapes, and was necessarily disqualified. The drafting of the Aberdeen schedule mentioned by “M.” was rightly styled idiotic, and this for a “Royal” show, too. The award of the “ducal judges” mentioned by “D.” on the same page is most absurd, and in such an instance the 3rd prize competitor would have been quite right had he appealed to the committee against the decision. *H.*

MONTBRETIAS.—Your correspondent, “H. T. Martin,” writing in your issue of August 27, p. 166, on Montbretias, says:—“The cultivation is very simple,” but he then proceeds to give directions, which if carried out where many are grown, would involve much unnecessary labour, and take up space required for other plants, and some would-be cultivators of these pretty plants might be discouraged. My experience is that *M. crocosmiflora* and *M. Pottsii* are quite hardy in the south of England. [Quite so. *Ed.*] Some fine masses which were lifted and transplanted last November, some of the bulbs lying on the ground at that time for several days exposed to frost not being injured, for the plants have thrown up flower-spikes 3½ feet high. These bulbs have braved the winter for several years without being in any way protected. It is advisable to transplant them every second year, well trenching and manuring the ground, otherwise the bulbs increasing so quickly become a mass of small growths, and afford few flowers. South or west aspects are best for the plants, which should be planted in lines or beds, placing the bulbs 6 inches apart. *Montbretia crocosmiflora*, which is a hybrid between *M. Pottsii* and *M. aurea*, is one of the best for out-door cultivation. *T. F. Conway, Ham House, Richmond.*

TOMATOS.—In reply to “C. J. P.'s” enquiry, p. 188, respecting the successful cultivation of Tomatos in a house with Melons, I may say that here I grow a great many Tomato plants under glass, and apart from the houses devoted to their sole use, I put plants at the lighter end of vineries, in vacant spaces in the Peach-house, or in any spot in which they can get plenty of sunshine. I have grown them very successfully in this manner; they receive the same kind of treatment as that afforded the permanent subjects in these houses. I usually fertilise

the flowers until the beginning of June, but after that time they generally set freely without such assistance. The several kinds of disease to which this plant is subject have given us much trouble for the last four years, but this season I have had, as yet, little cause for anxiety in this respect, as I have had to remove only two fruits with the "black spot," and the plants are free from the fungus, *Cladosporium lycopersici*, up to the present. I plant shallow, afford plenty of water at

earliest batch when swelling a large quantity of fruit; but I employed a top-dressing of old Mushroom-bed manure. I am of opinion that the discontinuance of liquid-manure, and giving a circulation of air at all times when possible, plenty of heat, and a good supply of water to the roots, have much to do with the freedom of the plants from disease. I allow each plant ample space for top-growth, as nothing is gained by thick planting. This

to be taken up this autumn. These trees are rather badly infested with brown scale, and they are literally swarming with wasps, although the remainder of the house is filled with Tomato plants. I should not be surprised if the wasps do not soon acquire a taste for the fruit of the Tomato, although up to the present I have not found any eaten by them. *R. D. Long, Wellington Hall Gardens, Lincoln.*

FIG. 54.—THE GREAT OAK IN THE HOME PARK, WINDSOR.

the roots when they are growing freely, and a little ventilation at all times, except when the wind is rough and cold. Where fire-heat is applied, an occasional damping of the surface of the beds is given in the afternoon of hot days. I mix a little lime with the soil in potting and planting. I grow them in pots, boxes, and planted out; but in the case of the two first, they are placed so that they can root through the bottoms, and unless they can do this, exhaustion soon sets in. I have applied no manure-water to the plants this season, except to the

is my experience so far; and it will be interesting to readers of the *Gardeners' Chronicle* if others will kindly describe their methods of culture and the results which follow. Many of the old notions respecting Tomato culture are being exploded, and I will give one instance. A few years ago we were told that by planting Tomatoes in fruit-houses we should not be troubled by wasps in these structures; but to prove that this is a mistaken idea, I may say that in destroying the trees in a Peach-house, two younger trees were left on the back wall,

THE GREAT OAK AT WINDSOR.

IN our Windsor Supplement, published in the *Gardeners' Chronicle*, October 31, 1874, we figured several of the famous Oaks in Windsor Great Park. Fig. 54 in our present issue represents a remarkable tree known as the "Great Oak" in the Home Park. When measured last year, its circumference at 5 feet from the ground was 36 feet. It was then only partly alive. The photograph, for which we are obliged to Mr. O. Thomas, and from which our figure has been prepared, was taken at an earlier date, but our readers will observe that it has many characteristics that age alone can give to the Oak. The figures in front of the trunk of the tree are those of John Tucker and his son. John Tucker was a lodge-keeper, late of the Royal Navy, and he served with H.R.H. the Duke of Edinburgh on board H.M.'s screw steam frigate *Euryalus*, a ship to which the Royal Duke was appointed a Naval Cadet in the year 1858.

LAW NOTES.

Re WALTER ADDISON,

SEED MERCHANT AND BULB IMPORTER, RESIDING AT 88, CHRISTCHURCH, AND 3, EAGLE STREET, IPSWICH.

THE Official-Receiver for the Ipswich District has now issued particulars under this failure, from which it appears that the debtor has filed a statement of affairs, showing liabilities expected to rank against the estate amounting to £2061. The assets include: Stock-in-trade, cost £1000, valued at £580; machinery, lease, goodwill, trade-fixtures, fittings, £250; furniture valued at £50: total £880; book-debts, good, £166; doubtful and bad, valued at £2 10s. The deficiency, after providing for the payment of preferential creditors' claims amounts to £1051. The report and observations of the Official-Receiver are to the following effect:—"The debtor, who is a seed-merchant and bulb-importer, informs me that he commenced business in Eagle Street, Ipswich, in 1874, having then a capital of about £100. He states that his necessary expenses have exceeded his profits, and he alleges his present position to have been caused through that. The books he has kept do not on the face of them disclose how or when his deficiency has arisen. A book of receipts and payments has been kept, but it has never been balanced, and it is admitted that it is incomplete. The debtor has not recently taken stock, or prepared any statement of his assets and liabilities, but he states that it is only within about a month that he realised that he was insolvent, although he admits that for some time he has been pressed by his creditors. There is a large stock of seed on debtor's premises, the value of which it is difficult to estimate. There is a lease of the premises, having seventeen years to run, at £21 per annum; fixtures are well adapted to the business, and no doubt they cost considerable sums, and also the goodwill of the business, which has been built up by a considerable expense in advertising."

SEED MERCHANTS SEIZE A WORKHOUSE FOR DEBT.

A curious seizure under a writ of *fi. fa.* obtained against the Guardians of the Kenmare Union, county Kerry, at the suit of a Belfast firm of seed merchants, in respect of a debt incurred, under the Seed Supply Act, has just been made at Kenmare. The local workhouse, and the premises attached thereto, have been taken possession of by the sheriff's officers, in execution of a debt of £103 1s. 7d., due from the

Guardians to Messrs. Cullen, Allen & Co., of Belfast, for goods supplied to the Union last spring, under the Seed Supply Act. The bailiffs retain possession of the workhouse and premises, pending a settlement of the account.

A FINE SPECIMEN OF THE CRIMSON RAMBLER ROSE.

It is not an unusual statement that such a person's specimen of this showy summer Climbing Rose possesses so many hundreds, or, in rare instances, a few thousands of buds and blooms, but we have never heard, nor doubtless have any of our readers, of a specimen with 32,000 buds and blooms. Yet this is the number counted by Mr. H. Turner, the raiser of the variety, and Mr. W. Marshall, the owner of the plant in question (Fig. 55), on one day this summer. The plant was bought and planted in October, 1892. The variety was seen, and a great future predicted for it by Mr. Marshall on the occasion of the Royal Horticultural Society's Gold Medal being awarded at an Earls Court show in June of 1892, to Mr. Turner, of the Royal Nurseries, Slough, for a plant in bloom.

This uncommonly fine seven-year-old Rose is planted in the front of a fence, but not attached to it in any way. It has grown to a length of 34 feet, and was furnished when the blooms were counted with 16 main branches, each with 50 trusses, and each truss with 40 blooms and buds.

THE BRITISH ASSOCIATION.

THE formal inauguration of this year's meeting of the British Association took place at the People's Palace, Bristol, at 8 o'clock on Wednesday, September 7. The retiring president, Sir John Evans, occupied the chair at the opening of the proceedings, and on his right-hand sat Sir W. Crookes, president-elect. Among those present were Lord Kelvin, Sir Frederick Bramwell, Sir J. Wolfe-Barry, Sir E. Fry, the Mayor of Bristol, the High Sheriff, Mr. Francis Gilton, Professor Carey Foster, Professor Lloyd Morgan, Mr. W. H. Preece, Professor Sollas, Professor Harold Dixon, Professor Ayrton, Professor Jupp, Professor Schäfer, Professor Roberts-Austen, Professor Marsh (of Yale), Professor Jastrow, Sir P. Magnus, Mr. L. W. Brabrook, Professor W. Ramsay, Professor Silvanus Thompson, Professor Rucker, Professor Hull, Professor Schuster, Professor Oliver Lodge, Dr. Macallum (of Toronto), Dr. Hicke, Sir Norman Lockyer, Sir Truman Wood, Dr. J. Scott Keltie, Mr. Howell Davies, Mr. Arthur Lee (secretary of the local committee), Dr. Bertram Ropers, Mr. Deacon, Professor R. Warrington, Professor Tylor, Professor Mascart (of Paris), Professor Meldola, Professor Lemström (of Helsingfors), Dr. H. O. Forbes, Professor Rupert Jones, Professor Poulton, Professor Viriam Jones, and Professor W. Grylls Adams.

The arrangements for the accommodation of the unusually large gathering of members were excellently devised and carried out. The People's Palace, which the committee were fortunate enough to secure in place of the Colston Hall, was just large enough to accommodate the 2000 ladies and gentlemen who attended to hear Sir William Crookes' address.

Sir J. Evans, in introducing the new president, and speaking in name of the association, condoled with the city in the loss it had sustained in the destruction by fire of the Colston Hall, and at the same time congratulated the local committee on the wonderful manner in which they had risen to the occasion and filled the gap caused by the conflagration. He also congratulated the city on the completion of the splendid monument, the Cabot Tower. This being the first meeting of the association since the gathering in Canada, he wished to express the extreme gratitude the association felt for the manner in which they were treated by both high and low in that great Dominion. He need hardly introduce his successor in the chair, for his name was known throughout the civilised world. At an early age he attained great eminence in chemistry, but he had not confined himself to chemical research, for he had experimented largely on various materials *in vacuo*, and the Crookes-tube was known throughout the world. These experiments had led to more important results than the radiometer. They might look to Sir W. Crookes as the real originator of those rays.

Sir W. Crookes, having taken the presidential chair, then proceeded to read his address, in the course of which he said:—

For the third time in its history the British Association meets in your city of Bristol. The first meeting was held, under the presidency of the Marquis of Lansdowne, in 1836; the second, under the presidency of Sir John Hawkshaw, in 1875. Formerly, the president unrolled to the meeting a panorama of the year's progress in physical and biological sciences. To-day the president usually restricts himself to specialties connected with his own work, or deals with questions which for the time are uppermost. To be president of the British Association is undoubtedly a great honour. It is also a great opportunity and a great responsibility; for I know that, on the wings of the Press, my words, be they worthy or not, will be carried to all points of the compass. I propose first to deal with the important question of the supply of bread to the inhabitants of these islands, then to touch on subjects to which my life-work has been more or less devoted. I shall not attempt any general survey of the sciences; these, so far as the progress in them demands attention, will be more fitly brought before you in the different sections, either in the addresses of the presidents or in communications from members.

SOCIETIES.

ROYAL HORTICULTURAL.

SEPTEMBER 6.—The usual fortnightly meeting of the committee was held on Tuesday last in the Drill Hall, Westminster. There was not a large display of exhibits before either of the committees, and Orchids especially were few. Amongst these, however, was an extraordinary specimen of the Dove Orchid (*Peristeria elata*), from the Royal Gardens, Windsor. Awards of Merit were recommended by the Floral Committee to six new Dahlias, including three "Cactus" varieties, two single-flowered ones and a Pompon. Similar honours were gained by a decorative Cordyline named *Duchess of York*, by *Lobelia Rivoirei*, and *Helenium autumnale superba*. A First-class Certificate was awarded to *Acer Negundo elegans*. Before the Fruit and Vegetable Committee were shown three collections of fruit, and numerous novelties. In the case of five varieties of Onions, seven varieties of Potatoes and a Red Globe Beet, Awards of Merit previously recommended at Chiswick were confirmed. A seedling white-fleshed Melon named *British Queen*, of uncommonly delicious flavour, was awarded a First-class Certificate. Five Cultural Commendations were also made, and three Medals awarded. The lecture in the afternoon was upon the cultivation of Disas.

Floral Committee.

Present: W. Marshall, Esq., Chairman; and Messrs. E. Molyneux, Geo. Stevens, James J. McLeod, H. B. May, John Fraser (Kew), J. Fraser, W. Bain, H. Selfe Leonard, Jas. Walker, H. J. Catbush, J. D. Pawle, Geo. Paul, H. H. D'Ombraun, Harry Turner, and E. T. Cook.

Messrs. SANDER & Co., St. Albans, Herts, had plants of *Hemantthus multiflorus* var. *superbum*, a brilliant-coloured, improved form of the species. Also plants of *Acalypha Sanderi*, A. Godseffiana, and *Dracena Sanderiana*.

Messrs. JAS. VEITCH & SONS, Royal Exotic Nursery, King's Road, Chelsea, obtained an Award of Merit for Cordyline (*Dracena*) *Duchess of York*, six pretty plants of which were exhibited. It is a narrow-leaved variety, about an inch wide at broadest part, green, edged with red. The younger leaves are much more coloured, however, and the stalks of them are bright. The variety will doubtless prove a useful one for decorative purposes. Messrs. J. VEITCH also showed sprays of several varieties of Hibiscus: *H. monstrosus*, white, with red centre; *H. celestis*, blue; and *H. lotus album*, pure white; and flowers and foliage of the following Nymphaeas: *N. alba*, *N. odorata*, *N. o. alba* and *sulphurea*, *N. Ellisiana*, *N. pygmaea*, *N. Marlacea carnea*, albidia, and *chromatella*; *N. Laydekeri*, *N. L. lilacea*, fulgens (red), and *rosea* (Silver Banksian Medal). The last exhibit of annuals for the season from Messrs. JAS. VEITCH & SONS included some very pretty species, the *Salpiglossis*, *Asters*, *Phlox Drummondii*, *Dianthus* and others were most noticeable. Some Gladioli from the same firm illustrated some of Child's hybrids. These have good sized flowers of much substance, and in colour ranging from light salmon to rich crimson.

From Sir TREVOR LAWRENCE'S gardens at Burford, Dorking (gr., Mr. Bain), came several choice species. An Award of Merit was recommended to *Lobelia Rivoirei*, a very strong and erect-growing *Lobelia*, with very pale pink-coloured flowers. *Lobelia Carmine* Gem was shown also the sprays, being very abundantly flowered, and *L. Crispum* Gem, and *L. Gorardi*, a blue-flowered one; *Rudbeckia bicolor superba*, yellow, each petal marked with big blotch of brown, and a number of varieties of *Pentstemon hybridus grandiflorus*. There last were all very fine, the flowers being large in size and beautifully coloured. Plants of *Angelonia grandiflora* and *A. g. alba* were shown as lifted from the open ground, in which they were planted in June. The plants were very freely flowered. Sir TREVOR also showed a fasciated growth 6 feet high, with many flowers, of *Helenium autumnale superbum* (Award of merit).

Messrs. PAUL & SON, Cheshunt, exhibited sprays of a very ornamental variety of *Acer Negundo*, and named *elegans*. The foliage is very prettily variegated, being green and yellow, in the older ones the yellow is lighter. As shown, it appeared to have a partially pendent habit, but whether it is constant or not we are not sure. (1st class certificate.)

Seedling Dahlias were shown by several exhibitors, and in some cases Awards of Merit were recommended. Mr. JAS. STREDWICK obtained an Award for Cactus Dahlia *Magnificent*, a large flower of good Cactus form, and in colour a curious mixture of buff and red. A similar award was made to Pompon Lady Rogers, a white variety of full size, and good form, shown by Mr. Leggatt, gr. to Sir ROBERT HARGREAVES ROGERS, Bexley, Kent. Almost a dozen very lovely new single-flowered Dahlias were shown by Mr. T. W. GIRDLESTONE, Sunningdale, Berkshire, and to two of these Awards of Merit were recommended. These were Puck, buff-red, with crimson a circle around the disc; and Columbine, a rosy-purple coloured flower, with yellowish centre. In each case the form of the flower was satisfactory.

Messrs. J. CHEAL & SONS, Lowfield Nurseries, Crawley, Sussex, showed a quantity of sprays of ornamental and flowering trees and shrubs. Amongst these was noticed *Ulmus Van Houttei*, a fine golden-leaved Elm; the curious *Salix annularis*, with twisted or rolled leaves; *Sambucus argentea variegata*, *Spiraea callosa rosea*. Messrs. CHEAL & SONS had also a very fine display of Dahlia blooms, of Cactus, Pompon, and single flowering varieties, in all sections there being many choice varieties. Awards of Merit were recommended to Cactus variety, *Lorelei*, an improvement upon *delicata*, rose with lighter centre, the petals much incurved; and to Mrs. Finlay Campbell, an orange scarlet flower of true Cactus form. This is a most attractive variety. A Silver-gilt Banksian Medal was awarded the exhibits.

Messrs. J. HILL & SON, Lower Edmonton made a large exhibit of choice Ferns, in which we noticed many good varieties of *Adiantums*, *Pteris*, *Gymnogramma*, also beautiful specimens of *Woodwardia radicans*, *Microlepia hirta cristata*, *Lastrea lepidota*. A new variety of *Asplenium* named *A. Hilli*, is a very pretty form with delicately cut fronds (Silver Flora Medal).

Mr. H. B. MAY, Dyson's Lane Nursery, Upper Edmonton, showed a group of plants in which some specimens of *Salvia splendens grandiflora*, *Bouvardia Humboldtii grandiflora*, and other varieties, *Swainsonia galegifolia alba*, &c., were included. A double-flowered Fuchsia, named *Ballet-girl*, with red sepals and white corolla, was shown in the form of half-a-dozen exceptionally fine, well-flowered plants, in 5-inch pots; Mrs. Leopold de Rothschild, Winter Cheer, Miss Jolliffe, and other Carnations, were also shown, the plants in each case being neat, pretty specimens (Silver Banksian Medal).

Mr. RUMSEY, Joyning's Nurseries, Waltham Cross, showed a fine lot of sprays of his new H.-P. Rose Mrs. Rumsey. For so late a date they were very good (Bronze Banksian Medal).

A fine lot of Canna spikes, and some *Streptocarpus* plants in pots from A. J. HOWARD, Esq., Worton Hall, Isleworth, was awarded a Silver Banksian Medal.

Orchid Committee.

Present: Harry J. Veitch, Esq., in the chair; and Messrs. Jas. O'Brien (Hon. Sec.), T. B. Haywood, Sydney Courtauld, De B. Crawshaw, A. H. Smee, J. Gurney Fowler, W. H. White, T. W. Bond, H. J. Chapman, W. H. Young, J. Douglas, and H. M. Pollett.

Mr. Owen Thomas, gr. to the QUEEN, Frogmore, exhibited a wonderful specimen of *Peristeria elata* (Dove Orchid), standing some 8 feet in height, and bearing eight spikes, having in the aggregate over 300 large, white, wax-like flowers and buds, whose fragrance was very apparent at some distance from the plant. Although a species long known in gardens, of which smaller specimens had often been shown, it has never been Certificated by the Orchid Committee, who accorded it now a First-class Certificate, and further voted a Silver Flora Medal as a recognition of good culture extending over what must have been a period of many years.

Messrs. JAS. VEITCH & SONS, Ltd., Royal Exotic Nursery, King's Road, Chelsea, staged a group of very fine Orchids, chiefly their hybrid Cattleyas, and *Laelio-Cattleyas*. Among them *Cattleya* × *Ella* (C. bicolor, C. Warszewiczii) made its appearance for the first time. It is a very pretty and distinct hybrid, with well-displayed flowers of good substance. The sepals were pale rosy-lilac, with a white area at the base; petals much broader, ovate and crimped, and of a darker shade of rosy-lilac than the petals. The lip was reminiscent of C. bicolor the seed-bearing parent in the rather small, pinkish side-lobes clipping the base of the fleshy column, and the narrow isthmus on which the front lobe was extended. The front lobe and its connection was of a glowing purple tint, the broad flat anterior portion bearing a narrow, fimbriated, lavender-coloured margin (Award of Merit).

Next in importance was *Cattleya* × *Euphrasia* var. *Langleyensis* (C. Warszewiczii and C. superba), a fine flower, of a bright light rose colour, the base of the lip being white, tinged with primrose-yellow, the showy front portion dark claret-purple, the margin prettily crimped.

Messrs. VEITCH also showed three plants of *Laelio-Cattleya* × *callistoglossa ignescens*, one of the finest of their hybrids, several *L.-C.* × *Nysa*, two varieties of *Cattleyas* × *Eros* (*Mossiae*, *Walkeriana*), their new and distinct *Cypripedium* × *Rothschildii* var. *villosum*, C. × *Clinkaberryanum*, C. × *H. Ballantine*, C. × *Milo*, C. × *Harrisianum superbum*, the remarkable *Epipendrum* × *radicante-Stamfordianum*, Mas-

devallia × Imogen, a good *Rodriguezia venusta*, *Renanthera matutina*, varieties of *Dendrobium Phalenopsis*, *Cattleyas*, &c. (Silver Flora Medal).

Sir TREVOR LAWRENCE, Bart., Burford (gr., Mr. W. H. White), showed a plant of the very remarkable *Dendrobium sanguineum* with slender, whip-like stems, bearing a large solitary blood-red flower, the sepals and petals of which were nearly equal, and the lip inconspicuous, giving to the flower the appearance of a crimson *Ixia* (Award of Merit).

EDGAR COHEN, Esq., Hall Road, St. John's Wood (gr., Mr. A. Vass), showed a grand plant of *Lælio-Cattleya* × *elegans*, Cohen's variety, a very handsome form, in which the sepal and petals had a very peculiar tint of greenish-yellow, tinged and veined with rose colour. The large lip, which partook much of the form of *Lælia purpurata*, had the tube cream-white, and the front portion of a rich bright purple.

Messrs. F. SANDER & Co., St. Albans, showed *Cypripedium* × *Mrs. Edgar Cohen* (*callosum* × *niveum*), a pretty white flower, tinged with rose; and *C.* × *William Trelease* (*Rothschildianum* × *Parishi*), a distinct hybrid, with a massive, yellow upper sepal, bearing many dark purplish lines; petals

Fruit Committee.

Present: Philip Crowley, Esq., Chairman; and Messrs. Jos. Cheal, W. Poupart, M. Gleeson, A. H. Pearson, Geo. Bunyard, J. Wright, Alex. Dean, Geo. T. Miles, C. Herrin, W. Pope, H. Balderson, Jas. Smith, and Geo. Norman.

Messrs. T. F. RIVERS & SON, Sawbridgeworth, Herts, showed a score of Peasgood's Nonsuch Apples of extra exhibition size and quality; they were orchard-house fruits, and faultless. They showed a bunch of Grapes each of the varieties Gradiska and Buckland's Sweetwater; also of a new white Grape from Australia named Centennial. The fruits of the last named were exceptionally large, but partly hollow, and deficient in flavour. Well-fruited Plum-trees in pots of the following varieties were shown: Jefferson, Burbank, Archduke, Victoria, Belgian Purple, Coe's Golden Drop, Pond's Seedling, and an unnamed seedling (Silver Knightian Medal).

Messrs. JAS. VEITCH & SONS, Royal Exotic Nursery, King's Road, Chelsea, exhibited a collection of over sixty dishes of fruit, which was awarded a Silver Knightian Medal Of

uncommon. Messrs. WATKINS & SIMPSON showed a very nice red Beet of the Globe type (Award of Merit).

The following Potatoes were recommended Awards of Merit:—Major, from Mr. E. R. WEBBER, Worcester; Challenge, from Mr. SYDENHAM, Birmingham; Miss Ellen Terry, from Mr. C. F. BLINCO; Fishtofts Seedling, from Messrs. W. W. JOHNSON & SON, Boston; Devonian, from Mr. O. THOMAS, Frogmore Gardens; Ivo (Canaries), from Mr. JOHN WRIGHT, Wandsworth; and Fidler's Queen, from Messrs. FIDLER & SON, Reading. These, as well as the following Onions, will be found described on p. 186, in our last issue: B cold's Banbury, and Nuneham Park ×, from Messrs. W. J. NUTTING & SON; Hurst, from Messrs. HURST & SON, Houndsditch; Wroxton, and Rousham Park, from Messrs. WATKINS & SIMPSON, Strand, London.

Mr. J. McINDOE, Hutton Park Gardens, Guisborough, Yorks, showed a dish of ripe fruits of the Burbank Plum, which are round and much resemble a Nectarine in appearance.

From H. O. HAGAN, Esq., River House, Hampton Court (gr., Mr. Last), were shown very fine "Exquisite" Peaches

FIG. 55.—VIEW OF CRIMSON RAMBLER ROSE IN THE GARDEN OF W. MARSHALL, ESQ., AUCHINRAITH, BEXLEY, KENT. (SEE P. 202.)

yellow, with a few irregular blotched lines of dark purple, the tips tinged with rose colour; lip tinged and veined reddish-rose. They also showed a fine variety of *Dendrobium Schroderianum* and other species.

Messrs. HUGH LOW & Co., Bush Hill Park, Enfield, showed *Cypripedium* × *Palawanense*, a natural hybrid, imported from North Borneo, and bearing much resemblance to *Cypripedium* × *Kimballianum*, illustrated in the *Gardeners' Chronicle*, June 29, 1895, p. 801, from a plant shown by Messrs. F. SANDER & Co., and which was also an imported variety, said to be a cross between *C. Dayanum* and *C. Rothschildianum*.

O. O. WRIGLEY, Esq., Bridge Hall, Bury (gr., Mr. Rodgers), showed *Cypripedium* × *Mrs. F. L. Ames* (*Fairleanum* × *tonsum*), with flower of the *C.* × *vexillarium* type, but with a decided green tint in the ground colour.

Sir T. G. FREAKE, Bart., Warfleet House, Dartmouth, sent *Dendrobium Phalenopsis*, Warfleet variety, with flowers of a pure white, except the lip, which had a slight yellow shade at the base, and purple veining on the front lobe.

C. L. N. INGRAM, Esq., Elstead House, Godalming, showed *Lælia* × *splendens* (*crispa* × *purpurata*), a fragrant, hybrid, with strong indication of *L. crispa* in the long, wavy, purplish crimson front lobe of the lip.

Apples we noticed good examples of Pott's Seedling, Grenadier, Keswick, Lord Suffield, Stirling Castle, Emperor Napoleon, Duchess of Oldenburgh (Kitchen); and of dessert varieties, Yellow Ingestre, Early Strawberry, Kerry Pippin, Lady Sudeley, Yorkshire Beauty, Duchess' Favourite, &c. Several varieties of Siberian Crabs, and fruiting branches of the same were shown. Sea Eagle and Princess of Wales Peaches, Denniston's Superb Greengage, Victoria Plums, Negro Largo Figs, and a few dishes of Pears were included. Of the Pears Clapp's Favourite, Mme. Treyve, and others showed signs of ripening, but fruit generally this season appears to be about a fortnight late (Silver Knightian Medal).

Messrs. SPOONER & SONS, Hounslow, Middlesex, also exhibited a collection of forty dishes of Apples, and a Bronze Banksian Medal was awarded the exhibitors.

Several new Tomatos were shown, including Stirling Castle, a roundish, smooth-fruited variety from Messrs. BARR & SON, King Street, Covent Garden, London. Yellow Peach Tomato, from the ROYAL HORTICULTURAL SOCIETY'S GARDENS, Chiswick; St. Simon, from Mr. J. H. WILSON, Handsworth, Sheffield; and Sutton's Peach Blow, from H. FAURE WALKER, Esq., Highley Manor, Balcome (gr., Mr. J. Cole). This exhibitor also showed a dish of exceptionally fine Morello Cherries, being in colour, and especially in size, very

and Pine-apple, and Rivers' Orange Nectarines (Cultural Commendation).

A new Melon, from Mr. O. THOMAS, Royal Gardens, Frogmore, was recommended a First-class Certificate. It is a white-fleshed variety, and resulted from a cross between Hero of Lockinge and Royal Ascot; it is one of the most deliciously-flavoured, white-fleshed Melons ever submitted to the committee.

Very commendable fruits of Early Grosse Mignonne Peach and Lord Napier Nectarine were shown by Mr. J. Day, gr. to Earl GALLOWAY, Galloway House, Garliestown, N.B. (Cultural Commendation). Good Sea Eagle and Princess of Wales Peaches were shown by Mr. T. ROBINSON, Elmsfield Gardens, Hollinbourne (Cultural Commendation); and a score of extra-fine fruits of Princess of Wales Peaches, from Mr. J. MILLER, gr. to Lord FOLEY, Ruxley Lodge, Claygate, Esher were also Culturally Commended.

Lecture.

THE CULTIVATION OF DISAS.

In the afternoon a paper by Mr. T. W. Birkinshaw on "The Disa" was read by the secretary (Rev. W. Wilks, M.A.), the chair being taken by Mr. Geo. Paul. Mr. Birkinshaw, who is a most successful cultivator of these charming

Orchids, after a few introductory words of appreciation of a Disa's attractiveness and utility, at once commenced to describe the details of its successful cultivation, remarking that primarily the directions were applicable to *D. grandiflora*, and its fine blood-red variety *superba*. Mr. Birkenshaw's references to the conditions under which his own plants were cultivated, went to show that they require a house to protect them from severe frost and cold draughts, but abundance of fresh air is necessary, and even during very cold weather the admission of a little air several times in the day to change the atmosphere will be of benefit to the plants. The atmosphere should not become dry during day or night. In the winter of 1894, said Mr. Birkenshaw, and owing to there being a weak boiler, the temperature of his Disa-house fell 1° or 2° below freezing point. The young growths were blackened, and the soil was quite hardened upon the surface. But by the use of cold water over the plants before the sun was upon them he prevented any injury resulting, and the same season he had forty to sixty spikes of bloom, which bore six, eight, or nine flowers upon a spike. The plants usually bloom during June and July, but by keeping the plants cool and shading them from the sun he had delayed them from flowering until July 1, and they had, then, lasted until the end of August. Disas take a short rest before growth commences, and when it is seen that the old foliage is becoming brown in tint, afford the plants water less frequently. The best time to re-pot the plants is in the latter part of September or beginning of October. Mr. Birkenshaw's practice is to re-pot them one year, and the following year merely to re-surface them and put the drainage in perfect order. Ordinary pots or pans are preferable to perforated ones. The crocks are best put ends downward, instead of flatly, and the young roots delight to run down between the crocks so placed. Cover the crocks with Sphagnum-moss, and be sure that the water will be able to pass away quickly.

For potting the plants use peat, a little dry cow-manure, and broken charcoal. Pass all through a $\frac{1}{2}$ -inch sieve, and reject the fine portion that passes through the same. The plants will require to be knocked out of the pots with care, that the roots be injured as little as possible. In potting it is best to elevate the plant a little above the rim; there is then less liability for damping to occur at the collar. The potting material may be surfaced with living sphagnum-moss and broken sandstone. Water the plants afterwards with tepid water, and remove them to their winter quarters. They should be shaded from hot sunshine, and for this purpose blinds are best, it being possible to remove them when not required. Little root-watering will be needed until after February, in which month the plants will commence to grow. During March, April, and May, however, they may be given copious supplies, and in the latter month guano at the rate of 1 oz. to 1 gallon of tepid water, if given twice a week, will be of much benefit. Mr. Birkenshaw exhibited a few flowers that his plants had produced so late as September.

BATH FLORAL FETE.

AUGUST 31 and SEPTEMBER 1.—The Bath Floral Fête was established in 1855, and ever since it has provided Bath with flower shows of an attractive character, the outdoor ones being held in the Sydney Gardens. The opening day was preceded by a boisterous night; the wind brought down a large branch from a gigantea Chestnut-tree, which fell upon the principal tent, doing some harm to the specimen plants. A brilliant day followed, and a large company came to see one of the best exhibitions held in Bath for some time past.

Fuchsias, an old-established feature, always take the lead in the schedule; and Mr. G. TUCKER was 1st with nine specimens, staging grandly grown and flowered plants, such as only the west of England can turn out. He had Diamond Jubilee, a fine bright variety of his own raising; Doel's Favourite, a local variety raised at Trowbridge some thirty years ago, and still one of the best exhibition varieties; Final, Charming and Bountiful, all dark; Western Beauty, one of Mr. James Lye's recent introductions, a rare exhibition and decorative variety; Mrs. Bright and Arabella. Mr. J. WILLERS, Bath, was 2nd with very fine, freely grown bush specimens; Mr. A. Young, gr. to Lady PITMAN, Bath, had the best six, also very good; and Mr. G. POND, Bath, had the best four; single specimens, light and dark were also staged.

The best group of plants of 100 square feet came from Mr. J. CYPHER, and was set up in his best style, and it formed a great attraction; Mr. Tauser, gr. to R. B. CATER, Esq., Bath, was 2nd with an excellent arrangement.

There was a good competition in the class for ten stove and greenhouse plants in bloom, Mr. CYPHER taking the 1st prize. Mr. GEO. TUCKER was a remarkably good 2nd; Mr. H. POCOCK, Trowbridge, had the best three plants; Mr. CYPHER had the best specimen plant, showing a fine one of *Ixora Duffii*; Mr. G. TUCKER coming 2nd with *Dipladenia Brialleyana*, specimens of which he brings to great perfection. Mr. TUCKER had the best greenhouse plant in *Statice Gilberti*.

Mr. CYPHER was the only exhibitor of six Orchids and six Heaths. The best newly-introduced plant was *Codiaeum Nestor*, from Mr. CYPHER.

Pelargoniums, or Geraniums, as they are still styled in the schedule, were good. The best six plants came from Mr. TUCKER. Cannas were small and poor in quality; and Gloxinias were decidedly good. Mr. TUCKER took the 1st prize. Lilliums, Cockscombs, and Petunias, were shown in fairly good character. Mr. Chester, gr. to E. T. D. FOXCROFT, Esq.,

had the best double-flowered Begonias; and Mr. G. TUCKER the best single ones.

Foliage plants were finely shown. In the class for twelve, with six specimens in bloom, Mr. CYPHER was 1st, with a fine collection of Palms and Codiaeums; Messrs. E. S. COLE & SON, Bath, were 2nd. Mr. G. HALLETT, Bath, had the best eight foliage plants. The best single specimen was *Codiaeum Chelsoni*, from Mr. CYPHER; Messrs. J. B. WOODS & SON, Chipping Sodbury, were 2nd, with *Cycas revoluta*.

Exotic Ferns in groups of twelve and six specimens, made a fine feature. In the former class Mr. GEORGE TUCKER was 1st, and Messrs. R. PALMER & SON 2nd. The best six came from Mr. TRUCKLE, gr. to T. CARR, Esq., Tiverton. Mr. G. TUCKER had the best specimen—a fine *Gymnogramma sulphurea*. Nice bushes of *Coleus* were also exhibited.

CUT FLOWERS.

There was always an extensive and fine display of cut flowers at Bath. The best collection of thirty-six spikes of *Gladioli* came from Mr. S. BIRD, gr. to F. H. FOX, Esq., Wellington, which comprised some very fine spikes. Mr. F. HOOPER, Bath, had the best twelve spikes.

Dahlias, in several classes, made a good display. The best twenty-four came from Mr. G. HUMPHRIES; Messrs. KEYNES, WILLIAMS & CO., Salisbury, were 2nd. Messrs. J. CRAY & SON, Frome, had the best twelve. Mr. G. HUMPHRIES had the best twelve fancies, a very good stand. Mr. J. BURGESS, Kingswood, had the best twelve bunches of single, a little over large, but very fresh and bright. Strange to say, prizes are not offered for either Cactus or Pompon varieties!

Roses were a good feature, Mr. J. MATTOCK bringing some remarkably good flowers for the season from Oxford; he was 1st with twenty-four varieties. Mr. G. GARROWAY had the best twelve. Mr. MATTOCK came in 1st with twelve Teas, showing in excellent form.

Zonal Pelargoniums in twenty-four bunches was a fine feature, Messrs. E. COOLING & SONS, Bath, taking the 1st prize with a collection containing many handsome novelties, German Asters, of the Chrysanthemum-flowered type, and the Comet type, were finely shown for the season.

Flowers of hardy herbaceous plants, in bunches of twelve, were very fine. Mr. A. A. WALTERS had the 1st prize for bold and striking bunches. Mr. GEO. GARROWAY had the best twenty-four bunches of hardy annuals, and staged a very showy and attractive collection. *Phlox Drummondii*, Stocks, African Marigolds, and double Zinnias were well represented.

Fruit.—There was a good display of fruit. The best eight dishes came from Mr. STRUGNELL, gr. to Col. DREXEL, Rood Ashton, who had good Alicante and Muscat of Alexandria Grapes, Sea Eagle Peaches, Pine-apple Nectarines, Hems Kirk Apricots, &c. Mr. G. PYME was 2nd, also with a good collection. The best eight bunches of Grapes in four varieties came from Mr. W. TAYLOR, gr. to C. BAYER, Esq., Forest Hill, London, who had excellent bunches of Black Hamburg, Muscat of Alexandria, Madresfield Court, and Gros Maroc; Mr. W. ALLON, gr. to W. MARSHALL, Esq., Taunton, was 2nd. The best three bunches of Black Hamburg came from D. E. TAYLOR, Esq., Bath. Mr. Malvern, gr. to A. R. BAILEY, Esq., Frome, had the best two bunches of Muscat of Alexandria, very good. Mr. Marshall, gr. to J. DOLE, Esq., Bristol, had the best three bunches of any other white, staging Buckland Sweetwater. The best any other black was Madresfield Court.

Melons were in plenty. The best dish of Peaches was Barrington; the best of Nectarine, Lord Napier. There were good Plums, Figs, and Cherries, with Nuts in abundance. The best three dishes of Pears were of Bourré Clairgeau. The best twelve fruits of dessert pears Pitnaston Duchess; the best three dishes of dessert Apples, were Worcester Pearmain, Duchess of Oldenburg, and Lady Sudeley. The best single dish was Lady Sudeley. The best three dishes of culinary Apples were Peasgood's Nonsuch, Ecklinville and Emperor Alexander. The best single dish consisted of Peasgood Nonsuch.

Vegetables.—Some very good vegetables were staged, the best collection of twelve dishes came from Mr. T. WILKINS, gr. to Lady T. GUEST, Henstridge; Mr. G. GARROWAY was 2nd. Mr. W. J. STOCKLEY had the best four dishes of Potatoes, and Mr. WILKINS won the 1st of the special prizes offered by Messrs. SUTTON & SONS for collections of vegetables.

Non-Competitive Exhibits.—Several miscellaneous collections of a valuable character were staged. Messrs. JARMAN & CO., Chard, had Dahlias, *Gladioli*, &c.; The Devon Chrysanthemum Nursery, Teignmouth, Dahlias and other flowers; Mr. J. B. BLACKMORE, Bath, had double and single flowered Begonias; Messrs. J. CRAY & CO., Sweet Peas, Dahlias, &c.; Mr. J. MATTOCK, a fine collection of garden Roses; Messrs. WEBB & SONS, Wordsley, cut flowers, &c.; Mr. A. A. WALTERS, Bath, a large collection of cut flowers; and Messrs. G. COOLING & SON, a table of plants and flowers, in addition to a large collection of Apples and Pears.

MAIDENHEAD HORTICULTURAL.

SEPTEMBER 1.—Last year the fortune of this Society reached a very low ebb, partly owing to bad weather, but also to a lack of enthusiasm in the executive committee, and the repetition of the same features from year to year.

There was a slight improvement on the occasion under notice, but more suitable grounds would be appreciated in which to hold the show. The groups of plants for effect were extremely good on this occasion. Fruit and vegetables were also abundantly shown, and of very good quality, outdoor Peaches and Nectarines being very good.

Plants.—Class 1 specifies twelve handsome foliage plants in 8-inch pots, which brought several good exhibits, Mr. Fulford, gr. to F. D. LAMBERT, Esq., Cookham, obtaining the 1st award with highly-coloured *Codiaeums* of Countess, Lady Zetland, Baron Frank Sellière, and Aigburthensis among others, and a *Panax Victoris* and good *Dracaenas*. Mr. Aitken, gr. to Col. MEEKING, Richings Park, Slough, was 2nd.

For six stove and greenhouse plants, three to be in flower, the latter exhibitor was 1st, with fairly good specimens; and also for six stove and greenhouse Ferns. For a single specimen flowering plant, Mr. PHILLIPS, gr. to A. N. GILBEY, Esq., Melmoth Lodge, Cookham, was 1st, with a very fine plant of *Eucharis grandiflora*, admirably flowered. Mr. FULFORD had the best specimen foliage plant, showing a finely-coloured *Croton*.

In a strong competition, Mr. Wood, gr. to Lord BOSTON, Hedsor, Maidenhead, was first for six plants suitable for table decoration. Fuchsias were fairly well shown, medium-sized, untrained specimens from Mr. PAXTON obtaining the 1st prize. Mr. J. W. STONE, Cookham Dean, was easily 1st with six nice tuberous Begonias; and Mr. PHILLIPS was the only exhibitor of zonal Pelargoniums, showing large and finely-flowered plants.

In the large-group class, Messrs. PHILLIPS and AITKEN were the chief competitors. Last year equal 1sts were awarded to these two exhibitors, but on this occasion Mr. Phillips somewhat easily beat his opponent, with an arrangement that left little room for improvement.

With a smaller semicircular group Mr. FULFORD was a long way ahead of other competitors, with a nicely arranged bank of good plants, among which *Clerodendron fallax*, *Dracena Sanderi*, and some nice Lilliums were noticeable.

Cut Flowers.—In the nurseryman's class for twenty-four Roses, Mr. G. PRINCE, Oxford, was 1st, with a good stand; 2nd, Mr. W. TAYLER, Osborn Nursery, Hampton. In the three following classes, for Dahlias and Asters, Mr. TRANTER, The Nursery, Henley-on-Thames, secured the 1st prizes.

In the amateur's classes Roses were numerous shown, but the quality was poor. Cactus Dahlias were very well staged by several exhibitors; Mr. POND, gr. to Mrs. LANG, was 1st for six bunches. Asters and Zinnias were strongly shown. With the latter Mr. POND was 1st, staging fine flowers. Mr. WOOD, Hedsor, was 1st for twelve spikes of *Gladioli*, with good specimens.

In the table decoration's class, restricted to ladies, Mrs. HERRIN, Dropmore, was 1st, also for three button-hole bouquets.

Fruit.—For a collection of six dishes, Mr. Goodman, gr. to Miss HAMMERSLEY, Abney House, Bourne End, was well 1st, with Muscat Grapes, Stirling Castle Peaches, fine Humboldt Nectarines, Kirke's Plum, and Brunswick Figs; 2nd, Mr. AITKEN. For four dishes, distinct kinds, grown in the open air, the judges gave the 1st award to an exhibit from Mr. G. LANE, gr. to Miss RIDGE, that contained two dishes of Plums, which was not according to schedule; 2nd, Mr. WOOD, with good Apricots, Plums, Peaches, and Nectarines; several other exhibitors also staging well in this class. Mr. JOHNSON, gr. to A. GILLIAT, Esq., Stoke Poges, Slough, was 1st with a fine dish of Princess of Wales Peach, and also in both classes for green and scarlet-fleshed Melons. Plums and Nectarines were staged by several exhibitors in fine condition. For Black Hamburg Grapes, Mr. LANE secured the 1st; and for any other black Grape, Mr. Blackmore, gr. to R. HAY MURRAY, Esq., Spintfield, Marlow, was 1st, with finely-coloured Madresfield Court. Mr. FULFORD was 1st for Muscats; and for any other white Grape, Mr. LANE was 1st, with Buckland's Sweetwater.

Vegetables were extensively shown, and the quality throughout was very good.

Non-competitive Exhibits were hardly so numerous as usual. Messrs. WEBB & SONS, Wordsley, Stourbridge, staged a large and interesting collection of annuals, among which the brightly-coloured Empress Larkspur was conspicuous, also seedling Carnations; Mr. R. OWEN, Castle Hill, Maidenhead, put up a large group of Cannas and floral decorations; Mr. E. F. SUEB, herbaceous flowers and annuals; Mr. G. PRINCE, Oxford, a collection of Roses in bunches; and Mrs. BROUGHTON, Norfolk Park Nursery, a group of miscellaneous plants.

HORTICULTURE AT LYONS.

SEPTEMBER 1, 2, 3, 4.—The International Horticultural Exhibition, held under the auspices of the authorities of the City of Lyons, to which allusion has been made previously in the columns of the *Gardeners' Chronicle*, was held in that city on the above dates, and, with its concomitant horticultural functions, may be pronounced to have been an unqualified success. Horticulturists, both amateur and professional, were present from all parts of France, whilst representatives attended from Great Britain, Germany, Italy, Switzerland, and elsewhere.

The arrangements made showed at one and the same time a comprehensiveness and a completeness of detail which were the admiration of everyone present, and the organising committee, under the presidency of Mr. ANTOINE RIVOIRE, is to be warmly congratulated on the successful results of its labours. The writer can personally testify to the great kindness and hospitality extended to foreign visitors on this occasion.

The exhibition was held in the spacious and beautiful square called the Place Carnot, which was fenced in for the occasion, and formed, with its magnificent monument to the Republic in the centre, an ideal location for a flower

show. Proceedings commenced with the assembling of the judges at the Secretary's tent on the show-ground, on the morning of August 31; they forthwith proceeded to the election of a president and secretary, the former office being filled by M. E. ANDRÉ, of Paris, and after being detailed into sections for judging the various classes, they adjourned to luncheon, the judging being performed in the afternoon, so that all might be ready for the opening of the exhibition to the public on the morning of September 1. All was completed in good time, and when it is stated that the schedule contained upwards of 240 classes, some idea may be formed of the work that had to be accomplished. On the evening of the opening day, a magnificent banquet was given to the judges and others interested in the exhibition, in the beautiful Salons Monnier, situated in the superb Place Bellecour; M. ANTOINE RIVOIRE presided, and after the dinner, in a graceful and elaborate speech, thanked the judges, in the name of the municipality, for their labours, to which M. ANDRÉ very happily responded.

On the afternoons of September 2 and 3, the Society of French Rosarians, of which M. OCTAVE MEYRAN is Secretary, held a Congress at the Palais des Arts, where papers on numerous questions interesting to rosarians were read, valuable discussions ensuing. On the evening of Sept. 2, the Syndicat of Horticulturists of the district of Lyons, of which Mr. PERNET-DUCHER is secretary, held a *fête* in the Salons Monnier, which was attended by a very large concourse of guests. The entertainment provided was most agreeable and instructive, one of the most interesting features being a lime-light exhibition of portraits of some forty deceased worthies of French and Belgian horticulture; each portrait was accompanied by a brief biographical notice by Mr. MEYRAN, who earned the thanks of all present for his painstaking labours in obtaining the necessary materials and information for such a unique exhibition. The whole festivities closed with a grand dinner, given by the Municipal Council of Lyons at the Town Hall on the evening of September 4.

Cut Flowers.—As regards the exhibition, it would, of course, be out of place to attempt to give a complete account of the various articles exhibited; but as some of them possessed special interest for English horticulturists, I propose to name a few that appeared to me most important from this point of view. Where, however, the material for election is so vast, and the quality of almost everything so good, it is not easy to make a selection, and I must claim the indulgence of your French readers for any errors of omission of which I appear to have been guilty. One of the most striking groups in the show was the large collection of cut blooms of Gladioli sent by M. LEMOINE, of Nancy. This included the cream of his introductions, and many of his finest seedlings not yet in commerce of the Lemoinei and Nanceianus sections, and it is difficult indeed to do justice to the richness and beauty of colour and form which distinguished the flowers of which this group consisted. Every shade of cream, yellow, fawn, rose, scarlet, crimson, and purple, almost to blackness, and likewise pure white, appeared to be present, the rich and brilliant ground hues of the flowers being blotched, dashed, striped, and shaded with other harmonious, though strangely contrasting colours of equal softness, brilliancy, and beauty. The general effect of this group was extremely beautiful, and it created quite a sensation in the show. It is difficult to believe that such a variety of tints could be found in any other flower. Gladioli in fine variety, principally of the Gandavensis race, were also well shown by Messrs. VILMORIN, ANDRIEUX & Co., of Paris.

Three classes of flowers for which the horticulturists of Lyons have long been famous, viz., Roses, Carnations, and Cannas, were of course much in evidence. Carnations and Cannas were exceptionally fine; but, owing to the prolonged heat and drought, the Roses were below the usual quality—indeed, a visit to the parched grounds of some of the best-known rosarians the day before the show made me wonder if any flowers at all would be forthcoming. No fewer than fifteen classes were allotted to Roses in the schedule, but in several there were no entries; and such groups as were exhibited did not present any special features. M. PERNET-DUCHER showed some nice flowers, not entered for competition, and he also received the Gold Medal for his seedling Soleil d'Or, a Rose of some interest, being a variety of *Rosea lutea*, blooming in autumn as well as in summer. The flower exhibited on this occasion was of medium size, full, and of the colour of Persian Yellow, shaded in the centre with the coppery-red tints of the Austrian Copper. It may be remarked in reference to this, that at another continental Rose-show last year, an autumn-blooming seedling of *Rosa lutea* from another source was exhibited; so that, without doubt, independently of any sports that may have accidentally bloomed in autumn in this country, we are now within measurable distance of having our gardens enriched in autumn with flowers of the rich and brilliant yellow tints of the *Rosa Harrisoni* and the Persian Yellow. Another seedling Rose came from M. BONNAIRE, and was named Madame Jacques Charraton; it received a Silver-gilt Medal. Carnations were exhibited by many growers; they are of the perpetual-flowering race, and were presented in large tufts, densely flowered, of all shades of colour; arranged in beds and masses on the cool green turf of the Place Carnot, they looked exquisite. M. CHAVAGNON received the premier prize, a Gold Medal, for them; but many other groups were also very fine.

Cannas, like Carnations, were shown by many growers, and were exceedingly beautiful, the lustrous tints of scarlet and crimson exhibiting an unusual brilliancy under the rays of a southern sun. Mr. MOLIN had an enormous collection of these plants in large pots, which completely surrounded

the Statue of the Republic. This was really a splendid exhibit, and among the host of varieties of which it was composed, may be mentioned as being especially fine—Menelik, scarlet; Auguste van den Heede, salmon-orange; Comte de Bouchaud, yellow, heavily spotted crimson; and the dwarf-growing Etandard, orange-crimson; Souvenir d'Antoine Crozy, scarlet, edged yellow; and Madame Favrichon, crimson, the last named was also shown in another place by M. FAVRICHON. Other flowers of special interest and merit were *Lobelia Gerardi* in variety, shown by Messrs. RIVOIRE; zonal *Pelargoniums* by Mr. ROZAIN-BOUCHARLAT, and others, some of the flowers rayed beautifully, and spotted with minute dots; annual and biennial plants, magnificent groups by Messrs. LEONARD LILLE of Lyons and VILMORIN of Paris; and "Oleanders" from several quarters. Mention must also be made of a fine group of aquatic plants in flower, shown by Mr. LAGRANGE, this included the new *Nymphæas*, now becoming so popular; one variety, *N. Marie Lagrange*, has large pink flowers, with a white stripe, and was shown in excellent condition.

Stove and Greenhouse Foliage and Flowering Plants.—These were largely exhibited, and were very fine. The principal prize of the show, the "Grand Prix d'Honneur," for the exhibitor who most contributed to the splendour of the exhibition, was awarded to Mr. B. COMTE, whose exhibits consisted of these plants.

Vegetables and Fruits showed in many classes the effects of the drought, but exception must be made in the case of the magnificent collection of the former, which was set up by Messrs. RIVOIRE & SON, and obtained the prize of honour in this section. It was an immense collection, almost bewildering in the number of its details, and plainly showing the many varieties of soil and climate for which this justly celebrated firm has to cater. Perpetual-bearing Strawberries were well exhibited, one kind, called *La Constante Fécondé*, being particularly good.

Hardy Trees and Shrubs—Excellent collections of Conifers, Hollies, Yews, Aucubas, and other hardy evergreens were shown by Messrs. JACQUIER, TREYVE, MOREL, and others; and a very distinct and striking group was a collection of some twelve varieties of *Magnolia grandiflora*, shown by Messrs. TREYVE.

No horticulturist on a visit to the beautifully situated City of Lyons would think of leaving without visiting the splendid Parc de la Tête d'Or, with its well-kept botanical garden. At the time of the show, the glorious hues of the bedding plants in the Parc bore testimony to the magnificent summer climate of this horticultural centre of France, as well as to the energy and skill of her sons, and the excellent culture everywhere apparent there formed a fitting complement to the beauties of the exhibition in the Place Carnot. *Arthur William Paul, Waltham Cross.*

NATIONAL DAHLIA.

SEPTEMBER 2, 3.—The annual show of the National Dahlia Society was held at the Crystal Palace on the above dates, in glorious weather. The general drought that has obtained, did not influence the character of the exhibition to a great extent. The "show" blooms were hardly so large and heavy as we have seen them; and the "Cactus" varieties, perhaps, failed to create so magnificent a display as last year, when they were exceptionally fine. But the Pompons were as nice as ever, and the few single-flowered ones shown were magnificent, whilst in the extent of the exhibition we believe there was little to regret. As will be seen below there was a number of novelties voted worthy of the National Society's First-class Certificate.

SHOW AND FANCY BLOOMS INTERMIXED.

The best exhibit of sixty blooms, distinct, was a collection of brightly-coloured, clean, not excessively large blooms, from Mr. J. WALKER, Thame, Oxon. The prettiest varieties in this extensive collection were the following: Wm. Powell, yellow; Sydney Humphries, rosy-purple; Florence Tranter, white, edged rose; Daniel Cornish, bright crimson; Arthur Ocock, a brighter crimson; Hercules, yellow, flaked, and irregularly marked with crimson; Kathleen, pale lilac, with light centre; Muriel Hobbs, a delicate but rich shade of yellow; Herbert Turner, white, or palest blush; Eclipse, a moderately-sized bright but intense scarlet; Maud Fellowes, pale purple with light centre; Virginale, whitish, but edged deeply with bright purple; J. C. Vaughan, yellow; J. S. West, purple shade of crimson, with yellowish centre; Mrs. Gladstone, blush-pink centre, cream-coloured; Duchess of York; John Walker, white; Mrs. Langtry, buff, deeply edged red; and Victor, deepest crimson. Close upon the heels of Mr. Walker was the Slough specialist, Mr. CHAS. TURNER, of the Royal Nurseries, whose blooms were generally a little smaller, but very praiseworthy; John Bennett, a red and buff flower, was the most distinct in this collection, but many others were of pretty tints. Mr. S. MORTIMER, of Farnham, was 3rd.

Mr. CHAS. TURNER had the satisfaction of winning the 1st prize for a collection of forty-eight blooms, distinct; and as being a first-class collection of that number of varieties, we append the names thereof: Jas. Cocker, Harrison Weir, H. Walton, Mrs. W. Slack, Imperial, Grand Sultan, Geo. Rawlings, Constance, John Standish, Maud Fellowes, Major Bartlett, Victor, Rev. J. B. M. Camm, Alice Emily, J. T. West, and Wm. Keith, back row; Mrs. Gladstone, Duke of Fife, Clara, Crimson King, Jno. Bennett, Gloire de Lyon, Prince of Denmark, Mrs. David Saunders, Shirley Hibberd, Earl of Ravensworth, Prince Bismarck, Hon. Mrs. Windham, States-

man, Goldfinch (a very pretty-coloured variety, being buff with crimson edge), Dante, and Miss Cannell, centre; and Wm. Powell, Ethel Britton, Duchess of York, Matthew Campbell, Goldfinger, John Forbes, Jno. Hickling, John Walter, A. Ocock, R. T. Rawlings, Arthur Rawlings, Mrs. Saunders, Hope, Colonel, Flag of Truce, and Sunbeam, at front line. The position being reversed in this class. Mr. J. WALKER, Thame, was the exhibitor of the 2nd prize collection; and he was followed by Messrs. KEYNES, WILLIAMS & Co., Salisbury, and Mr. S. MORTIMER, Farnham, in the order given.

Next in importance was the class for thirty-six blooms, distinct, and it was won by Mr. W. TRESEDER, of Cardiff, who appears to be showing Dahlias with increasing success. A point that should be counted to the credit of this exhibitor was the fact that he attached a label to each bloom, and these were written plainly, an uncommon event at a Dahlia show. These blooms excelled most in point of colour. Mr. G. HUMPHRIES, Kingston Langley, Chippenham, was very little behind the Welshman, however, and the judging must have been by points only. The 3rd place was taken by Messrs. KIMBERLEY & SON, Stoke Nursery, Coventry; and Mr. M. V. SEALE, Sevenoaks, was 4th.

In the twenty-four blooms, distinct, class, the 1st prize went to Mr. G. HUMPHRIES, who rather narrowly beat Messrs. KIMBERLEY & SON; Mr. M. V. SEALE, Sevenoaks, was 3rd; and the 4th position fell to Messrs. J. CHEAL & SONS, Lowfield Nurseries, Crawley.

The best twelve blooms, distinct, were from Mr. J. STREDWICK, St. Leonards, who had among other varieties Prof. Fawcett, Colonel, Crimson Ring, Warrior, Mr. Campbell, T. J. Saltmarsh, John Hickling, Dazzler, Mr. Harris, and Our President; these blooms were very praiseworthy. The 2nd prize went to Mr. J. R. TRANTER, Henley-on-Thames; and the 3rd to Mr. W. BAXTER, The Nurseries, Woking.

Fancy Blooms.—The best twelve blooms, distinct, in this section, where the petals are all more or less flaked, tipped, or edged with a secondary colour or tint, was from Mr. J. WALKER, and he staged the following varieties: Rebecca, Mrs. Mortimer, a large, yellow bloom, slightly marked, at centre of each petal with pale purple; S. Mortimer, Duchess of Albany, Buffalo Bill, Comte de la Saux, Hercules, Prof. Fawcett, Choister, Mrs. Saunders, Dorothy, and Rev. J. B. M. Camm. Following Mr. Walker was Messrs. KEYNES, WILLIAMS & Co., who had a very large proportion of yellow and buff varieties, only one being purple; and Mr. G. HUMPHRIES was 3rd.

Cactus blooms.—In these classes was the greatest advancement evident. The character of the blooms has been changed exceedingly during the last few years. The 1st class was for eighteen bunches of six blooms each, and the winners were Messrs. J. BURRELL & Co., Cambridge. The most conspicuous and attractive varieties in the stand were Regular, crimson; Mrs. Peart, white; Starfish, scarlet; Charles Woodbridge, crimson; Harmony, a charming variety of distinct tints; Lucius, a narrow-petalled scarlet; Fantasy, one of the most distinct; Arachne, white and scarlet; Night, exceeding deep; and Lady Penzance, a lovely clear yellow. Messrs. KEYNES, WILLIAMS & Co. were 2nd, and they included several new seedlings. Of these we well liked Exquisite, a reddish-salmon self; Captain Broad, an uncommonly bright scarlet, but of not quite the florist's best form; Radiance, Lady Lonsdale, Wallace, and others are promising. The 3rd prize was taken by Messrs. J. CHEAL & SONS, and the 4th by Mr. G. STREDWICK.

The best twelve bunches in as many varieties came from Mr. S. MORTIMER. The varieties were Mary Service, Fusilier, Harry Stredwick, Keynes' White, Lady Penzance, Night, exceptionally good; Starfish, Miss A. Nightingale, Alfred Vasey, Chas. Woodbridge, Britannia, and Fantasy. The only weak bunch was that of Keynes' White. 2nd, Mr. M. V. SEALE, Sevenoaks; and 3rd, Mr. G. HUMPHRIES. There were five competitors.

The class for twenty-four blooms, distinct, is a disappointing one. The lovely Cactus varieties are best shown in sprays. Their beauty is lost on the flat surface of the show boxes. The 1st prize was awarded to Messrs. J. BURRELL & Co., the 2nd to Messrs. KEYNES, WILLIAMS & Co., the 3rd to Messrs. J. CHEAL & SONS. There were eight competitors.

Pompons.—It is pleasing to note a greater tendency on the part of exhibitors to show the blooms of this type in typical condition in regard to size. The largest class for these was for twenty-four bunches, distinct, ten blooms of each. The 1st prize went to Mr. M. V. SEALE, whose exhibit included, for the most part, the best types of this section. Particularly pretty were Bacchus, Dr. Finn, Eva, Sunny Daybreak, Rosebud, Emily Hopper, Jessica, Ernest Harpe, Adrienne, Amber Queen, Phoebe, Little Sweetheart, and Lilian; Messrs. J. CHEAL & SONS were 2nd, the flowers being very brightly coloured, but scarcely so refined as those in the premier exhibit; 3rd, Mr. C. TURNER. There were four exhibitors in this class.

The winners of the class for twelve varieties were Messrs. BURRELL & Co., and they staged the following varieties: Bacchus, George Brinckman, Arthur West, E. F. Jungker, Janet, Tommy Keith, Emily Hopper, Eurydice, Whisper, Douglas, Nerissa, and Isabel; Mr. G. HUMPHRIES was a good 2nd, showing pretty little blooms of nice colour; and Mr. J. STREDWICK was 3rd.

Single-flowered Varieties.—There were only two exhibits in the class for twenty-four bunches distinct, ten blooms of each.

The prettiest flowers in the 1st prize stand of Messrs. J. CHEAL & SONS, were Mrs. Coninck, white centre, purple edge; Cleopatra, exquisite in form, and a good crimson self

Donna Casilda, in which three tints at least may be observed, but which reflexes rather badly; Formosa, scarlet self; Beauty's Eye, a distinctly marked, but rather less-refined flower than many; Miss Morland, crimson; Aurora, and Duchess of Marlborough. We include the last-named variety from its fine colouring, but its cup-like form is by no means deserving of encouragement. The 2nd prize went to Mr. SEALE, who had also a pretty lot of flowers.

AMATEURS.

Show and Fancy Blooms Intermixed.—The exhibits from amateur growers were eminently satisfactory. The 1st prize for these was won by Mr. BURGIN, St. Neot's, Hunts, who showed large blooms of good quality, composed of show and fancy varieties in almost equal proportion; T. ANSTISS, Esq., Brill, was 2nd, and he had a very fine bloom of Majestic, and some others; T. HOBBS, Esq., Bristol, 3rd. There were five or more exhibitors.

The winner of the class for eighteen blooms distinct, was Mr. R. C. WEST, Northlands, Salisbury, who had a very even lot of high-class blooms.

Show Varieties Only.—The best twelve blooms were from Mr. S. COOPER, Chippenham, who had nice blooms, but neither this exhibit, nor the only other exhibit in the class, had names attached to the varieties.

C. F. KEEPER, Esq., 59, Sunny Hill Road, Streatham, S.W., had the best six blooms, showing Mrs. W. Slack, Victor, R. T. Rawlings, Miss Cannell, Lord Chelmsford, and Duchess of York; Mr. E. WEST, Jr., Henley-on-Thames, was given 2nd place; and H. A. NEEDS, Esq., Horsell, Woking, the 3rd.

Fancy Varieties.—The best exhibit of twelve blooms was from Mr. R. BURGIN, St. Neot's, whose blooms were of capital quality. Frank Pearce was uncommonly good, and the remaining varieties were Duchess of Albany, Lottie Eckford, Mrs. N. Halls, Peacock, Gaiety, Rev. J. B. M. Camm, Mrs. Saunders, Dazzler, Henry Eckford, T. W. Girdlestone, and Matthew Campbell. The 2nd prize was won by Mr. S. COOPER, Chippenham; and the 3rd by T. ANSTISS, Esq.

Mr. R. C. WEST had the best collection of six blooms, showing the Rev. Camm, General Grant, Duchess of Albany, Emin Pasha, Mrs. J. Downie, and Comte de la Scaux; 2nd, Mr. E. JEFFRIES, Langley Burrell, Chippenham.

Cactus Blooms.—The best collection of twelve varieties in bunches of six blooms was from Mr. R. KEEBLE, gr. to F. W. SHARP, Esq., Twyford. He had in excellent condition the varieties Miss A. Jones, J. E. Frewer, Starfish, Matchless, Mrs. Montefiore, and Beatrice. A good 2nd was Mr. J. HUDSON, Gunnersbury House Gardens, Acton, who had smaller flowers, but varieties most characteristic of the type; Arachne, Fantasy, Regulus, Starfish, and others were very good. 3rd, Mr. W. MIST, Ightham, Sevenoaks.

The best six were from H. A. NEEDS, Esq., Horsell, Woking; he staged Starfish, Gloriosa, Matchless, Charles Woodbridge, Mrs. Wilson Noble, and Mrs. Barnes. Mr. R. C. WEST, Northlands, was 2nd, and Ed. MAWLEY, Esq., 3rd.

The best collection of nine varieties in bunches of three blooms was from H. A. NEEDS, Esq. In this stand were excellent blooms of Miss A. Nightingale, Lady Penzance, Chas Woodbridge, Starfish, and Harry Stredwick.

Pompons.—The best six bunches of ten blooms each were from Mr. G. WYATT, gr. to S. HILDITCH, Esq., Twickenham; these were very pretty little blooms, and the varieties as follows: Little Sweetheart, Phoebe, Tommy Keith, Dr. Jim, Nerissa, and Bacchus; it was a very praiseworthy exhibit. Mr. J. HUDSON was 2nd, and W. C. PAGRAM, Esq., Weybridge, 3rd. The same number of varieties in bunches of six blooms only were best from Mr. R. C. WEST, whose blooms of Bacchus, Dr. Jim, Emily Hopper, and Sunny Daybreak were very good; 2nd, C. F. WOOD, Esq., Heathfield, Reigate; and 3rd, Mr. R. BURGIN, St. Neot's.

Single-flowered Varieties.—T. W. GIRDLESTONE, Esq., of Sunningdale, Berks, had the best exhibit of six varieties, in sprays of ten blooms each, and each of these varieties was exquisitely pretty: Naome Tighe, yellow, with reddish ring around the disc; Donna Casilda, purple and red; Polly Eccles, orange buff, with brownish crimson ring; Puck (new), light brown, with intense ring of deep crimson; Eric (new), of exquisite form, and peculiar satiny tint; all these were really attractive. Mr. JAS. HUDSON was 2nd, with more showy varieties.

The same number of varieties, in bunches of six blooms, were best from Mr. ED. MAWLEY, the varieties W. C. Harvey, Miss Roberts, Demon, and Northern Star being very good. J. PETERS, Esq., Horley Station, was 2nd.

Dahlias in Decoration.—The prettiest "shower" bouquet was one from Mr. W. TRESEDER, Cardiff. It was composed of blooms of Cactus Dahlia Mabel Keith, a variety with blooms having yellow-tinted centre, and outer petals of mauve. With well-coloured Croton leaves, sprays of Asparagus plumosus, and the usual ribbons, a very pleasing effect was produced. Mr. M. V. SEALE, Sevenoaks, was 2nd.

The best epergne was arranged by Mr. HUDSON, Gunnersbury House, Acton. Pompon and single-flowered varieties were alone used in this case; and Mr. E. MAWLEY, Rosebank, Berkhamstead, had the best vase of Dahlia blooms. In this class the 1st prize exhibit was well but not heavily furnished with blooms; the vase gaining 2nd prize, on the other hand, being insufficiently showy, apparently through a desire to avoid crowding.

OPEN CLASSES.

The class for eighteen varieties of Fancy single Dahlias, as shown in bunches of twelve blooms, brought a delightful exhibit from Mr. T. W. GIRDLESTONE, the President of the Society. The Fancy single Dahlias stand the same relation

to the self-coloured and edged flowers as to the Fancy Show Dahlias to those technically known as Show Dahlias, and they are either striped or tipped, some lighter colour being on a dark ground.

Nearly the whole of Mr. Girdlestone's blooms were new varieties of his own raising, such as Tommy, yellow, heavily flaked and pencilled with bright crimson; Violet Forbes, white, broadly edged with deep crimson; Ganem, orange, flaked with crimson; Nan, bright red, broadly margined with white; Tommy Tucker, orange-scarlet, slightly flaked; Bal Masque, maroon and purplish-crimson, tipped white; Princess Petula, yellow, tipped and flaked with pale purple; Creole, cream, with side margins of bright crimson; Splosh, yellow, flaked and striped with dark crimson; Ruy Blas, orange-salmon, striped with dark orange-red; Louise, side margins crimson, with a flame of white reaching to the tip; Suzette, white, with side margins of pale brick-red, and with these, Folly, Trilby, Jeannette, Jack Sheppard, and Phyllis, probably one of the best stands Mr. GIRDLESTONE has ever set up; Mr. M. V. SEALE was 2nd, with such pretty varieties as Tommy Harter, Emmie, Paragon, Folly, Dorothy Seale, Gulielma, Duchess of Albany, Phyllis, &c.; Messrs. J. CHEAL & SONS were 3rd. All three collections were remarkably good.

The best six blooms of any dark Dahlia were those of Rev. J. Godday, shown by Mr. J. WALKER; Mr. GEO. HUMPHRIES came 2nd; and Mr. S. MORTIMER 3rd, both with Arthur Rawlings. Six blooms of any light, not yellow, 1st, Mr. R. E. WEST, with Mrs. Gladstone; Mr. J. R. TRANTER came 2nd, with the same; and Mr. J. WALKER 3rd, with Mrs. Morgan. Six blooms of a yellow Dahlia, 1st, Mr. J. WALKER, with J. Hickling, very fine; 2nd, Mr. S. MORTIMER; and 3rd, Mr. M. V. SEALE, with R. T. Rawlings. Six blooms of a red variety, 1st, Mr. S. MORTIMER, with James Stephen; 2nd, Mr. R. E. WEST; and 3rd, Mr. SEALE, both with Duke of Fife. The best white was John Walker, from Mr. S. MORTIMER; Mr. J. WALKER was 2nd; and Mr. WEST, 3rd, with the same. With six blooms of any other colour Mr. SEALE was 1st, with Duchess of York, no other prizes being awarded. The best tipped Dahlia was Comedian (fancy), shown in fine character by Mr. J. WALKER; Mr. SEALE was 2nd, with Mrs. Saunders; and Messrs. J. E. FREWER & Co., Stowmarket, 3rd, with Peacock. The best striped was Rebecca (fancy), from Mr. J. WALKER; Mr. T. ANSTISS was 2nd, with Emin Pasha; and Mr. MORTIMER, 3rd, with Duchess of Albany. Mr. J. WALKER had the best six blooms of any tipped Dahlia, staging Miss Cannell; Mr. MORTIMER was 2nd, with Rosamond; and Mr. SEALE, 3rd, with J. T. WEST.

The Silver Cup given by P. A. Fellowes, Esq., for the best bloom, show or fancy, in the exhibition, was awarded to Mr. J. WALKER, for the yellow self William Powell. The special prizes offered by Thomas Hobbs, Esq., for the best show and also for the best fancy Dahlias exhibited by amateurs, were won by Mr. R. BURGIN, St. Neot's: the first with self Arthur Rawlings, the second with fancy Frank Pearce. The special prizes offered by Mr. A. DEAN for the best bunch of a white Cactus Dahlia, was taken by Messrs. KEYNES, WILLIAMS & Co., with Keynes' White. The special prize offered by Mr. R. DEAN for the best bunch of a new Cactus Dahlia exhibited for the first time, was won by Messrs. J. BURRELL & Co., with Lucius.

SEEDLING DAHLIAS.

But very few of the show or fancy type were produced as new. Mr. G. HUMPHRIES received a Certificate of Merit for David Johnson, a promising self of a salmon colour, the reverse of the petals slightly flushed with purple; and the same award was made to Messrs. KEYNES, WILLIAMS & Co., for fancy Dahlia Watchman—yellow ground, heavily flaked and striped with dark crimson; a finely-formed flower of a promising character. Pompons Snowflake (SEALE), a beautifully-formed pure-white variety; and Claribel (C. TURNER), pale ground tipped with deep purple; and Pompon Cactus Mrs. Holford (CHEAL), as a garden variety received the same award. Cactus Magnificent (STREDWICK), soft pale salmon; Lucius (BURRELL), bright orange-scarlet—very fine; Clown (KEYNES & Co.), dull red tipped with white; Countess of Lonsdale (KEYNES & Co.), orange-salmon tipped with purple; and Antelope (BURRELL), bright corise-scarlet, all received Certificates of Merit. As did also single flowered Leslie Seale (SEALE), dark crimson ring margined with pale lilac; and Eric (GIRDLESTONE).

Non-competitive Exhibits.—Mr. J. R. BOX, West Wickham and Croydon Nurseries, showed sprays of fine double flowering tuberous Begonias, cut from the open ground. Mr. JOHN GREEN, Dereham Nurseries, Norfolk, showed a considerable variety of Dahlia blooms, and included an immense flower from a seedling; this was named Red Rover, and was 8 inches across. It is a brilliant colour, and about equal "Cactus" form to the old Juarezii. Messrs. DOBBIE & Co., Rothsay, N.B., furnished a stand with Dahlia blooms, chiefly of the Pompon and "Cactus" sections; and another such collection was shown by Mr. THOS. S. WARE, Hale Farm Nurseries, Tottenham. Messrs. J. FEED & SONS, Roupell Park Nurseries, Norwood Road, London, in addition to a collection of Dahlia blooms, had also a few hardy flowers. And Messrs. CARTER, PAGE & Co., London Wall, E.C., had a very showy stand of Dahlia flowers.

NATIONAL CHRYSANTHEMUM.

SEPTEMBER 6, 7, 8.—The first show of the season by the National Chrysanthemum Society was held in the Royal Aquarium, Westminster, on the above dates. There were few

Chrysanthemums staged, but a large display of Dahlias and Gladioli blooms made an exhibition of some attractiveness. Some of the cut Chrysanthemums, and the single-flowered Dahlias especially, soon became the worse for the hot atmosphere of the building, and on the second day of the show these presented a much faded appearance. Cut flowers of Chrysanthemums, with few exceptions, were very poor.

CHRYSANTHEMUMS.

There appeared to be only one exhibit in the class for twelve bunches of Chrysanthemums, distinct, and it was shown by Mr. ERIC F. SUCH of Maidenhead. We noticed no new variety of importance in the collection.

Mr. ERIC F. SUCH had the best six bunches of Chrysanthemums, and his exhibit included Harvest Home, Piercy's Seedling, and others. The same exhibitor won 1st prize for the best dozen blooms of an early-flowering variety, other than Madame C. Desgranges and its sports, showing Lady Fitzwigram.

The best dozen blooms of Madame C. Desgranges were from Mr. W. Perrin, gr. to C. W. RICHARDSON, Esq., Sawbridge-worth; whilst slightly smaller blooms from Mr. Chas. Crooks, gr. to the Dowager Lady HINDLIP, Hadsor House, Droitwich, were given 2nd prize.

Miss DEBENHAM, St. Peter's, St. Albans, won 1st prize for twelve bunches of Pompons. Her varieties were Madame Galeus, Mdle. Jolivat, California, Alice Butcher, Précoceité, Piercy's Seedling, Mrs. Cullingford, and Strathmeath. Mr. E. F. SUCH was 2nd; and Mr. S. J. COOK, gr. to A. N. STEPHENS, Esq., Holmwood, Hendon, 3rd.

Mr. NORMAN DAVIS, Framfield, Sussex, showed very well in the class for a collection of cut flowers of Chrysanthemums, any type. The blooms in most cases were of good size and in fine character, especially Harvest Home, Mrs. Hawkins, Mdle. Marie Masse, Lady Fitzwigram, &c.

A very handsome epergne was tastefully decorated with Chrysanthemum blooms, and suitable greenery for relief, by Mr. W. C. VINCE, Spring Villa, Thornhill Road, Leyton, who was 1st in this class; Mr. J. ROSE, 23, Charlotte Street, Plumstead, being 2nd.

Mr. W. WELLS, Earlswood Nurseries, Redhill, showed a collection of cut Chrysanthemums in variety. Among these were noted nice bunches of Bronze Bride, Harvest Home, Madame Marie Masse, Arthur Crepey (yellow), Longfellow, Albert Chausson, Sam Barlow, Mychett White, &c. Mr. W. WELLS, was also awarded a First-Class Certificate for Chrysanthemum Louis Lemoine, a sport from Grunerwald.

Mr. H. J. JONES had a group of Chrysanthemums in pots, faced by plants of tuberous and fibrous-rooted Begonias, Dracenas, Caladiums, &c. Among the plants were several of a new, early, white-flowering Chrysanthemum named May Manor. It is of a large size, white, with lemon-coloured centre, and will be useful (First-class Certificate). Mr. JONES had fruits also of a new Tomato named Challenger.

Mr. J. H. WITTY, Nunhead Cemetery, had a circular group of Chrysanthemums in pots, a very meritorious one.

Messrs. CANNELL & SONS, Swanley, Kent, showed heads of fine Cockcombs, and cut flowers of the earlier flowering Chrysanthemums; and Mr. J. R. CHARD, Stoke Newington showed some epergnes, very tastefully decorated with Chrysanthemum blooms.

DAHLIAS.

Mr. JNO. WALKER, nurseryman, High Street, Thame, took the leading prize for forty-eight blooms of Dahlias, in not fewer than thirty-six varieties; Mr. CHAS. TURNER followed. Mr. J. WALKER was also most successful in the class for thirty-six blooms, distinct.

For twenty-four blooms, distinct, Mr. GEO. HUMPHRIES, Kington Langley, Chippenham, was 1st; and in a similar class reserved for amateurs and gardeners, Mr. T. AUSTIN, Brill, Bucks, was 1st.

Messrs. J. BURRELL & Co., Howe House Nurseries, Cambridge, had 1st prize for eighteen bunches of Cactus varieties, distinct; and Messrs. KEYNES, WILLIAMS & Co. were 2nd.

The 1st prize for twenty-four bunches of Pompon Dahlias, distinct, went to Mr. CHAS. TURNER, Royal Nurseries, Slough; and Mr. M. V. SEALE, Sevenoaks, was 2nd.

The best twelve bunches of Pompons came from Messrs. J. BURRELL & Co., Howe House Nurseries.

Mr. S. MORTIMER had 1st position for a collection of twelve bunches of Cactus varieties.

In the open class for twenty-four bunches of single-flowered Dahlias, distinct, Mr. F. W. SEALE, Sevenoaks, was 1st; and T. W. GIRDLESTONE, Esq., Sunningdale, Berks, had 1st prize for a collection of twelve bunches.

Mr. JNO. GREEN, Nurseries, Dereham, Norfolk, showed a collection of Dahlia blooms, in which the system of display was very distinct, and of considerable effectiveness.

Mr. T. S. WARE, Hale Farm Nurseries, had a very showy display of Dahlias upon the floor of the building. There was a large central cone or pyramid, and smaller ones at each corner. A few plants were interspersed in the exhibit, which was certainly a very gay one.

Mr. M. V. SEALE had a non-competitive exhibit of Dahlia blooms; and Mr. JNO. MATTOCK, New Headington, Oxford, had a stand furnished with fragrant Roses.

GLADIOLI.

Messrs. J. BURRELL & Co. had the 1st prize for a collection of Gladioli spikes, showing upwards of fifteen dozen spikes of blooms. Messrs. HARKNESS & SONS, Hitchin and Bedale, had also a display of Gladioli.

TRADE NOTICE.

FROM a prospectus just to hand we notice that the old-established nursery and seed business of W. H. Rogers, Red Lodge Nursery, Southampton, is to be made a limited liability company. Alderman W. H. Rogers, owing to advanced age, will retire from an active management in the business, but the three new directors will include Mr. A. C. Rogers, the vendor's son. The capital of the new company, W. H. Rogers & Son, Ltd., will consist of £20,000, out of which £13,000 will be paid for the acquirement of the business. The subscription lists opened on the 8th inst., and will close on or before Thursday, the 15th inst.

USEFUL INVENTIONS.

A POTATO-PLANTER, AND TURF AÉRATOR AND WEED-KILLER.

At the great trials of implements at the Royal Agricultural Society in 1896, Messrs. Ransome, Sims & Jefferies obtained a First and Second Prizes for Potato-planters; and this year they showed a new implement equal in all other respects to their first prize designs, but fitted with a finger-and-thumb contrivance, which picks up the Potato sets without injuring them, and by means of a cam the sets successively drop into their places in the furrow made by the plough fixed in front of the planter as if placed by hand. The machine not only opens the furrow, but marks the position of next bout.

The other implement, by the same firm of implement makers, is intended for aerating and renovating turf or old pasture land. It has a flat-cutting share 1 foot broad, which works at about 2½ inches below the surface, thus cutting through the roots of weeds, but leaving the turf whole and unimpaired. The slice of turf, guided by two side-blades, passes over the convex surface of the share and is deposited in its place in the rear, after being loosened in its passage. The machine is provided with small grubbers or harrow-tines, which loosen the subsoil as it passes along, facilitating the passage of the roots of the grasses to a greater depth in the soil.

Obituary.

ISIDORE BUSCH.—The death, in his seventy-seventh year, of this well-known American nurseryman, founder and head of the firm of Busch, Son, and Meissner, Grape Growing Co., in Buschberg, Missouri, and president of the Isidor Busch Wine and Liqueur Co., of St. Louis, took place at the latter place on August 5. With the death of Isidore Busch, who did much for Grape-culture, wine-manufacture, and horticulture generally in the United States, there passed away one of the few living Germans who took part in the revolutionary outbreak of March, 1848. For the part he took in that rising he thought it necessary to leave his native land soon afterwards. He chose America as his home, settling at St. Louis, and carrying on the cultivation of the Vine at a neighbouring town, called in his honour Buschberg. The deceased was one of the first, if not the first, who, on the appearance of the Phylloxera devastans in Europe, successfully imported American Vines to this side of the Atlantic. He was the author of a work on Vine culture, which has seen its fourth edition, and has been translated into five different languages. It was the firm of Busch which was the first in America to carry out the wholesale propagation under glass of Vines from single eyes. *Deutsche, Gärtner Zeitung.*

MR. MATTHEW RUSSELL OF HATFIELD, MYTCHETT, HANTS.—We regret to announce the death of Mr. Matthew Russell at the early age of 48, which took place on Saturday, August 27. Mr. Russell was well known to the cultivators of the Chrysanthemum, having been a very successful raiser of many fine seedlings that have been distributed by Messrs. Jones, Wells, and others, and was the raiser of the celebrated Mytchett White, also the Early Giant

Strawberry; he leaves behind many seedling Chrysanthemums of great merit, besides unbloomed seedlings. Mr. Russell was the third son of the late Matthew Russell of Fishergate, Sussex. He was gardener at Henfield for several years, and a member of the Adne Lodge of Freemasons. He came to Mytchett in 1892, where he made many friends, and was only recently elected a member of the Frimley Urban Council; he was buried at Frimley on Wednesday, August 31, many friends following him to the grave.

MURRAY FINCH-HATTON, EARL OF WINCHILSEA.—The Earl of Winchilsea died on Wednesday, Sept. 7, at Haverholme Priory, near Sleaford, in the presence of his family, after a long illness. His lordship, who is succeeded by the Hon. Henry Stormont Finch-Hatton, was the twelfth earl, having succeeded his half-brother in the title in 1887. When the Agricultural Congress was held in 1892, at St. James's Hall, during the Smithfield Show week, *Punch* published a cartoon which represented agriculture as seeking, but failing to find, the "missing word." "Union" was suggested by Lord Winchilsea as being the solution of the puzzle, and afterwards he acted on his own suggestion by establishing the National Agricultural Union, with the object of uniting agriculturists, and to induce them to co-operate in all matters of mutual interest. In season and out of season his lordship preached co-operation as applied to agriculturists, and in his newspaper, *The Cable*, he wrote article after article, driving home the same truth.

[The term "accumulated temperature" indicates the aggregate amount, as well as the duration, of degrees of temperature above or below 42° Fahr. for the period named: and this combined result is expressed in Day-degrees—a "Day-degree" signifying 1° continued for twenty-four hours, or any other number of degrees for an inversely proportional number of hours.]

THE PAST WEEK.

The following summary record of the weather throughout the British Islands for the week ending September 3, is furnished from the Meteorological Office:—

"The weather was unsettled, with occasional rain, in all parts of the kingdom, at the commencement of the week, and these conditions continued to prevail over the north of

Ireland and the greater part of Scotland until almost the end of the period. In other parts of the kingdom, however, the weather soon became very fine and dry, and at the close of the week this improvement was spreading northwards.

"The temperature differed very little from the mean for the time of year. The highest of the maxima were recorded on September 3, and varied from 83° in 'England, S.' and 81° in 'Scotland, E.' to 70° in 'England, N.W.' and to 68° in Scotland, N.' The lowest of the minima, which were registered on somewhat irregular dates, ranged from 40° in 'England, E. and S.W.' to 46° in 'Scotland, W.' and the 'Channel Islands.'

"The rainfall greatly exceeded the mean in Scotland, but was deficient over England and Ireland. Over the eastern and southern parts of England, and in the south of Ireland, the fall was very slight indeed.

"The bright sunshine was in excess in nearly all the English districts, but showed a deficiency in Ireland and Scotland. The percentage of the possible duration ranged from 64 in 'England, S.' and the 'Channel Islands,' and 59 in 'England E. and S.W.' to 21 in 'Ireland, N.' and to 20 in 'Scotland, N.'"

MARKETS.

COVENT GARDEN, SEPTEMBER 8.

[We cannot accept any responsibility for the subjoined reports. They are furnished to us regularly every Thursday, by the kindness of several of the principal salesmen, who revise the list, and who are responsible for the quotations. It must be remembered that these quotations do not represent the prices on any particular day, but only the general averages for the week preceding the date of our report. The prices depend upon the quality of the samples, the supply in the market, and the demand; and they may fluctuate, not only from day to day, but often several times in one day. Ed.]

POTATOS.

60s. to 90s. per ton. John Bath, 32 and 34, Wellington Street, Covent Garden.

REMARKS.—There is a fair demand for eating Apples, such as Ingestres, Quarrendens, Worcester Pearmain, and Duchess Favourite; all command a trade. Good Lettuce and good Cabbage are both short supply. Peas are practically done, and this week will nearly finish the supply of home-grown Victoria Plums; and owing to the continued drought Scarlet Beans have become a short supply, thus the price. The few Pines on sale are in the hands of a few dealers; of Mushrooms there are now both outdoor and house produce coming. The Spinach now coming is called by some New Zealand; by others, Patent.

SEEDS.

LONDON: Sept. 7.—Messrs. John Shaw & Sons, Seed Merchants, of Great Maze Pond, Borough, London, S.E., write that this protracted drought, as might be expected, naturally restricts the sowing demand; meantime Trifolium, which is for the moment the article chiefly in request, is in meagre supply, and prices for same are consequently firm. There is no alteration this week in either Mustard or Rape-seed; winter Tares, however, come cheaper, and some choice samples of same are now obtainable for surprisingly little money. Giant seed Rye, on the other hand, is dearer. As regards bird seed, no fresh feature presents itself. Quotations for Peas and Haricots keep steady, and Linseed shows some improvement.

CORN.

AVERAGE PRICES OF BRITISH CORN (per imperial qr.), for the week ending September 3, and for the corresponding period of 1897, together with the difference in the quotations. These figures are based on the Official Weekly Return:—

Barley	25 11	27 8	+ 1 9
Oats	17 0	18 11	+ 1 11

FRUIT AND VEGETABLES.

GLASGOW: Sept. 7.—The following are the averages of the prices recorded since our last report:—Peaches, Scotch, 3s. to 8s. per dozen; Grapes, English, 1s. to 1s. 3d. per lb.; ditto, Muscats, 1s. to 1s. 6d. ditto; ditto, Scotch, 1s. to 1s. 3d. ditto; ditto, Guernsey, 6d. to 8d. ditto; Apples, Suffolk, 6s. to 7s. per bushel; ditto, Ecklinville, 7s. to 7s. 6d. ditto; ditto, Manx Codlin, 7s. to 8s. ditto; ditto, Americans, 16s. to 20s. per barrel; Plums, Violets, 1½d. to 2d. per lb.; ditto Orleans, 1½d. to 2d. ditto; ditto, Pershore, 8s. 6d. to 9s. 6d. per cwt.; ditto, Victoria (middle size), 2d. to 2½d. per lb.; do., Cambridgeshire, 1½d. to 2d. do.; Greengages, 1½d. to 2½d. do.; Cucumbers, 2s. 6d. to 3s. 6d. per doz.; Tomatoes, Scotch, 4d. to 7d. per lb.; do., English, 3d. to 4d. do.; do., Guernsey, 3d. do.; Lemons, Naples, 16s. to 25s. per case; Melons, home, 2s. to 2s. 6d. each; do., Valencia, 4s. 9d. to 5s. 9d. per case; Pears, Angers Williams, 4s. 3s. 9d. to 4s. 3d. do.; do., small, 3s. to 3s. 6d.; do., Duchesse, 3s. do.; do., Havre Williams, 6s. to 7s. do.; do., Wine, 4s. 6d. to 5s. 6d. per moly; Chestnuts, 4d. per lb.; Cobnuts, 4d. to 8d. do.; Oranges, 1s. 6d. to 2s. 6d. per dozen; Cabbages, 7d. to 10d. do.; Cauliflowers, 2s. 6d. do.; Mint, green, 6d. to 9d. per bunch; Onions, Valencia, 3s. 6d. to 5s. 9d. per case; do., Dutch, 3s. 3d. do.; Parsley, 1s. to 1s. 6d. per stone; Potatoes, best, 1s. do.; Peas, 1s. to 1s. 9d. do.; Lettuces, 6d. to 9d. per dozen; do., Cos, 6d. to 1s. do.; Radishes, 1s. per dozen bunches; Horseradish, 1s. 6d. per bundle; Mushrooms, 1s. to 1s. 2d. per lb.; Beetroots, 7½d. per dozen; Mustard and Cress, 3d. per punnet; Spinach, 1s. 6d. to 2s. per stone; Turnips, white, 2d. to 3d. per bunch; Celery, Scotch, 1s. 6d. per bundle.

LIVERPOOL: September 7.—Average of the prices at under-noted markets:—St. John's: Potatoes, 1s. to 1s. 2d. per peck; Grapes, English, 1s. 6d. to 3s. per lb.; do., foreign, 4d. to 8d. do.; Pine-apples, English, 4s. to 6s. each; Peas, 1s. to 1s. 4d. per peck; Cob-nuts, 8d. per lb.; do., 1s. per basket. Wholesale Vegetable Market: Potatoes, per cwt., Early Regents, 2s. 5d. to 2s. 9d.; Giants, 2s. 6d. to 3s.; Main Crop, 3s. 4d. to 4s.; Bruce, 2s. 8d. to 3s. 3d.; Kidneys, 3s. 6d. to 3s. 9d.; Turnips, 6d. to 8d. per dozen bunches; do., Swedes, 1s. 6d. to 1s. 8d. per cwt.; Carrots, 6d. to 9d. per dozen bunches; Parsley, 4d. to 6d. do.; Onions, foreign, 4s. to 5s. per cwt.; Lettuces, 6d. to 8d. per dozen; Cucumbers, 1s. to 2s. 6d. do.; Cauliflowers, 10d. to 1s. 10d. do.; Cabbages, 4d. to 8d. do.; Celery, 1s. to 2s. 3d. do.; Peas, 2s. 6d. to 3s. per bushel; Beans, 9d. to 1s. do.; do., Kidney, 8d. to 1s. per peck.

ROYAL CALEDONIAN HORTICULTURAL SOCIETY.—A great show of fruit will be held in the Waverley Market, Edinburgh, on Wednesday and Thursday, September 14 and 15; and, fortunately for intending exhibitors, this is one week later than last year, as the season, on the whole, in the north is nearly a fortnight later than usual. Though the fruit crop can hardly be said to be an average one, there can be no doubt that a fine exhibition will take place. The money prizes offered on this occasion amount to £366. It may be useful to remind intending exhibitors from the south or distant parts, that the council of the Royal Caledonian Society have adopted the list of the Royal Horticultural Society's culinary and dessert varieties of Apples, Pears, and Plums; and all exhibits of fruit at the show of the Royal Caledonian Horticultural Society must be in conformity therewith. We believe we are correct in stating, that by gracious permission of the QUEEN, Mr. OWEN THOMAS, Royal Gardens, Frogmore, will exhibit largely. *A propos* of this show, we have been asked if it would be considered fair to admit Apples, Pears, Plums, Figs, or other hardy fruits, grown in separate glasses against walls, (a single fruit or a cluster of fruits in a glass, somewhat in the manner that Cucumbers used to be grown in glass-tubes), to compete against hardy fruits that had had no such protection?

GARDENING APPOINTMENTS.

MR. R. PULLING, late General Foreman in the gardens, Croxteth Park, Liverpool, as Gardener to Lady MEUX, Theobalds Park, Waltham Cross, Herts.
MR. GEO. GUMMER, for the past five years general Foreman in the Grove Gardens, Stanmore, as Gardener to W. G. PHILLIPS, Esq., Berwick House, Shrewsbury, Shropshire.
MR. GEO. SCALES, until recently Gardener at Beech Grove, Mirfield, as Head Gardener to Mrs. PRESTON Ellet Grange, Lancaster.

CARNATION SEEDLINGS: J. E. The flowers are very good, but not better than others we have seen.

CHRYSANTHEMUM LEAVES ATTACKED BY FUNGUS: Subscriber. See answer to "B. W." in our last issue.

COLOURING OF LADY DOWNES' SEEDLING AND BLACK ALICANTE GRAPES: A. N. Provided the Vines were started in April or earlier, the fruit would be ripe in six months, so that the period of colouring would fall in what is commonly the warmest part of the season; and, providing the Vines have been pushed along whilst the days were long and solar heat abundant, fire-heat would only be required for the varieties named in the final stage in dull weather, or when cool days prevail, so as to admit of ventilation being afforded day and night. In such weather as we have lately experienced in the south, fire-heat will have rarely been necessary. Late Vines whose start was delayed as long as possible will have needed fire-heat, and may still need it till the fruit is ripe.

EMPLOYMENT: C. Smith. We fear that you have no redress, unless a written agreement exists between you and the employer. You might, as a yearly servant, sue him in the county court for a fortnight's wages, &c., as being entitled to one month's notice, you having had only fourteen days.

NAMES OF FRUITS: H. & S. From the one specimen you sent, we should take it to be Ecklinville Seedling.—Armstrong. The black Plum is Black Diamond, and the red one may be a small fruit of Pond's Seedling. We would prefer to see several fruits of each before being certain.

NAMES OF PLANTS: Correspondents not answered in this issue are requested to be so good as to consult the following number.—Syria. An Artemesia, but cannot determine the species without flowers. Numerous species of Artemesia are cultivated in the Levant.—W. P. Bougainvillea speciosa; the plant will live out-of-doors, and flower in Devon and Cornwall.—W. B., Talygarn. 1, Cuscuta epithymum on Ulex europaea; 2, Spiraea discolor; 3, Ligustrum lucidum; 4, Spiraea Thunbergi; 5, Abies grandis.—J. Sparrow. Atriplex hortensis var. rubra.—A. H. H. Acacia neriifolia.—E. C. C. D. Melilotus arvensis.—C. Kilminster. 1, 2, and 3, Sueda maritima; 4, Atriplex littoralis; 5, Solanum dulcamara; 6, Salicornia herbacea.—F. C. V. 1, Melica uniflora; 2, Dactylis glomerata elegantissima; 3, Lavendula dentata (called French Lavender by some); 4, Helianthus rigidus; 5, Antonaria tomentosa; 6, Veronica spicata.—D. C., Dundee. Aeschynanthus speciosus.—J. M. Aeschynanthus speciosus.—J. McM. Clematis flammula.—W. Y. Stanhopea Wardii var. aurea.—H. E. The Dianthus is no doubt a seedling sport of the "Marguerite" section.—G. W. M. 1, Miltonia Regnelli; the barred flower, M. Clowesii; 3, Vanda corulea, not of the best type; the white flower, Phalaenopsis Aphrodite; 5, Coelogyne Dayana; 2 and 4 had their tickets loose, but the explanation of character above will render it easy to identify them.—J. E. C. The Adiantum resembles one of the forms of A. cuneatum in cultivation, though its peculiarity of not bearing fertile fronds, if constant, renders it distinct; 2, is Dictyogramma japonica variegata.—M. J. S. 1, Hæmanthus coccinea; 2, next week.—Haver. 1, Chamæpeuce diacantha; 2, C. Casabonæ; 3, Probably a Celsia; send when in flower.

PHILODENDRON LINDENI: Syria. The flowering of this species is not common, but given a strong plant, good soil, and a minimum warmth of about 65°, there should be no difficulty in getting the plant to flower. Monstera deliciosa and other species of Philodendron fruit readily under these conditions. The spathe is an interesting object.

THE

Gardeners' Chronicle.

SATURDAY, SEPTEMBER 17, 1898.

FLOWERS OUT OF SEASON.

A PROTEST.

"WEE modest crimson-tipped flower,
Thou'st met me in an evil hour,
For I maun crush amang the stoor,
Thy slender stem;
To save thee now is past my power,
Thou bonny gem."

This sweet, pathetic wail of Burns' over the buried Daisy was suggested to my mind during last winter, whilst being conducted over a large establishment for the production of Lily of the Valley blooms, blanced Lilac, Narcissus, and other flowers essentially belonging to the advent of spring, and as I watched the contents of scores of boxes and flower-pots, shorn of their floral wealth, being tossed on the rubbish-heap to freeze and rot, I could not help wondering if amongst all the young gardeners employed by the firm there were any who felt an occasional remorseful feeling akin to that of the poet's, as they dashed on the heap box after box of roots which, had they been treated in a rational manner, would have made gay with their blossoms many a goodly parterre in the returning springtide, yielding, methinks, a degree of pleasure to the mind unapproached by the wan and sickly forced flowers of winter.

Were poor Burns, after a century's rest, to "revisit the glimpses of the moon" in search of a theme for his muse, he would find the "wee modest crimson-tipped flower" as fresh and lovely o'er field and fell as on that memorable morn when the painful and sympathetic feeling crept into his tender heart at the destruction of that "bonny gem." "The burn stealing under the lang, yellow broom," as clear and limpid as he beheld it in the heyday of his life. He would find "the milk-white Thorn that scents the evening gale," as pure and fragrant as on that day when he bade an eternal farewell to his Highland Mary on the banks of the Ayr. All these might tempt him to strike afresh that lyre which has so entranced "fair Scotia" and the world, since he passed like the snowflake on the river to the land of shadows. Nay, lover exclusively though he was of Nature unalloyed by art, he might even find a theme in the beauties of a modern sub-tropical garden, or in the happy arrangement of colours in an artistic display of carpet-bedding. He might even at Christmas-tide stay his footsteps for a moment in front of a nineteenth century florist's shop-window, and give expression to his wonder and admiration of the beauty therein displayed; but what would he say to the manner of its production? Methinks, lament would be followed by indignation.

In these degenerate days it would almost appear that a gardener's services were appreciated and valued only in proportion to his

ability in producing flowers of various kinds at an unseasonable time of year, the craze for which is largely on the increase regardless of all sacrifice and sentiment. To-day (September 9) I have just been shown by the manager of a florist's establishment a batch of Lily of the Valley in full bloom! Lily of the Valley forced into flower in suffocating glass-houses, when the garden is filled with Dahlias, Gladiolus, Mignonette, and a hundred other flowers, rich in beauty and in fragrance! An excuse may be offered for the production of forced flowers in winter, but assuredly no one would be so bold as to tender an excuse for the production of spring flowers by artificial heat in September, with the thermometer ranging from 80° to 90° in the shade.

One is often told that forced flowers tend to keep alive during the dreary winter months our love for the beautiful in Nature, but I venture to believe the very opposite to be the truth. Visit the flower-stalls of Covent Garden market in the spring-time, and tell me if the sight of the vernal beauty displayed there—enhanced, perchance, by occasional glints of sunshine—does not yield more real joy than half-a-dozen visits during the winter to see many of the self-same kinds of flowers fresh from the hands of the professional forcer and annihilator. Joy and delight in Flora's handiwork is not augmented by forcing the hand of the goddess, but rather by the well-marked intervals which occur between each display of her gifts. It is these lulls which stimulate enjoyment; forcing can only produce satiety.

Surely we have enough and to spare of winter flowers proper for our wants in Chrysanthemums, Violets, Orchids, Bouvardias, Ericas, Christmas Roses, and others, without encroaching upon those of a different season, involving the wasteful sacrifice of many millions of plants annually, by rousing them from their natural rest to reluctantly yield up their premature beauty, and then consigning them, perhaps, to the rubbish-heap.

As a rule, these plants, after yielding up their floral treasures under compulsion, are allowed to perish, it being found unprofitable to keep them for any length of time in order that they may regain their vitality. By this destructive process of the florist, and the encouragement given him by a thoughtless public, combined by the raisers of these plants hastening to meet the demands of the plant-forcers, are we not rapidly drifting towards a time when complaints will be heard of weakness and disease in those plants we are now treating in such an irrational fashion, and counter to all dictates of Nature? But even if this danger be non-existent, I still maintain that this manner of striving after riches on the part of the florist, and the want of discernment on the part of the public which encourages him, tend to deaden and destroy one of the finest feelings of the human heart. Had we never another winter flower than the Chrysanthemum, the capabilities of the plant are proved to be such that it would yield ample employment for the florist during the winter months without that sacrificial and deplorable work which now, to so great an extent, occupies his attention.

Dr. Nansen, leaving the good ship *Fram*, and after his long, arduous wanderings in the world of ice and snow, writes:—"At last came spring, with sunshine and birds. How well I remember that first evening a few days before the sun had appeared above the horizon, when we suddenly saw a flock of little auks sail past us along the mountains to the North. It was

like the first greeting from life and spring.' The feelings of the heart engendered at that moment by the flight of those little birds out-balanced all the sufferings and doubts of mind previously experienced, an ecstasy that comes but once in a man's life. Had Nansen carried about with him over the ice-bound land and sea a few of these little birds to remind him of "life and spring," would the daily sight of them have produced the feelings experienced by the flight of the wild birds? Assuredly not.

Feelings akin to these are produced in the hearts of most of us when the advent of spring reveals the first Primrose or Snowdrop. The heart leaps up, and impressions are produced which become fixed to cheer us through life, and perish only in death. But these enviable emotions are in danger of never being produced in the breasts of those who, throughout the bleak winter months cultivate, buy, sell, and use for the adornment of church, home, and person a plethora of those unnaturally produced flowers which belong essentially to other seasons. With these constantly under their eyes during the autumn and winter months, spring is robbed of its impressive charm, and the surfeited heart refuses to respond joyously to Nature when she unfolds her earliest treasures at the appointed time.

To me it is absolutely pleasureless to visit a spring-flower manufacturing establishment during the winter, and see the wan and sickly-looking plants of Lily of the Valley, and more sickly-leaved "white" Lilac, and nodding Daffodils being produced by the aid, usually, of darkness and heat, and all to gratify a joy-destroying fancy. Much rather would I linger over the memory of a little incident of childhood, which has been to me a joy for ever. Over half-a-century ago, under the spreading boughs of a great Beech-tree, whose lower branches lay on the greensward, grew a solitary Tulip of the olden type, far away from any garden. On its first discovery I stood and admired, not so much perhaps on account of its beauty, as of its appearance in a semi-wild state. I visited the spot daily and alone, watching the plant's development, flowering, gradual decay, and final disappearance. During the intervening months I frequently thought of the solitary Tulip, wondering if it would re-appear in the following spring. The season came round in due course, and brought with it joy to my childish heart in the re-appearance of the flower. When the bloom was again fully expanded, I brought my little sisters to the spot to see it, giving them the strictest injunctions to keep the place of its growth a profound secret, and not to cull the bloom, or otherwise disfigure the plant. The sight of this plant growing under such conditions produced a joy deeper, I believe, than any that ever came to me in after-life.

The latter-day florist has spared no pains in ransacking Nature's realms in search of subjects for forcing, and he has laid hands on almost every plant that will yield more or less willingly to his art in compelling it to produce its blossoms prematurely; but I always feel thankful when I remember that there are some of earth's treasures that defy his cunning, and that the Primroses, nodding wild Hyacinths, and Snowdrops, are left in peace to gladden our hearts in the returning spring-tide. Could these subjects be forced into flowering by December, the sheets of fragrant yellow blooms, the modest, drooping, snow-white belis, and the galaxy of blue, would quickly vanish from our

gardens and woodlands, and these typical flowers of childhood would soon be all but annihilated.

The male portion of creation, to a certain extent, encourages this art of the florist in the production of out-of-season flowers; but I am bound to say that the ladies are the greater culprits. It is to them, therefore, that we must appeal in redressing this evil, and ask them to set their faces against such a traffic in Nature's sweetest gift to mankind—a traffic calculated to blunt some of the finest emotions of the mind. Some of them have done much and highly praiseworthy work in the attempt to put a stop to the wholesale slaughter of small birds merely for the ornamentation of dress and head-gear. Why not, then, extend their good offices to the vegetable kingdom, and do all in their power to, at least, check a traffic in those flowers which are produced so greatly out of season, and in such an objectionable manner?

It may be urged, "What would the fair sex do without the forced flowers of winter to adorn their persons and halls during the festive months?" As already pointed out, there are enough and to spare of naturally-produced flowers in the winter season without the aid of those untimely productions which tend only to satiety, and to blunt our susceptibilities to the beauty of the natural flowers of spring and summer.

Another encouragement which is undoubtedly given to the professional forcer is the extravagant custom of employing large quantities of flowers at funerals.

"Sweets to the sweet," are Hamlet's pathetic words as he strews a handful of simple flowers in Ophelia's grave; and such unaffected acts produce deeper and more sympathetic feelings in the beholders than car-loadings of wreaths and other floral emblems.

When the wish is uttered, "No flowers," many shudder at the thought; but such notice is circulated either by the desire of the lost one, or of relatives who are left behind, and springs from the fear that the too common practice of sending such large quantities of floral tributes on such occasions tends to destroy rather than produce those feelings of sympathy and love which it is so wise to foster and cherish.

By all means let us cherish and foster the love of flowers; at the same time let us not violate nature, and let us hope that the time is not far distant when we shall feel it our duty to say with regard to the present methods of production and use of flowers—

"Ring out the old, ring in the new;
Ring out the false, ring in the true."

J. Lowrie.

NEW OR NOTEWORTHY PLANTS.

LONICERA HILDEBRANDIANA, COLLETT & HEMSLEY.*

ALTHOUGH our gardens are already well supplied with numerous species of *Lonicera*, some being very handsome shrubs, there is none among them that will at all compare in size of flower with the present novelty, for it is by far the finest species that has yet been introduced into cultivation, and may easily claim to be the prince of Honeysuckles. This grand shrub flowered in August with Mr. F. W. Moore in the Botanic Garden at Glasnevin, Dublin, probably for the first time in cultivation, and just about ten years after its discovery. As may be seen from our illus-

* *Lonicera Hildebrandiana*, Collett & Hemsley, in *Journ. Linn. Soc.*, v. 28, p. 64, f. 11.

tration (fig. 58, p. 219), it is the giant of the genus, its flowers being larger than those of any other known species, and as they are of a brilliant orange-scarlet, they make a fine display. *Lonicera Hildebrandiana* is a native of the Shan Hills, where it was discovered by Sir H. Collett in 1888, growing at 5000 feet elevation, and probably requires the temperature of an intermediate house for its successful cultivation. The leaves are stalked, $3\frac{1}{2}$ to 5 inches long, 2 to $3\frac{1}{2}$ inches broad, ovate, or elliptic-ovate in outline, rather abruptly and obtusely pointed at the apex, rounded at the base, and quite glabrous. The flowers are produced in pairs on short peduncles, in the axils of the leaves. The calyx is about one-third of an inch long, and shortly 5-toothed. The brilliant flame-coloured corolla is about 5 to 6 inches long, and is said to attain a length of 7 inches, the lips measuring $2\frac{1}{2}$ to 2 inches. N. E. B. [A notice of this species from the pen of Mr. W. Watson appeared in the *Gardeners' Chronicle* December 16, 1893, p. 742. Ed.]

THE CHRONICLE OF A LITTLE CORNISH GARDEN.

(Continued from p. 98.)

AUGUST.—Within a mile of my house is a road whose limiting western hedge-bank is gloriously and gracefully festooned by the interlacing growth of wild Clematis—"Virgin's Bower trailing airily." It is impossible to describe its infinite grace and freedom of growth, but it always impresses me with one gardening lesson, namely, that beautiful flowers are but a part of the æsthetic product of a beautiful plant. This is a lesson which cannot be sufficiently drummed into the ears of gardeners, who for the most part concentrate all their skill and labour on the task of producing wonderful flowers—often beautiful, but frequently simply monstrous—utterly regardless of the beauty afforded by leaf and stem, and by a plant's habit of growth.

A beautiful Rose—no matter how it has been produced—is a beautiful object, but it will not go far to help in the making of a beautiful garden unless the plant on which it grows has some of the grace and freedom of the Briar. It is as though our artists were to care only for some one feature of the human face, and, portraying that in full appreciation of its individual beauty, whilst disregarding all else, call upon us to admire their pictures of beautiful human faces. The whole of the plant is necessary for the full enjoyment of it, and in order that it may be an object of beauty, its growth must appear natural and unrestrained. This does not mean that a Rose-bush should not be pruned, and the herbaceous clumps left ever undivided, but that the more a plant can be let alone, compatibly with its health, the more beautiful will it be.

Gardeners, as a class, are by no means the best or wisest of garden critics. Like very many other people, they are apt to value a garden in proportion to the rarity of its contents, and to the amount of labour obviously bestowed on it. A painter, again, is by no means necessarily the best critic of pictures, for he, too, is led aside by technical details from an impartial view of the finished work. Too much and too intimate a knowledge of technique is a little apt to produce that form of blindness which causes inability to see the wood for the trees.

A flower-garden has—or should have—a purely æsthetic value, and the principles which operate in the production of a good vegetable-garden do not apply. To create a series of beautiful pictures, composed of numerous objects of great individual beauty, is the legitimate aim of flower-gardening; and this aim is not compatible with a desire to outvie one's neighbours in expensive masses of glaring colours, or to win prizes at shows for flowers larger than other people's. The persons most competent to express an opinion on a garden are they who possess a certain knowledge of gardening, a considerable knowledge of plant growth, a familiarity with all sorts of gardens, and much experience in the contemplation of objects from the point of view of beauty; and it is a wise act to occasionally obtain the verdict of such on one's garden.

The weather having broken up, somewhat of a lull has occurred in my garden's flowering. The Hollyhocks and summer flowers are over, and the Dahlias, Asters, Chrysanthemums, Sunflowers, and *Anemone japonica* are not yet producing more than occasional flowers. Roses and Carnations are blooming away merrily, however, and one wants little more—each offering us much variety of colour and scent; but I must abstain from saying more about these fascinating flowers. Far and away the most brilliant flower in bloom is *Lobelia cardinalis*, of which a couple of clumps have become well established, and are producing dozens of tall spikes of vivid scarlet blossoms. This plant requires shade and a rich soil, in order to thrive, and show its possibilities of beauty. The singular form of the individual flowers of the *Lobelia* at once strikes the attention. If one examines their structure, it will be seen that the five anthers have coalesced to form a tube from which, in the younger flowers near the apex of the spike, pollen may be easily pressed. Through this tube the style, with stigmatic surface concealed, gradually makes its way, pressing the pollen before it. In the older flowers, towards the spike's base, the stigmas will be found protruding from the tube (which is now empty of pollen), and exposing their papillar surfaces for fertilisation.

The Pentstemons are now at about their best, although they have been flowering for a couple of months, and will probably continue to bloom until October. Few flowers are more useful, as their flowering period is so long and their constitution hardy. For the most part, their colours are not brilliant, and are apt somewhat to pall, but, with the exception of the washed-out magenta ones, they are pleasant flowers to look upon. Of newer varieties I have grown, the best are President Carnot, purple, with white throat; Emile Deschanel, scarlet; and Mrs. F. Gordon, rose, with white throat. Still, a threepenny packet of seed will give plenty of plants with beautiful flowers, without the expense of buying named ones. I must not forget to mention the coral-coloured flowers of *Pentstemon barbatus*, a plant of which has been blooming for months past.

Another group of plants not as much grown as their beauty deserves they should be, are the *Potentillas* or *Cinquefoils*. Every shade of yellow, orange, and red is represented, and the plants are hardy, and of the easiest culture.

By far the most important flowers of the month, however, are the autumn-flowering *Phloxes*, about the most valuable of the many floral beauties which North America has given us. Perfectly hardy, very floriferous, of an infinite variety of colour, and of noble habit, *Phloxes* are, naturally enough, general favourites. Deeply-dug soil enriched with manure, and room to grow, are the two requirements of these plants. The varieties are extremely numerous, and a complete collection would require some acres. Of the few varieties I have, the best are the lilac *Eugénie Dautanvilliers*, with a large white eye; the orange-coloured *Etna*, the salmon and rose-tinted *Molière*, *Leonardo da Vinci*, pure white, with dark eye; and the snow-white *Avalanche*.

The very brilliant and conspicuous *Kniphofias*, *Tritomas*, *Flame-flowers*, *Torch Lilies*, or *Red-hot Pokers*, so many synonyms do they possess, are also very striking objects in the garden at present. I suppose it is much easier to grow these plants in Cornwall than in the northern counties, as mine have already grown into nice clumps, whereas, I understand, in many places they get killed by frost. Of them all, I think the grandest is *Kniphofia nobilis*, a variety of *K. aloides*, with its tall flower-stems, surmounted by immense orange-red spikes. *K. Burchelli*, whose flower-stem is marked with dark spots, still shows some bright red heads, with yellow bases, but it is past its best. The dwarf *K. comosa* is just beginning to show its bright yellow drooping flowers, and *K. serotina* is showing its flower-buds, which will not open yet.

The trellis which I so recently erected is now almost covered by *Tropæolum canariensis*, Sweet Peas, Vegetable Marrows, and Nasturtiums. What beautiful flowers these last are! Who has seen a *Nasturtium* of

bad or even poor colour? There are few flowers concerning which this question might safely be asked. Primroses, Phloxes, Pentstemons, even Roses, produce on occasion flowers of execrable colour. Sweet Peas, perhaps, may pass the test, and, it may be, one or two other plants. The Sweet Pea hedge which I "topped" in July is now rewarding me for my sacrifice by producing as great a mass of flowers as in June. These second flowers, however, are produced on shorter stems than were the first crop.

Convolvulus, which I am reluctant to destroy, yet dare not leave alone,

"White cups, whose wine
Was the bright dew yet drained not by the day."
Vernacular names for flowers are by no means always attractive or poetic, and it was no poet who first named this beautiful flower "Old Man's Nightcap."

Mignonette, Violas, Pansies, Campanulas, Fuchsias, Lychnis, and Snapdragons are the names of but a few of the plants now flowering. The time of preparation

Veitch & Sons, Limited, of the Royal Exotic Nursery, Chelsea. Both contained well cultivated examples, and both were the admiration of the numerous visitors. Mr. Mitford's exhibit included a specimen of every known hardy Bamboo. In addition small collections came from Mr. V. N. Gauntlett, of the Bamboo Nurseries, Redruth, and Mr. T. Ware, of the Hale Farm Nurseries, Tottenham. We now afford our readers illustrations of two out of four species, all of which were included in Mr. Freeman-

FIG. 56.—ARUNDINARIA NITIDA, TOGETHER WITH DETAILS OF EDGE AND BACK OF LEAF, ENLARGED 10 FOLD; AND A FULL-SIZED LEAF AND SHOOT.

I said that the perennial Sunflowers are only yielding a few advance blooms; but I am having a foretaste of their beauty in another North American composite, Rudbeckia Newmanii, whose dark-centred yellow flowers are being produced in great profusion. This is a very hardy plant, and, like most of the plants I grow, it simply wants deep cultivation, manure, and space to develop.

The weeds are making their last struggle for the year. Among others I notice the lovely white

for next year is beginning, and we now know the extent to which we have succeeded in attaining our ideal garden for 1898. Harry Roberts.

BAMBOOS.

At the meeting of the Royal Horticultural Society on July 26 last, two fine representative collections of Bamboos were shown by A. B. Freeman-Mitford, Esq., of Batsford Park, Moreton-in-the-Marsh, and Messrs. J.

Mitford's collection, namely, Arundinaria nitida, A. aristata, A. metallica, and Phyllostachys fulva, the figure of the first named being prepared from a plant in Messrs. J. Veitch & Sons' collection, this being the better plant. The plant measuring 7 feet in height, and 10 feet in diameter. The other two illustrations will be given in a subsequent issue. We append the following descriptive notes kindly furnished by Mr. Freeman-Mitford:—

Arundinaria nitida (Mitford), fig. 56.—A beautiful

and graceful *Arundinaria* from Northern Ssu Chuen. The slender purple stems grow to a height of upwards of 10 feet, so far as the plant has hitherto been proved. They, as a rule, do not branch until the second year, when there are but few leaves; but in the third year they are literally borne down to the ground by the weight of most brilliant foliage; and these three stages in the life of the stems give the plant a most graceful and attractive effect.

Mr. Mitford, in his *Bamboo Garden*, refers to this species as "By far the daintiest and most attractive of all its genus. *Arundinaria nitida* possesses the additional advantage of quite exceptional hardiness. . . . When the Bamboo garden was being formed at Kew, Mr. Bean came across it in Messrs. Veitch's collection at Coombe Wood, where it was then named *Bambusa nigra*, from which (a *Phyllostachys*), of course, it is absolutely distinct. At that time the only *Arundinaria* known to have black stems was the Himalayan *A. Khasiana*, and with this species the plant now under notice was conjecturally identified. As *Arundinaria Khasiana* accordingly, it was described by Mr. Bean in the *Gardeners' Chronicle*, and by myself in the *Garden*. Attention, however, was called to the subject by Mr. Gamble's monograph of the *Bambuseæ* of British India, from which it is clear that this *Arundinaria* agrees only in its purple stems with *A. Khasiana* (which is closely allied to, and indeed hard to distinguish from *A. falcata*), and, moreover, that there is not among the *Bambuseæ* of the Himalayas any known plant corresponding with it."

"After careful search, it was discovered that Messrs. Veitch's plant was raised from seed received in 1889 from Dr. Regel, the Director of the Botanic Garden of St. Petersburg, who had obtained the seeds from the Russian traveller, Mr. Potanin, who collected it in North Ssu-Chuen. The same plant was likewise detected in the herbarium of Dr. Henry, who found it in Hu-pei. As this *Arundinaria* had not hitherto been described (except, as I have pointed out, under a false title), it was necessary to give it a name, and I chose "nitida" as appropriate to its brilliancy and beauty" (see *Gardeners' Chronicle*, August 17, 1895, p. 186).

Arundinaria aristata (Gamble), fig. 57.—This interesting Bamboo is found at a height of 10,000 feet on the North Eastern Himalayan ranges in Sikkim and Bhutan. The culms grow from 8 to 12 feet high, with a diameter of half to six-tenths of an inch. The foliage is very pretty, the bright pale-green leaves hanging in most graceful clusters from the bending stems. The culms are yellow with reddish branchlets. There is a strong likeness between this species and *Arundinaria spathiflora*, but from minute distinctions in the flowers, Mr. Gamble does not hesitate to separate the two.

(To be continued.)

ALPINE GARDEN.

NEW AND RARE PLANTS FOR ROCKERIES.

(Continued from p. 283, vol. xxiii.)

Mandragora autumnalis,* Bertol., and *M. vernalis*, Bertol., are two varieties of the old *M. officinarum* of Lorné, common upon sea-shores in the very south of Europe. It grows chiefly in the Orient, where it was in great request because of the form of its big roots. Friend says:—"The root of the Mandrake is shaped like a Parsnip or Carrot, and is often forked. Fanciful persons have thought that, when thus divided, it bears some resemblance to the legs of a man, and the crafty money-seekers of the past were not slow at assisting the folly of the superstitious by artificially increasing the similitude, and then attributing to the plant supernatural powers. The Romans, even, called the Mandrake Semi-Homo, while the Greeks knew it as *Anthropomorphon*. So late as 1810 the images already referred to were to be seen exposed for sale in several of the sea-ports of France, and they were frequently bought by such as wanted

to have the passion of love excited, or to avoid disgrace in the domestic circle."

In the Middle Ages the roots of Mandrake were sold very dearly. The *Revue Horticole de Paris*,* published last year two very curious figures representing two of these roots that were brought from Syria.

The *M. autumnalis* has short-stemmed violet flowers, the stem being reddish, and flowers in September and October. It is believed that this species is the one spoken of in the thirtieth chapter of Genesis. The *M. vernalis* has white, greenish, or bluish flowers, and blooms in May. Both have big undulate leaves, and large roots. They should be cultivated in a dry and warm place with south-west aspect, or at the base of a wall. They are hardy here, and must be so in the midlands and south of England.

Mertensia lanceolata, D.C.—This is a herbaceous plant from the alpine regions of the Rocky Mountains, flowering here in May—June. The leaves are almost all on the stem (caulinares), very few being radicals; they are of a very light glaucous-green; the stems are single, erect, and slender; the flowers are pendent, of a very beautiful light blue, not so large as those of *M. virginica*, but as pretty as those. It is a very good addition to the herbaceous border, and to big rockeries; it requires a good deep soil and a dry place, for the roots suffer from humidity in their resting time.

Micromeria piperella, Benth., is a very dwarf-growing little shrubby plant from the south of Europe, odoriferous and nice. The stems are single, erect, covered with small and numerous leaves, and bear a spike of small pink flowers, that succeed one another on the stem from July till October. The plant requires a sunny and dry place.

Mimulus primuloides, Benth., is one of the nicest plants for rockeries, and one of the best of those from the mountains of New Zealand [?]. The plant is very dwarf-growing, and forms nice little tufts or rosettes. The leaves are covered with long hairs; from the centre grows a slender and thin stem, quite naked, bearing a very pretty flower of deep yellow; these stems are numerous, and succeed one another on the tufts from July till September. A very good plant, which should be planted in every rockery. It requires a half-sunny or sunny place, and light, fibrous soil. The plant may be increased by seeds or division.

The *Mimulus radicans*, Hook. f., from New Zealand, has a creeping stem and small, obovate leaves; the flowers are white, with a purple spot on the upper lip. It is not quite hardy with us, and does best in a damp place. (Figured in *Gard. Chron.*, July 7, 1883, p. 21.)

Moluccella frutescens, L. (*Ballota spinosa*, Link.).—A very rare little shrub, belonging to the Labiateæ, and growing in the very south of Europe; the stems are very ramose, and grow to 10 to 30 cent. (1 foot); the leaves are small and rare, and at their base there are one to three long and spiny bracteoles; the flowers (one to three) are white, and the upper lip is very hairy. It requires a hot position in the rockery, and is quite hardy in Switzerland.

Mulgedium albanum (*racemosa*), D.C., is one of the choicest of blue-flowering herbaceous plants; seeds of it were brought to me by Messrs. Levier and Sommer, on returning from their journey in the Caucasus, in 1890. It is a tall-growing plant, the stems ascending to 2 metres and even 3 metres in good soil. They are single, and bear at a third of their length a long spike of blue flowers, of which the stalks are reddish. They flower abundantly and freely from May till end of August.

Origanum Dictamnus, L. (*Amaracus Dictamnus*, Benth.) is one of the most interesting plants of Crete, where it grows in the fissures of the rocks in the low and mountain regions up to 4500 feet. It is a dwarf shrub, the stems of which are covered with round and white leaves, covered with a woolly pubescence just like cotton; the flowers are pink, and included in much coloured bracts of a deep

carmine. They are disposed in spikes, and appear from August till November. It should be planted in a small hole in a very sunny place in the rockery. It is liable to be injured by damp. The plant may be propagated by cuttings and seeds. (*Bot. Mag.*, t. 298.)

O. pulchrum, Boiss. et Heldr., is another very pretty Labiateæ of the Orient. It grows in the fissures of the rocks, and in the stones of the mountains of Eubæe in Greece, to an altitude of 5,500 feet. The leaves are obovate, glabrous, very fragrant and somewhat viscous; the flowers are of a very brilliant carmine-rose, and the numerous bracts are purple-mauve. It is a very showy little shrub, seldom seen in gardens, and flowers from August to October. We plant it in a stony soil in a sunny situation. In winter we cover it lightly, but I think that in the English climate it would stand the winter without being covered. It requires a dry and sunny place in the rockery, and may be increased by cuttings and seeds. *H. Correvon, Geneva.*

NURSERY NOTES.

MESSRS. JAS. McBEAN & SONS, COOKSBRIDGE.

MR. JAMES McBEAN is one of the most successful growers of flowers and plants for market in the county of Sussex, and, moreover, he is one who can boast that every shilling used in purchasing his land, building his houses, and establishing his business, has been earned by his own diligence, aided by his no less persevering sons. He started in business in a very small way less than twenty years ago.

His aim has always been to grow favourite flowers in quantity, and to grow everything well, and consequently the subjects cultivated have varied in the same degree as the fashion in flowers. Hence, when Orchid blooms were much in demand, Mr. McBean decided to invest in these plants on a limited scale, in spite of the fact that he had little knowledge of their culture. Feeling his way gradually and cautiously by buying only the cheap ones out of importations, he soon acquired remarkable proficiency in their cultivation, especially with the *Odontoglossums*, of which he has three fine ranges of glasshouses filled with plants in various sizes. The plants thrive in such a remarkable manner, that Mr. McBean considers that not only is degeneracy in the Orchids in which he has experience another name for bad cultivation, but that even the plants degenerating in some gardens can soon be grown into fine specimens in proper hands, though to grow such plants is more difficult than to grow even the worst of freshly-imported specimens. In proof of his contention, Mr. McBean pointed to a batch of *Odontoglossums* acquired by him from a private collection, and still bearing the record of the date of their importation, viz., 1883. These had been gradually declining for twelve years or so, before he got them but afterwards they quickly made good growth, and they have steadily improved. The same story of progress can be seen in all the houses, and especially in that containing the large specimens, all of which have bulbs of great size, of a rich dark green colour, often tinged with purple, and they bear thick, fleshy, green leaves, and in many cases stout flower-spikes, and yet these plants were the smallest of the different importations out of which they were bought. In obtaining choice varieties Mr. McBean has been very fortunate, for he has flowered some grand spotted varieties, a number of which occupy a prominent place at the end of the principal Orchid-house. There are some novel arrangements about the houses which are noteworthy, as they have some bearing on the good condition of the plants contained in them.

For instance, rain-water only is used, and many are the provisions made for its storage, but it was found that during long, dry summers, the rain-water in the tanks failed, and the problem was how to eke out the supply in such a manner as to tide over a dry time. The staging for the plants consists of a slate lower-

* *Flowers and Flower Lore*, vol. 1, p. 294.

* *Revue Horticole*, 1897, p. 131.

stage, for moisture, and an open wood-work one on which to stand the plants, and Mr. McBean had the lower one made water-tight, and with openings here and there over the water-tanks, so that the large amount of water previously wasted during the watering of the plants should always fall on this close stage, and thus return to the tanks again. Since that arrangement was made the supply has not failed. Another unusual feature is that the canvas blinds, which run on an iron and wire-frame about a foot from the glass do not run up and down, but from the middle to each end. They are not rolled up, and by this means the blinds are said to last longer.

Dendrobiums are another special feature at Cooksbridge, and the varieties of *D. nobile* and other showy kinds make very strong growths, and flower abundantly. In most of the houses there are Orchids suspended over the roof and on shelves near the glass, while the staging is principally occupied by decorative plants, such as *Kentias*, *Caladium argyrites*, *Asparagus plumosus*, *Crotons*, *Dracenas*, &c.

In one house are some fine specimens of *Dendrobium splendidissimum grandiflorum*, with very stout growths 3 to 4 feet long; the true *D. nobile nobilissimum*, with very strong pseudo-bulbs about 4 feet in length; the blush-white *D. nobile Ballianum* in all sizes; *D. n. Cooksoni*, and most of the other varieties in fine condition. *Dendrobium Dearei* is grown in quantity, and *D. bigibbum*, *D. formosum giganteum*, &c.

In the next house were observed plants of the true *Cattleya aurea*, some of the older plants being in flower and sheath; some good *Oncidium Papilio* and *O. Krameri*, and other showy species.

In another house are the cool-growing *Oncidium*s of the *O. Marshallianum* class, a batch of *Dendrobium*s ripening their growths, a good selection of *Cymbidium*s, and at the cool end a number of plants of *Oncidium macranthum*, with very large pseudo-bulbs and strong flower-spikes. Then there was a houseful of *Dendrobium*s, &c., in which *D. Wardianum* were completing their growth, and *D. Devonianum*, which some growers find difficult to manage, was very strong and healthy.

At the sunny end of the next house was a batch of varieties of *Lælia anceps* sending up spikes from even the smallest pieces much more profusely than they would if kept more shaded. In bloom here was a very handsome form of *Zygopetalum crinitum*, with ruby-red hairy lines on the lip in place of the dark blue usually seen; and very pretty were a quantity of plants of the green, white, and red *Saxifraga tricolor*.

CHRYSANTHEMUMS

and other florist's flowers are cultivated at the Plumpton establishment, some distance from Cooksbridge. The Plumpton Nursery consists of some 12 acres, partially covered with glass-houses, in which the old double white *Primula*, *Pelargonium Volonte Nationale*, *Richardias*, *Vallotas*, *Lilies*, and other market flowers and Ferns are grown. Many of the houses are cropped with Tomatos, which, on being cleared, will make room for the immense stock of *Chrysanthemums*, and for Fielder's white *Azaleas* and other flowers for winter supplies. One large house has given a splendid crop of *Lilium longiflorum Harrisii*, and was filled with pure white *Lilium lancifolium album* and *L. Kratzeri*.

This nursery was formerly a brick-field, and in a large square area of it where clay was dug out, Mr. McBean stands his thousands of large-flowered *Chrysanthemums*. These plants are full of great promise, their leaves reaching almost down to the rims of the pots. A clever contrivance for ensuring the watering of this large number of plants economically has been provided by placing tubs at intervals of 12 feet to 15 feet all round the square, and lengths of piping carry the water from tub to tub.

In the open ground thousands of the varieties of *Madame Desgranges Chrysanthemum* were in full flower, and there were large numbers of the early-flowering kinds in pots; also large beds of Sweet Peas, Asters, *Doronicums*, *Eryngiums*, and other flowers.

FORESTRY.

(Continued from p. 177.)

OUR WOODS AND FORESTS.

THE enclosed plantations of the New Forest cover about 11,000 acres of ground, the major part of which is under seventy-five years of age. These trees consist of Oak, Beech, and other hardwoods, and also a large extent of Scots Fir, which thrives on the poorer soils unsuited to Oak. Although these plantations can be protected from cattle, they cannot be cleared of timber in the usual manner adopted when the latter becomes ripe; but a certain proportion must be left to rot or blow down, in order to satisfy the incomprehensible provisions of an incomprehensible law. Indeed, the most recent legislation on the subject appears to have been drafted without the slightest recognition of the fact that the forest proper is a natural growth, and as such is subject to natural decay, and accidents peculiar to living organisms. It provides only for the immediate interests of the present generation, and entails a needless waste of ground without any compensating advantages.

In the Forest of Dean, the conditions under which the Crown exercises its rights are somewhat better: one-half of the whole area may be enclosed, and the right to enclose is not confined to any particular part of the forest, but is applicable to the entire area. From a picturesque point of view, this forest is quite equal, if not superior, to the New Forest, although the numerous collieries and other works scattered about it dispel much of that sense of removal from everyday life which a large forest invariably inspires. As a timber-growing area, however, it is probably the best of all the Crown forests, and in past times was regarded as the chief source of Oak timber for the Navy. Mining and grazing rights place certain restrictions upon the growth of timber; but as the latter only exist on the unenclosed land, a large area is available for the raising of plantations. At the present time, however, only 5000 out of the permitted 11,000 acres are enclosed, although steps are being taken to increase the area until the whole of the ground allowed for the purpose is taken in.

Windsor Forest, apart from the great park and the plantations around Cumberland Lodge and Virginia Water, may be best described as a gravelly heath, with a considerable number of Scots Firs scattered over the surface. Its proximity to a royal residence invests it with a more game-preserving character than is the case with the other two forests, but still a large area is available for timber-growing purposes.

In addition to these three forest areas, the Crown also possesses smaller woodlands, such as the High Meadow Woods, adjoining the Forest of Dean; Alice Holt Woods, Bere Woods, &c., near the New Forest, and others, comprising a total area of over 50,000 acres, after deducting waste ground in the New Forest and elsewhere, which is not adapted for afforestation.

The above is a rough and imperfect sketch of our Crown woodlands, which represent in this country those vast areas of forest-covered land which the State owns in most European countries. Small as they are compared with the latter, they cannot be despised in a thickly-populated country, in which individual ownership is developed to its fullest extent. It might reasonably be expected that the example of most civilised States would be followed, and by increasing the area of these woods by the acquisition of poor tracts of semi-waste land, a system of State forestry would be gradually built up, which has been so successfully accomplished abroad. But judging from past experience, and present appearances, this does not seem to be the intention of the authorities. Either their experience of State forestry as a commercial undertaking has not been satisfactory, or they feel that public money would be wasted by expending it in a manner which our Continental neighbours have clearly demonstrated is for the public good, in both an æsthetic and economic sense. So far as past experience goes, we do not possess figures to show the exact financial results of the Crown forests over a long series of years, but we know that early in

the present century timber of considerable value was removed from the Forest of Dean; and also from the New Forest since the year 1850.

Of recent years, little more than a sufficient sum for their maintenance has been obtained, but, as they contain no proper succession of mature timber, the majority of the plantations being comparatively young, this is not to be wondered at. But it is not very probable that the return from them in the past has been on the whole satisfactory from a strictly financial point of view. When timber crops are exposed to the browsing of cattle and horses, the growth of the trees usually leaves much to be desired; while the supervision of a large area of unproductive ground, the erection and maintenance of gates and fences, and the amount of surveillance necessary for ground frequented by all classes of the public, raises the cost of management far above what it should be on freehold property. But apart from all this, timber crops can never be very profitable unless managed in a judicious and skilful manner, and it is an open question (if not a dead certainty to the contrary), if the Crown forests have ever been managed upon sylvicultural principles.

Those who have visited either the New Forest or the Forest of Dean cannot have failed to notice large areas of ground covered with low-crowned, short-stemmed Oaks, standing in straight rows, reminding one more of a thickly-planted Apple-orchard than a forest of indigenous timber-trees. The explanation given of this unpicturesque, and certainly unprofitable method of growing Oak, is that it originated in the days when the Crown forest supplied Oak for the Navy, and that crooked timber was of more value in those days than clean, tall stems such as are now in demand. But it hardly seems possible that the peculiarities of naval requirements can be responsible for the management of those plantations formed during the last fifty years, or since iron took the place of wood in shipbuilding; yet the younger plantations in our Crown forests do not exhibit such a marked improvement sylviculturally over those of an older date, as one would expect to find in woods presumably managed for the production of marketable timber. Their present appearance would almost lead one to imagine that the system of management adopted was based a good deal more upon rule-of-thumb and ignorance of sylvicultural principles than with a definite view to the production of good timber. Some years ago an eminent French sylviculturist eulogised the system of growing Oak in the Forest of Dean, and many members of the Royal Scottish Arboricultural Society looked forward to learning a few "wrinkles" on this interesting subject. But with the exception of one or two enclosures (which probably did duty in the eulogy referred to for the whole forest), little was seen to inspire much enthusiasm either as regards past or present management. As in the case of most British plantations, over-thinning seemed to have been the weak point, aggravated by the mixing of species in a manner which rendered good results difficult to obtain. Enclosures were thrown open too soon in many cases, and before the trees were old enough to dispense with the humus layer which close order had provided them. Before the trees had reached anything like timber size, they were deprived of their richest feeding-ground, and the surface became hard and grass-covered, giving the growth of the timber a check it never recovered from. This class of timber forms a striking contrast to the grand old trees which still exist in places as the remnants of former crops, proving that suitable sylvicultural conditions are all that are needed to get similar results in the future. *A. C. Forbes.*

(To be continued.)

BOOK NOTICE.

RECENT CHRYSANTHEMUM LITERATURE.

UNDER the above heading, I gave in the *Gardeners' Chronicle* of March 6 last year a brief résumé of such publications on the *Chrysanthemum*, both English and foreign, as had been published during the

previous twelve months, or thereabouts. Since then the attention of horticultural writers does not seem to have been devoted to the same extent to this subject; but, nevertheless, some useful additions to this branch of literary work have been made, and a few notes bringing the subject close up to date will be acceptable to those readers specially interested in the flower from a literary standpoint.

It will be remembered that the line was drawn at trade catalogues, many of which contain much useful matter, but which form an independent section of their own. The first country to claim our attention on the present occasion is America, and although there has been nothing to compete with some of the older works, mention should be made of the energy and regularity with which the Cornell University issues its set of bulletins devoted to horticultural subjects, and of these No. 136 by Messrs. L. H. Bailey and Wilhelm Miller is entitled *Chrysanthemums of 1896*. This is uniform with previous issues, and deals with novelties under trial at the University Experiment Station at Ithaca. There are seven photographic reproductions of various types of novelties, and the bulletin concludes with a classification of good varieties arranged in regard to their colours; promising varieties, unpopular varieties, less promising varieties, and a significant short list headed "not true to name."

From Belgium we have only one addition to notice, viz., M. O. de Meulenaere's third supplement to his general catalogue, which ranks as a standard work of reference, giving as it does names, dates, raisers, classification, &c. The Nederlandsche Chrysanthemum Club of Amsterdam is probably the only Society in Holland that pays exclusive attention to the golden flower, and its first show was held in November last, on which occasion the executive issued for the use of visitors at a small charge, a neatly-printed brochure of fifty-six pages, containing amongst other things a history of the Chrysanthemum, by Mr. J. K. Budde, of Utrecht, a Cultural Guide, the Rules of the Club, and a List of prize-winners at the show.

English contributions are not numerous, there being, so far as it is possible to learn, only two, and these but small treatises. One is entitled *Modern Chrysanthemum Culture for the Million*, by George Garner; the other, *The Show Chrysanthemum and its Cultivation*, by C. Scott.

The French have issued five, of which two are new editions of works previously noticed. The other three comprise a pamphlet, reprinted from a local horticultural society's journal, entitled *Culture du Chrysanthème*, par M. Ernest Baltet; a second, called *Le Chrysanthème, son Histoire sa Culture*, by M. Cabos of Havre; and the third, a reprint of various papers read at the Orleans Conference of the French National Chrysanthemum Society last November, entitled *Maladies et Parasites du Chrysanthème, de la Fécondation dans le Chrysanthème*, and *Des Meilleurs engrais et Composts*, the whole forming a neatly-printed brochure, issued under the auspices of the Society, but published by M. Doin of Paris.

The various organs of the three French Chrysanthemum societies continue to be published at intervals. Thus the *Nord Horticole* regularly appears every month, and is supplied gratis to the members of the northern French Chrysanthemum Society, whose head-quarters are at Lille, and whose show and Conference there next November promises to be an event of some importance. Then we have *Le Chrysanthème*, the official organ of the French Chrysanthemum Society, which is located at Lyon, and this publication has just run into its seventeenth number. The Paris Chrysanthemum Committee's *Journal* has been published at somewhat longer intervals, the last issue being Part 6, and containing several illustrations of the Paris show in November, 1897, and several articles relating to the flower in various ways.

The most recent periodical publication is *Il Crisanthemo*, the quarterly journal of the newly-formed Italian National Chrysanthemum Society, No. 2 of which has just been distributed amongst the members. This number consists of twenty-four pages, and contains a good deal of matter on various subjects.

Apart from purely society information, there are articles on the history of the flower, the origin and spread of it in Europe, classification, a cultural calendar, a list of forthcoming shows, &c. Verily the English Chrysanthemum fancier who desires to keep in close touch with what is now being done in regard to his favourite flower, will have to be endowed with the polyglot attainments of an Elihu Burritt or Cardinal Mezzofanti.

And we have not exhausted the list, for it is intended to issue yet another journal by one of the continental Chrysanthemum societies, viz., the Swiss N. C. S., the first number of which will appear directly after the ensuing season.

Looking at these foreign periodicals that are published in countries where the Chrysanthemum is almost a newly-discovered exhibition flower, I can only repeat what I said in my former paper, that one would have thought that we in England, with all our professions of affection for the flower, would have long since started and loyally supported a weekly or monthly magazine specially devoted to the dissemination of Chrysanthemum news. C. Harman Payne.

TEWIN WATER.

THE seat of H. Trower, Esq., is situated about a mile from Welwyn Station, and contains many features of a very interesting character. The country round is diversified and undulating, broad meadows interspersed with stretches of woodland and cover, in which trees of fine dimension, full of health and vigour, are flourishing; avenues of Spanish Chestnuts of large size, Beech also, and lines of Walnuts, may be seen as one rambles through the glades of the fine preserves. Here, too, were Oaks of immense size; one of them having a trunk perfectly hollow, into which one could easily crawl, and passing upward make an exit, dignified or otherwise, some 8 or 10 feet higher up. A singular excrescence had formed on one of the trees, and had so swollen that, on looking at it from one side, the exact form of an immense crouching toad could easily be imagined.

These woods are of considerable extent, and in their season are a fine cover for game, of which much is reared on this and adjoining estates. The pleasure grounds are extensive, and in excellent condition, the lawns formed of a dense turf springing to the tread; grand specimen trees stand at intervals, perfect in form, and vigorous in growth. The beauty of this part, as also the whole area of the estate, is enhanced by a clear stream of water running through it, in which are found some fine fish. On the bank of the stream in the pleasure-grounds a fine lot of strong-growing Spiræas, Bamboos, and other water-side plants have recently been planted, which, when established, will add interest and beauty to this portion of the grounds. At a part where the garden adjoins a meadow, and where the stream is widest, a bog garden and an island are going to be made and planted during the autumn.

The flower-garden of large size adjoins the mansion. The flower-beds are filled with bedding plants, and some with herbaceous perennials, and with Cannas, Fuchsias, and Dracænas. A capital piece of work has just been completed in furnishing the grounds and gardens with water from the river Nimran, the stream alluded to above, by means of an hydraulic ram.

In a basin surrounding a fountain I noticed some of the new Nymphæas that were planted out in pots in the summer, which are growing freely. I remarked *N. Caroliniana nivea*, *N. odorata sulphurea*, *N. alba rosea*, *N. Marliacea carnea*, *N. Laydekeri*, and *N. Signor Eti*. These useful additions to our existing species and varieties are likely to do well.

Passing from the lawn by a winding path, a fine clump of Pæonies and Carnations was remarked, and a little further a border of herbaceous perennials came in sight. This is more than 100 yards in length, and the beds on each side are planted with Pæonies, Delphinium, Campanulas, early Gladiolus, Stocks, *Lychnis viscaria flore-pleno*, with numerous other useful species, and edged with the useful white

Pink Her Majesty, a Box edging, and a smooth gravel path.

In the kitchen-garden good crops of vegetables were noted; healthy pyramidal fruit-trees, and on the walls, trees of the Peach, Nectarine, Plum and Cherry, were showing well for fruit. A north border was wholly filled with Violet runners, for lifting in the autumn. A neat residence for the gardener has been erected; and near by is the cottage for the electrician—the mansion and adjoining buildings, stables, &c., being lighted by electricity.

The engine-house, dynamos, and accumulators are located in a block of buildings at a short distance from the mansion, and being covered with Ivy, and hidden by trees, are in no way an eyesore or detrimental to the pleasure and comfort of the proprietor. A number of plant and fruit-houses have been erected, and the young trees and plants are making good progress. There were good crops of Cucumbers and Melons to be seen, and among the latter were Blenheim Orange, Eastnor Castle, and High Cross Hybrid, the latter a white-fleshed Melon. In another division were Caladiums, Achimenes, Gloxinias, &c. Some Orchids, also, have already made their appearance, some plants of *Cattleya Mossiae* being in flower. Carnations were found in flower in another division, including *Souvenir de la Malmaison* in variety, and the useful *Germania*. Cannas, Lilliums, Hydrangeas, Fuchsias, *Streptocarpus*, Begonias, &c., filled the show-house. Peach-houses and vineries had been but recently planted; of these little further need be said than that the trees were growing away freely, and the spaces at present unoccupied by trees were planted with Tomatoes.

Mr. Thomson took charge of the gardens last March. W. Swan.

FOREIGN CORRESPONDENCE.

PROTECTION AND SHELTER.

A SURGEON of eminence in his day was the author of a book inculcating the necessity for rest in the treatment of disease. It seemed like a truism, but experience shows that the lesson cannot be too strongly enforced, and so in the planting of trees, shelter is often all important. We have recently seen some striking illustrations of the value of protection and of the injuries which are inflicted when such protection is not and cannot be afforded. Our first illustration is taken from the garden of a hotel on the shores of the Lake of Geneva, at Ouchy. There, sheltered from cold and wind by the surrounding hills, exposed on the southern aspect, and to occasional fogs, is a collection of trees perfect in symmetry, and some of them attaining proportions which we are not accustomed to see in our own country. As usual, some of the trees are already spoiled, and many more will be so from overcrowding and want of thinning. Nevertheless, many of them are fine specimens of their kind, and they illustrate very strikingly the characteristics of particular species.

The Sequoias (Wellingtonias) are faultless specimens, averaging 19 metres in height, exceeding the height of the hotel itself. Singularly enough, not one of them has produced a cone. A very noble Deodar, whose dimensions we do not know, occupies the centre of the ground. Its weeping plumose branch-system, convex on the upper surface, and the ultimate shoots curving downward, is very characteristic, even in a tree of this size. There is a curious variety of this species to be seen here, which has elongated, serpentine branches trailing along the ground after the fashion of those of the Serpent Fir, or of some of the Weeping Beeches.

Cedrus atlantica is represented by several fine specimens, glaucous in hue, often with stout, ascending, primary branches, while the smaller ones are horizontal, the ramifications flat, not convex, and the ultimate branchlets long, thinly beset with needles, and widely spreading, or if erect, tapering into long whip-like shoots.

Of *Cedrus Libani*, there are also some majestic specimens, with ascending main branches, and others spreading horizontally, more densely covered with

FIG. 57.—*ARUNDINARIA ARISTATA*, TOGETHER WITH DETAIL OF THE BACK OF LEAF TO SHOW NETTING; EDGE OF LEAF ENLARGED TO FOLD, AND A FULL-SIZED LEAF AND SHOOT (SEE P. 212.)

foliage, and more compact and less extended than in the corresponding shoots of *C. atlantica*.

Of course, every one who knows anything about Cedars, knows how exceedingly variable they are in habit. Nevertheless, when several large specimen trees of the various species are grown together, as here, the differences now pointed out are clearly observable.

There are some fine specimens of the Maidenhair tree (*Ginkgo*), of which sex we do not know, but they afford an illustration for the necessity of thinning in due time. The problems now are whether it is better to leave things as they are to the detriment of both trees, or to sacrifice either the *Sequoia* or the *Ginkgo*. Fortunately the question does not depend upon us for its solution.

Among other fine trees are *Pinus Lambertiana*, *P. monticola*, *P. Pinaster*, *Abies Pinsapo*, *Picea Morinda*, and *Cypresses*, reminding one of Italy. Fortune's Weeping Cypress is very beautiful, but it is allowed to be sadly over-grown; *Juniperus pendula* and *J. excelsa*, *Taxodium distichum*, and many others which it is not necessary to name; specifically our present object being to illustrate the value of shelter in the production of noble specimens, and the short-sightedness of owners in allowing these fine trees to become spoiled for want of timely thinning. On another occasion we may give illustrations by way of contrast of the terrible effects of a want of shelter.

SHRUBS WHICH SUCCEED BENEATH TREES.

FREQUENT inquiries are made for a list of flowering shrubs that will thrive beneath old trees. The chief difficulty is in the matter of feeding material in the soil, and not so much a question of shade, which is not expected to be really dense. Near the surface of the ground beneath old trees, there is a great network of roots, which must extract a very large amount of moisture and food. These roots, being more numerous and stronger, do not permit a newly-planted shrub to get much of the necessities of life, and the new-comer is slowly starved to death.

There are a number of plants that delight in shade, and if the soil be kept in condition, there should be no difficulty in growing them in such locations. The main attention should be in heavily mulching the ground above the roots with well-rotted manure, which will furnish both food and moisture. The following selection would prove very desirable and well adapted for such locations:—*Ceanothus americanus*, *Azaleas*, *Rhododendrons*, *Pyrus japonica*, *Clethra alnifolia*, *Cornus mas*, *Itea virginica*, *Ligustrum vulgare*, *Pavia parviflora*, *Berberis Thunbergi*, *Spiræa Bumalda*, *Laurus Benzoin*, *Hamamelis virginica*, *Mahonias*, *Kalmias*, *Hypericums*, *Diervilla trifida*. Many additions could be well made to this list. *Meehans' Monthly for September*.

VARIORUM.

JAPANESE IN AN ORCHID CRAZE.—The latest craze that has made its appearance in Japan is the Orchid craze; and if reports are true, the Tulip craze in Holland of several centuries ago may well look to its laurels. According to the *Tokio Asahi* (Morning Day), a new variety of a small Orchid, jointly owned by the well-known gardener of Shitaya, Maru Shin, and by two others, is at present enjoying the highest reputation. It is called "Amakusa," for every rare variety has its own special name. Its leaves measure only 4 inches in length and 1½ inch in width, this variety being the only one now found in Japan. The leaves, only eleven in number, are whitish, with yellow-hued stripes widely marked, and the whole appearance exceedingly graceful. The fame of the "Amakusa" has sent all the circles of Orchid-hunters into a flutter. Numerous applications have been received by the triple owners asking them to part with even one leaf, for Orchids, as is well known, can be propagated by roof separation. But all these applications have been courteously declined. The other day, says the *Asahi*, a delegation representing ten villagers of Chitagori, Okari, came up to Tokio. They were all men stricken with

the Orchid mania, and hearing of this rare variety, each of them subscribed 500 yen (a yen is 50 cents in United States currency), and one of them, the head man of the village, arrived on the important mission of purchasing a leaf. While the negotiations were in progress, the Kyoto Horticultural Company despatched its president also on the same errand. The owners of the precious Orchid conferred with each other, but decided not to accede to the offers made them, for they have in mind a similar case of another rare variety which several years ago brought the fabulous price of 10,000 yen per leaf. So both delegations were obliged to return home crest-fallen; and the *Asahi* adds, "Even supposing that the owners might be persuaded to part with that Orchid at 5000 yen a leaf, that would bring them a sum of 55,000 yen, while if the price were to rise to 10,000 yen each, that amount would be doubled." *Western Morning News*.

A LAND WITHOUT A NURSERY.—Nurserymen who complain of the results of competition may be surprised to learn that in a certain part of the United States territory there is not a single nursery. The *Rural New Yorker* publishes a letter from C. E. Haskins, of Oregon, to Professor H. E. Van Deman, in which the writer detailing his experiences in the Hawaiian Islands, says:—

"A German horticulturist took to me, and we went all over the islands together. I formed the acquaintance of all the officials in the agricultural and pomological departments, and saw all of their many kinds of fruits, Nuts, plants, &c. I found them all very interesting, but must say that I was surprised to find that there was no such thing as a nursery such as we have, in all the Hawaiian Islands. No fruits are grafted or budded, as we do in the United States. They simply plant the seeds and trust to luck, just as our grandfathers did with the old seedling Apple orchards. I did some budding of Oranges, and grafted some Mango-trees, and found it as easily performed and as sure as at home, if everything was properly handled, and at the right time.

"Fruits vary from seed here as elsewhere, and I found some of the finest individual varieties among the Mango-trees as well as among other fruits. But after learning all I could, I do not think it would pay to grow anything in the fruit line, and ship it over 2,000 miles to market; but for home use, it would pay to grow better fruits.

"All kinds of fruits can be had twelve months in the year—Papaya, Pine-apple, Banana, Custard Apple, Mango, Orange, Lemon, Fig, Palms, Strawberry, Water Lemon, and many other fruits, and in numberless varieties." *The National Nurseryman*, September, 1898.

THE WEEK'S WORK.

HARDY FRUIT GARDEN.

By W. H. DIVERS, Gardener to the Duke of Rutland, Belvoir Castle, Grantham.

Gathering Fruit of the Apple and Pear.—Such varieties as ripen during late autumn and winter must be gathered when the pips begin to change to a brown colour, and the fruit-stalk will part easily from the wood on being raised by the hand. The season being a backward one generally, the gardener need be in no hurry to gather the fruit, but wait till the changes adverted to have taken place, and even then he should take only those fruits from a tree that are quite fit, leaving the others for gathering at later dates. A gathering-basket should be long, flat, and not hold more than a few dozen fruits. It should be lined with coarse sacking, so as to prevent bruising; and no fruits should be squeezed, bruised, or allowed to roll over each other, but every one handled as carefully as if it were an egg. In Kent, when gathering from a ladder, a bag is used, fastened at the man's side by means of a strap round the waist. It is a convenient method, but by it the fruit is much bruised; and I consider that baskets or trugs furnished with a cross-handle for hooking on to the rungs of the ladder are much to be preferred to bags. For tall bushes a double ladder is best. These are made wide at the bottom in order that they may stand firmly, and are bolted together at the top; but for the tops of tall standard trees, single ladders are indispensable, which, if placed nearly upright, do not injure the fruit and spurs much. When placed in the fruit-room the fruit should not be put more than two layers deep if required to be kept for any length of time; and more than this, prevents the ready detection and removal of decaying fruits. To ensure good

keeping, as far as possible doubtful fruits should not be stored with the best fruits, but kept apart for immediate use, or given to the pigs if unfit for anything else. The fruit-room should be well ventilated till sweating is over, and on no account should straw or hay be used under the fruit, as it breeds mildew and imparts a disagreeable flavour; and if anything be necessary over the boards, clean newspapers may be used. In very cold fruit-rooms, two or three thicknesses of paper should always be placed over the fruit. The length of time during which Williams' Bon Chrétien, Marie Louise, and other autumnal varieties of the Pear are fit for use, may be very much extended by gathering the ripest fruits first, and placing these in a warm dry room, and continuing to gather the fruits weekly. The atmosphere of the fruit-room must always be sweet, and free from objectionable odours, as ripening fruit absorbs these quickly.

PLANTS UNDER GLASS.

By W. MESSENGER, Gardener to H. C. BERNERS, Esq., Woolverstone Park, Ipswich.

Violets.—The demand for these fragrant flowers during the autumn, winter and spring, is now so general, that all necessary preparations should be made to ensure a constant and sufficient supply. The young plants in the open, I presume, are now in proper condition to be removed to pits and frames, where they may be expected to give a supply of flowers during mid-winter, provided that the pit may be heated when necessary. Ordinary cold-pits or frames will be sufficient for the accommodation of plants to bloom in autumn and spring. Prepare the pits and frames a few days previous to moving the plants, that there may be sufficient time to thoroughly moisten the soil, and to allow the beds somewhat to settle down. Wash thoroughly the wood-work and glass, to remove any insect-pests there may be, and to admit all the sunlight possible. Make up the beds of well-rotted manure, so that when the addition of 6 to 8 inches of soil—according to the variety and size of the plants—has been made, the surface will be a few inches only from the glass. It is not advisable to use light or fresh manure for making the beds, or the sinkage will be considerable, and the plants will fall a considerable distance from the glass at a time when it is essential they should be near the light. The manure should be well trodden before covering it with the soil. Previous to lifting the plants, take care that the soil is in a moist condition, and select plants with good plump single crowns, cutting off all runners. Do not allow the roots to become dry after lifting, but re-plant without delay. When this has been done, give them a good soaking with water; and if the weather be mild, keep the lights off as much as possible. During dry weather syringe the plants twice each day.

Caladiums.—In the same degree as the foliage dies off, so should the supply of water be decreased, and when the plants are resting, the pots may be placed away in a moderately warm house. Do not allow the soil to become dust-dry at any time, or the tubers are apt to shrivel and die. *C. argyrites* and similar varieties are most likely to suffer from this cause.

Dracenas.—Plants that have been repeatedly used for decorative purposes, and have lost their bottom leaves, may be topped. These tops if placed in bottles filled with soft water containing a few lumps of charcoal, to keep the water sweet, and kept in a close, moist temperature and shaded, will quickly emit roots. Should the tops be large and heavy, possessing a considerable amount of foliage, the stems may be notched, then wrapped with moss, which should be kept wet. By such a method roots will soon be induced. The stems, if kept moderately dry during the winter, will produce young growths that may be made cuttings early next year.

THE KITCHEN GARDEN.

By J. W. McHATTIE, Gardener to the Duke of Wellington, Strathfieldsaye, Hants.

Late and Early Cabbages.—Let the quarters be cleared of the remains of the Cabbage crop, and of all weeds, raking off the latter and burning them. Ply the hoe frequently between the rows of the late Cabbages and of those plants which are beginning to form hearts, in order to aerate the soil and destroy weeds, the best-kept land being difficult to keep free from weeds at this season. The plants in the seed-beds of Cabbage must be kept free from weeds by hand-weeding the beds, and a copious watering afforded afterwards. If the plants are crowded in any degree, let them be thinned by drawing out the weaker

plants, planting these on good soil in a warm position, affording them water for a few days with a water-pot having a rose on the spout. They will make strong, sturdy plants, fit to set out towards the end of the present month. A good position for a bed of spring Cabbage is the quarter occupied by the Onion crop now removed, merely forking the ground and planting them in rows 18 inches apart, and one foot between the plants. If any plants of Ellam's Early Cabbage are strong enough to plant out, set them out forthwith. Make the ground very firm about the roots of all Brassicas, affording water whenever it is needed.

Lettuce.—Seeds may be sown thinly in beds or lines for standing the winter without transplantation, the sorts to sow being Brown and Bath Cos, and Hammer-smith Hardy Green or All-the-Year-Round Cabbage. The beds should be warm and dry, no manure being applied unless the soil be [poor, and then only such as is decayed; but it should be deeply dug. Lettuces raised from seed sown last month should have the ground hoed, and all the weeds removed from among them, water being applied freely, or the plants will make small progress. A piece of land should be got in readiness on a warm border, and handlights cleaned and mended to put over them when transplanted. I like to transplant Lettuces early in order that they may get a firm root-hold before winter sets in. Afford encouragement to Lettuce plants which are intended for transplanting into brick pits, cold frames, and cool fruit-houses, for affording early winter supplies.

Endive.—Continue to transplant successional sowings of Endive as directed in my last month's calendars, also putting some of the plants into any spare frame, pit, or cool orchard-house.

Small Salading.—It will be found necessary to sow seeds of Radishes, Mustard and Cress, on a dry, warm border, particularly now that the days and nights are getting cooler; making a sowing once a week outside; and towards the end of this month make sowings in pits, frames, or boxes.

Herbs and Seeds.—All sorts of sweet, pot, and medicinal herbs should now be gathered when dry, and dried as rapidly in the shade as the state of their growths will permit. Any seeds which it may be thought desirable to save for future use, should be collected, and dried in readiness for storing.

THE ORCHID HOUSES.

By W. H. WHITE, Orchid Grower to Sir Trevor Lawrence, Bart., Burford, Dorking.

The East Indian-House.—Such species as *Aërides*, *Saccolabiums*, *Angræcums*, and the warm growing *Vandas* having made considerable growth, they may be encouraged to grow so long as this [warm weather continues, for these species not forming pseudo-bulbs, the plants do not require nearly so long a rest as those which have pseudo-bulbs. They should be treated in a great measure as resting plants, more especially in the matter of water at the root. At the present time the roots should be kept uniformly moist, allowing them, however, to become properly dry immediately the green tips of the roots commence to change colour, and fire-heat to any great extent is needed to keep up the temperature, the moss must be permitted to become quite dry before affording water, and even then it must be afforded in moderation. Amongst the heat-loving *Vandas*, *V. Sanderiana* is now pushing up its flower-spikes, and those who possess plants of it should afford them encouragement as regards heat, moisture, and light, but carefully protect the plant from direct sunshine; *V. Sanderiana* has generally been considered a difficult plant to establish, or to keep growing vigorously for any length of time. I have tried several expedients, and up to the present time the most successful has been to fasten the plant in an upright position upon a Teak-raft, the rods of which are about an inch apart, using no compost; the roots twine round the rods in great luxuriance. The place in which it stands is the hottest corner of the house, and near to the roof, where there is plenty of light but no direct sunshine. The stems and roots are moistened twice or thrice daily during bright weather, but on dull days only once. In affording water, care must be taken not to wet the foliage, or water will accumulate in the axils of the leaves, and probably set up decay. Scale insects are liable to infest it, quickly disfiguring the foliage, and these should be frequently sought for and destroyed. *V. teres*, *V. Hookeriana*, and *V. x Miss Joaquim* likewise thrive when placed upon Teak-rafts, and these at this season should be exposed to full sunshine, syringing them overhead

several times a day. The same kind of treatment is advised for *Schomburgkia tibicinis*, *S. undulata*, *S. Sanderiana*, *S. rosea*, *S. Kimballiana*, &c. The whole of the *Cypripediums* which occupy a shady position in this house are now growing freely, and will require abundance of water at the root. Dryness at the root, especially to pot-bound plants, or in the atmosphere surrounding them, is sure to cause weak growth, and such is a prey to insect pests.

Small *Cypripedium* Seedlings.—It should now be ascertained which of these must be repotted, as the present is a suitable season for performing this operation. Seedlings usually grow fast, requiring to be repotted twice in the year. These delicate little plants require much attention in regard to water, for should a check be caused by giving them too much or too little, progress is checked for a long time.

Miscellaneous.—*Paphinia cristata* suspended from the roof is now flowering in the Cattleya-house, and till growth is completed copious applications of water will be given it, and then the compost will be merely kept moist. Plants of *Lælia purpurata*, whose growths are about 3 inches high, will soon begin to emit roots, and if any plant requires more room, now is the time to repot. When affording these plants larger pots, it is wise to allow for two seasons' growth. Old plants that require to be broken up may also be taken in hand. *Lælia elegans* and its varieties have always been considered first-class Orchids, and at the present time plants that are strong will be flowering from the apex of the current season's growth. At this time the new growths are tender and easily decay, either by affording more water at the root than the plant needs, or from a cold, damp air. When such mishaps occur, the decayed parts should be removed with the knife, and the plant placed in a drier and warmer house. *L. elegans* may be repotted soon after the flowering season, as the new roots that are emitted from the base of the flowering growth at once enter the new compost and re-establishment is rapid. Fibrous peat, a little sphagnum-moss, and plenty of crocks and charcoal, well mixed together, form a suitable compost for this species, as well as for *L. purpurata*. It is important when repotting the plants to do this firmly, and to use a few neat stakes, and tie the strongest pseudo-bulbs to them. Water should be afforded sufficient to prevent the excessive shrivelling of the pseudo-bulbs. Strong, well-rooted specimens may be allowed to carry their flowers till the latter fade, but from weakly plants the flowers should be removed as soon as these expand. Newly-imported plants of *Lælia purpurata* and *L. (Brassavola) Digbyana* may be potted up on arrival, and placed in the Cattleya-house.

FRUITS UNDER GLASS.

By G. NORMAN, Gardener to the Marquess of Salisbury, Hatfield House, Herts.

The Peach-house.—Trees from which the fruits have been gathered should now be looked carefully over, with a view to removing as much of the wood made last year, as will not be required to be laid in. No more need be retained than is necessary to cover the space without crowding. When the superfluous shoots have been removed, those which are retained will obtain greater benefit from increased light and air, which, by more fully maturing the wood, will render the crop next season a more sure one. To the same end ventilate the house freely, and examine the soil in the borders as often as necessary, and afford copious supplies of water whenever such is required. Syringe the foliage over in the afternoon of each bright day, and endeavour to keep it healthy and green as long as possible. Peach-trees in pots that were not repotted last autumn, will need to be done this year, and such work should not be long delayed, or the roots will be unable to take any hold of the new soil before the end of the season. The pots to be used for such a purpose must be sound and clean. The sizes needed will depend upon the sizes of the pots from which the trees are to be removed. As a rule, space should be provided for about 1½ inch of new soil between the ball of the plant and the sides of the pot. The soil should be chopped, or pulled to pieces by the hand, and in character the same as recommended in a previous Calendar for making borders for Peach trees. Before the trees are removed from the pots they at present occupy, ascertain if the soil about the roots be very dry, and if this be the case water the plants. Pot-bound trees sometimes are difficult to get out of the pots without breaking the pots. The ordinary way of doing this, however, is the best. Turn the plant as nearly

upside down as the top of the tree will permit, and give the top of the pot a gentle rap on the bench, at the same time pulling the stem of the tree. Remove the crocks, and prick out as much soil from between the roots as may be done without damaging them. Allow about 2 inches of drainage material at the bottom of each pot, using strong ones at the bottom, with smaller ones over them. Cover the crocks with a layer of the roughest of the soil, making it firm with the potting-stick. On this the trees may be placed at such height that the roots will be covered with soil, and a space be left of 2 inches on the surface for holding water. Put the necessary soil around the ball of the plant in small quantities, and pot firmly throughout. A cool orchard-house is the best place for them for a little time after repotting, but the front ventilators may be closed during bright sunshine, and when the outside air is very dry. A thorough root watering is necessary as soon as the plants have been returned to their positions. They may be syringed twice on each bright day.

Cherry and Plum-trees that require to be repotted may be treated in the same manner. Orders for fruit trees required to be delivered early in November should be placed in the hands of the nurseryman without delay.

THE FLOWER GARDEN.

By H. WALTERS, Gardener to Lord Gerard, Eastwell Park, Ashford.

Tuberous-rooted *Anemones*, though amongst the oldest of garden plants, are not now cultivated so extensively as they might be. By planting at successive periods, commencing in September, *Anemones* may be had in flower during the greater part of the year. If the first batch be planted during the present month, it should be followed by another one in October, during which month the main batch should be planted for blooming in the spring. It is useless to plant during November, December, January, and February, as the roots would be more likely to decay; but in March and April further batches may be planted, to bloom during summer and autumn. The varieties are exceedingly numerous, and all of them are very beautiful, the colour of their flowers being brilliant and most variable. The plants delight in a rich loam, in which well-rotted manure has been well intermixed; and if the soil be at all retentive, a mixture of sharp sea-sand is advisable.

Irises may be had in bloom from March to August. Early autumn is the best time to plant them, and though they appear to flourish in any soil, a damp situation suits them better than a dry one. There are numerous groups of *Irises*. The Palestine *Irises* are beautiful; the Spanish *Iris* (known as the Garden *Orchid*), the Bearded or German *Iris*, the Siberian *Iris*, the English *Iris*, and a variety recently introduced by Messrs. Carter as the Oxford and Cambridge *Iris*, from the colours of the flowers being pale and dark shades of blue. *Irises* should be planted in groups, as they are then most effective. Many of the varieties are sweetly scented, and all are useful for furnishing flowers for cutting.

Eulalia japonica zebrina is a graceful and ornamental plant, especially valuable for planting on the banks of ornamental lakes, or by the side of a running stream. It is perfectly hardy, and in situations where Bamboos will not thrive this plant is almost equally effective. It grows 4 to 6 feet high, and the leaves, which are a dark green, are prettily marked with a yellow bar. As a dot plant on lawns, or in clumps, it is as effective as the Pampas Grass.

Carnations.—The earliest layers should now be removed from the old plant, and planted in the beds or borders where they are intended to flower. These borders should have been previously deeply dug, and enriched by good rotten manure. If the soil be heavy, some sand or road-grit would be helpful if well mixed with the staple soil. When planting make the soil firm around the roots of the plants, and if the soil remains dry, afford a good watering after planting. Should hot weather continue, an occasional sprinkling overhead with water from a fine rose-can towards the wane of the afternoon will greatly benefit the plants, and stimulate growth. Carnations require a sunny position. Take every care in removing the layers not to injure the roots, and do not allow the layers to remain on the old plant too long, or they will make roots and growths that will sustain a severe check when they are ultimately severed from the old plant. Never coddle the Carnation, as the plant is essentially hardy, and except in places where dampness or fog abounds, will stand the severest winters.

EDITORIAL NOTICES.

ADVERTISEMENTS should be sent to the PUBLISHER.

Letters for Publication, as well as specimens and plants for naming, should be addressed to the EDITOR, 41, Wellington Street, Covent Garden, London. Communications should be written on one side only of the paper, sent as early in the week as possible, and duly signed by the writer. If desired, the signature will not be printed, but kept as a guarantee of good faith. The Editor does not undertake to pay for any contributions, or to return unused communications or illustrations, unless by special arrangement.

Illustrations.—The Editor will thankfully receive and select photographs or drawings, suitable for reproduction, of gardens, or of remarkable plants, flowers, trees, &c.; but he cannot be responsible for loss or injury.

Local News.—Correspondents will greatly oblige by sending to the Editor early intelligence of local events likely to be of interest to our readers, or of any matters which it is desirable to bring under the notice of horticulturists.

Newspapers.—Correspondents sending newspapers should be careful to mark the paragraphs they wish the Editor to see.

APPOINTMENTS FOR THE ENSUING WEEK.

TUESDAY, SEPT. 20 { Royal Horticultural Society's Committees.

SALES.

MONDAY, SEPT. 19 { Dutch Bulbs, at Protheroe & Morris' Rooms.

TUESDAY, SEPT. 20 { Dutch Bulbs, at Protheroe & Morris' Rooms.
Sale of the Highfield Nursery, Stevenage, Herts, and Goodwill; also, the Stock re Young & Dobinson, by Protheroe & Morris.

WEDNESDAY, SEPT. 21 { Dutch Bulbs, at Protheroe & Morris' Rooms.

THURSDAY, SEPT. 22 { Dutch Bulbs, at Protheroe & Morris' Rooms.
Annual Unreserved Clearance Sale of Greenhouse Plants and Shrubs, at the Floral Nurseries, Castle Hill, Maidenhead, by order of the Executors of the late Mr. R. Owen, by Protheroe & Morris.

FRIDAY, SEPT. 23 { Dutch Bulbs at Protheroe & Morris' Rooms.
Imported and Established Orchids at Protheroe & Morris' Rooms.

AVERAGE TEMPERATURE for the ensuing week, deduced from Observations of Forty-three Years, at Chiswick.—56.7°.

ACTUAL TEMPERATURES:—

LONDON.—September 14 (6 P.M.): Max., 80°; Min., 60°.

PROVINCES.—September 14 (6 P.M.): Max., 80°, Greenwich; Min., 53°, Off Shetland Isles.

The Orchids of the Sikkim Himalaya.*

A LARGE and important work bearing the above title has just appeared, containing a nearly complete account of the Orchids of Sikkim, with a figure of each, the only exceptions being some half-dozen species, of which living specimens could not be obtained for figuring. It forms volume viii. of the *Annals of the Royal Botanic Garden, Calcutta*.

The nature of the work may be inferred from the introductory remarks of Sir GEORGE KING, in which its origin and progress are very lucidly explained. The following is an extract:—

"For many years Mr. PANTLING had occupied his leisure by making drawings of the Orchids found on the Government Cinchona plantation in Sikkim, where he has lived since 1882. The appearance of the parts of the *Flora of British India*, containing Sir JOSEPH HOOKER's account of the family, gave an impetus to Mr. PANTLING's studies; and when he showed his drawings to me, I most strongly urged him to continue the series until it should include one of each species found in the Cinchona plantation and its immediate neighbourhood. The preparation of these drawings, gradually worked itself into a project for the preparation of a complete Orchid Flora of the Sikkim-Himalaya, each species to be illustrated by a life-size figure of the plant, accompanied by analyses of the parts of the

flower on an enlarged scale. The liberality of the Government of Bengal made it possible to publish the projected work in the *Annals of the Calcutta Garden*, and it now takes form in the present volume, which is the joint production of Mr. PANTLING and myself. The drawings from which the figures were lithographed were entirely the work of Mr. PANTLING, my share in the production of these plates having been confined to the supervision of the lithographers who put them on the stone. . . . For the letterpress Mr. PANTLING and myself are jointly responsible. . . . The drawings have all been put on the stone by natives of Bengal educated at the Government School of Art in Calcutta; and the colouring has, under very careful supervision on Mr. PANTLING's part, been done by the sons of Nepalese coolies employed on the Government Cinchona plantations—boys who had never, until Mr. PANTLING took them in hand, been accustomed to use any implement more delicate than a hoe. Mr. PANTLING's perseverance and skill in drilling these boys into accurate colourists have been a standing marvel to everybody who has seen them at work."

The way in which some of the specimens were obtained is both novel and interesting. It was believed that some novelties might be found "in the alpine part of the country lying between the valley of the Great Rungeet and the higher snows," and therefore "a small party of trained Lepcha collectors was sent during the hot and rainy seasons of several successive years. These men were provided with a few swift coolies, by whom living plants of every species collected were quickly conveyed to Mr. PANTLING, who, while the plants were still fresh, made drawings of them. As a precaution, the collectors were provided with a stock of Formaldehyd, in a weak solution of which they were instructed to preserve inflorescences of every species collected." In this excellent preserving medium the shape of the flowers is retained, and for a considerable time the colours also; and it is in the exact coloration only of flowers of a few of the alpine species thus preserved that a few departures from accuracy are suggested as possible.

The conditions under which the work was prepared are such as to inspire us with confidence in its thoroughness and accuracy. The latter point we are fortunately able to test, for a number of the species are more or less familiar in cultivation, and we congratulate Mr. PANTLING on the accuracy of the drawings and analyses. It should here be remarked that the lithographs in half the edition of three hundred copies are uncoloured, and the remainder partly coloured, and in the latter point the fidelity to Nature is again marked, and thus the plates are invaluable helps in the identification of the living plants. The work is divided into four parts, each having a separate title-page and index, and is issued unbound in two cases, each forming a stout volume.

The number of species figured is about four hundred and fifty (a few of the plates containing more than one species), which are divided into ninety-one genera, from which it will appear that the Sikkim Orchid flora is very rich. Besides the plates and full descriptions, the work is fully provided with analytical keys, by which it is easy to trace the systematic position of any Orchid which occurs within the area treated of. BENTHAM's arrangement of the Order is very largely followed, but a few changes are introduced. For example, Malaxideæ is kept apart from Epidendreæ, and Neottieæ is divided into two tribes, Listereæ and Goodyereæ; while a few of the genera are transferred from their old positions in consequence of changed views as to their affinity. Thus *Ione*, which

had been merged in *Bulbophyllum*, is not only kept apart, but transferred to *Vandea*, together with *Cryptochilus*, *Calanthe*, and *Oreorchis*—a position by no means free from objection.

The most startling innovation, however, occurs in the tribe Ophrydeæ, which is defined as having "anthers two, each with only one perfect cell," and as this is not in accordance with the generally accepted view, Sir GEORGE KING goes into some detail in defence of his hypothesis, which he explains is not shared with Mr. PANTLING, and is therefore published on his own responsibility. His argument may be condensed as follows: if the anther-cells of the Sikkim Ophrydeæ be carefully examined it will be found difficult to explain their structure on the monantherous theory. For, although in some species the anther-cells lie close together, in many they are widely separated, the pollinia being also produced into long caudicles contained in canals, neither caudicles nor canals having any apparent attachment to a rostellum. Moreover, each of the fertile anther-cells bears on its outer surface a rugulose body, which is referred to as the staminode. In certain species the fertile anther-cells are separated by a broad expanse of cellular tissue, and of which the prolonged caudicles are enclosed in forward projecting tubes, there being apparently no rostellum. In our opinion, the Sikkim species of Ophrydeæ have really two anthers, one cell of each of which is fertile and the other infertile. The infertile cell invariably occupies a position on the outer surface of the fertile one, and is the body usually described as a staminode. The two fertile anthers belong, in my opinion, to the inner whorl, the infertile being merged in the column. One of the three stigmas is infertile, and the two lateral are fertile, the fertile ones being quite distinct from each other, or conjoined into a simple or bilobed mass, and the infertile forming a thickened line between the anther-cells, or a more or less developed hood, as in *Diplomeris hirsuta*, which in this character closely resembles the South African *Bonatea*.

These remarks only show how deceptive appearances sometimes are in this remarkable family of plants. The peculiarities pointed out, apart from the interpretation placed upon them, exist in Orchids from many countries beside Sikkim, and the homologies of the different organs are often difficult to make out without very careful analysis. There can be no reasonable doubt that the Ophrydeæ are monantherous, and that the anther occupies the same position as in all the rest of the Monandree, but the connective is often so broad that the two cells are widely separated, and their contents—i.e., the pollinia—quite distinct. The "infertile stigma" is the rostellum, and this is often trilobed, the side lobes being variously united with the anther channels, and developing the glands—to which the pollinia become united—at their apex, while the front lobe may become nearly obsolete. The staminodes invariably represent the two lateral stamens of the inner whorl, and not two infertile cells, as suggested. This division of the anther is not peculiar to Ophrydeæ, for it occurs in *Mystacidium* and elsewhere, though the details are different. This new hypothesis, however, if it fail to explain the facts, is outside the scope of the work, and therefore does not affect its value. It is dedicated to Sir JOSEPH HOOKER, as a cordial token of admiration and respect, and we congratulate the authors on the completion of so excellent a work.

* *The Orchids of the Sikkim Himalaya*.—By Sir GEORGE KING, K.C.S.I., and ROBERT PANTLING. Large 4to, pp. 342, tt. 448. (Calcutta: Printed at the Bengal Secretariat Press.)

FIG. 58.—*LONICERA HILDEBRANDIANA* : COLOUR OF THE FLOWERS BRILLIANT ORANGE-SCARLET. (SEE P. 210.)

THE ROYAL HORTICULTURAL SOCIETY.—Fruit-growing in suburban gardens is not a very easy matter, but that it may be pursued with comparative success is evident from the exhibits of fruit shown from time to time at the Drill Hall. Mr. W. ROUPELL, who has on many occasions shown fruits from his suburban garden that have excited the highest appreciation, is going to read a paper upon the subject on Tuesday next, Sept. 20, when the committees of the Royal Horticultural Society will meet in the Drill Hall, Westminster. Suburban gardeners would do well to exhibit samples of their produce on that occasion.

HUNGARIAN HORTICULTURAL EXHIBITION AT BUDA-PESTH.—The Hungarian Horticultural Society, which is under the patronage of the Minister of Agriculture, intends to hold a horticultural exhibition this year in Buda-Pesth, from October 9 to 16 inclusive. In recent years Hungary has made efforts in all possible directions to improve the cultivation of fruits, vegetables, and flowers, and the Minister of Agriculture is desirous of affording assistance by means of an exhibition of fruit, vegetables, and flowers, and by arranging to have a fruit market. The exhibition, which promises to be on a very large scale, will be held in the afore-mentioned period in the Stadtwaldchen, and in the Vajda Hungader Castle buildings. The object of the exhibition being the improvement of horticulture in general, and in particular in fruit cultivation, the exhibition committee invite all native horticulturists to participate therein, bringing whatever vegetable produce they may have in fresh or conserved conditions, also flowers and ornamental plants, fruit bushes and trees, cut flowers, Roses, specimens of the bouquetist's art, Vine-grafting, table and culinary fruits. Only native cultivators can exhibit these productions; but as the object of the exhibition is the improvement of horticulture, foreign implements, machinery for dealing with the cultivation, drying, and preservation of fruits and vegetables will be allowed to compete; and such object may consist of apparatus for drying, vessels for fruit-steaming and boiling, fruit-grinding, and pressing machines, peeling and slicing tools, &c. In this section awards of gold, silver, and bronze medals will be made by the Hungarian Minister of Agriculture, as well as of silver and bronze medals of the society. No rent will be charged for standings, but the cost of exhibiting any article will have to be borne by the exhibitor himself. Entries in this section cannot be accepted later than Sept. 25. All information in reference to the exhibition can be obtained on application to the *Ungarischen Landes Gartenbau Verein, Buda Pest, (IV. Kev. Korona-hererguterza 16)*.

THE RECENT HOT WEATHER.—During Wednesday, Sept. 7, the thermometer in the shade rose to 87° in London, and 81° at York, but touched 87° at Cambridge, 86° at Loughborough, 85° at Oxford, 79° at Jersey and Liverpool, and 77° so far north as Nairn. The succeeding night to that the minimum readings were 60° in London, very slightly lower at the inland stations and at Parsonstown, and 55° to 57° over the greater part of Scotland. A maximum temperature of 91° in London is by no means unique in July or in August; thus, as recently as July, 1893, we had 92° at Cambridge, and 90° at Hillington; and in August of the same year there was 93° in London and at Stamford, and 92° at Cambridge. For the month of September, however, 91° appears to be unique. The continued drought in the south and south-east of England is now becoming almost a calamity, and although on several occasions the clouds have indicated rain, the movements of the barometer do not tend in that direction.

STOCK-TAKING: AUGUST.—Our last notice of the *Board of Trade Returns* had not a very happy outlook as a conclusive remark; but the figures now before us are of a reassuring nature, and leave the outlook for the remainder of the year altogether more cheerful. The imports for the past month, then, footing up at £37,216,527 show an increase of some £3,845,142 over the sum recorded for August, 1897. The value of imported articles of food, duty free, is in excess of the same

period last year by £1,992,868—largely due to imports of Wheat from the British East Indies. Metals have gone up £181,801; chemicals, &c., £16,342; oils, £193,073; raw materials for textile manufactures—cotton from America and Egypt showing most largely—£632,250; other raw materials, £466,927; manufactured articles have improved by £399,245; perhaps this latter item is not altogether a desirable increase. There is a decrease of £30,674 in dutiable articles; and in Tobacco £120,266 represents the drop in value. By the way, animals for food have shrunk by £157,479. The value of Hops imported last month shows an increase of £6,484; seeds show a gain of £92,913; wood and timber have improved by £21,910. Our usual extract from the summary table is as follows:—

IMPORTS.	1897.	1898.	Difference.
Total value ...	£ 33,371,385	£ 37,216,527	+3,845,142
(A.) Articles of food and drink—duty free ...	11,728,883	13,721,751	+1,992,868
(B.) Articles of food and drink—dutiable	1,940,789	1,910,115	—30,674
Raw materials for textile manufactures ...	2,247,764	2,880,014	+632,250
Raw materials for sundry industries and manufactures	5,635,240	6,102,167	+466,927
(A.) Miscellaneous articles ...	859,078	1,106,032	+246,954
(B.) Parcel Post ..	82,551	106,652	+24,101

The accompanying table relating to fruits, roots, and vegetables is very suggestive and explanatory of many market phenomena, as indicated by the plus or minus signs. The imports for the eight months past show a total of £309,076,495, an increase of £14,511,316 over the corresponding period last year.

IMPORTS.	1897.	1898.	Difference.
Fruits, raw:—			
Apples ... bush.	182,747	116,860	—65,887
Cherries	5,577	34,535	+28,958
Grapes	109,653	236,041	+126,388
Pears	450,616	128,854	—321,762
Plums	471,073	491,668	+20,595
Unenumerated ...	344,533	433,457	+88,924
Onions	639,027	629,799	—9,228
Potatoes ... cwt.	68,764	90,989	+22,175
Vegetables, raw, unenumerated ... value	£186,375	£207,716	+£21,341

EXPORTS

for August foot up at £20,186,016, an increase of £1,412,019 over August, 1897. It is worthy of note that machinery and mill-work have increased by £273,093, textile machinery of the value of £80,000 having gone to Russia and Germany, £50,000 worth to the East Indies. The greatest increase is in fish exports, the amount being £305,217, herrings standing for £295,985; metals, and articles manufactured therefrom, excepting machinery, show an increase of £241,810; yarns and textile fabrics are better by £228,678; nor must we omit, in conclusion, to record an increase in "apparel and articles of personal use," amounting to £64,725. The exports for the eight months show a decrease of £4,901,828 as compared with August in last year; but there are yet to be recorded the figures for the four remaining months of 1898.

PRESENTATION TO MR. D. ROBERTS.—The influence in a district of a properly managed, energetic, association of gardeners, who occasionally meet to debate questions of horticultural interest, we have always appreciated. That the work such an organization occasionally inflicts upon the secretary is very great, we have had experience, and it is pleasant to record instances where the members themselves are appreciative of good work rendered by their secretary. On the 6th inst., the members

of the Loughborough and District Gardeners' Mutual Improvement Society at a dinner following upon the Annual Show of Dahlias and Gladioli, &c., presented their hon. secretary, Mr. D. ROBERTS, of Prestwold Hall Gardens, with an illuminated address and a purse of gold. In this address were words of warm acknowledgment of the work Mr. ROBERTS has done on behalf of the society, and of respect to him personally. In acknowledging this gift, Mr. ROBERTS said that all he had yet done, had given him the greatest pleasure to perform, and had they delayed the honour for 21 years, he might have hoped that in some measure he would have been deserving of their kindness.

MESSRS. TILLEY BROTHERS, OF BRIGHTON, have recently held an exhibition of vegetables and flowers upon their premises at Brighton. The produce was from the firm's customers only, and £25 were offered in prizes. The Potatoes are described as very satisfactory, and vegetables generally were good.

BAMBOOS AND ARCHITECTURAL FEATURES.—The monopoly enjoyed by the Weeping Willow threatens to be broken down. We have lately seen some Bamboos in association with monumental urns and similar constructions, and the effect was excellent.

CANNAS are now to be seen in most of the continental cities, being generally grown in raised mounds or beds, surrounded by an edging of various plants. To our thinking this edging is an impertinence. The plants, which have no little dignity of appearance, show to better advantage when springing direct from the turf, than when encircled by common bedding-plants. The same remark applies to beds of *Phormium tenax* and *Caladium*.

ALNUS IMPERIALIS, ETC.—It is as well to mention this, for though by no means new, it is not appreciated as its merits deserve. It is a very graceful tree, with deeply-cut foliage, and is a good town tree. *Pterocarya fraxinifolia* is also used with good effect in many continental towns.

UNITED HORTICULTURAL BENEFIT AND PROVIDENT SOCIETY.—The annual dinner of this society will take place at the Holborn Restaurant on Wednesday, October 5, at 6.30 P.M., at which Mr. GEORGE BUNYARD, V.M.H., of Maidstone, has kindly consented to preside.

A WATER-COLOUR DRAWING BY HER ROYAL HIGHNESS THE PRINCESS OF WALES.—We have received from the editor of *The Gentlewoman* an advance copy of an original water-colour drawing, recently sketched in Denmark by the Princess of WALES, which is to be presented as a supplement to *The Gentlewoman*, by the gracious permission of Her Royal Highness. It is to accompany the issue of the paper dated 17th inst., at the usual price of sixpence. The drawing is a daintily-coloured sea-scape, depicting a jetty and a wide expanse of still water, with a city in the background, the time evening.

CRIMSON RAMBLER ROSE.—In the note on the magnificent plant figured in our last issue, Mr. MARSHALL tells us we have erred in exactly dividing it into so many shoots, and giving to each shoot a certain number of blossoms; but he adds in all fairness, that the total number remains unaltered, and he is prepared to take the responsibility for that. The exhibition at which he saw the variety for the first time was the International Horticultural at Earl's Court, and the Gold Medal awarded was theirs.

LÆLIO-CATTLEYA × SCHILLERIANA.—This cross has again been raised artificially, this time by M. CH. MARON, of Brunoy, who records, in the *Revue Horticole*, July 16, p. 335, having obtained a hybrid between *Cattleya amethystina* syn. *intermedia*, and *Lælia purpurata*. He has named it *Lælio-Cattleya × elegans*, but the so-called white forms of *C. elegans* really must be referred to *Schilleriana*, to which this new variety likewise belongs.

DUTCH HORTICULTURAL AND BOTANICAL SOCIETY.—On the occasion of the meeting of the Floral Committee on August 10, the committee awarded First-class Certificates to the Horticultural School of Wageningen, for *Canna* hybr. O. J. Quintus; to Messrs. E. H. KRELAGE & SON, of Haarlem, for *Chrysanthemum maximum* Triumph, *Dahlia* (Cactus) Leonora, D. C. Regulus, D. C. Ruby, *Gloxinia hybrida grandiflora* Cyclop, and *G. hybr. g. Goliath*; to Mr. W. VAN VEEN, of Leiden, for *Chrysanthemum maximum* Triumph, and *Dahlia* (Cactus) Britannia; to Mr. K. WEZELENBURG, of Hazerswoude, for *Chrysanthemum maximum* Triumph; to the Horticultural School of Frederiksoord, for *Heliotropium peruvianum* fol. varieg.; to

culous and [painful excess, but was at length ridiculed out of existence. For this improvement of taste, horticulture is mainly indebted to Mr. WILLIAM ROBINSON. Still, it was not the practice itself that was wrong, but the excess in its use and its adoption everywhere, often in the most unsuitable situations. There are, we fancy, some indications of a revival of the bedding-out system; if so, we trust it will be used with discretion and taste, and, above all, in suitable places, as in association with architectural features. Some richly-coloured and well-harmonised beds may be seen on the terrace of the Palais Federal, at Lausanne, on either side of the building. The rich coloration of the flowers was remarkable, and not less their skilful combination.

crop not exceeding one-third of the normal; and in seven States the crop is reckoned at from one-third to one-half of the normal; five States are placed at from half to two-thirds of a crop. The satisfactory indications are very limited.

HORTICULTURAL PROSPECTS IN CANADA.—Business shows a marked improvement this season. Although in some parts of the country drought has been injurious, as a whole the crops are very superior, and as prices will be good, there will be a considerable amount of money to spend. In fruit there is no large amount of planting being done, as for a number of years past there seems to have been over-production in small fruits, Peaches, Pears, and Plums;

FIG. 59.—VIEW FROM ONE END OF THE FLOWER GARDEN AT THORNBRIDGE HALL, BAKEWELL, DERBYSHIRE. (SEE P. 222.)

Messrs. GRATAMA & Co., of Hoogeveen, for *Rosa* hybr. *bifera* Souv. de Mme. Joseph Méline, and *R. indica* *fragrans* Madame Yvonne Gravier; and to Mr. G. A. VAN ROSSEM, of Naarden, for *Rosa indica* *fragrans* Auguste Waltine. Certificates of Merit were awarded to the Horticultural School of Wageningen, for *Canna hybrida* *Oranjevlag*, and *C. h. Wageningen*; to Mr. K. WEZELENBURG, of Hazerswoude, for *Centaurea montana* *rosea*, and *Chrysanthemum maximum* *filiferum*; and to Mr. G. A. VAN ROSSEM, of Naarden, for *Rosa indica* *fragrans* Mdle. Anna Chartron. A Botanical Certificate was awarded to the Botanical Garden of Leyden for *Boea Commersoni*.

BEDDING OUT.—A quarter of a century ago or rather more, belts and beds of violently-coloured flowers were to be seen everywhere, in places fit and in situations unfit. The thing was carried to a ridi-

ASPARAGUS SPRENGERI, FOL. VAR.—We read in American gardening journals notes upon the white variegated form of the pretty decorative *Asparagus Sprengeri*. If the variegation be constant it is likely to add greatly to the attractiveness of the plant, especially by artificial light.

CROPS IN THE UNITED STATES.—The following particulars are taken from the August report of the Agricultural Department, just received. Spring Wheat: Average condition, 96.5, or 1.5 points higher than last month, and 9.8 above the average at the same date last year, and 13.5 points over August average of the last ten years. Potatoes: The fall in July has been succeeded by a rise of six points as compared with the same date last year, and 3.2 points below the August average of the previous ten years. Apples: In some half dozen States the indications are for a

but farmers generally are buying more freely, and the business prospect is brighter than for a number of years. There is said to be ample stocks in Canada to supply all needs.

CARNATIONS IN THE OPEN.—Our correspondent, "B., East Lothian," desires us to say, that Sept. 15 is the latest date at which he plants the layers, not the whole of the month, as stated by him on p. 195.

GHENT.—At the last meeting of the *Chambre Syndicale des Horticulteurs, Belges*, the following awards were made, viz., Certificates of Merit to M. A. GALLET (*par acclamation*), for seventy varieties of *Canna indica*, and a tuberous *Begonia*, with blooms like those of a *Chrysanthemum* (*à l'unanimité*); to MM. DE REUSSE BROTHERS, for *Dracæna De Reusse*; to M. VAN STEENKISTE, for seedling Lily Madame

Van Steenkiste; and to M. MAURICE VERDONCK, for a hybrid *Odontoglossum*.

PUBLICATIONS RECEIVED.—*Report on the Progress and Condition of the Government Botanical Gardens, Saharanpur and Armagh, for the year ending March 31, 1898.*—*Orchid Review*, for September.—*Indian Gardening*, Index to vol. ii., January to June, 1898.

THORNBRIDGE HALL.

THIS residence and estate, recently acquired by George Jobson Marples, Esq., is situated about two miles from Bakewell, in the Peak district of Derbyshire, standing upon a plateau about 500 feet above sea-level. It is sheltered on the north-east by Longstone Edge, a chain of hills running up to Buxton, whilst on the east and south the views are lovely and varied; hill and dale diversified by woods, and cultivated land stretching away to a ridge of hills contiguous to Matlock and Chesterfield. The estates of Chatsworth and Hassop adjoin that of Thornbridge in such a manner that the general effect is one of continuity. When Mr. Marples purchased Thornbridge, it had practically only about 20 acres of parkland. Of the adjoining fields, with their rough stone dividing walls, about 100 acres were purchased, the walls removed, plantations laid out, and ornamental lakes made, and an approach road from the Bakewell side was constructed. The work of constructing the latter, which is about 700 yards in length, proved a heavy task. To obtain low even grades, cuttings, in some places 12 feet deep, had to be made, and many thousands of cubic yards of soil, boulders, &c., to be removed; this was utilised in forming mounds and embankments for the lakes. Trees and shrubs of an unusually large size have been planted, so as to afford immediate effect, and the result is very fine.

Great care was exercised to have the ground well and deeply trenched, and the results have fully justified the expenditure on this item. The slopes of the drive have been clothed with Heather, and in some steep places rockwork has been introduced, and masses of Fern, Gorse, Cotoneaster, Junipers, and similar low-growing plants used to cover it. The drive passes through a pinetum planted with choice Conifers, now ranging from 6 to 10 feet high; and clumps of tall deciduous trees, Rhododendrons, and other evergreens.

After rising about 100 feet the drive terminates in an outer square court, surrounded by splendid Beech, Sycamore, Elms, Yews, &c. This outer court is connected with an inner one by another short road opposite to the main entrance, on the west side of the Hall. Here, a little to one side, a winter garden is being constructed, with underground caves, cascades, and a miniature lake. This conservatory is about 50 feet by 40 feet, and 20 feet in height. It will be planted in a natural style, chiefly with Palms, Tree-ferns, and flowering greenhouse-plants, whilst in the caves filmy and other Ferns will be introduced.

The garden on the south side of the Hall is laid out in two main terraces, the upper one being separated from the lower by a wall 4 feet high, which is clothed with evergreen creepers, and has a border at the foot for the growth of dwarf plants, bulbs, &c. Both these terraces are in grass, and are intended for promenades and for playing games. They are protected at the west end by old Beech, Holly, Yew, and other trees. At the east end of these terraces is a pannelled Rose-garden, surrounded by clipped Yew-hedges.

The east, or garden front of the Hall is by far the finest feature of the place. Upon this part of the ground there used to be a kitchen-garden and pond, both of which have been done away with, and the following arrangement carried out.

Leaving the Hall by the garden entrance, a broad terrace is crossed which runs the whole length of the building, affording the effect of a solid base. Next comes a wall 4 feet high of equal length covered with creepers, with a grass slope descending from it to the main promenade which runs from the Rose-garden to the fruit-houses, 150 paces or so, and passes at its

north end under a massive rocky archway—in reality a portion of the alpine-garden. From the main promenade before mentioned, a Dutch garden with lakes and cascades, &c., is seen; whilst on the rising ground beyond many hundreds of large Rhododendrons and other shrubs are planted.

The illustrations (figs. 59 and 60) afford a good idea of the effect produced. The Dutch garden is formed 9 feet below the main promenade, and surrounded by Yew hedges enclosing clipped specimens of green and golden Yews and Hollies, both standards and pyramids.

The small beds are filled with low-growing bright-coloured evergreens, and upon the grass panels it is the intention of the proprietor to have beds for flowers. The alpine garden (together with the garden lakes) cover about $1\frac{1}{2}$ acres. The ground falls from north to south about 60 feet, and is traversed by a small stream, which is used to form a series of cascades. Mr. Marples' desire was to have a natural-looking piece of rockery upon which he could have great masses of free-growing alpine plants and shrubs, and to avoid all weakly growing species which require special care. This object has been attained; the rock garden, although planted last year, is now covered with the plants. On the north of the alpine garden and adjoining it, a terraced fruit garden in three tiers, promises to become a most useful as well as an ornamental adjunct. Above this again stands a range of glasshouses in five divisions for the cultivation of Vines, Peaches, and flowering plants. It is in contemplation to erect another range of glasshouses, and to form a new kitchen-garden north of the present fruit garden. The whole of the alterations in the park and garden, as we learned, were entrusted to Messrs. J. Backhouse & Son, nurserymen, of York. Though this firm gave designs for the bulk of the work, many of the ideas originated with Mr. Marples himself, who has shown himself ever ready to adopt suggestions which he considered would add a charm to his future home.

HOME CORRESPONDENCE.

MONTBRETIAS (TRITONIAS).—In your issue of September 10, p. 200, Mr. Conway takes exception to my remarks respecting the cultivation of these beautiful Iridaceous plants. I maintain that the majority of cultivators will find great advantage in annually lifting the bulbs, as directed in my note; not so much for the purpose of protection in winter (the hardiness of the Montbretia was not brought into question), but in order that the small weakly growths may be removed, and either destroyed, or planted by themselves till in course of time they become flowering bulbs. The reason for this, as I stated before, being to dispense with these flowerless growths, in order to favour the full development and maturation of the flowering bulbs; and the only means of ensuring maturation is to lift annually, and, in my opinion, this is best performed in the autumn, thereby insuring protection in the event of an unusually severe winter. Few gardeners can afford to take in hand any unnecessary work; but I contend that the simple instructions I have laid down, if followed out, will amply recompense the cultivator for his trouble. Quite as much pains are often taken over many less useful and beautiful plants grown in our gardens, than I advocated in my notes respecting the Montbretias. *H. T. Martin, Stoneleigh.*

While I have found *M. Pottii* absolutely hardy, without even a mulching of leaves or coal-ashes put over the roots during the winter, I cannot say the same of *M. crocosmiflora*, and strong clumps of the latter are sometimes killed outright under conditions of culture similar to that given to *M. Pottii*. The soil of this garden is somewhat heavy, and consequently cold in the spring, therefore less suited to the safe wintering of bulbous or tuberous-rooted subjects than a light loam. No difficulty, however, is experienced with even *M. crocosmiflora*, if at planting time the natural soil is removed 15 inches in depth, the bottom broken up so as to admit of the rapid drainage of water to lower depths, and the whole filled with charred soil, leaf-mould, grit, and the refuse soil from the potting-bench. Early in the autumn, when the leaves of the plants have decayed, a thick mulching of partially

rotten leaves is spread over the soil as a protection against frost, and treated in this manner I have never failed to obtain success with this plant, which is one of the most effective of hardy border flowers. In and around Cromer this variety of Montbretia is to be met with in hundreds of gardens, large and small, and judging from the luxuriance of its growth, the plant is quite at home in the sandy soil of that part, giving little trouble in its cultivation. *E. M., South Hants.*

THE ROYAL HORTICULTURAL SOCIETY'S FRUIT SHOW.—I think the correspondent (p. 199), who complains of want of clearness of the R.H.S. fruit schedule must have written his paragraph before perusing its pages, for I find each question asked fully answered in the notes on p. 8, and in the regulations for the exhibition, both of which every exhibitor should certainly read throughout. The requirements state that all fruits must be absolutely grown by the exhibitor or his employer, and the number of fruits to constitute each dish is plainly stated. I am, however, at a loss to understand why exhibitors in Division 5 are barred from exhibiting in Division 1, so that should a grower from Scotland, Wales, or either of the county divisions exhibit Apples or Pears, he is excluded from showing Grapes, or collections of indoor fruits. *H.*

THE MORRAB PUBLIC GARDENS should be spelled MORRAB GARDENS.—These gardens have their entrance in Morrab Road, in which road in 1894 I lived for some time, and therefore know the gardens well. It is unfortunate that the view does not show at least one of the tall *Dracenas* (I forget which species) for which the grounds are famous. *W. Thomson, Bishop's Teignton.* [Another result of indistinct handwriting. *ED.*]

LATE SWARMING OF BEES.—On September 5, while walking round the park looking for wasp's nests by day, so as to destroy them at night, I observed, to my surprise, a swarm of bees settle on a Thorn-bush. I quickly went to the gardens for a hive and shook them into it. Several aged inhabitants of the place to whom I mentioned the circumstance, said that they never knew bees to swarm in the month of September. There is no doubt the heat of the weather was the cause of the swarming at so late a date. The swarm is considered to be a good one. *W. Mould, Ledgers Park Gardens, Chelsham, Surrey.*

THE NEW FLOWER GARDENING.—I imagine your correspondent writing under the initial of "K." extracts more out of the above article than it originally contained. The Hollyhock was one plant I referred to, the Carnation another, while "K." may rest assured that spring and summer bulbous plants such as Crocuses, Tulips, Narcissus, &c., transplant safely immediately the flowers are over. *Lilium elegans* is another plant that transplants well at its time of flowering. I need only add that "K.'s" remarks about herbaceous borders in no respect apply to those in Regent's Park. *B.* [Many species of plants are transplanted at unusual periods of their growth; but hardy herbaceous perennial plants, even at Regent's Park, are not removed when approaching flower, unless in a few cases. *ED.*]

A PROFITABLE COMPETITION.—I observe in a paper of the largest circulation amongst the working-classes, mention of a recent great competition in one particular variety of Onion—Golden Rocca. There were no fewer than 761 lots of three Onion-bulbs each sent in, and that works out as 2283 in all. If those bulbs were left on hand for any purpose, seed-production or otherwise, they would represent a big sum in value. Then as no fewer than 761 competitors entered, it is not unreasonable to assume that 800 at least purchased seed; so that the sum of £25 offered in prizes was reimbursed with interest. But hundreds of the persons encouraged to compete were cottagers and allotment-holders. It would be interesting to learn how many of these were amongst the eight prize-winners, and what chance had these in competing against first-class gardeners. It must be remembered that there were no fewer than 753 who were unsuccessful. *D.*

THE ORIENTAL PLANE.—Referring to the note on species of *Platanus*, in the last issue of the *Gardeners' Chronicle*, p. 190, I lately saw what I thought was a remarkable specimen of the Oriental Plane, growing in the garden at Blickling Hall, Aylsham, Norfolk. The tree in question was of great age, as was shown by the stem, at 1 yard up from the ground being fully 4 feet in diameter. The remarkable feature about this tree was its manner of growth. The lower branches had reached the ground many

years ago, and being allowed to remain undisturbed they had struck root in the turf, and doubtless had imparted vigour to the tree. These rooted branches grew erect for many years, and they then bent down to the earth and again took root. This sort of natural layering had gone on for many years, increasing the diameter of the tree considerably, until it now exceeds 50 yards. Many of the secondary growths are of the size of small trees, and the whole constitutes a remarkable feature. The gardens at Blickling are thrown open to the public by the owner, the Dowager Marchioness of Lothian, on certain days in the week, a privilege much appreciated by the visitors to Cromer. *E. Molyneux.*

AT WHAT AGE SHOULD SEEDLING STRAWBERRIES BE CERTIFICATED?—Two recent examples, Monarch and William Carmichael, have recently afforded some useful hints to growers on this point. Those who raise new varieties are naturally somewhat

italics are mine, as I wish to draw special attention to the subject, having seen many fine crops of Strawberries pushed past blooming, or with scant flowering, through excessive feeding. Still, a very curious point in connection with some new and also old varieties of Strawberries, is their attempts to revert from an apparently fixed form of fruit and growth and flower. Monarch and William Carmichael are our most-modern illustrations of these peculiarities. In the first row of William Carmichael, seen by the writer, there was scarcely a barren plant, and its character and quality were all that Mr. Bunyard describes them to be at Maidstone. The next year, almost the whole stock proved barren; hence its withdrawal from commerce by its raiser on the advice of his friends. And yet, now, with a change of site and soil, from Edinburgh to Kent, all its original free-fruited qualities are restored. What can it all mean? In the case of these modern varieties, is it a struggle for the supremacy of the

exception of a few daintily bunched alpine in the early spring and autumntide, I have never eaten a Strawberry in France comparable to our best British sorts. *D. T. Fish.*

LAW NOTES.

FLORISTS' CHECKS.

AT Brentford County Court, on Friday, before His Honour Judge Bagshawe, Q.C., Isaac Thornton, ironmonger, of Chiswick, sued Wm. Hills, of Bury Street, Lower Edmonton, and Covent Garden, florist and fruiterer, for £3, the cost of making a quantity of metal checks.

Mr. Leonard Wells was for the plaintiff, and Mr. Medcalfe for the defendant.

Plaintiff received an order on April 1 from the

FIG. 60.—VIEW FROM THE SIDE OF THE FLOWER-GARDEN AT THORNBIDGE HALL, BAKEWELL, DERBYSHIRE. (SEE P. 222.)

impatient for results. Hence, when a seedling Strawberry, two, three, or more years old succeeds in convincing competent jurors of its merits as a novelty, it seems entitled to a certificate or some kind of award to mark its merits. And yet, in the end, probably the raiser would gain rather than lose could his seedlings be subjected to a longer probationary period before being sent out as varieties that were better or different to existing ones. The trial grounds of the Royal Horticultural Society, at Chiswick, could be turned to no more useful account than as trial grounds for seedling Strawberries. And it would not seriously tax the coffers of the society to provide at least three kinds of soil for this purpose, that might be correctly described as heavy, light, and medium loams. Some persons might say that two sorts of soil, poor and rich, would suffice—but it would cost but little more to provide a third; and animal and artificial manures might be tested as to their fitness for application to these plants. I particularly note that Mr. George Bunyard, nurseryman, of Maidstone, a high authority on this subject, specially notes, that the sorts were grown on poor soils. The

paternal or maternal parent, or are these and other seedling Strawberries merely asking for more time for fixing their characteristics? Then, why are some Strawberries so erratic at first, and others by the same raiser, such as Queen of Denmark, Richard Gilbert, Britannia, assume and retain their true character at the first? Further, and beyond all this, why should the change of William Carmichael Strawberry from Edinburgh to Maidstone restore or, even, increase its primitive fertility? One word more, and it is one of warning. I have lately seen or heard it stated that growers may safely propagate from blind plants. To any disposed to listen to such advice, I would like you to print in the biggest type, the single word—"Don't." In the interesting article on "Strawberry Culture in France" (p. 102), the following puzzling sentence occurs:—"The varieties which have no runners, such as the Gallion, is naturally good for outdoor culture." Might I venture to ask the writer, or some one well versed in French varieties and culture, why runnerless varieties are preferred? And may I venture to add that with the

defendant for 1000 metal checks. He had executed such orders before, and had a die by him, but as the defendant required fresh numbers on the checks, a fresh die had to be constructed. Plaintiff at once sent to the Mint, Birmingham, to have the die made, which came to hand in the early part of May, when the stamping of the checks was at once put in hand.

Plaintiff, in giving evidence, said there was no delay, and it was not until May 13 that he learned the defendant required them by a certain time. When they were sent they were returned.

In cross-examination, he knew defendant was a gardener and had a stall in Covent Garden, and that these checks were necessary in his business. He denied, however, that he knew the gardening season ended in May, and that if the checks were not delivered early in April, they would be valueless. He did business among gardeners, and some had to wait longer than the defendant for their checks.

Mr. Medcalfe called the defendant. He admitted

giving the order on the written form produced. He needed the checks urgently, and quite expected them in a fortnight, as plaintiff had executed similar orders for him in that time. On May 8 he wrote complaining of the delay, and the trouble he was in consequence being put to, and this letter plaintiff acknowledged. Defendant then wrote stating that he must have the checks by May 13, or he should repudiate the order. They did not arrive until three or four days afterwards.

Cross-examined: His letter of the 13th would be received on that day.

His Honour: Then it would be utterly impossible for him to comply. The time given was unreasonable. Why were these checks useless? You could use them next season.

Defendant: They would require a fresh number probably.

His Honour: If there is a probability they will, there may also be a probability they won't. He found for the plaintiff. In the order there was no time specified, and he did not find any evidence of undue delay for which the plaintiff was responsible. The orders for the dies were sent to a big firm in Birmingham, and the inference was, that they executed the order with due diligence. Judgment for the plaintiff with costs.

WIMBLEDON HOUSE.

THIS pleasantly-situated House and estate, for many years in the occupation of the late Sir Henry Peek, is, we fear, shortly to come into the market, and the probability is that the house will be pulled down, and the estate parcelled out in building-plots. When the mansion was the residence of Sir Henry and Lady Peek, the gardens were among the most beautiful in the neighbourhood of London, the pride of their owner, and the joy of horticulturists, as they were well-kept, and contained a great number of rare exotics. After the death of Lady Peek, however, Sir Henry apparently conceived a dislike to the place, and for the last four or five years the house has stood empty, and the grounds have been neglected, flower-beds and paths choked with weeds.

Built about the middle of the last century, Wimbledon House has been the residence of a long list of notable persons. On the death of its first owner, Sir Henry Bankes, a London Alderman, it was bought by Benjamin Bond Hopkins, heir of the celebrated "Vulture" Hopkins, and M.P. successively for Ilchester and Malmesbury. From him it was purchased by M. Calonne, of French Revolution fame, and from him again by Earl Gower, afterwards Marquis of Stafford. Subsequently it became the home of the Prince de Condé, and between his occupancy and that of Sir Henry Peek it was for many years the abode of Mr. Joseph Marryat, M.P. (father of Captain Marryat the novelist), and of his widow. It was in Mrs. Marryat's time that the gardens achieved fame as including the finest private collection of exotics in England.

Frequent mention of the horticultural treasures of the place are to be found in our earlier volumes.

On September 10, 1870, we figured the very ornate gardener's cottage; and on January 22, 1876, we gave an illustration of an Ivy-covered Oak. The flower-garden was a unique example of the fashion of the forties in design and in furnishing, few alterations having been made since the time of Mrs. Marryat.

THE BRITISH ASSOCIATION.

(Concluded from p. 202.)

SECTION K. — BOTANY.

SEPT. 8.—The President of their section is Professor F. O. Bower, F.R.S., who discussed in his address the homology of the members of the plant body at large, with special reference to the question of homology involved in the alternation of generations in green plants. After a reference to the importance of the work of Steenstrup and Von Sachs, both of whom died in the course of last year, he said:—

I propose to invite your attention to the morphology of plants. The present time is one of unusual bustle and change in morphology, consequent upon the discovery of new facts, and the introduction of new methods. The

development of the study may be divided into three periods, we ourselves standing upon the threshold of the third. These three phases of morphological inquiry have naturally overlapped one another; we recognise, however, that first description, then formal comparison, and now experiment, have been the leading features in morphological investigation during these successive periods.

HOMOLOGY.

The ideal aimed at in the study of the morphology of plants is to trace their real relationships and mode of origin, on the basis of the widest observation—in short, to reconstruct the evolutionary tree. In order to make comparison possible, or at least manageable, a terminology is necessary, and this not only of the plants themselves, but also of their parts. I propose to-day to discuss not the classification of plants, but the classification of the parts of plants, their grouping according to their homology. A reconsideration of the term is necessary; is it to be applied equally to such parts as are connected by linear descent, and also to those which we have good reason to believe have resulted from parallel development in quite distinct phyla? Or, to put a finer point upon our enquiry, are we to distinguish in any way the cases of "individual repetition" from those of "essential correspondence"? In the latter case I think no good end would be served at present by accentuating this distinction by terms; the steps of divergence are so slight and gradual. None the less should it be clearly borne in mind that comparisons of parts commonly ranked as homologous in the plant body are based on a less complete individual correspondence than that of parts usually compared in the animal body. But the case is different in dealing with parallel developments, and some doubt arises whether parts which probably, or it may be certainly, have arisen by separate evolutionary sequence in distinct phyla are to be classed as homologous in the same sense as those directly related by descent. The successive foliage leaves of most plants are assumed in the individual to be the result of a mere repetition of development. But it is quite a possible view that in the plant-body (as is contemplated in the animal in those cases of "serial homology" which Lankester recognizes as homoplastic) homoplasy may have had a place. We must inquire whether all those structures which we designate "leaves" have actually been the result of a development identical, or at least essentially similar, as regards their origin in the race. The problem is, given a plant with numerous leaves of various form and function, to unravel the real story of their evolution. Two distinct factors may be contemplated as possibly occurring even in the individual—viz. (1) homogeneity of genetically related parts, with or without repetition of the parts formed; (2) homoplasy, an origin of two or more distinct categories of parts, not genetically related, on the same organism. Working upon either of these, and thus complicating the problem by obliterating such distinctions as may have existed at first, may be the phenomenon of metamorphosis. This has lately received its evolutionary definition at the hands of Professor Goebel, as restricted to those cases where there has been an obvious change of function. We see how change of function accounts for various forms of leaf in certain cases; but it does not follow that all leaf-forms on the same plant were so produced, by metamorphosis of a single original type.

ALTERNATION.

But the questions above discussed are mere matters of detail, compared with that great enigma of the alternation of generations in green plants, or of alternation at large. This is, after all, a question of degree of homology, not now of the parts only, but of the whole plant or "generation." How this greatest of all adaptations was really initiated, we cannot expect to bring to the point of demonstration; at best we can only venture opinions of probability. Still, this discussion commands at present more widespread interest among botanists than any other in the sphere of plant morphology. It is the alternation as seen in these green plants that I propose to discuss. Writers have distinguished various types of alternation, including under the term divers modes of "alternation of shoots." But gradually the issue in the case of green plants has been simplified, and the question now centres round that alternation of phases which some of us describe as "antithetic," while others believe the phases to be really "homologous" as regards their origin. Briefly put, the question is, How was the first start made? Has the neutral generation or sporophyte been the result of change of any other part of the sexual generation than the zygote itself? If so, the alternation is of homologous generations; if not, then the alternation is what is styled antithetic. The whole discussion is like a purely historical inquiry, but with the minimum of documentary evidence, for on this point the fossils give scanty help. In the absence of more direct evidence we are thrown back on other arguments, such as those based on comparison of normal specimens, and, secondly, upon the study of abnormalities.

The President, after a somewhat minute and technical inquiry into (1) the bearing of the Algae and certain fungi on the question, (2) the comparison from the Bryophyta, and (3) the argument from abnormalities, continued:—

This discussion was entered on with a view to finding whither phylogeny as a basis of morphology would lead us. However unprepared we may be to pursue it with certainty into detail, or to apply a terminology to the sequences which we recognise, we must, I think, accept phylogeny as the natural basis for morphology. I do not think that any middle course between this and an artificial system is possible or reasonable. But here we launch ourselves upon a sea of uncertainties on which we must keep our course with care. Following it, we think we espy certain great move-

ments in Nature. We may recognise what we believe to be a true evolutionary sequence, but who is to say whether it is a progressive or a retrograde sequence? it may even be one divergent from some middle point. There is no finality to this judging of probabilities, a fact which should be always before the mind, especially in the warmer moments of discussion.

CATEGORIES OF ORGANOGRAPHY.

We may now briefly review our position as regards organography, and the following categories are to be recognised, though they graduate almost imperceptibly into one another:—Homogeny includes (a) repetition of the individual part in successive generations, with the same number and position; (b) essential correspondence of parts varying in number and position but corresponding in character and development, produced in a regular sequence; and (c) transferred position of parts, similar in origin and structure to those produced in regular sequence. Homoplasy may be recognised with varying degrees of probability, starting from cases where the question of community of descent is open (as with nearer circles of affinity), and proceeding to those in which distinct evolution is virtually certain. Taking the case of leaves for the purpose of illustration, we may contemplate the following possibilities:—(a) A possible origin of two homoplastic series of leaves in the same plant, and the same generation (Phylloglossum); (b) two homoplastic series in the same plant, but in different generations (Lycopodium cernuum); (c) a possible distinct origin of homoplastic leaves in distinct phyla, but in the same generation (sporophyte of Ferns, Lycopods, Equisetaceae); (d) a distinct origin of homoplastic leaves in distinct phyla, and distinct generations (e.g., leaves of Bryophyta and of Pteridophyta). Now, homology has been used in an extended sense as including many, or even all, of these categories. It seems plain to me that this collective use of the term homology carries no distinct evolutionary idea with it; it indicates little more than a vague similarity—the word will have to be either more strictly defined, or dropped. The old categories of parts based upon the place and mode of their origin are apt to be split up if the system be checked by views as to descent. Comparison, aided by experiment, supersedes all other methods, and the results which follow raise the question of terminology of parts which have arisen by parallel development. In parts which are of secondary importance, such as stipules, pinnae, the indusium, hairs, glands, the inconstancy of their occurrence points to independent origin by parallel development in a high degree; in parts of greater importance, such as leaves, a parallel development may also be recognised, though in a less high degree. Finally, the sexual organs are probably homogenetic in all Archegoniate plants, but we have no proof that sexuality arose once for all in the lower plants; the probability is rather the contrary. Thus we may contemplate as very general a polyphyletic origin of similar parts by evolution along distinct lines, but resulting, it may be, in forms essentially similar.

METHODS OF TERMINOLOGY.

There are two extreme courses open to those who wish to convey clearly to others such matters as these; the one is to use a separate term for each category of parts, which can be followed as maintaining its individual or essential identity throughout a recognised line of descent. The other course is to make it clear always in the use of terms applied to parts, that they do not convey any evolutionary meaning, and to use them only in a descriptive sense. Perhaps the former is the ideal method, and it may be a desirable thing, as polyphyletic origins of parts become more established, that the terminology should be brought to reflect at least the more important conclusions arrived at. But, for the present, the whole matter is still so tentative that it is well to be content with something which falls short of the ideal, and to maintain the usual terms, such as stem, leaf, root, hair, sporangium, &c., as simply descriptive parts which correspond as regards general features of origin, position, and nature, but with no reference either, on the one hand, to conformity to any ideal plan, or, on the other, to any community by descent. I have attempted to touch upon some of those questions in the morphology of plants which specially interest us at present. The want of finality in this unravelling of history without documents, the ample latitude for difference of opinion, according to the relative weight attached by one or another to the same facts, are difficulties inherent in the very nature of our study, while to many minds they increase rather than diminish its attractions. Nevertheless, the progress of morphology in late decades has plainly been towards a truer appreciation of how divers forms have originated, and so towards a better recognition of affinities.

On September 9 a paper read was one by Mr. W. S. P. Ellis on "A Method of Obtaining Material for Illustrating Smut in Barley."

Dr. D. H. Scott, F.R.S., next read a paper on "A New Medullosa from the Lower Coal-Measures of Lancashire."

Professor Marshall Ward read another paper on "Penicillium as a Wood-Destroying Fungus," in the course of which he said that spores from pure cultures of penicillium sown on sterilized blocks of Spruce-wood, cut in March, were found to grow freely and develop large crops of spores on normal condiphores. Sections of the infected wood showed that the hyphae of the mould entered the starch-bearing cells of the medullary rays of the sap-wood, and consumed the whole of the starch. The resin was untouched. In culture three months old the hyphae were to be seen deep in the substance of the wood passing from tracheide to

tracheide *vid* the bordered pits. Control sections, not infected and kept side by side with the above, contained abundance of starch, and no trace of hyphæ could be detected in them. The observation appeared of interest in several connexions. Penicillium was one of our commonest moulds, and undoubtedly played a part in the reduction of plant debris to soil constituents; how far it could itself initiate the destruction of true wood, or how far it merely followed on the ravages of other fungi, bacteria, &c., was unknown. There were strong grounds for believing that it destroyed the oak of casks, &c., but since these were impregnated with food materials that was not very surprising. It appeared as if penicillium might be a much more active organism in initiating and carrying on the destruction of wood than had hitherto been supposed, and that it was not merely a hanger-on or follower of more powerful wood-destroying fungi.

SOCIETIES.

THE SCOTTISH HORTICULTURAL ASSOCIATION.

SEPTEMBER 6.—The usual monthly meeting of this popular association [kept out owing to lack of space in our last issue. Ed.] was held on the above date in the society's room, 5, St. Andrew Square. There was a good attendance; Mr. M. TODD in the chair.

Mr. Todd contributed to the brightness of the meeting with a rich and varied collection of Asters, Gaillardias, and Coreopsis; Messrs. COCKER & SONS, Aberdeen, sent a very fine collection of Roses; Mr. MOYES, of Dalmeny Park, had a capital display of seedling Carnations; Mr. MUIR, Beel Gardens, Prestonkirk, sent some fine double-flowered seedling Begonias.

But while giving due credit to these floral contributions, it will be readily admitted that the chief attraction of this meeting lay in the fresh and thoughtful paper read by Mr. T. DALE, gr., Aikenhead House, Cathcart, on "The Cultivation of the Rose." He treated of the early history of the Rose, tracing its origin to China, and giving many interesting historical facts as to its cultivation in early times, its use in medicine, and as a food plant, qualities almost ignored or forgotten in these days. Mr. DALE was awarded a hearty vote of thanks for his paper.

LOUGHBOROUGH AND DISTRICT GARDENERS' MUTUAL IMPROVEMENT.

SEPTEMBER 6.—With a view to encouraging the growth of the Dahlia and Gladiolus, the above Association held an exhibition in the Philharmonic Hall, Loughborough, on the above date.

Two groups of plants occupied the centre of the hall, W. B. PAGET, Esq., Southfield Park (gr., Mr. F. Reynolds), putting up an attractive group of Palms, Cannas, and foliage plants, edged with Ferns, Lycopodiums, &c.; and Messrs. J. SMITH & SON, Derby Road Nurseries, a group consisting of early-flowering Chrysanthemums. On the platform were arranged three groups of Palms, contributed by W. B. PAGET, Esq., and A. W. N. BURDER, Esq., The Elm.

This being the second attempt of the Association to obtain an exhibition of the various classes of Dahlias, the response by local growers was very encouraging. Messrs. SMITH & SON staged a very fine exhibit of Show, Pompon, and Cactus varieties. Mr. H. WEEKS, gr. to Lady BYRON, Thrumpton Hall, Derby, was very highly commended for his exhibit of Dahlia blooms, and the tasteful arrangement that it showed. Mr. JAMES WRIGHT, of Granby Street, Leicester, staged excellent Show, Cactus and Pompon in this class—very fresh and meritorious blooms.

For the best twelve Show blooms, Mr. H. HICKLING, of Bedford Street Nurseries, was awarded a Certificate for blooms of refined growth and good colour. Mr. JAMES WRIGHT took a Certificate for twelve Cactus varieties, with flowers of substance, breadth of petals, and good colour.

For the best twelve Pompons, in distinct varieties, three blooms of each, Messrs. SMITH & SON carried off a Certificate, with a nice collection, well staged.

For the best twelve spikes of Gladiolus, distinct varieties, Messrs. SMITH & SON again won a Certificate.

Mr. W. English, gr. to the Right Hon. Lord BELPER, Kingston Hall, contributed a collection of Pompon and Cactus Dahlias of great merit; Mr. WOODFIELD staging two dozen good Cactus varieties. Mr. HAMSHIRE, gr. to Mrs. PERRY HERRICK, Beau Manor Park, contributed cut blooms of herbaceous Phlox, zonal Pelargoniums, and Zinnias. Mr. J. SMITH, gr. to J. GRIGGS, Esq., staged a dozen plants of Trachelium coeruleum. An exhibit of Blackberries grown in pots, Phlox, and Asters, contributed by Mr. TETHERTON, added interest to the exhibition. Mr. H. HICKLING staged a fine display of cut flowers, consisting of Dahlias, Gladiolus, Asters, Pansies, and early-flowering Chrysanthemums.

THE ANNUAL MEETING.

The Secretary reported upon the essays sent in for competition as follows:—There were three papers sent in upon the cultivation of the Cineraria, and the 1st prize was awarded to Mr. T. CHAUNT, of Kingston Hall Gardens; 2nd Mr. GEO. HUCKLE, Kingston Gardens; and 3rd, Mr. F. T. MARSH, Loughborough. The Cyclamen prize was awarded to Mr. A. HAMSHIRE, Junr., Beau Manor Park Gardens,

his being the only *bond fide* paper sent in. The report and balance-sheet was read and adopted. The membership upon the books number seventy. The officers were re-elected: President, W. C. BURDER, Esq.; Chairman of Committee, Mr. A. HAMSHIRE; Hon. Treasurer, Mr. W. English; Hon. Sec., Mr. D. ROBERTS.

DERBY HORTICULTURAL.

SEPTEMBER 7, 8.—The thirty-seventh annual exhibition was held at Derby on the above dates, and was a great success. There were several fine groups of miscellaneous plants.

The 1st prize was won by Mr. Edmonds, gr. to the Duke of ST. ALBANS, who had a fine plant of Geonoma gracilis in the centre of his group, and around this were dotted tall plants of Acalypha Macafeana, Crotons in variety, Arundinaria falcata, Casuarina equisetifolia, Cocos, Dracenas, Sugar Cane, and Abutilons. Beneath these was an undergrowth of Caladiums, Selaginellas, Eulalias, and Ferns in variety, the whole being relieved by a few plants in flower of Cattleya, Dendrobium, Phalenopsis, Francoa ramosa, and Anthurium Andreanum. This was a group of fine plants, well arranged in regard to colour and general effect. Mr. WARD won the 2nd prize, with a group that contained some grand Crotons; Ixoras, too, were well flowered, and a number of other plants, consisting of Lilliums, Coleus, Dendrobiums, &c., were arranged in a natural style on mounds of moss. A few additional tall feathery plants would have brought out the effect of the Crotons to better advantage. Mr. MCINTYRE, Woodside Gardens, Darlington, was 3rd.

In the class for a decorated dessert-table, Mr. GOODACRE, Elvaston Castle Gardens, was well to the front, securing the 1st prize with a very tasteful arrangement. The centre contained three trumpet-shaped glasses, lightly filled with sprays of Odontoglossum crispum, Montbretia crocosmiflora, Eulalia japonica, draped with Selaginella caesia, the sprays of which were extended thinly over the cloth between the dishes of very fine Black Hamburg and Muscat of Alexandria Grapes, Golden Eagle and Lord Palmerston Peaches, Washington and Gasconne's Seedling Apples, a Queen Pine, with Plums, Figs, a Melon, Pears and Nectarines. Mr. EDMONDS was 2nd, with some fine dishes of fruit, set off with sprays of Smilax and Selaginella.

In the class for Black Grapes, Mr. CAMPBELL, gr., Mickelover Manor, was 1st, with three splendid bunches of Black Hamburg; Mr. DOE, gr., Rufford Abbey, 2nd, with large bunches of Barbarossa, perfect in colour. For White Grapes, Mr. CAMPBELL was again 1st, with Muscat of Alexandria, perfectly finished; 2nd, Mr. GOODACRE, with the same variety. Peaches brought a strong competition: Mr. READ, gr., Brethly, took 1st prize; Mr. WOODGATE, gr., Rolleston, 2nd. Apples also were numerous and fine, Mr. GOODACRE taking 1st prize in both classes.

The committee would do well by adding a few new classes to this portion of the schedule. It is not usual or proper to exhibit Black Hamburg Grapes against Barbarossa; and in the white Grape class the same kind of grievance requires remedy. Plums, Morello Cherries, and collections of fruit, also should be encouraged.

Dahlias were remarkably fine; Mr. CARRINGTON took the 1st prize. Messrs. Suttons' prizes for a collection of vegetables brought some excellent exhibits. Mr. T. SMITH, Elvaston, was placed 1st. In the single dishes of vegetables, Messrs. READ, SHAW, WOODGATE, NEWBOLD, and STIRLING, took the chief prizes with very fine exhibits.

YORKSHIRE FUNGUS FORAY.

SEPTEMBER 10 AND 12.—The members of the Mycological Section of the Yorkshire Naturalist Union met last week at Harewood, near Leeds, for a three days' investigation of the fungus flora of that district.

The Earl of Harewood had kindly given this section a two days' permission to search the extensive parks and woodlands of the Harewood estate. A considerable amount of success attended the work, although the dryness of the weather during the previous few weeks had not been favourable to the growth of the larger species. This being the case, it was decided to devote time and energy to the searching out of species of a microscopic character. Excellent results were eventually obtained. Altogether, over 300 species, great and small, were dealt with. This included many species of the smaller kinds, that have hitherto been recorded only by their first discoverers. On the last evening of the foray, the Rev. W. Fowler, M.A., Vicar of Liversedge, read a most interesting paper on "The popular aspect" of the subject. Included in it was much excellent advice and encouragement to students and others. He showed the vast importance of mycological study, not only from a purely scientific, but also from an economic point of view, pointing out the necessity and scope there was for investigating the enormous number of plant (both wild and cultivated) diseases due to the attacks of this comparatively little-known group. Mr. H. T. SEPPETT, of Halifax, gave great attention during the whole of the visit to this class of fungi. Chas. Crossland, Halifax, Hon. Sec.

GLASGOW AND WEST OF SCOTLAND HORTICULTURAL.

SEPTEMBER 7, 8.—The annual exhibition under the auspices of the Glasgow and West of Scotland Horticultural Society was opened on the 7th inst. in the St. Andrew's Hall. There were upwards of 1,300 entries, an increase of 300, or more, over those of last year. The quality of the exhibits generally was very good.

For the accommodation of the exhibiton the whole of the ground suite of halls was occupied, and, as far as possible, the exhibits were arranged in sections. In its general features the show presented an exceedingly pleasing and interesting scene, the disposition of the numerous and varied collections being carried out with a view to picturesque effect as well as to adequate display. In such hot weather as prevailed at the time, however, good tents would have been preferable, which would have afforded sufficient room to promenade. Suitable sites for such tents might easily be found in the neighbourhood of Glasgow; at the Botanical Gardens, for instance, where, under the management of the popular Curator, Mr. D. DEWAR, combined with the business capacity of Mr. John Coats, the Secretary, we think a most successful exhibition might be held. At any rate, the suggestion may be worth the consideration of the committee, and of Mr. Dewar. In the principal hall the larger plants, the competitions in decorative arrangements, and the fruit section were arranged; while other collections of distinctive classes found places in the Kent, Berkeley, and Octagon Halls. The most striking exhibit in the section open only to gardeners and amateurs, for tables of plants arranged for effect, was that by Mr. H. REID, gr. to Mr. W. CAMPBELL, Williamwood, Kennishead. This was one of the outstanding features of the show, and attracted general attention. The collection, which was awarded the Cup for the most meritorious exhibit in the show, was arranged on a large table, and consisted chiefly of Crotons, Dracenas, Orchids, Lilliums, and Celosias, set on a groundwork of Maidenhair Fern. There was a charming array of bouquets.

In a collection of Ferns, for which the 1st prize went to Mr. MILLER, gr. to A. RUSSELL, Esq., Auchendraith, was included an exceptionally fine Davallia. Mr. MILLER also carried off leading honours for two remarkably good Ericas in flower. For four exotic plants in bloom, distinct, Mr. LANDS- BURG, gr. to Mrs. MUIR, Beechwood, Bearsden, was 1st; and corresponding awards were made to Mr. J. GALLOWAY, gr. to Mrs. GILBERT, of Yorkhill, for Palms; to Mr. LANDS- BURG, for six table plants; and to Mr. JOHN SUTHERLAND, Victoria Nurseries, Lenzie, for twelve table plants. The success of Mr. SUTHERLAND in this department makes a record which is probably without parallel, this being the twentieth year in which he has carried off this important prize.

Fruit was excellent, and Grapes, especially so those shown by Mr. LUNT. We have seldom seen better fruit upon the whole than was exhibited here. In the competition for twelve dishes, of fruit, the winner was Mr. AIRDRIE, gr. to Mr. J. H. A. GRAHAM, Larbert House, with a magnificent assortment; and Mr. D. MURRAY, gr. to the Marquis of AILSA, Culzean Castle, Maybole, was 2nd. Mr. T. LUNT, gr. to Mr. A. STIRLING, Dunblane, was 1st for six dishes of fruit, and he also secured leading honours in the classes for two bunches of White Muscat Grapes, and that for four bunches of Grapes, the last made up of magnificent specimens of Muscat, Foster's Seedling, Alnwick Seedling, and Black Hamburg.

The best collection of six dishes of hardy fruits was from Mr. GEO. WATSON, Walkinshaw Gardens, Renfrew; 2nd, Mr. J. McMillan, gr. to J. W. HARVEY, Esq., Castle Semple, Lochwinnoch. The leading prize for two bunches of Black Hamburg Grapes went to Mr. D. BUCHANAN, gr. to Major HAMILTON. Mr. D. MURRAY, gr. to the Marquis of AILSA, was 1st for twelve baking Apples, and the leading prize for twelve Pears went to Mr. ANGUS, Dalzell, who was also 1st for Melons. For two bunches of Grapes, other than Black Hamburg, Mr. J. CAMERON, gr., Auchterarder House, was 1st.

Of cut flowers, Dahlias, Asters, Marigolds, and Pansies were very fine. Mr. CHARLES IRVINE, Jedburgh, whose specialties in Pentstemons are well known and greatly admired, had an artistic show, which also included Hollyhocks and Carnations. A fine lot of hardy herbaceous flowers was shown by Mr. M. CUTHBERTSON, Rothesay, the Gladiolus being especially fine. Mr. JOHN SMELLIE, Busby, had a fine lot of Cactus and Show Dahlias, including the newest varieties. Fancy Pansies were also a feature of his exhibit.

Herbaceous flowers were shown in great number and variety by Messrs. DOBBIE & CO., Rothesay, and their specialties in Cactus Dahlias were particularly good. Messrs. KERR BROTHERS, Dumfries, also showed Dahlias and herbaceous flowers. An attractive stand was that of Mr. JOHN FORBES, Hawick, whose Pentstemons, Phloxes, Hollyhocks, and Carnations have a high reputation.

Messrs. COCKER & SONS, Aberdeen, had a grand display of Roses, for which they carried off the 1st prize in the competitive section. Another very large and interesting show of Dahlias and Carnations was that of Mr. M. CAMPBELL, High Blantyre.

Messrs. A. LISTER & SONS, Rothesay, won in a competitive class for twenty-four Dahlia blooms. Mr. M. CAMPBELL took 1st prize for a collection of twenty-four Carnation blooms; and for twenty-four blooms of fancy Pansies Messrs. A. LISTER & SONS were the winners.

In the competitive classes in this section, Mr. MILLER, gr. to Mr. JAMES CAMPBELL, Tullichewan, was 1st for Sweet Peas. Mr. L. M'KINNON, Cardross, was 1st for Cactus Dahlias, his lot being superior in colour, form, and size, and including the newest and best varieties. The amateur section and the ladies' competitions were interesting features of the exhibition. Vegetables were shown in the Kent Hall, and were admirable both as regards variety and quality. The best collection of vegetables was one from Mr. JAS. BROWN, gr. to A. A. SPIERS, Esq., Houston; and Mr. CHAS. TRAIL, gr. to Mrs. BALLANTINE, Ashgrove, Kilwinning, was 2nd.

ISLE OF WIGHT HORTICULTURAL IMPROVEMENT ASSOCIATION.

SEPTEMBER 10.—The above Association had their last excursion of the season on Saturday last to Worth Park, Crawley, the residence of Mrs. Montefiore, and to the well-known neighbouring fruit nurseries of Messrs. Cheal & Sons.

The day was beautifully fine, and the sixty-four members who availed themselves of the excursion fully enjoyed the outing, and greatly appreciated the kindness of Mrs. Montefiore who provided some refreshments, and to Messrs. Cheal who provided a substantial tea. The party left Ryde Pier early in the morning, many having travelled from Ventnor and district and from Newport in brakes; whilst others utilised their bicycles to reach the starting point. The party were accompanied by their esteemed chairman (Dr. J. Groves, B.A., J.P.), and the honorary secretary, Mr. S. Heaton, F.R.H.S. The extensive gardens at Worth Park, under the able management of Mr. Allen, were a source of pleasure and profit. As to Lowfield Nurseries, the extent and the variety of the trees, &c., cultivated, absorbed the attention of the party for several hours. The party returned to the Island highly delighted, and the outing will be recognised as another red-letter day in the history of the association.

WELLINGBOROUGH AND MIDLAND COUNTIES DAHLIA.

SEPTEMBER 9, 10.—This Society, which has just held its third annual exhibition, appears likely to make the Dahlia become a highly popular flower in the Midland Counties.

The working-men of Wellingborough and district are taking up the cultivation of the Dahlia with spirit, and there is a most satisfactory growth in the number of cultivators and of exhibitors. The spacious Corn Exchange was almost filled with Dahlia blooms on the above dates, and the quality of the exhibits was high. The prizes in the classes open to all comers were good enough to tempt several of the trade growers in the south to enter, and they took to Wellingborough some of their finest blooms.

The open class for twenty-four Show Dahlias brought seven entries, Mr. JOHN WALKER, nurseryman, Thame, taking the 1st prize with finely-developed blooms; chief among them were Mrs. Every, John Hickling, Mrs. J. Downie, Buffalo Bill, William Powell, James Cocker, Harry Turner, John Walker, Duke of Fife, Perfection, &c. Mr. S. MORTIMER, Swiss Nursery, Farnham, was 2nd. There were nine entries for twelve blooms, and here again Mr. J. WALKER was placed 1st, with fine flowers; and Mr. S. MORTIMER 2nd.

There was a class for twenty-four blooms of Cactus Dahlias, distinct, shown in the same manner as the Show Dahlias. This brought six entries, and all were remarkably good. Messrs. KEYNES, WILLIAMS & Co., who had blooms of extra fine quality, were placed 1st; chief among them were Britannia, Stella, Exquisite, Daffodil, Mrs. J. Goddard, Harmony, Ethel, Progenitor, Laverstock Beauty, Wallace. The Clown, Starfish, Countess of Lonsdale, &c., several of the foregoing being fine novelties of the present year. Messrs. J. BURRELL & Co., Howe End Nurseries, Cambridge, were a close 2nd, their collection consisting largely of novelties of their own raising; a few of the leading blooms were Lucius, Island Queen, Britannia, Keynes' White, which though not faultless, appears to top all the other whites; Debonair, Ajax, Mimosa, &c. Messrs. KEYNES & Co. also had the best twelve blooms similarly shown, staging similar varieties to as those in the foregoing class; Mr. GEO. HUMPHRIES, Kingston Langley, Chippenham, was 2nd.

Then followed a class for twelve bunches of Cactus Dahlias, three blooms to form a bunch; Messrs. KEYNES & Co. taking the 1st prize with very fine fresh blooms of Radiance, Britannia, Wallace, Progenitor, Countess of Sherbrooke, Countess of Lonsdale, The Clown, Starfish, &c.; Messrs. J. BURRELL & Co., were a close 2nd. There were six entries in this class.

Five competed in the class for twelve blooms of Pompon Dahlias, Messrs. J. BURRELL being 1st with fresh bright bunches of medium-sized, even flowers of Arthur West, George Brinkman, Tommy Keith, Rosebud, Douglas, Phoebe, Bacchus, E. F. Jungker, &c. 2nd, Messrs. KEYNES & Co., also with excellent bunches.

There were certain open classes from which nurserymen were excluded. There were six entries of twelve cut blooms; Mr. F. MIDDLETON, Althorp, taking the 1st prize with very good blooms indeed; and Mr. R. BURGIN was 2nd. In the class for six blooms there were seven competitors, and Mr. BURGIN was 1st, and Mr. MIDDLETON 2nd. Mr. MIDDLETON had the best twelve blooms of Cactus varieties, showing remarkably good examples of Island Queen, Britannia, Earl of Pembroke, Standard Bearer, Starfish, Arachne, Night, &c.; 2nd—and a very close 2nd, too—Mr. H. A. NEEDS, Horsell, Woking. Mr. MIDDLETON also had the best six; Mr. W. E. PRENTICE, Wellingborough, was 2nd. Mr. H. A. NEEDS was 1st with six bunches of Cactus Dahlias, three blooms in a bunch; and Mr. R. BURGIN was 2nd. There was a class also for six bunches of Poppies; and special prizes, offered by Mr. RICHARD DEAN and Mr. G. HUMPHRIES, brought good competitions.

There were several exhibits of fruits and vegetables.

As a number of new Dahlias were submitted for Certificates, the whole of the growers present with the judges, formed a committee, with the result that the following Certificates of Merit were awarded:—To Cactus Dahlias Wallace, Progenitor, The Clown, Viscountess Sherbrooke, Radiance, and Countess of Lonsdale, from Messrs. KEYNES & Co.; to Cactus Dahlia Magnificent, from Mr. J. STRUDWICK, St.

Leonard's-on-Sea; to Cactus Lucius and Antelope; and also to Pompon The Duke, from Messrs. J. BURRELL & Co.; and to Show Dahlia David Johnson, and to Cactus Ranji, from Mr. GEO. HUMPHRIES.

ROYAL CALEDONIAN HORTICULTURAL.

SEPTEMBER 14, 15.—This year's autumn exhibition held, as usual, in the Waverley Market, was undoubtedly one of the best held in Edinburgh during late years.

The prize for a table laid out as for dessert, with sixteen dishes of fruit, and decorated with flowers and foliage, was perhaps the exhibit that attracted most attention. Mr. CAIRNS, Balruddery Gardens, Dundee, and Mr. KIRK, Norwood House Gardens, Alloa, were the only exhibitors, the former being 1st, with good fruit and beautiful flowers, nearly all Orchids, but which, with advantage, might have been somewhat more lightly arranged. Mr. KIRK's exhibit was, in this respect, heavier still, though his fruits were, as a whole, better.

Mr. CAIRNS' collection of ten dishes of fruit, included some good first-class specimens, his Grapes, Pineapple and Apples being most noteworthy. Mr. BESANT's orchard fruit was excellent, and some of the dishes fine.

GRAPES.

Amongst the Grapes, Mr. LUNT's collection of six sorts, comprising three bunches Muscat of Alexandria, two of Black Hamburg and one of Alnwick seedling, were very fine indeed.

The collection of four varieties were all black, and these were all less generally good than in the sixes.

In the one bunch classes the fruit was rather wanting in size and finish; there were several good examples of Muscat of Alexandria, and of Black Hamburg, and Alicante, but Gros Colman and Lady Downes were of high merit.

HARDY FRUITS.

Hardy fruits, for which there were numerous classes, mostly in single dishes were generally small and deficient in colour. Pears were also below the usual standard. On the other hand, many dishes of Plums were fine, and of these there was a large exhibit. Peaches were excellent, as also Nectarines. Hardy fruits from Mr. DAY, Galloway House Gardens, Garliestown, were most commendable for the present season.

PLANTS.

In the plant classes Mr. LUNT exhibited some of the finest in the show, being in particular strong in Crotons. Flowering plants were in general small, but the Orchids though not numerous shown included some good plants. There was a very large number of plants shown, such as Fuchsias, Coleus, Chrysanthemums, Vallotas, and some grand Ferns. Quantities of Palms; great numbers of table plants, &c., were lovely.

A table of plants, circular in form, and arranged for effect, brought three exhibitors, all of whose collections seemed to be wanting in lightness of touch.

CUT FLOWERS.

Among cut flowers were some lovely Roses, perhaps smaller than usual, but in brightness of colour leaving nothing to be desired. Sweet Peas, Dahlias, and other autumn flowers were also numerous. In general these were not quite so good as usual. Herbaceous plants, however, must not be included in the preceding remark, as they were extra fine.

NURSERYMEN'S AND MISCELLANEOUS CLASSES.

Of the classes set apart for nurserymen, the one for tables of cut herbaceous flowers, formed a grand exhibit. Both Messrs. COCKER & SON, Aberdeen, and Messrs. HARKNESS & SON, Bedale, York, put up very fine lots of the more popular autumn flowers.

Trade growers and others set up beautiful displays of fruit and flowers.

From HER MAJESTY'S Gardens at Windsor, a very large table was set up by Mr. OWEN THOMAS, which contained a large number of Apples not quite of the largest size; Pears were better than the Apples, and many Melons, including British Queen, in five fine fruits. A large number of dishes of Peaches, Nectarines, and Plums, Bananas and Grapes, with a good Pine-apple as a centre-piece, completed the sides. Mulberries, Strawberries, Morello Cherries, John Downie Crab, and dessert Tomato with Royal Sovereign Melons completed the ends. A number of Nepenthes were raised high above the fruits, and a few vases of cut flowers and foliage. An edging of dried Statice completed the arrangement.

Messrs. J. VEITCH & Sons, Ltd., King's Road, Chelsea, London, had a group of fine foliaged and other plants, arranged in circular form on the floor. The plants included Crotons, Nepenthes, Caladiums, a few Orchids, Javanese Rhododendrons, &c.

Messrs. METHVEN & Sons had a nicely arranged table, as had also Messrs. LAIRD & SON, both of Edinburgh.

Messrs. DICKSONS & Co., Edinburgh, set up a collection of plants of a miscellaneous character; Grapes in pots, with Sweet Peas, Violas, Carnations, &c.

From Messrs. WALLACE & Co., Colchester, came a fine collection of autumn or flowering Lilies.

Hardy herbaceous and other cut flowers were shown in amazing quantities by nurserymen, including some from Mr. M. CAMPBELL, Blantyre, who put up some good Carnations and Dahlias of fine quality.

Mr. JOHN FORBES, Hawick, whose table was rich in Hollyhocks, had a large number of good Carnations, many Pentstemons, &c.

Messrs. DOBBIE & Co., Rothesay, put their dependence for effect mainly on Dahlias, of which the Cactus forms were very beautiful. In that of Messrs. COCKER & SON's, Aberdeen, were some glorious bunches of the best hardy herbaceous flowers.

Mr. H. J. JONES, Ryecroft Nursery, Lewisham, London, set up a group of plants on the floor of the building, boldly arranged in low groups, and filled in with lovely Ferns, Begonias, Caladiums, &c.

Messrs. D. & W. BUCHANAN, Kippen, exhibited a table of beautiful Grapes, and several varieties of Tomatoes, interspersed with a few tall trumpet vases, furnished with prepared Vine-leaves, Ferns, and Rowan berries. This was a highly meritorious exhibit.

Messrs. THOMSON & Sons, Clovenfords, showed some of their fine Grapes and Tomatoes, and also a table of plants.

THE ROSARY.

ORANGE-FUNGUS ON ROSES.

THE Rose-grower has ever need to bear in mind the well-known proverb, "Never holla until you are out of the wood;" thus I had hardly written the statement that I had not been troubled with this pest, when a violent attack of it, consequent, I suppose, on the long-continued drought, attacked my plants, and the leaves of my hybrid perpetuals are so badly affected that in a couple of days a large quantity of them have fallen from the bushes, and their aspect sets one thinking as to the cause and history of this pest. On turning back to one's book of reference there is no one whose authority on the Rose is greater than the late Mr. Thomas Rivers, and he writes of it thus: "There is yet another red, or rather orange-coloured, fungus, peculiar to dry soils, which often makes its appearance in August on the under surface of the leaves of Roses, more particularly those of the Moss and Provence Roses. I have seen thousands of young and old plants of these two old favourite sorts with the under surface of every leaf covered with a thick coat of impalpable bright orange-coloured dust. No cure has yet been found for this disease; all the fungus remedies have failed. There is a preventive—the Roses should be lifted and replanted every autumn, giving them at the same time plenty of manure, and stirring the soil three feet deep; rotation in cropping should also be attended to, so as to give the Roses a bed in the Rose-garden which has had a crop of annuals the preceding summer." Now in this statement it will be observed that the writer lays a stress upon the fact that it is more frequent in dry soils. I hardly think that later experience has altered this conclusion, and it certainly does appear that the attack is more virulent in droughty than in damp seasons; and I think that probably had the beneficial rain that we had on August 7 and 8, come a few days before, the attack would not have been so violent as it is. I have never been able to observe that it did any lasting injuries to the plants; it disfigures them for a time by leaving them so bare of foliage, but that is all, so far as I can see. Of course, it may be said "but how much better your plants would have been had they not been attacked by it," but to this we can give no reply. As to Mr. Rivers' remedies, I very much question whether any of them would be of any avail. But there is one point in connection with this fungus that seems to me very curious, and which I should be glad if any of the *quid nuncs* can account for, and it is this, that it never seems to attack the Tea Roses. I speak of my own experience; but I have asked several Rose-growing friends, and their experience agrees with mine. I have gone carefully through what Roses I have, and find that my experience of former years is that of the present. I find a large quantity of it on my hybrid perpetuals, some being more infected by it than others; while on my Teas, planted close by, I can see no trace of it. I find very little of it amongst the hybrid Teas, and the nearer the varieties approach the Teas, as in Kaiserin Augusta Victoria, I find it entirely absent; in the same way I find that mildew does not affect the Teas and hybrid Teas as badly as it does H.P.'s. I should add, that my soil is light, and the situation warm. I have tried in turn various chemical preparations with which I have syringed the plants, but I have

never found them of any use. I am very dubious about the lifting of the plants, for I notice that newly-planted H.P.'s are as subject to it as the older plants. It is, therefore, one of those annoyances which I suppose we must put up with; but if any of my brother rosarians can suggest a preventive for this disease, or say how to get rid of it when it does appear, I think they will confer a favour on Rose-growers by letting it be known. *Wild Rose.*

[The term "accumulated temperature" indicates the aggregate amount, as well as the duration, of degrees of temperature above or below 42° Fahr. for the period named: and this combined result is expressed in Day-degrees—a "Day-degree" signifying 1° continued for twenty-four hours, or any other number of degrees for an inversely proportional number of hours.]

The districts indicated by number in the first column are the following:—

0, Scotland, N. Principal Wheat-producing Districts—1, Scotland, E.; 2, England, N.E.; 3, England, E.; 4, Midland Counties; 5, England, including London, S. Principal Grazing, &c., Districts—6, Scotland, W.; 7, England, N.W.; 8, England, S.W.; 9, Ireland, N.; 10, Ireland, S.; * Channel Islands.

THE PAST WEEK.

The following summary record of the weather throughout the British Islands for the week ending September 10, is furnished from the Meteorological Office:—

"The weather was very fine in all parts of the kingdom during the earlier half of the period, and this condition continued to prevail over England throughout the week. In Ireland, Scotland, and the north of Wales, however, the later days were unsettled and rainy. A brilliant display of aurora was observed on Friday night in nearly all parts of the country, and again at a few stations on Saturday night.

"The temperature was unusually high for the time of year, the average for the week having been as much as 10° above the mean in 'England, S.,' the 'Midland Counties,' and 'Scotland, E.,' 9° in 'England, E.,' and 8° in nearly all other districts. The highest of the maxima occurred early in the week over Ireland and Scotland, but on the 8th over England. They varied from 92° in 'England, E.,' 91° in 'England, S.,' and 90° in the 'Midland Counties,' to 81° in 'Scotland, W.' and 'England, N.W.,' and to 80° in 'Ireland, S.' These values are higher than any registered in September—over Scotland since 1871, and over England since 1868. The lowest of the minima, which were recorded on very irregular dates, ranged from 42° in 'Scotland, N.,' to 54° in 'England, S.,' and to 57° in the 'Channel Islands.' During the greater part of the week the minimum readings were very high in all districts, the thermometer at many stations not falling to 60°.

"The rainfall was much more than the mean in 'Ireland, S.,' and slightly exceeded the normal in 'Ireland, N.,' in all other districts, however, it was less, and over the greater part of England rain was entirely absent.

"The bright sunshine exceeded the mean in all districts, the excess in almost all cases being large. The percentage of the possible duration ranged from 71 in 'England, S.,' and 70 in the 'Channel Islands,' to 41 in 'England, N.W.,' and 38 in 'England, N.E.' and 'Scotland, W.'"

MARKETS.

COVENT GARDEN, SEPTEMBER 15.

[We cannot accept any responsibility for the subjoined reports. They are furnished to us regularly every Thursday, by the kindness of several of the principal salesmen, who revise the list, and who are responsible for the quotations. It must be remembered that these quotations do not represent the prices on any particular day, but only the general averages for the week preceding the date of our report. The prices depend upon the quality of the samples, the supply in the market, and the demand; and they may fluctuate, not only from day to day, but often several times in one day. Ed.]

POTATOS.

60s. to 90s. per ton. John Bath, 32 and 34, Wellington Street, Covent Garden.

REMARKS.—On Friday last there was in the market a quantity of Blackberries in butter-tubs from Ireland, and they realised 10s. per cwt. There has also been a good supply of Runner Beans in bushel-bags from Worcestershire, and of Cabbages from Yorkshire and Lancashire. There is a good supply of Apples, but really good samples are few. The Californian Plums, quoted Pond Seedlings, are described as Gross Prunes. An amber-coloured Plum is called Japan; it is very like Coe's Golden Drop, but rather broader at the base, and has little of the mottle-colouring.

FRUIT.—AVERAGE WHOLESALE PRICES.

	s. d. s. d.		s. d. s. d.
Apples, Keswick, bush.	3 0-4 6	Oranges, Califor-	16 0—
— Suffield, bush.	4 0-5 0	— Italian, do.	15 0-16 0

Oranges, Australian, cases	9 0-12 6		

SEEDS.

LONDON: Sept. 14.—Messrs. John Shaw & Sons, Seed Merchants, of Great Maze Pond, Borough, London, S.E., write that orders for Trifolium become daily scarcer and smaller. A few English growers who delayed marketing their seed will now have to carry same over for another season. New winter Tares offer freely, and at tempting rates; whilst Rye continues in short supply, and tends upwards in value. Full prices are asked for Mustard and Rape seed. As regards blue Peas and Haricot Beans, holders, relying on the approaching scarcity of green vegetables, show a bold front. The trade for bird seeds presents no fresh feature. The Board of Trade Returns give the imports of Clover and grass seeds into the United Kingdom for the eight months of this year, ending August 31, as 232,652 cwt., value £451,918; as against 185,482 cwt., value £376,844, for the corresponding period of 1897.

CORN.

AVERAGE PRICES OF British Corn (per imperial qr.), for the week ending September 10, and for the corresponding period of 1897, together with the difference in the quotations. These figures are based on the Official Weekly Return:—

Description.	1897.	1898.	Difference.
	s. d.	s. d.	s. d.
Wheat	33 1	26 10	— 6 3
Barley	27 4	27 0	— 0 4
Oats	17 3	17 10	+ 0 7

FRUIT AND VEGETABLES.

GLASGOW: Sept. 14.—The following are the averages of the prices recorded since our last report:—Grapes, English, 1s. 3d. to 1s. 6d. per lb.; do., Muscats, 1s. 6d. to 2s. 6d. ditto; do., Scotch, 1s. 3d. to 1s. 6d. ditto; do., Guernsey, 5d. to 7d. ditto; Apples, Americans, 18s. to 20s. per barrel; do., Canadian, 16s. to 20s. ditto; do., English, 14s. to 20s. per cwt.; Plums, Pershore, 8s. to 9s. ditto; ditto, Victoria (middle size), 2½d. per lb.; do., Cambridge-shire and Kent, 14s. to 20s. per cwt.; Greengages, 3d. to 4d. per lb.; Tomatoes, Scotch, 5d. to 8d.; do., English, 3d. to 4d.; do., Guernsey, 3d. do.; Lemons, Naples, 16s. to 25s. per case; Melons, home, 2s. to 2s. 6d. each; do., Valencia, 4s. 9d. to 5s. 9d. per case; Pears, Duchesse, 2s. 6d. per case; do., Havre Williams, 3s. to 4s. 6d. per case; do. Wine, 3s. per moly; Cabbages, 7d. to 10d. per dozen; Cauliflowers, 2s. 6d. do.; Mint, green, 6d. to 9d. per bunch; Onions, 4s. 6d. to 6s. 6d. per cwt.; do., Valencia, 3s. 6d. to 5s. 6d. per case; Parsley, 1s. to 1s. 6d. per stone; Potatoes (best), 1s. do.; Cucumbers, 2s. to 3s. 6d. per dozen; Lettuces, 6d. to 9d. do.; do., Cos, 6d. to 1s. do.; Radishes, 1s. per dozen bunches; Horseradish, 1s. 6d. per bundle; Mushrooms, 1s. to 1s. 2d. per lb.; Beetroots, 7d. to 8d. per doz.; Mustard and Cress, 3d. per punnet; Spinach, 1s. 6d. to 2s. per stone; Turnips, white, 2d. to 3d. per bunch; Celery, Scotch, 1s. 6d. per bundle; Onions, Valencia, 3s. to 3s. 6d. per case.

LIVERPOOL: September 14.—Average of the prices at under-noted markets:—St. John's: Potatoes, 10d. to 1s. per peck; Grapes, English, 1s. 6d. to 3s. per lb.; do., foreign, 4d. to 8d. do.; Pine-apples, English, 4s. to 5s. each; Damsons, 6d. per lb.; Cob-nuts, 8d. per lb.; Cucumbers, 3d. to 4d. each; Mushrooms, 8d. per lb.; do., 8s. per

basket. Wholesale Vegetable Market: Potatoes, per cwt., Giants, 1s. 9d. to 2s. 8d.; Main Crop, 2s. 6d. to 3s.; Bruce, 2s. to 2s. 4d.; Kidneys, 2s. 6d. to 3s. 3d.; Turnips, 6d. to 8d. per dozen bunches; Carrots, 6d. to 9d. per dozen bunches; Parsley, 4d. to 6d. do.; Onions, English, 7s. per cwt.; do., foreign, 2s. 9d. to 3s. 6d. do.; Cucumbers, 1s. to 2s. 6d. per doz.; Cauliflowers, 1s. to 1s. 8d. do.; Cabbages, 6d. to 10d. do.; Celery, 1s. to 2s. 3d. per roll.

GARDENING APPOINTMENTS.

- Mr. Wm. MEADS, late Head Gardener at Buscot Park Farm, Faringdon, Berks, has been appointed Head Gardener and Bailiff to Sir G. W. ALLEN, Free Chase, Hayward's Heath.
- Mr. A. VINCE, late of Morant's Court, Sevenoaks, as Head Gardener and Bailiff to Lt.-Col. DANSEY, Cams Hall, Fareham, Hants.
- Mr. GEORGE BURROWS, late of Berwick House, Shrewsbury, as Head Gardener and Bailiff to G. E. BELLIS, Esq., The Dell, King's Norton, near Birmingham.
- Mr. FRED LODGE, as Gardener to J. S. BERGHEIM, Esq., Belsize Court, Hampstead, N.W.
- Mr. THOS. WALCROFT, Gardener to the late JAMES STIFF, Esq., as Gardener to V. B. TRITTON, Esq., Norfolk Lodge, Barnet, Herts.
- Mr. A. B. WADDS, for the past five years Gardener to W. W. ASTOR, Esq., Cliveden, Maidenhead, as Gardener to Sir WETMAN D. PEARSON, Bart., M.P., Paddockhurst, Worth, Sussex.
- Mr. W. H. KEEN, until recently at Warley Place Gardens, Brontwood, as Gardener to Colonel TUFNELL TYRELL, Boreham House, Chelmsford.

CATALOGUES RECEIVED.

- M. BRUANT, Poitiers, Vienne, France—Bulbs, Seeds, &c., required in the autumn; Chrysanthemums.
- ARMITAGE BROS., Nottingham—Bulb, Roses, Carnations, Hardy Plants, &c.
- W. PAUL & SON, Waltham Cross, Herts—Roses.
- CHR. LORENZ, Erfurt, Germany—Vegetable and Flower Seeds.
- B. S. WILLIAMS & SON, 169, Piccadilly, W., and Upper Holloway, London, N.—Florists' Specialties.
- H. DUNCAN CARR, 22, Kimberley Road, Stockwell, London, S.W.—Bulbs, Roses, Chrysanthemums, &c.
- H. CANNELL & SONS, Swanley Kent—Bulbs, Strawberries, and small Fruit Trees.
- HOWDEN & CO., Inverness—Bulbs, &c.
- THOS. KENNEDY & CO., 126 & 128, High Street, Dumfries.—Bulbs.
- ARTHUR ROBINSON, 1A, Bishopsgate Without, City—Bulbs.
- A. DESSERT, Chenonceaux, France—Peonies.

A SICK CATALPA-TREE: *E. H. W.* The tree may be rejuvenated if it be not too far gone by digging a trench round it at the extremities of the roots, tracing the latter back towards the stem for a yard or two, and laying them in new soil, consisting of heavy loam, two-thirds; decayed manure, one-third; and mortar-rubble sufficient to effect good drainage, making it firm before and after laying-out the roots. The surface-soil should also be removed, replacing it with a similar mixture of soil, and over all a mulch of leaf-mould or decayed hot-bed manure should be laid. Probably, a copious application of water may be necessary, the soil being in a very dry condition. Manure-water once or twice during the winter would benefit the tree.

ADVANCEMENT IN HORTICULTURE: *D. Macgregor.* We think that you should endeavour to obtain employment, say, first in the Royal Botanic Gardens, Edinburgh or Dublin, and then at Kew; or, if you would like foreign experience, you might go to the Jardin des Plantes in Paris, or the Botanic Gardens at Berlin or Vienna. To obtain admission to these gardens is not very difficult, provided your testimonials are good.

ALPINE GARDEN: *E. H. W.* If the work can be undertaken forthwith, there is so much heat in the earth that transplanted things would become established before the advent of winter. Otherwise make preparations in the winter, and defer all planting till March and April.

CATERPILLAR: *W. Pease.* The larvæ of the Privet Hawkmoth, *Sphinx ligustri*.

CHRYSANTHEMUM LEAVES WITH FUNGUS: *H. F. C. Q. and B. W.* We are continually receiving specimens of Chrysanthemum leaves attacked similarly to yours. The disfiguration is caused by a "rust" fungus, which was fully described in *Gardeners' Chronicle* for October 9, 1897, p. 256. As you have 250 plants

so attacked, it will be best to remove the affected leaves from same, and burn them. If the few plants first attacked had been burned, probably the fungus would have failed to spread. It might be useful to syringe all the plants with Condry's fluid or a copper solution, especially wetting the underneath side of the foliage. Until the last year or two this pest very rarely attacked Chrysanthem plants, but it is unfortunately becoming very common and destructive.

CODIÆUM (CROTON) LEAVES DISFIGURED: *T. C. M.* The specimens you send are insufficient to form an absolute conclusion upon. There does not appear, however, to be any disease upon them, and the disfiguration by spotting, &c., would appear to be due to some detail in their cultivation, and this view is strengthened by the weakly appearance of the leaves. Try a fresh stock of plants or strong cuttings, and grow them liberally, without an excessive use of manure, and you will probably find that they may be kept free from such defects. See that the glass of the house in which they are cultivated contains no flaws that will concentrate the rays of the sun, and thus burn the plants.

CRATEGUS FOR NAME: *G. P.* We have unfortunately no record of the two specimens.

DONATION.—Received for the Royal Gardeners' Orphan Fund, the sum of 2s., with thanks, from J. Shaw, and a similar sum from F. Williams, Cliveden, for the Gardeners' Royal Benevolent Institution.

EARLY SINGLE-FLOWERED BEDDING TULIPS, ROSE OR PINK SELF-COLOURED: *E. H. W.* Rose Applati, very large and handsome; and Rose Luisante, fine deep rose. Double early-flowering Couronne des Roses, shaded rose, very fine; and Rosene, rosy-pink, a good bedder.

EULALIA JAPONICA VARIEGATA COMING GREEN FROM SEED: *D. P.* A common occurrence. It is a reversion to the original colour of the plant. Try the effect of planting in poor soil.

EXHIBITING HARDY ANNUALS: *Constant Reader.* The wording of the schedule being as stated, the decision in the case was necessarily thrown upon the judges. There may be something in your contention that if seeds of Asters, Phlox Drummondii, Zinnia elegans, and Ten-week Stocks be sown in spring out-of-doors, and exhibition blooms be produced by them, without being afforded protection at any stage of their growth, they are hardy. But it is only at a certain period of the year; they will not stand frost. Seeds cannot be sown in autumn with a view to obtaining spring flowering plants. The hardy annuals, if left to themselves, will reproduce themselves naturally by seed. Will Zinnia elegans and Phlox Drummondii succeed in these conditions? We think not, and therefore they are "tender" annuals rather than perfectly hardy plants. The judges could hardly have done other than disqualify you under the circumstances you describe.

FUNGUS: *G. Paul.* Young immature specimens of Polyporus ovinus. *M. C. G.*

IMPORTED FRUIT: *S. W.* The last returns are obtainable from Messrs. Pyre & Spottiswoode, Queen's Printers, East Harding Street, London, E.C. Further information might also be obtained from the Board of Trade, Whitehall Gardens.

INSECTS: *D. Ireland.* The caterpillar on Peas is that of the Cabbage Noctua moth (*Mamestra brassicae*), not to be confounded with the Cabbage-butterflies. It will feed on almost anything. *R. McL.*

LEAVES BROWNED IN PARTS: *K. S.* No fungus was discovered on the leaves, and the appearances seem to be due to scalding or burning by solar heat.

LILIUM AURATUM: *Frank Dicks & Co.* The plant was introduced from Japan by the late J. G. Veitch in 1862 (see *Gardeners' Chronicle* for July 12, 1862, p. 644). A flowering plant was shown by Messrs. Veitch at a meeting of the Royal Horticultural Society held in the then new conservatory at South Kensington on July 2 the same year. It was found growing wild on the hill-sides of the midland provinces of Japan.

NAMES OF FRUITS: *A. B.* 1, Royal Codlin Apple; 2, Warner's King Apple.—*H. E. G.* Beurré Giffard.—*H. Oakley.* Cox's Pomona.

NAMES OF PLANTS: *Correspondents not answered in this issue are requested to be so good as to consult the following number.*—*H. E. G.* Helianthemum polifolium.—*J. Wright.* Tritonia (Montbretia) crocosmiflora = *T. Pottsii* × *Crocasmia aurea*.—*M. J. S.* 2, Polystachya luteola, Hook.—*E. G. L.* Probably Betula pendula, but cannot determine without better material.—*H. G.* 1, Euphorbia peplus; 2, Veronica polita; 3, Potentilla anserina; 4, Scabiosa Succisa; 5, Stellaria aquatica; 6, Polygonum persicaria.—*West Wickham.* Achillea ptarmica flore-pleno, dyed blue, probably.—*G. D.* 1, Hæmanthus species, probably an imperfectly developed *H. tigrinus*; 2, Helianthus rigidus; 3, Saponaria officinalis flore-pleno; 4, Fuchsia procumbens.—*C. L.* A very fine example of Houletia Brocklehurstiana.—*H. & Co.* Piptanthus nepalensis (evergreen Laburnum).—*J. F. W.* Ophiopogon Jaburan variegatum.—*W. D.* 1, Croton (Codiæum) angustifolium; 2, Croton variegatum; 3, Ixora coccinea; 4, Ixora Dixiana; 5, Dipladenia amabilis; 6, Poinsettia pulcherrima var. fastigiata; 7, Mesembryanthemum cordifolium variegatum (variegated Ice-plant); 2, Alternanthera paronychioides major; 3, Echeveria glauca.—*J. R. P.* 1, Prumnopitys elegans; 2, Cupressus thyoides; 3, Cephalotaxus pedunculata var. fastigiata; 4, Acer campestre; 5, Spiraea Nobleana; 6, S. japonica; 7, S. Douglasii.—*A. J. C. J.* 1, Geranium sanguinea; 2, Galium verum; 3, Polygonum cuspidatum.—*X. (from abroad).* Clerodendron foetidum.

NATIONAL CHRYSANTHEMUM SOCIETY: *Anxious.* The next meeting is on Monday, September 26.

ORCHID STAGE: *Orchid House.* The kind of staging most favoured by cultivators is one made of battens standing 6 or more inches above an impervious one. Moisture-holding materials, as partially decayed tree leaves, coal ashes, gravel spar, shell gravel, &c., being placed on the latter.

PINUS STROBUS: *L. E. Smith.* Kindly send full address. The matter shall then have attention forthwith.

TOBACCO: *G. K. G.* The leaves are of use the first year; indeed, the plant being grown as an annual in the open air dies away during the winter. The plants should be raised in heat, and planted out as soon as it is safe to do so, so as to have full-grown plants in September, whilst there is still warmth enough to dry the leaves under cover without the need of fire-heat, though the latter has usually to be made use of to finish off the drying process. Side-shoots should be pinched out, and when a good proportion of large leaves are formed the plants are the better for being topped, this operation usually removing the flowers.

TO KEEP MAIDENHAIR FERN FRESH: *E. H. W.* The plants are grown entirely cool, or they are placed in a cool house for a week or two previously to cutting the fronds, and scarcely shaded at all from the sun, in order to impart firmness to the tissues. It is a good practice to immerse the fronds in cold water before making use of them in floral devices.

VINE: *A. C.* Golden Champion.

WATERPROOF, TRANSPARENT PAPER FOR COVERING GLASSHOUSES: *C. A. C.* Can you send some here for our inspection?

WHITE-FLOWERED PEA: *E. H. W.* What is meant, is probably, Lathyrus latifolius albus, the "Everlasting Pea," itself a slight variety of *L. sylvestris*, a common European species.

CONTINUED LARGE INCREASE in the CIRCULATION of the "GARDENERS' CHRONICLE."

Important to Advertisers.—The Publisher has the satisfaction of announcing that the circulation of the "Gardeners' Chronicle" has, since the reduction in the price of the paper,

MORE THAN DOUBLED, and that it continues to increase weekly.

Advertisers are reminded that the "Chronicle" circulates among COUNTRY GENTLEMEN, AND ALL CLASSES OF GARDENERS AND GARDEN-LOVERS at home, that it has a specially large FOREIGN AND COLONIAL CIRCULATION, and that it is preserved for reference in all the principal Libraries.

THE Gardeners' Chronicle.

SATURDAY, SEPTEMBER 24, 1898.

THE GARDENS AND GARDENER AT COMBE ABBEY.

THE residence of the Earl of Craven is situate nearly midway between Rugby and Coventry, being rather nearer to the latter very interesting town than to Rugby. The nearest railway station is a small one named Brandon, on the L. & N.-W. Ry. In walking or driving from the smart little village of Brandon, where the cottage-gardens are well cultivated, and the hedges are good and neatly trimmed—to Combe Abbey—one gets a glimpse of a bit of characteristic Warwickshire scenery. There is little that is wild, or even picturesque in the landscape; the country is too flat to afford such effects, but there are extensive tracts of rich pasture land; the trees, such as Oak, Ash, Beech, and Elm are very fine umbrageous specimens, and the lanes are pretty. Gaining the estate, a drive almost straight, and about 2 miles in length, leads to the noble Abbey, the first half of the drive being through a plantation, and the remaining portion through the park, in which feed hundreds of deer. A general view of the south part of the Abbey from the park, and showing the deer under the trees, is reproduced in fig. 61, p. 230. The original Abbey was built more than eight centuries ago, but the greater part of the present building is modern, whilst its style of architecture cannot be satisfactorily described, so irregular is it, and non-characteristic. In the *Graphic Illustrations of Warwickshire* we read thus:—

"The Princess Elizabeth, daughter of James I., and afterwards Queen of Bohemia, occasionally resided here with Lord Harrington, who was entrusted with the superintendence of her education. The son of Lord Harrington dying without issue, the estate was shortly after sold to Sir William Craven, the ancestor of the Earl of Craven, the present possessor. The eldest son of Sir William Craven having at a very early age signalised himself in Germany and the Netherlands under the Prince of Orange, was, on the accession of Charles I., ennobled by the title of Baron Craven, and at the Restoration advanced to the dignity of Viscount Uffington and Earl of Craven. Urged by an enthusiastic desire for glory, and perhaps also, as is supposed, by a chivalric attachment to the beautiful, high-minded, and accomplished Elizabeth, Queen of Bohemia, he was one of the most ardent of that gallant band of Englishmen who strove to reinstate her unfortunate consort, Frederic, in his possessions. Through all the distresses and calamities with which Elizabeth had to contend after the death of Frederic, Lord Craven continued to devote himself and his fortunes to her service, and it was at length, owing principally to his munificence in appropriating his mansion of Drury House to her use, that she was enabled, in 1661, to return to her native country, where she shortly after terminated her eventful life, bequeathing to her valued friend and benefactor her papers, books, and pictures, which latter form an appropriate and

interesting part of the excellent and valuable collection of paintings with which the several apartments of Combe Abbey are adorned."

One of the most remarkable of the natural features of Combe is the very large lake that stretches away from the front of the house a distance of $1\frac{1}{2}$ miles, and covers an area of 90 acres. This lake was the work of "Capability Brown." The outlines of this huge lake are very pleasing, and as one walks around it, he realises that there are few, if any, of our country seats that possess such a feature. Unfortunately, the best part of the lake, from any standpoint, is the end furthest removed from the Abbey; indeed, the way in which it approaches the residence lacks nobility. The water is well stocked with fish, and there is a considerable variety in the aquatic birds which adorn its surface. Towards the further end there exists a heronry, and the ungainly nests of these now rather uncommon birds are plainly visible in the trees. The scene at this point is extremely wild, charmingly unfamiliar, and with a field-glass, how easy it would be to linger there, when the summer's sun makes the air upon and around the water warm and pleasant! Nor have we cited all the charms there exists in connection with the lake, for a study of the number of aquatic plants on the surface of the water, indigenous and naturalised, would offer great interest and enjoyment. A considerable tract of land near to the lake is little else than a wet bog, and a number of rare British plants peculiar to such sites have been discovered there.

In the *Gardeners' Chronicle* for May 7 last, Mr. Miller told how he had treated the narrow end of the lake, which had become so silted up by the inflow of a muddy stream that it had grown into an unpleasant-looking, evil-smelling swamp. In the place of dredging and distributing the mud on the surface of the land, which method was abandoned on account of the cost, canals were cut through the mud, and ridges were thrown up between them, 2 to 3 feet above the level of the water area. These ridges have been planted with suitable species of semi-aquatic plants, and further planting has still to be done. Short of thoroughly dredging the whole area, a more satisfactory method of abating the evils that existed could not have been adopted.

The gardens proper were laid out in their present form by the veteran who has still charge of them. In the heading to this note the "gardens and gardener" have been associated, and for this reason, that it would be quite impossible to write or to think of the one apart from the other. One cannot study the gardens without obtaining a great deal of knowledge therefrom respecting the man who designed them, and to some extent has since controlled their development. Mr. W. Miller took service under the Earl of Craven so long ago as 1861, and was engaged by his lordship from the gardens of the Royal Horticultural Society of London. In the Lord Craven of those days the new gardener found a sympathetic employer whose encouragement he could depend upon in any efforts he made to improve the establishment. Consequently a new kitchen-garden was made, the grounds were planted with the best of the ornamental trees and shrubs that were to hand, and many new drives and paths were made, or existing ones altered. Thus was greater convenience secured, and unsightly objects screened, or a pleasing view more fully opened. Flower-beds were designed, and for

some years the flower-gardening at Combe was equal to the best that could be found in any part of the country. There was, for instance, the unique ribbon-border at the foot of the kitchen-garden, and just outside its walls. That border was 700 feet in length, and the number of plants required to fill it was very large. There was much additional bedding in various suitable spots, but little, however, immediately round the Abbey, which is unfortunate in regard to its position. In the kitchen-garden were erected the whole of the glass structures, and most of our older readers will remember what an excellent fruit-grower Mr. Miller proved himself. In those days the Grapes, Peaches, and other fruits from Combe, but especially the Grapes, were exceedingly difficult to beat on the exhibition-tables, Mr. Miller having obtained three gold medals for collections in three successive years at Regent's Park.

THE GARDEN AT THE PRESENT TIME.

Had the energetic and liberal policy that characterised the management of the gardens in Mr. Miller's earlier days been permanently continued, Combe to-day would have been a garden of great fame. From various causes, however, the speed had to be slackened; alterations and improvements were not commenced with the spirit of former days, and the grounds as already laid out were found to be too expensive of maintenance for the means of the owner; thus the more extravagant kinds of flower-gardening were sacrificed, many flower-beds turfed over or planted with shrubs, and certain paths and lawns it was intended should be kept trim have been regarded as more or less outside the "kept" portion of the establishment.

Having said this much respecting the history of these gardens, we will now describe briefly some of its features as we observed them a month ago. In the first place, the kitchen garden is an excellent type of an ornamental vegetable-garden. It is 4 acres in extent, and is enclosed with brick-walls, which are covered with fruit-trees. The greater length is from north-west to south-east; and along the wall that faces nearly south are the lean-to Peach-houses and vineries. At the south-west end is Mr. Miller's residence (see fig. 62, p. 230), beautifully clothed with flowering and berry-bearing plants, including *Wistaria chinensis*, *Cratægus Lelandi*, and the *Virginian Creeper*. When the photograph was taken the house was clothed by varieties of the beautiful *Ceanothus*, but a severe winter killed these. From this house runs down through the centre of the garden a path of unusual width, which leads at one end into the pleasure-grounds, first passing through what was intended to be, and is sometimes called, an ornamental garden entrance. The architect who designed it had not the happiest conception of the fitness of things. A view of this principal entrance to the kitchen garden is given in fig. 63, p. 231, and through the centre of this may be seen the gardener's house 700 feet distant, connected one with the other by the broad path above mentioned. Midway of the length of the garden, two side-paths lead from the central one, and at this point a fountain exists, which sends forth several spirally-twisted streams of water into the air, to watch which for a length of time is bewildering. This fountain stands in a large stone basin, containing some *Nymphæas* in bloom. The ground slopes very considerably to the south-west, and at three-fourths of the descent a terrace was formed with grassy slopes, whilst the path is conducted down some steps. Around the fountain flower-beds are arranged, and it appears

very unusual to see the rows of Celery terminate in closely-mown turf, and breaks of Brassica encircled with borders of Sweet Peas, of Roses, and neatly-trimmed hedges of Cupressus Lawsoniana. The whole of this kitchen-garden is treated in an ornamental manner that is very pleasing, but one's curiosity is aroused as to how the gardener manages to obtain from the comparatively small area of land within the walls that is given to vegetables, the amount of produce required for the kitchen. We suspect the explanation would be in intensive cropping, allowing no waste and no fallow land. That no waste of fruit is permitted was clearly indicated by the method adopted to protect Strawberries and some other kinds from birds. Over the Strawberries a frame-work about 2 feet high was erected, and the top and sides were covered with small meshed wire-netting, a substantial and more effective means than merely throwing fish-nets over the plants. Instead of describing the vegetable crops in detail, which it may be remarked were generally praiseworthy, we would mention a flower-border in this same garden which was just looking very gay. In it were Gladiolus, Pentstemons, Gaillardias, and a few other species. We remember it so well because Mr. Miller remarked: "This is Kelway's border; are not the Gladiolus and Pentstemons fine? I always have a Kelway border." There were other features in this walled-in garden that might be referred to in more detail, such as the Gooseberries on trellises; the fine lot of Violets; two exceptionally fine specimens of the Golden Yew, &c., but the Peach-houses and vineries, and plant-houses were awaiting inspection.

Here we see what some people call the old-fashioned Peach-cases, similar, yet in detail different, to those at Trentham and other places. These at Combe are about 8 feet wide only, and the top is a span resting on a wall, with an upright front of glass. They are probably 18 feet high. Here were trees of the variety Padley's Seedling (Padley's Early Purple) = Grosse Mignonne, *vide Hogg's Manual*, for which Mr. Miller had more than one good word. It was sent out by Osborns' from their nursery at Fulham more than thirty years ago. In training his Peach-trees, whether inside or out, Mr. Miller secures perfectly straight sticks in the positions the young shoots are to take, and as during the summer the shoots extend, they are secured to these sticks, which is sufficient to make certain their being trained straightly.

The methods of Vine culture practised at Combe have been more than once described in these pages by Mr. Miller himself, and years ago he propagated Vines by layering the canes in place of the orthodox system of striking the eyes. On the present occasion, therefore, though we noticed the bricks upon the borders, which, says Mr. Miller, keep the surface moist, and so encourage the roots thereto, and other characteristic features in their culture, all of which have been explained in these columns; the reader will excuse us from writing at the moment more fully upon the subject.

At the back of one of the vineries was a fine plant of the true *Passiflora edulis*, bearing a heavy crop of fruits, there being something like 650 of them.

THE FRONT FLOWER-GARDEN.

There needs still to be remarked upon a feature in these gardens that has been added only two or three years since. It is the new

FIG. 61.—COMBE ABBEY FROM THE PARK. (SEE P. 229.)

flower-garden immediately in front of the Abbey. One cannot wander through the gardens of Combe without being struck with the evidence of Mr. Miller's originality, as seen in his treatment of numerous circumstances that have arisen from time to time. He is by no means a copyist; and where he fails to strike out a line of his own, whether in the training of his trees, the clearing of the lake, or whatever it be, it is because he has been unable to think out some method better than that in use by his contemporaries. He has no desire to follow in his neighbour's footsteps, he would much rather

they follow him. This new parterre flower-garden was designed after the determination had been made to avoid if possible triangular and other symmetrical beds of the ordinary type.

Mr. Miller, with pencil and paper, soon developed an original design, and the same having been since reduced to practice, and to some little extent modified, the result is an exceptionally pleasing flower-garden, altogether dissimilar to any we have previously seen. It has most resemblance perhaps to the type at Eaton Hall, the Duke of Westminster's seat,

FIG. 62.—THE GARDENER'S COTTAGE, COMBE ABBEY. (SEE P. 229.)

which flower-garden was illustrated in the *Gardeners' Chronicle*, Jan. 7, 1871. At Eaton, however, the beds represent two instances of a capital W, while the one at Combe portrays an idealistic tree growing from an ornamental vase, nearest the house, and spreading in fanciful curves over the space the garden covers, some of the branches terminating in little beds, similar in form to the Shamrock leaf; and others resemble the flower-head of a Thistle. The vase and its ornamentation is planted in semi-carpet-bedding style, and the branches of the trees are like so much tracery, the beds being only from $\frac{3}{4}$ of a foot to about $1\frac{1}{2}$ feet in width. The planting of such beds can only suitably be done with neat-habited plants, and Pelargoniums and other showy species were most effective. By the sides of this tracery there are two long beds in which a very bright display was made by certain hardy perennial

example of one of the old school, who acquired their professional training in the days of Fleming of Trentham, Paxton, and others, he is also one that has not been slow to accept new ideas and adopt new methods of practice. Nevertheless, if there be anything in the foregoing lines that would suggest the contrary, it may be safely asserted, Mr. Miller has a proper appreciation of the formal style of gardening. This may be easily detected in his treatment of the kitchen-garden, in the trimmed stone-wall-like hedges, and other features. Had circumstances required it, he would have formed and maintained a garden of the above description, and the work would have been agreeable to him. Mr. Miller never did lack energy, nor does he now. When able to obtain leisure from the work of superintending the gardens and woods, and doing a large amount of the work that belongs to an estate office, he may be found

Six fine specimens, each bearing about a dozen handsome flowers, with dark claret-purple sepals and petals, and a bright rose-coloured lip veined with crimson, are in flower in the fine collection of Edgar Cohen, Esq., Hall Road, St. John's Wood (gr., Mr. A. Vass), and a very pretty group they make, arranged with some good examples of *Odontoglossum grande*, above which rise the graceful sprays of white and rose coloured flowers of *Oncidium incurvum*.

The varieties of *Cattleya Loddigesii* are also here very effective, and a large number of fine specimens of *C. labiata autumnalis*, and a smaller number of *C. aurea*, promise flowers later in the season.

PICKING, GRADING, AND PACKING APPLES.

APPLES are already appearing in the markets in quantity, and the all-important question comes in as to picking, grading, and packing. It is equally true in this country, as in Canada, that there is still room to learn something of this trade, as to how to handle and when to handle this wonderful commercial product—the Apple. Mr. L. Woolverton, of Grimsby, Ontario, in writing recently upon this subject, says, there is no question that the fruit industry is one of the most important industries in that province. So rapidly has it developed in some sections of late, that the income so derived far exceeds that from any other part of the farm. All this is in spite of the many disadvantages under which fruit-growers often labour.

The first means, he says, of aiding in the development of the Apple industry is by imparting information concerning profitable varieties. Many orchards are full of worthless varieties, fit only for cider. The trees occupy the same space as good varieties, and they cost as much to cultivate and prune; the fruit costs as much to harvest and market, besides glutting the markets and giving growers a bad reputation, while the margin of profit, if any, is the lowest possible. What do we hear constantly from fruit salesmen? "Good sound winter Apples wanted; no sale for inferior trash." There are two questions which have to be studied: (1), the varieties most wanted for the market, and (2), the places where each variety will succeed. Trees that bear small Apples should either be cultivated and manured until they produce large fruit, or else top-grafted with large fine varieties that would pay for handling.

Of course, it goes without saying that the fruit-grower who wishes to make a name for himself must have every Apple picked and handled like eggs, and not like Potatoes, for every tiny bruise tends to make the fruit of second grade.

The next important steps in helping to develop the fruit industry are proper methods of grading and packing.

There is a common notion that Apples should lie sweating in heaps for some days before packing, but this is a mistake, for in this way they are made to ripen too fast. They should be packed as soon as picked, and hurried away at once to some cold store-house if the best results are to be expected, so that their crispness may be retained.

Mr. Woolverton's plan is to take his packing-table out to the orchard, and on it the pickers empty their baskets as the fruit is gathered, and the Apples are at once packed and carted away. In this way, one man, with a little assistance, will sort and pack for five or six pickers, and several gangs may be sent out if necessary. The ordinary first-grade fruit should go into barrels, and fancy Apples into smaller packages. This fancy stock is picked off the packing-table and sent to the packing-house, where women are employed to wrap the fruits in thin Manila-paper, and pack for a special trade. Now, if this class of Apples could be stored in cold-storage warehouses safely, and sent to market just when each variety is most wanted, at the best prices, a great step would be taken toward developing the Apple industry.

Really the most deplorable ignorance exists in this work of grading Apples, or else the utmost carelessness. Ideal packing is scarcely thought of. Growers need to take some lessons from our Californian

FIG. 63.—CHIEF ENTRANCE TO THE KITCHEN-GARDEN, COMBE ABBEY. (SEE P. 229.)

and summer bedding plants, disposed in a mixed pincushion system, thus affording a feature in the same view, of entirely different style. We would suggest that a visit to Combe would be of interest to many a gardener, if only from a study of this flower garden.

In the pleasure-grounds may be noticed many a fine tree, and some good specimens of coniferous species. Of Cupresses *Lawsoniana* there are hundreds of instances, and it is used to form capital hedges. *Taxodium distichum*, the Deodar Cedar, the Scots Fir, *Abies Pinsapo*, *A. Douglasii*, *Picea Nordmanniana*, and others succeed well. There is a *Wellingtonia* avenue and, singularly enough, the trees fully exposed to the east are the most vigorous.

Mr. Miller has lived at Combe many years. He can look up to Poplars over 60 feet in height, and remember planting the same. He may not remain very much longer, but he has already seen the effect of his early work—an experience denied to most gardeners. Though a good

studying British plants, especially those species that grow in and about the beautiful lake. His library, which contains an excellent copy in five volumes of *Curtis's Flora Londinensis* published in 1777, and other valuable books, affords him the means of following his study with success, and is an increasing source of interest and pleasure. *R. H. Pearson.*

ORCHID NOTES AND GLEANINGS.

MILTONIA SPECTABILIS MORELIANA.

SINCE the introduction of this distinct and richly-coloured variety, fifty years ago, there appears to have been no large importation of it at any one time until recently, when a fairly large quantity of plants of the true variety was imported by Messrs. F. Sander & Co. Buyers of this importation did not expect all the plants to be the true *M. s. Moreliana*, and they were doubtless agreeably surprised when the plants flowered.

friends, with whom packing is a business, and who do not hesitate to pay packing companies a certain price per package for grading and wrapping their fruit ready for distant shipment. Large and small Apples should never go in the same package. We wish to emphasise the fact, that if the fruit-grower would be successful in the preservation of perishable fruits, he must begin to put them into cold storage before the first stage of ripening begins. The process of ripening, the process of maturing, is in reality a process of decay; and although at the beginning it may not be recognised as such, it goes on gradually step by step from the time the Apple is green till the time it is in a perfect state of maturity, and later on when it is past that step and has begun to decay. So that it is absolutely necessary that the grower should recognise this fact and this principle, and in storing fruit put it in a storage-room before any actions consequent upon the beginnings of ferment commence. *J. J. Willis, Harpenden.*

PLANT NOTES.

INULA HOOKERI.

TWENTY-FIVE years ago I cultivated *Inula glandulosa*, when it was by no means common in gardens. It used to make a few very large flowers, on not very robust stems, 2 feet high, and many barren tufts, having a disposition to die out. Fifteen years ago I obtained—I forget where—a plant named *I. Hookeri*, growing 5 feet high, with very stout stalks, always monocephalous. The flowers resembled those of *I. glandulosa*, but the rays were shorter and straighter. The seed of this plant—I still have the original—is abundantly fertile; the seedlings are of various height, generally 4 to 5 feet, and the flowers very large and handsome, generally with long rays. I sent flowers selected from three varieties, all seedlings of the same plant, to the highest botanical authority, and had them returned respectively *I. glandulosa*, *I. grandiflora*, and *I. Hookeri*. I concluded that *I. glandulosa* and *I. Hookeri* had amalgamated into a mixed lot in the seedlings; but *I. grandiflora* I never had in my garden. I may add that I have carefully, but without any conclusive result, compared my plants with the characters of the three named species, as given in De Candolle's *Prodromus*, Boissier's *Flora Orientalis*, and Hooker's *Flora of British India*. As for *I. grandiflora*, five years ago an *Inula* was sent to me as *I. Oculus Christi*, which puzzled me, and I sent it to Kew and to Geneva, to the Boissier Herbarium, for a name, and it was returned from both as *I. grandiflora* (Willd.). This surprised me, as it is of slender growth, hardly more than one foot high, and the flowers are scarce half the size of those of *I. glandulosa*; though, according to E. Boissier, *Flora Orientalis*, vol. iii., p. 187, *I. grandiflora* ought to have the larger flowers of the two. All these *Inulas*, as grown in my garden, have glands on the edges of the leaves, and are strictly monocephalous, though *I. Hookeri* is described as having one to three flowers on a stalk. I do not know where to get further help in the identification of these doubtful plants. *C. Wolley Dod, Edge Hall, Malpas.*

ARCHED CORDON PEARS.

THE practice of growing cordon Pear-trees over garden walks, secured to iron arches, is not at all uncommon. On the other hand, it is not at all common. It is yet a very pleasing way of growing these trees, and as a rule they fruit very well. I have not anywhere seen a better example of this form of training than is to be found in the gardens of Sandhurst Lodge, near Wellington College. This is the residence of Sir William Farrar, who is as enthusiastic an amateur horticulturist as his gardener, Mr. Townshend, is one professionally. The garden-walks where planted with Pears in this way, roughly form three sides of a quadrangle, and the entire length is probably 150 yards, the width across from row to row is about 7 feet, and the trees are on either side planted 4 feet apart; not in all, but in most

cases, the same variety has been planted opposite. That is a rule which should always prevail, as the arch is so much more evenly furnished. Some of the varieties are on the Pear stock; some on the Quince. The latter, even in the sandy soil of the garden, seems to give rather the better results. Free growing varieties give the best appearances and crops. In almost every case the trees have sometimes met overhead, and the arch is then completely furnished. Many of the trees are heavily cropped, and all are very clean. The vistas furnished by the long bower of trees in fruit is very pleasing. Pears on walls, too, are first-rate here, and cropping heavily. Pitmaston Duchess, grafted years ago on Jargonelle, is fruiting grandly above, but branches of the original tree have not a fruit on them. *A. D.*

ROUND MAIDSTONE.

PRESTON HALL.—At this fine place, belonging to Mr. H. L. C. Brassey, we found the garden to be still under the capable charge of Mr. Walter Jarman, who, when five years ago we last visited Preston, had been there rather less than two years. In the time that has elapsed much improvement has been effected, particularly in the indoor fruit-department. We well remember some rare old Vines that, though still affording a certain amount of fruit, were practically of little future service. In their place now may be seen nice young Vines of strong growth, bearing excellent crops of Grapes. This kind of work needs to be done in instalments, however, if an average yield of fruit is to be maintained, and a few of the less aged Vines have not been as yet rooted out. In these cases however it was observed that fresh canes had been laid in, and when these had become large enough, the older ones were removed. The roots are the same, but in the obtaining of a new top-growth to a partially exhausted Vine, a benefit follows that all save those who have experienced it would think improbable. The vineries generally were such as a gardener may show a visitor with satisfaction, and the finish and flavour in the handsome black Grape Madresfield Court, and in the Alexandria Muscats was capital.

Anywhere other than the Maidstone district, Preston would be considered an extraordinary place for Peaches. Even indoors the yield is very large. There are numerous houses devoted to them, one of the ranges being 150 feet long. The fruits had been gathered from most of the trees, but all of them bore indications of healthfulness and good fruiting qualities. One characteristic the trees had. They had not the large amount of small fruiting wood that in some districts is thought to be so essential. In place of that there are stronger shoots, and some of them grow several feet in length. A large number of Melons is grown, and we observed many fruits ripening. Mr. Jarman said that on the previous day the plants from one house had been thrown away. They had yielded sixty fruits which averaged 2½ lb. each. There is a nice fernery here, and a fig-house is covered with one fine plant of Brown Turkey. This tree grows up the back wall, and is trained down the lean-to roof-trellis, consequently it is in a most unnatural position, but the tree crops splendidly. In the greenhouse were some pretty Marguerite-Carnations, carrying a fine lot of lovely blooms. They were from seed sown in February, and for cutting purposes the flowers are as pretty and useful as the florists' Carnations. An unusual feature was remarked in the excellent specimen plants of Coleus in 8 and 10-inch pots, and several feet in circumference; and such plants are not now seen in many gardens.

The fruit outside was abundant. The Peach walls looked really beautiful, and most of the trees still bore quantities of splendid fruits, generally approaching ripeness. The yield of Peaches, of course, is far beyond the needs of the establishment, and thousands of them are sent to market. Of Apples and Pears, there are good crops of fruits this season; some varieties have more or less failed, others are better cropped than usual, but all out-of-door fruit-trees, alike with everything else, are suffering much from drought. Two pleasant features of the garden are the Pear-

tree arbour and the Rose arbour. The latter costs considerable labour to keep it in fine condition during such a season, but it is a valued feature, and in early summer the plants afford such a wealth of the loveliest blossoms, that whilst water can be procured, it is not grudged them. The Pear arbour is not so old—indeed, five years since we remember it to have been very imperfectly covered; but the trees have been encouraged to grow, and the arbour now presents a very nice appearance, the large fruits hanging beneath contributing greatly to this effect.

The view from the north front of the hall is just as lovely as when last we had the pleasure to see it. It carries you over part of the park to the village of Aylesford, where the pretty little church is an object of tender beauty, and beyond over typical Kentish scenery terminating in the circular range of hills, at the foot of which can be seen several chalk pits. But close to the hall the trees are higher; several of the Conifers have specially improved, and the garden is thus better furnished. In the parterre flower-garden, which is just below a terrace that screens the beds from view from the lower windows, the species of plants used show that an endeavour is made to use a class of beautiful plants that show the latest striking improvement wrought by the hybridist. We refer to the Cannas; and most of the curious scroll-like beds are filled with them. In some, the improved varieties sometimes described as *Gladolus*-flowered Cannas have been exclusively planted, and they were flowering freely and well. It needs hardly to be said that the effect of them is at once uncommon and grateful. But blending the old with the new, in several of the beds was remarked that prince of bedding *Pelargoniums*, *Henri Jacoby*, blooming with its well-known freedom, and producing an effect of showiness.

Two beds that flank a pleasure-ground path near to the hall are worthy of remark. The centre of each was planted sparsely with an *Aucuba japonica* about a foot high, and the interspaces with the variegated *Pelargonium Bijou*. The margins contained exceedingly dwarf plants of *Retinospora*, and each plant of same was surrounded with *Iresine Lindenii*. The effect of the whole was most satisfactory, and, said Mr. Jarman, when the bedding-plants are removed, the spaces betwixt the evergreens will be filled with bulbs.

We reproduced a photograph of Preston Hall, showing part of the front flower garden, in the *Gardeners' Chronicle*, August 26, 1893.

(To be continued.)

LOBELIA RIVOIREI.

ON the occasion of the meeting of the committees of the Royal Horticultural Society on September 6, amongst varieties of *Lobelia* shown from Sir Trevor Lawrence's garden by Mr. Bain was a pale pink-flowered form, having a median line of a crimson tint and a trace of the same tint in the eye (fig. 64, p. 233). The plant has the general habit of *L. cardinalis*, but the leaves and stem are of a green colour. It then received an Award of Merit. For the sake of variety, it is worthy of a place in the flower border.

MARKET GARDENING.

HARDY FRUITS.

(Continued from p. 193.)

BUT there are other things that must be given attention before one can reckon on marketing his fruit. Alas! just as the fruit is ready for gathering, it too frequently happens that a storm will thresh many of the Apples from the trees, and bruise and disfigure those that are left. In view of this, it is a good plan to plant a row or two of sheltering trees to protect your orchard where it is most exposed. Fruit-trees may be used for the purpose, the *Farleigh Damson* being especially suitable, as it forms a close-growing, twiggy tree, and if pruned judiciously the first year or two after planting, it not only makes a capital shelter, but bears fruit at an early age. I have it on very good authority that one grower in a scarce year

marketed no fewer than 3000 bushels of this fruit, and obtained an average price of 14s. a bushel for them.

In planting for shelter, use two rows of trees, and these may be placed 12 feet apart in the rows, every alternate row being in the spaces between the plants in the former one. It will not hurt these Damson-trees if they be planted close to, or even in a quickset or other hedge. If a screen is wanted in the quickest time possible, plant Black Italian Poplar, or the sort known in nurseries as "Nova Canadensis," which is not so strong in growth, but more twiggy, and it is not so easily injured by wind as the first named. There is always danger, however, that the long roots

dwarf or bush trees in plantations. Doubtless for large fruits, this is by far the better method, as the liability to be blown down is thus minimised, and what is of great import to those who have land upon short leases, or a small balance at their bankers, the return is much earlier, as bushes of Currants, Gooseberries, Raspberries, and Strawberries may be grown between the rows of trees, which will make a profitable return long before the Apple-trees begin to bear remunerative crops. Dwarf or bush trees, costing only two-thirds as much as standard trees, are recommended for small tenant-farmers and others who do not own their land.

growth, and thus failing to properly ripen, it remains sappy and unfruitful. Further, in the case of some tender sorts, the sap-laden cambium is frozen, and in thawing the cells are ruptured, and canker and other evils supervene. These remarks are very necessary in the case of Apples on the dwarfing or Paradise stock; and if the intending planter wishes quickly to take a crop from his plantation, let him plant Apples only so worked. On the other hand, if a good permanent orchard be desired, the Crab stock is the best, though it will delay the fruiting period.

Apples cultivated as dwarfs or bushes should be planted as they are received from the nursery, and the

FIG. 64.—LORELIA RIVOIREI. (SEE P. 232.)

from such trees will invade the good soil in the orchard, and rob the fruit-trees; so if practicable, plant the other side of your hedge, and have a dry ditch between to check the invader. No one, I fear, needs to be told that the weather has much to do with success in this industry, also the absence of insect pests which are, specially in some seasons, very difficult to combat.

Intending fruit-growers I would strongly advise to study the admirable book by Miss Eleanor Ormerod, *Injurious Insects* (London: Sonnenschein & Allen).

DWARF OR BUSH APPLE-TREES.

So much, therefore, for the Apple grown in orchards as standard trees; and now a few words on

They may, in the first instance, be planted 12 feet apart, and the intermediate land be cropped with soft fruits, &c., until the young trees require all the space, always bearing in mind not to cultivate too deeply, or too near the trees, as this not only disturbs them, but has a fatal tendency to drive the roots downward; whereas, to get the best quality and quantity of fruit, the roots should always be encouraged to keep near the surface of the soil, where they are naturally stimulated by the life-giving rays of the sun, and artificially by the addition of occasional mulchings of manure. But be judicious in the use of the latter, and if your soil be good and moderately deep, the less of stimulants you apply the better, as they are apt to force the trees into rank and coarse

next March the shoots will need heading back to three, four, or at most five buds. After this, all that is generally called for is to remove weakly and crossing branches with a sharp knife, with a view to forming an open or basin-shaped tree, unshaded at the top, and able to receive and appropriate all the sunshine possible, producing ripe, healthy wood—an essential condition of success. After this, the majority of trees, if left to themselves, will yield good crops of fine fruit, so large and handsome that during the first few years, if dessert kinds are grown, it may profitably be sold by the dozen, in punnets, or small open baskets. If he be inclined also, the grower may exhibit with a fair chance of success. It must, however, be noted here that the best-coloured

and handsomest fruits are grown on the Paradise stock, which no doubt is owing to the peculiarity of this stock to make masses of fine fibrous roots at the surface of the soil.

Grand exhibition examples of Apples, Pears, and hardy stone-fruits, are produced by what are called cordon-trees, from the French word *cordona*, a girdle; these may be single, or in two, three, or four tiers; but as they are "fancy" trees, and not commercially remunerative, I shall not further discuss them.

PYRAMIDAL APPLE-TREES.

It remains now only to name the Pyramidal Apple, but I have found even in gardens of note the management of this kind of tree is so little understood that I would advise those who do select this form not to prune excessively; and supposing you get two-year-old pyramids from the nursery, do not cut them at all till the following March, and then only head-back those shoots which spring from the centre bole to an outside eye or bud, and cut down the leader to a single bud. The following year another will come on the opposite side to the first, and thus ensures a tolerably straight centre to your tree. If the trees are on the right Paradise stock, and consist of fertile varieties (and I do not advise you to plant any others), after the third year let Nature have her own way. Yet varieties of Apples have many distinct habits, and there is no golden rule for their management. The cultivator must keep his eyes open and be docile, when Nature will assuredly reveal her secrets.

For pyramidal Apples in a plantation which is to be permanent, and the ground between the rows occupied by annual crops or Strawberries, let the stock be of the English or broad-leaved Paradise, on no account using the French stock, not that this is so bad as it is sometimes painted. I have heard fruit-dealers state gravely, and no doubt they believed it, that the cause of the dry, bad cooking quality of continental Apples was, "they were grafted on Willow!" The truth probably being that the stock used forces maturity. If, however, the soil be poor and thin, the trees may be worked on the ordinary Crab-stock, which, though it may not give a return so quickly as the first, has the merit of permanency; and if the trees on it are looked after and not allowed to grow up like Birch-brooms, so compact that no air or sun can penetrate their branches, the trees will become fertile and produce good fruit.

When manuring is necessary, put on a good mulching of farm-yard or stock-yard manure, and leave it on the winter through, digging or ploughing it in, in the following February. Should artificial manure be preferred, as being more easy of application, let such be rich in phosphates. My Kent friends use shoddy, or woollen rags, in their plantations with good effect. *Experience.*

MR. W. PFITZER'S GARDEN AT STUTTGART.

[See Supplementary Illustration].

MR. PFITZER'S garden, attached to his nursery at Militar, Strasse, with its little fountain, green lawns, a fine Willow, is like an oasis in a desert of bricks and mortar. The houses in Stuttgart generally have scarcely any front gardens, but are built close up to the pavement. The lack of trees and shrubs is somewhat counterbalanced by the beautiful hills and vineyards which surround the city on three sides, and which may be seen from the ends of nearly all the streets running from one side of the valley to the other.

The Willow-tree is a splendid specimen of *Salix babylonica* var. *Baron Solomon de Rothschild*, and has a history. It was brought as a cutting by Mr. W. Pfitzer, sen., the founder of the firm, and now a hale old gentleman, in the year 1850, from Boulogne, near Paris, from the garden of Baron Rothschild, where seeds had germinated on the banks of the Seine. It is a very vigorous and fine specimen, and it finds an abundance of moisture in the subsoil, but doubtless has been cut back to keep it in harmony with its surroundings. Unfortunately, however, a fungus

common to the genus *Salix* is attacking it, which, combined with the inevitable builder, who is particularly busy in the neighbourhood, will sooner or later doom the tree and its surroundings to oblivion.

Mr. Pfitzer's house and offices, almost hidden in the photograph by the Willow, are covered with *Aristolochia Sipho*, and at the front with *Wistaria sinensis*, &c., always a sight when in flower, as well as a fine *Reine Marie Henriette*, the red *Gloire de Dijon* Rose. The house in Moorish style to the right of the picture is the dwelling-house of Mr. Pfitzer's assistants. The roof of this building, which is flat, is gravelled, and decorated with fine specimens of *Chamærops excelsa*, pyramids and standards of Sweet Bay, bushes of *Punica Granatum* in tubs during the summer, &c., whilst along the railings Ivy-leaved *Pelargoniums*, *Nasturtiums*, and other summer flowers are planted in boxes.

In the garden itself, besides Sweet Bays, *Dracænas*, *Latantias*, *Chamærops*, *Conifers*, &c., are planted out in small groups, with such specialties of the firm suitable for this kind of work, as *Pelargonium semperflorens*, and tuberous *Begonias*, *Heliotropes*, or other older or newer plants, which it is particularly wished to display, such as the group of *Nicotiana colossea* variegata and *Arundo Donax* fol. variegata, as well as the *Ægopodium Podagraia* fol. variegata, round the fountain. The whole is finished off on this side with *Musa Ensete* and *Colocasia nymphaeifolium*, as well as *Cannas* and *Ceanothus*. These beds are planted several times each season, so that there is in them always something interesting and beautiful. The greenhouses, and the *Canna*, *Begonia*, *Tritoma*, *Phlox*, and *Aster* fields stretch away to the right of the picture, gradually leading up to the hills seen in distance. Our photograph was taken by Mr. Alfred Hirrlinger, Gartenstrasse, 9, Stuttgart. *H. R. W., Stuttgart.*

TREES AND SHRUBS.

ABELIAS.

THIS small genus of low growing shrubs should not be overlooked by planters, all the species included in it being ornamental in flower, leaf and habit, and therefore deserving of a place in the garden. Two come from China, one each from Mexico, Japan, and India. Although hardy in the south and west of England, they are better adapted in the north for greenhouse culture. The plants thrive in a sandy loam or peat; and they are propagated readily by means of cuttings taken in the summer, or by layering the shoots in the early spring, which, when done out of doors, should be protected in severe weather by means of handlights or cold frames. The plants possess deliciously fragrant flowers, and several of the species produce them in the autumn, when few other shrubs are to be found in flower.

Abelia floribunda and *A. rupestris* are the most deserving of cultivation. The first named is free flowering, the flowers of a rosy-purple colour; five-lobed, tubular, and about 1½ to 2 inches in length. They are produced in the axils of the leaves at the end of the branches, and appear in March. The leaves are dark-green, ovate, crenate, and smooth on the upper surface. It is a handsome, free branching evergreen shrub, with a rather straggling habit, and grows 3 feet in height. It is a native of Mexico, and was introduced in 1842. A figure is found in the *Bot. Mag.*, t. 4816.

Some fine plants of *A. rupestris* are now flowering freely at Woking. The flowers, pinkish-white, are produced in pairs at the ends of the branches. Their fragrance is similar to that of the common Jasmine. The plant is deciduous, and grows to a height of about 5 feet; the leaves are of a deep green colour, small and in shape oblong. It is from the Chamoo Hills in China, whence it was introduced in 1844. A description appears in *Bot. Reg.* of 1846, t. 8.

A fine garden form, called *A. rupestris grandiflora*, is sometimes met with, which has larger and finer flowers than the type. *A. spathulata* is a Japanese form, which I have never seen in flower. The flowers are white and fragrant, and the leaves bear a resemblance to *A. rupestris* in shape, and are of a deep-green colour. It was introduced from Japan in 1881, and is described in *Bot. Mag.*, t. 6601.

A. serrata is a very distinct evergreen species, with

large, red, fragrant flowers, that are produced in March on single terminal stalks. The leaves are deep green, and deeply serrated on the margins. The plant grows to a height of 2 feet, and is much branched. It was introduced from China in 1844, and is occasionally met with under the name of *A. uniflora*, and is described as such in *Bot. Mag.*, t. 4694.

A. triflora, a species that is rarely seen in gardens, is probably the least known. The flowers are of a pale yellow colour, tinged with red, and they are borne in triplets at the ends of the branches, and though small in size, they are produced in great profusion during the month of September. Its small, green leaves are lanceolate in shape. It is an evergreen shrub, with a much-branched habit, growing about 5 feet in height. It was introduced from India about 1847. So far as I can judge from small plants, it has proved as hardy as any of the species. A description appeared in *Paxton's Flower Garden*, p. 8 (1851-3). *E. S., Woking.*

THE WEEK'S WORK.

THE FLOWER GARDEN.

By H. WALTERS, Gardener to Lord GERARD, Eastwell Park, Ashford.

Auriculas and Polyanthus.—The stock of these may be increased by dividing the plants at once. The plants should be lifted and pulled to pieces by hand, but do not divide them to a greater extent than necessary to provide the number of plants required. Plant them afterwards in soil that has been well dug, and that has been enriched by a dressing of well-rotted manure. Should the staple soil be of a retentive nature, some leaf-mould may be worked into it at the time of digging. When planting, take care to make the soil firm around each plant. Beyond keeping them free from weeds, the plants will need no further attention for some time.

Montbretias.—With the exception of Lilies, *Montbretias* are the most useful of late summer-flowering bulbous plants. The graceful spikes of bloom are most adaptable for use as cut flowers, and they last a considerable time in water. They succeed best in a light, sandy soil, and in a sunny position. The best time to plant is during March or April. The bulbs increase very rapidly in a favourable situation. The most choice varieties are *M. crocosmæflora*, the flowers of which are golden-orange in colour, and *M. solfatare*, pale yellow, with brownish foliage.

Ligustrum marginatum aureum (the Golden Privet).—There are but few hardy evergreen shrubs that can equal the Golden Privet in the striking effect it produces when judiciously planted. When planted in clumps by the side of a lake, or as a front row to shrubberies, it is very effective. The plant is a rapid grower, and makes an exceedingly pretty hedge, kept nicely trimmed.

The Rose-garden.—The recent spell of very hot weather experienced has had a very marked effect on the second, or autumn flowers. Rarely do the plants at this season of the year suffer from drought as at present, and the blooms are consequently poor. In very light soils it will be judicious to give the plants a good watering, not only to keep them in health, but to assist the development of any flower-buds, particularly those of the Tea varieties. The varieties, however, seem to have withstood the drought here much better than the Hybrid Perpetuals, and especially *Madame Van Houtte*, which has grown and given better flowers than at any time during the season. The blooms of *Viscountess Folkestone*, usually one of the best of Hybrid Teas for autumn flowering, have been literally bleached white, and have not the delicate flesh-shade that makes the variety so desirable.

FRUITS UNDER GLASS.

By G. NORMAN, Gardener to the Marquess of SALISBURY, Hatfield House, Herts.

Melons.—The latest plants upon which the fruits are now swelling, as the sun declines in power, will require more artificial warmth in proportion as the sun decreases in power. Maintain a temperature of about 70° by night and 75° by day, allowing a rise of 10° to 15° by sun-heat. It is necessary to obtain a sweet atmosphere in the house by ventilation, but this should be done gradually in the forenoon, and after reducing the same by degrees, the house should be closed early in the afternoon. Syringe the plants once on fine days, preferably in the morning, and cease syringing altogether when the fruits com-

mence to colour. To maintain a genial atmosphere during dull weather, the floors and other bare surfaces of the house may be damped. Supply water to the roots as often as the plants need it, and reduce the quantity given as the fruits commence to ripen. Pinch off laterals as often as may be required, and take care that the support used for the fruits, whether nets or bast, does not press the fruits too tightly. The two indications of ripeness, viz., fragrance and a cracking of the stem from the fruit, should be observed before cutting the fruits. It is best at this season to defer cutting a day or two than to cut too soon. Melons in frames, on hot beds, should be kept moderately dry, and the atmosphere also, and the fruits should rest upon pieces of tile, or on slates, and above the foliage. Afford a little air only during the earlier part of the day, and if the weather should become cold, cover the glass at night with mats.

Cucumbers.—Plants that have been bearing a considerable time may be given another thin top-dressing of the same kind of light, turfy soil as that recommended in a previous calendar, viz., three-parts loam to one-part old Mushroom-bed manure. Thin out the old bine, and stop and tie-in the young shoots. Give the roots liberal supplies of tepid water when necessary, and occasionally substitute liquid-manure. Syringe twice on fine days for the present. Cucumbers are heat-loving plants, and when the weather is cold and sunless, fire-heat must be used to maintain the temperature at 70° by night and 75° by day. Afford a little ventilation at the top of the house when the temperature is above 80°, and close early in the afternoon. If the temperature subsequently rises a few degrees higher than 80° no harm will ensue. Cucumbers planted last month, that are now growing freely, must be given frequent attention. Train the leading shoot up the trellis, and if a sufficient number of side-shoots appear from the main stem to furnish each wire, about 10 inches apart, at right-angles to the stem, the leading shoot need not be stopped until it reaches the top; but, if necessary, the main stem must be stopped, in order to obtain side-shoots. Secure a side-shoot to each wire, and stop after the third joint. Thin out surplus shoots, and only lightly crop the plants, as they will not need to fruit until December. Afford fresh soil to the roots, and freely extend the area covered by the mounds, but the depth should not be increased more than one inch at a time. If it is intended to plant for winter-bearing, the work must be done without further delay; for if the plants have not time to become established before the winter, they will not produce fruits.

THE ORCHID HOUSES.

By W. H. WHITE, Orchid Grower to Sir Trevor Lawrence, Bart., Burford, Dorset.

Sobralias.—All of the *Sobralias* succeed well in a Cattleya-house or other structure in which is kept an intermediate temperature. Though remarkable for the size and colour of their individual blooms, these Orchids are less popular than they would be did the flowers last a longer period. Where a fully representative collection is grown, however, there will be some of the plants in bloom during the greater part of the year. From the beginning of April to the present time, the following species and hybrids have here maintained a continuous supply of flowers: *S. macrantha*, *S. m. alba* (Kienastiana), *S. m. splendens*, *S. xantholeuca*, *S. leucoxantha*, *S. Veitchii* ×, *S. Princess May*, *S. Lucasiana*, *S. Lindeni*, *S. virginialis*, *S. liliastrium*, *S. albo-violaceum*, *S. Sanderae* ×, and *S. Warszewiczii*. *Sobralias* are very free-flowering plants, and when in vigorous health almost every fully-developed shoot of the preceding year's growth will bloom, producing in succession from three to six flowers; so that a good specimen-plant remains in bloom for a very long time. The plants require considerable pot-room, and those that are suffering for lack of root-space may be repotted as soon as the flowers have faded. Provide them with good drainage, and pot firmly with lumps of fibrous-peat and rough yellow loam, adding a moderate quantity of clean crocks and coarse silver-sand. It is not necessary to raise the plant above the rim of the pot, but when pressing the compost down, leave about half-an-inch of space below the rim, so that water may be easily afforded. It is, as yet, too soon to remove the old flowering-growths, but as each plant becomes thoroughly established they may be cut down to their base. Afterwards tie the newer growths out at a considerable angle from the centre of the pot, so as to give the young shoots plenty of space and light. Plants that do not need to be re-

potted may be top-dressed when the young growths are about 2 to 2½ feet in height.

Oncidiums.—Some of the plants of *O. Krameri* and *O. Papilio* are now in bloom, and will continue for a considerable period to produce fresh flowers from each stem. It is not advisable to prolong their flowering season unduly, or the plants will become weak, and possibly they will dwindle away; remove each spike, therefore, when it has produced three or four flowers. These beautiful *Oncidiums* prefer a light position, and should be suspended from the roof-glass of the Cattleya-house during the summer months; but in winter, the East Indian-house is the most suitable place for them. Both varieties may be grown in basket or pan, and require but a very small quantity of material in which to root.

Epidendrums.—The tall-growing *Epidendrums*, as *E. elongatum*, *E. O'Brienianum* ×, *E. radicans*, *E. arachnoglossum*, *E. crassifolium*, *E. evectum*, *E. Wallisii*, *E. xanthinum*, and *E. Schomburgkii* are growing freely, and will require plenty of root-moisture. Examine the points of the young shoots for scale and mealy-bug. *E. sceptrum* being now in bloom, it should be afforded water very carefully. All the above varieties require a light position in the intermediate-house; while the following tall-growing species, *E. syringothyrus*, *E. myrianthum*, *E. Cooperianum*, and *E. Frederici Guillemi* thrive best in the cool-house, but they require more light than the *Odontoglossums*.

The Cool-house.—Among plants in bloom in the cool-house, *Zygopetalum maxillare* is a very handsome species. This is one of the few Orchids which thrive best upon pieces of Tree-Fern, upon which it is nearly always imported. Dryness at the root at any period is fatal to the plants, and an abundance of water should be poured through the root mass almost every day during hot weather. *Angraecum falcatum* is also flowering in this house; it should be grown in shallow baskets containing but a very thin layer of sphagnum-moss. The intermediate-house is the best place for it during the winter months.

THE KITCHEN GARDEN.

By J. W. McHATTIE, Gardener to the Duke of Wellington, Strathfieldsaye, Hants.

Lifting the Potato Crop.—The lifting all crops of ripe Potatoes may be proceeded with in dry weather. Having pulled up the tops, turn out the tubers with a digging-fork carefully, not bruising them, spreading them out thinly to dry for a few hours, and gathering them into the Potato-cellar or other store before night-fall. Failing a storing-place, pits may be dug in the soil 1 foot deep, and 4 feet wide, and the tubers placed therein in the form of a ridge, not higher than 2 feet to the apex, covering the heap with bracken or straw, and moulding it over just thickly enough at the first to keep out rain. More can be added when the weather gets cold. In a cellar or store the tubers may be laid about 6 inches deep, and securely screened from the light by some means. Potato-sets should be selected when lifting a crop, and put aside in a frost-proof shed or cellar.

Asparagus-beds.—Asparagus which it is intended to lift and force in pits and frames should now receive a copious application of water, but before affording it, let the beds be hand-weeded, and the alleys hoed and raked. The other beds may receive a slight dressing of salt or nitrate of soda when rain seems imminent.

Winter Spinach.—The drought in some parts of the country has had a bad effect on the last sowings of Spinach, and it will help the plants that have come up, and the germination of seed still in the soil, if a heavy application of water be made forthwith. Keep the beds and lines stirred with a Dutch-hoe, killing weeds, and aerating the soil. The thinning of the plants may proceed as may be found necessary, allowing 7 to 8 inches space, according to variety, from plant to plant. The large-leaved varieties, as *Monstrous de Viroflay*, and *Large Prickly*, which are usually sown for winter supply, covering a good space of ground with their leaves.

Compost Heaps.—The various kinds of composts needed in the kitchen garden should be turned over again, mixing the various ingredients together, and throwing the whole into conical heaps, putting a big label marked with the use it is to be put to with each. Heaps thus prepared are at all times better than when used fresh. This holds good of all kinds of waste materials used as manure, and if such can be afforded copious applications of manure-water, they will be rendered better fertilisers. Heaps of fermenting dung, &c., should be slightly moulded

over, so as to retain the ammonia as much as possible, and if the heaps cannot be sheltered from the rain, a pit should be dug and puddled, or a big tub sunk in the ground near by, into which the drainage may run, it being the more valuable part of the manure, and that which is too often allowed to run to waste. Loam and turf should be carted in, placing it in stack to heat and partially decay before making use of it for any purpose.

PLANTS UNDER GLASS.

By W. MESSENGER, Gardener to H. C. BERNERS, Esq., Woolverstone Park, Ipswich.

Winter-Flowering Begonias.—As the plants are now actively making growth, a little weak stimulant may be given them. Plants which have been in cool frames during the summer should now be placed in a warmer atmosphere. The earliest plants of *B. Gloire de Lorraine* are here showing flower freely, and may be transferred to the greenhouse or conservatory. If extra early flowering batches of this charming variety be required for next season, it will be advisable to cut down a few plants in about a fortnight's time, and they will then produce an early supply of cuttings for the purpose. Do not in any degree crowd the plants, as most of the varieties have highly ornamental foliage, and it is necessary they should be given plenty of room to develop. A slight degree of shade should be afforded the plants during bright sunshine, and if the air continues warm plenty of ventilation may still be given during the day.

Sericographis Ghiesbreghtiana.—A slight top-dressing of good loam with a little Clay's Fertiliser added, will materially benefit these plants. If such a dressing be given them, no further stimulant will be needed for a week or ten days afterwards. Do not permit the plants to become infested with mealy-bug. If any be observed, use a weak solution of paraffin emulsion, and if carefully applied, it will destroy the pest. Use the syringe freely to spray the plants overhead, and maintain a moist warm temperature.

Thysanacanthus rutilans.—Plants may be treated in a similar manner to the *Sericographis*. Afford them all the light possible, and endeavour to produce a strong sturdy growth.

Pelargoniums.—Plants that were cut-back recently, and which have since made growths of an inch or more in length, may be shaken from out of the pots, at the same time removing all the loose soil from the roots. The plants may then be put into pots of a smaller size, using a compost of loam, leaf-mould, and sand, with a sprinkling of bone-meal. Pot the plants firmly, and after the first soaking of water little will be needed until growth has again become active. The plants should be put into a pit or frame, and the atmosphere kept rather close for a few days. Should the plants flag, a little shade may now be afforded them; but when they have recovered from the check, ventilate the frames as freely as practicable, and without creating injurious draughts.

HARDY FRUIT GARDEN.

By W. H. DIVERS, Gardener to the Duke of Rutland, Belvoir Castle, Grantham.

Tomatos.—Now that the hours of sunlight are shorter, the gardener should make use of every ray of sunshine in order to get the fruit ripened, all new growth being removed as fast as it appears, and the remaining fruits exposed as much as possible, but the large leaves retained, as these assist to elaborate the sap, without which the fruit would swell but imperfectly; although where they shade the fruits, it is well to fasten them aside, out of the way. After this date, frosts may occur at night, and a quantity of covering material should be held in readiness to put over the Tomato plants, for they are very tender, and if the fruit gets frozen it becomes worthless. When actual cold weather sets in, the fruit makes no more progress, and it is prudent to cut it off singly, and ripen it in a warm, dry room or vinery. The flavour of such fruits is not so good as that of those which ripen naturally on the plant, but it is useful in the kitchen, when no convenience exists for growing Tomatos under glass. All small fruits, whether green or ripe, may be used for pickling when the plants are cleared of the fruits, as it is only necessary to put them into cold vinegar, with two or three ripe Capsicums, and in a short space of time they will be fit for consumption. When the fruits are all gathered, clear away and burn the plants as soon as possible, thus destroying all spores of fungus and insect-pests, this being especially necessary where the plants have been infested with the white midge, as this always leaves an abundant stock of eggs to perpetuate the race.

EDITORIAL NOTICES.

ADVERTISEMENTS should be sent to the PUBLISHER.

Letters for Publication, as well as specimens and plants for naming, should be addressed to the EDITOR, 41, Wellington Street, Covent Garden, London. Communications should be WRITTEN ON ONE SIDE ONLY OF THE PAPER, sent as early in the week as possible, and duly signed by the writer. If desired, the signature will not be printed, but kept as a guarantee of good faith. The Editor does not undertake to pay for any contributions, or to return unused communications or illustrations, unless by special arrangement.

Illustrations.—The Editor will thankfully receive and select photographs or drawings, suitable for reproduction, of gardens, or of remarkable plants, flowers, trees, &c.; but he cannot be responsible for loss or injury.

Local News.—Correspondents will greatly oblige by sending to the Editor early intelligence of local events likely to be of interest to our readers, or of any matters which it is desirable to bring under the notice of horticulturists.

Newspapers.—Correspondents sending newspapers should be careful to mark the paragraphs they wish the Editor to see.

APPOINTMENTS FOR THE ENSUING WEEK.

MONDAY, SEPT. 26 { National Chrysanthemum Society's
Floral and General Committee
Meeting.

THURSDAY, SEPT. 29 { Royal Horticultural Society's Show
of British-grown Fruit, at the
Crystal Palace (3 days).

SALES.

MONDAY, SEPT. 26 { Dutch Bulbs, at Protheroe &
Morris' Rooms.

TUESDAY, SEPT. 27 { Dutch Bulbs, at Protheroe &
Morris' Rooms.

WEDNESDAY, SEPT. 28 { Dutch Bulbs, at Protheroe &
Morris' Rooms.

THURSDAY, SEPT. 29 { Dutch Bulbs, at Protheroe &
Morris' Rooms.

FRIDAY, SEPT. 30 { Dutch Bulbs, and Imported and
Established Orchids, at Protheroe
& Morris' Rooms.

AVERAGE TEMPERATURE for the ensuing week, deduced from Observations of Forty-three Years, at Chiswick.—55°4°.

ACTUAL TEMPERATURES:—

LONDON.—September 21 (6 P.M.): Max., 74°; Min., 54°.

PROVINCES.—September 21 (6 P.M.): Max., 66°, South
Counties; Min., 48°, Shetland.

Fine, dry, absence of rain.

Protection and Shelter. In a recent article we alluded to the question of shelter as a dominant factor in securing the symmetrical growth of trees and in the production of sound timber. A very different picture presents itself on the slopes of the Riffel, and, of course, on hundreds and thousands of similar situations in the mountain districts of Switzerland and elsewhere. The Riffelberg, with its continuation, the Gorner Grat, rises some 10,000 feet above sea-level. In olden times the measurements of mountains and the delimitation of zones of vegetation were made in metres or in feet. Now-a-days the measurements may be made by computing the distance between hotel and hotel!

Thus, starting from the Valley of Zermatt, crowded with hotels, we pass through pastures till we reach the forest, the topmost limits of which (in this particular district) are marked by the Riffel Alp Hotel. Above the forest comes a belt destitute of trees, but rich in alpine plants, mostly out of bloom at

the time of our visit. This zone is roughly marked at its upward limit by the Riffelberg Hotel at an altitude of 8,430 ft. Comparatively few alpine plants grow above this level, though some few reach nearly to the top of the Gorner Grat, the height of which is given as 10,290 feet. The Gorner Grat is surmounted by an hotel, whence a most imposing view of the great mountains which separate Switzerland from Italy is spread out before the awe-struck spectator. Noble as these mountains are, we do not intend to dilate upon their majesty and grandeur, but propose to confine our remarks to the forest belt between the upper level of the lowland pastures, and the lower level of the alpine plant region.

An electric railway just opened conveys the visitor slowly by bold sweeps from the valley through the forest to the top, but although many a glimpse is obtained from the carriage windows, yet to gain a good idea of the forest vegetation it is necessary to traverse the woods repeatedly in various directions on foot. This we have recently had the opportunity of doing, and deeply has the contrast between the sheltered vegetation of Lausanne already alluded to, and that of the mountain side been engraven on our recollection. Let us say that the trees consist mainly of the sweetly-smelling Cembra Pines intermixed with Larch. The undergrowth, the value of which we shall have occasion to refer to later on, consists of *Juniperus nana*, *J. Sabina*, *Rhododendron ferrugineum*, and *Vaccinium myrtillus*. The Pines are mostly large trees of considerable age, and their appearance testifies to the intensity of the struggle to maintain their very existence in which they are engaged. When allowed to grow naturally, the Cembra Pines are bushy-headed trees, very different in aspect from that generally associated with coniferous trees. Apart from external influences they are very variable in habit, often producing giant limbs, which at first run horizontally or with a downward curvature, and then rise parallel in direction to, and not much smaller in dimensions than, the main trunk. The purple cones are placed mostly on the topmost boughs, but this year they are very scarce, which sets us wondering what the squirrels will do for food. Now and then we may pick up a cone from which the seeds have been dextrously removed by a squirrel, but this year, as we have said, there are in this district very few cones for those clever operators to manipulate. While fine old trees are still numerous, yet felling is going on recklessly, and in many areas we estimated that the number of stumps and felled trees exceeded the number of seedling plants coming up to replace those that were cut. Moreover, whilst a few seedlings struggle through the protecting undergrowth, yet they seem to be destroyed by some cause before reaching to any great height; and, as a rule, we found no intermediates between the seedlings and the mature trees. We have then a forest rapidly diminishing. Little or no provision is made for its renewal. The trees in many cases are sickly and yellow, as if likely soon to die. The Cembras, wearied with incessant fight, seem as if giving up the struggle, and allowing the Larch, which better resists the buffets of circumstance, to take its place. But what interesting and striking objects these storm-tossed Cembras present! They are pictorial enough to make an artist rave with enthusiasm, varied enough to arouse the speculations of the botanist, and to excite the curiosity of the forester. Riven by lightning, decapitated

by falling boulders, maimed and mutilated by winter storms and snow, riddled by Pine-beetles, and subject to a hundred other evils, they valiantly struggle to repair the injuries they receive. Thus, while their picturesqueness is beyond description, their mode of growth and adaptation to untoward circumstances are facts which impress the botanist with wonder and admiration, and afford lessons which should not be lost on the practical forester.

The Larch, with its lighter green foliage, contrasts well with the Cembra, and withstands the fierce shock of the elements better than the Cembra. It seems likely to take its place in the near future, a change which may be for the better, for the Larch timber is of more value than that of the softer Cembra.

The value of the undergrowth in protecting the young seedlings has been already alluded to, but that value is greatly lessened by the practice of allowing the cattle and the goats to roam amid the forest to get what food they can. They are pretty enough objects, and the rhythmic tinkling of their bells is pleasant enough, but the injury they inflict on the young trees is incalculable. Our Swiss friends, then, may be earnestly recommended for their own sakes and that of their successors to exclude the cattle from the woods, and to allow a fair chance to the young trees, already face to face with dangers and injuries of all kinds to such an extent that it is clear that in this district the Cembra as a forest-tree is doomed to destruction.

The underwood has not only a value in protecting the young seedlings, but in saving the soil from destruction. This soil is, for the most part, very rich in humus, freely mixed with sand derived from the attrition of the granitic rocks. It is so rich that it looks as if anything would grow in it, and of such texture as to gladden the eyes of a gardener. It covers the rocks often to a considerable depth, and it fills the chinks and crannies which provide homes for an endless profusion of Saxifrages, *Semprevivums*, and other plants. But where reckless felling has bared the rocks, and where the scanty growth has been destroyed by showers of stones hurled from above, or by torrents of water pouring from the melting glaciers above, there the rich soil is swept away, and bare and barren hill-sides are the result. Supposing the communes who own the forests had public spirit enough to adopt a proper system of forest conservancy, and to attempt to re-forest their barren hill-sides, they would in many places have great difficulty in accomplishing the task, owing to the absence of the soil which once covered the now bare rocks.

We may add, that in the woods we have been alluding to, the Spruce is almost entirely absent, thus forming a marked contrast to some other parts of Switzerland, where the hill-sides are clothed almost exclusively with Spruce. This is perhaps due to differences of soil. Another point we may mention, and that is the relative absence of fungi and especially of those injurious to timber-trees. A dry, hot summer, prolonged into autumn, might account for the comparative absence of terrestrial fungi, but could hardly efface the injuries which the fungi inflict on the trees. In any case, amongst the numberless injuries to which the unfortunate Cembras are subject in this district, hurt from fungi seems relatively unimportant.

On the whole, a melancholy feeling attaches to these interesting trees, whose decadence and ultimate extinction, here at least, seem by no means remote.

ESTABLISHMENT OF MR. W. PFITZER, STUTTGART.

The rotting of the stem in Pelargonium. IN the course of the year some examples of decay in the stems of zonal Pelargoniums invariably reach us, the senders mostly expressing surprise at the failure of the plants owing to their cultural requirements having been quite correct.

The causes are very simple, viz., too deep insertion of the base of the cutting, and improper application of water, the disease rarely attacking plants which have got beyond the first year. To avoid such mishaps the gardener should take only such shoots as cuttings as are matured at the base, indicated by the half brownish colour of the rind, and half woody texture of the tissues—soft unripe shoots being carefully avoided. Such cuttings should be denuded of the lower leaves and cut square across, close below a joint, and placed singly 1 inch deep in large 60's, using a heavy, sandy loam, with some coarse clean sand at the base of the cutting, and should be well watered once with a rose water-can, afterwards placing them in cold frames. No more water should be afforded till the earth in the whole of the cutting-pots is dry, when the entire lot should be afforded water in the same manner, and in the early morning in fine weather. We allude here to August-made cuttings.

By the end of September the cuttings will fill the pots with roots, and in October they may be brought into the greenhouse or brick pits furnished with the means of maintaining a minimum warmth of 45° Fahr. In mild weather plenty of air should be afforded the plants, and water only when the whole of the soil in the pots is dry, and then as before with a rose-can, and in fine weather. The position occupied by the plants should be as light as possible, and near to the roof-glass. Little labour is entailed in the winter beyond keeping the plants free from decaying leaves. These plants, if required for bedding, should not be repotted, and late in April they may be stood out-of-doors after being hardened off by full ventilation, taking the precaution to afford them protection against cold at night. Pelargoniums treated in this manner rarely suffer from decay of the stem, and they flower early and abundantly after being planted out in the beds.

Where space is limited, six to twelve cuttings may be placed in larger pots than 60's, in which case repotting in the early spring time, and a short course of treatment on a mild hot-bed till re-establishment has taken place, becomes a necessity.

FRUIT SHOW OF THE ROYAL HORTICULTURAL SOCIETY.—The Royal Horticultural Society's great show of British-grown fruit will take place at the Crystal Palace on Thursday, Sept. 29, and the two following days. Entries should reach the Royal Horticultural Society's office, 117, Victoria Street, S.W., by Sept. 24. On each day of the show, after 10 A.M., Fellows of the society (on producing their tickets) will be admitted to the Palace free.

THE HURRICANE IN THE WEST INDIES.—It is officially announced that the Lord Mayor of London has decided to open a Mansion-house Fund for the relief of the distress produced by the terrific hurricane which swept over many of the West Indian islands, destroying numerous lives, wrecking innumerable habitations, ruining or carrying away crops, and rendering thousands of people homeless and destitute. The formal appeal will not be issued until some further particulars have been received; but donations may be forwarded at once either to the Bank of England or to the Mansion-house. At the moment of going to press, it is stated that a sum of £5000 has been contributed.

THE CINCHONA INDUSTRY OF JAVA.—The British Consul at Batavia, in his last report on the trade of Java, mentions an important development in the Cinchona industry of the island. Java produces about two-thirds of the world's supply of Cinchona, and it has for years been regularly shipped to Holland, where it has been sold by public auction. The large quinine manufactories, which are mostly situated in Germany, supply themselves with the raw material in the Dutch market, and of late years the manufacturers have combined to keep the prices at such a low level as to render the Cinchona cultivation unprofitable, although the manufacturers of quinine have been earning large dividends. To meet this combination it was resolved to establish a quinine factory in Java, and this has been done at Bandoeng, where the first Java quinine has been produced. This is described as of excellent quality and equal in all respects to the best European brands. Some of the planters were tempted early last year by the rise of prices in Europe, consequent on the establishment of the factory at Bandoeng, to consign their Cinchona to Europe rather than to their own factory; but more recently they have seen that this course must result in the destruction of their own factory, and now the latter is being well supported with the local raw material. Some large shipments of Bandoeng quinine have been made to London, and smaller ones to other parts of the world, and the future of Java quinine will depend on the result of these ventures. Last year the total production of Cinchona in the island was over 8½ million pounds avoirdupois.

RETARDING STRAWBERRIES.—We read of a singular experiment carried out on a quarter of an acre of Strawberries by Mr. T. R. DEVINE, of Sullivan County, New York, with the object of prolonging the Strawberry season. The plants were set out in June, 1897, being potted plants which had been kept in a cold store, and they bore a few fruits in September. This, however, is an incident which has nothing to do with the experiment. On January 22 a layer of ice, 16 inches thick, was put on the plants, and in the first week of February a second layer, 14 inches in thickness, the two layers being equivalent to 680 tons put on quarter of an acre. Over the ice was placed a covering of straw, 8 to 10 inches thick, about 7½ tons. The straw was removed by degrees, a portion of the land being uncovered on May 20, and all by June 23, when the plants were found in fine condition. The ground was soon afterwards cleaned and mulched. On July 16 the first Strawberries were picked, and the picking was continued till the third week in August, the chief variety being the Marshall, whose time of fruiting is June in New York State. The yield was said to be greater than on unretarded plants, and the fruits were remarkably fine, and of excellent flavour. It undoubtedly lengthens the season of the Strawberry; but would it pay? Ice is not so plentiful here as in New York State, and the plan would not pay in this country. A cheaper plan would be to retard the plants in pots, in a cool chamber, as is done with Lily of the Valley and other plants, till June, and then place them out-of-doors to fruit. We remember to have heard of a similar plan being adopted, or at least advised, in this country in order to prevent the early flowering of wall and free-standing fruit-trees.

SEEDS FOR THE SOUDAN EXPEDITION, &C.—An apt illustration of the saying that trade follows the flag is afforded by the circumstance that Messrs. JAMES CARTER & Co., of Holborn, London, seed-merchants, have sent out a large assortment of seeds to Sir HERBERT KITCHENER; whilst a parcel has also been transmitted for the expedition coming north from Uganda. Her Majesty's Resident in Abyssinia has recently taken a quantity with him for sowing in that country.

THE OPENING OF PRIVATE GARDENS IN AID OF GARDENERS' CHARITIES.—On Thursday, September 8, the gardens of Ragley, near Alcester, where bedding-out in various styles is managed on a scale exceeding that of many public parks, were thrown open to the public for one day by the kind

permission of R. OLIVERSON, Esq., on behalf of the Royal Gardeners' Orphan Fund, and the Royal Gardeners' Benevolent Institution. Bearing in mind that it was the first occasion on which the gardens had been opened for such a purpose, the small adjacent population, and the tropical heat of the weather (in the gardens 91° were registered in the shade), the result was most gratifying. Leaflets from the Secretaries of both Charities were distributed among the visitors, so that the objects of both will now be more widely known, and gratifying results in subscriptions and donations will doubtless be reaped in the future.

PROFESSOR GIBELLI.—We regret to have to announce the death, on the 16th inst., of this gentleman, who was Professor of Botany and Director of the Botanic Garden at Turin. He was known for numerous publications on the Italian flora.

HOW THE ORCHARD THIEF WAS CAUGHT.—An amusing incident occurred the other evening in the grounds of St. Joseph's Retreat, Highgate, London. It appears that a gardener saw a man in the upper portion of the extensive grounds engaged in "scrumping," i.e., Apple stealing. He informed one of the reverend fathers of what he had seen, and the two went together towards the spot at which the man had been seen. The thief, however, was on the alert, and as soon as he caught sight of them, he made off rapidly, the gardener and the "father" pursuing him. Presently the thief came to a fence, which he cleared, but, as he had not looked before leaping, he dropped into a huge butt of water on the other side. He was hauled out by his pursuers, drenched with evil smelling rain-water, and was given into custody.

PUBLICATIONS RECEIVED.—*Cantor Lectures on Plants Yielding Commercial India-rubber*, by D. Morris, C.M.G., M.A., D.Sc., F.L.S., Commissioner Imperial Department of Agriculture in the West Indies.—*Kew Bulletin*, No. 141, for September, 1898, contains an article on China Grass, and notices of machinery of different kinds used in its preparation; description of New Plants; Notes having reference to Dr. Morris' Appointment as Imperial Commissioner of Agriculture in the West Indies; and on the Insense Trees of the West Indies.—*Mittheilungen über Düngungsversuche*, No. 10, for May, 1898.—*Proceedings and Journal of the Agricultural and Horticultural Society of India.*—*Horticultural Nomenclature*, by F. A. Waugh; published by American Gardening, Rhinelander Buildings, Rose and Deane Street, New York.—*The Agricultural Gazette of New South Wales*, for July, 1898.—*Queensland Agricultural Journal*, Vol. III., Part 2, August, 1898.—*Organographie der Pflanzen, insbesondere der Archegoniaten und Samenpflanzen*, von Dr. K. Goebel. Part II. (Gustav Fischer, Bookseller, Jena.)—*Elizabeth and her German Garden* (Macmillan & Co.)—*Handbuch der Blüten Biologie*, Dr. Paul Knuth (Williams & Norgate).—*Die Alpen Pflanzen in der Garten Cultur*, Von Erich Wocke (Williams & Norgate).—*Sunny Jersey*.

THE SEED TRADE.

THE GRASS AND CLOVER CROPS.—Advices which have come to hand from the seed districts of Darmstadt show that after an extremely mild winter came favourable weather in early spring, and all growing crops looked quite promising, until the summer came in, bringing with it heavy cold rains, which did injury to the maturing plants, discolouring the seed, and delaying the harvests for many weeks. Long exposure to moisture has materially affected the germinating power of various seeds.

Agrostis.—The two forms of the Bent-grass (*Stolonifera alba* and *vulgaris*) have yielded an abundance of good seed, both in Germany and the United States, and it is expected that prices will be lower than for some years past.

Aira.—The Waved Hair-grass (*A. flexuosa*) has yielded a good crop of fine seed; and the same holds good of the tufted form (*A. caespitosa*).

Alpecurus.—This year's crop of the Meadow Fox-tail grass (*A. pratensis*) is one of the best for some

time past, as far as quantity is concerned, while the quality is good, but as full of impurities as usual, while a "red larva" is mixed with it, making a careful selection necessary. The loss in cleaning is large; still, some fine seed will be obtainable at moderate prices.

Anthoxanthum.—The common Sweet Vernal grass has furnished only a moderate crop of seed of heavy weight; and the same holds good of a form of Sweet Vernal-grass known in Germany as *A. Puelii*. The tall Oat-grass (*Avena elatior*) is smaller than that of last year, but it is of fine quality; it is, however, not expected there will be any great advance in price. The Yellow Oat-grass (*A. flavescens*) is very scarce, and high prices are expected to rule.

Dactylis glomerata (Cocksfoot) is reported to have yielded a smaller crop of seed than usual in New Zealand, and good prices are obtained for fine, bright, heavy seed; the bulk of the season's yield is of indifferent colour, and its germinating power not so good as could be desired. American Cocksfoot is both impure and light in weight; some good samples have been obtained in Germany, but they are not so pure as could be desired.

Cynosurus cristatus (Crested Dogtail).—Abundance of seed has been obtained of good weight, but samples have suffered in point of colour, and there is an absence of the bright golden-coloured seed so much preferred.

The harvesting of the Fescue Grasses coincided with the worst of the wet weather experienced in the district; and while a large quantity of seed was saved the quality is unsatisfactory, stained, and in the case of the rough seed it is much mixed with weeds. Prices are expected to be lower than those of last year. The harvest of the narrow-leaved Fescue (*tenuifolia*) is very much smaller than last year, and it is expected the best samples will realise high prices. The Tall Fescue (*elatior*) has been harvested in the Rhine country of excellent quality in large quantities, and the prices are expected to be lower than those of last year. Meadow Fescue (*Poa pratensis*), seems to have given a smaller crop than has been obtained for many years; this is confirmed by reports from the United States of America. Large portions of the lands on which it was being cultivated have been ploughed up, because not worthy being harvested, and the yield is thereby reduced. Still, estimates vary, but it is certain prices rule higher at this moment than they have done for years. Fine samples are said to have been obtained from the Rhine lands.

The perennial Darnel Grass (*Lolium*), and the Italian Ray Grass (*L. italicum*), have both been produced in abundance and of fine quality, and prices range low. *L. italicum* is strikingly distinguished from the other forms of *L. perenne* by the long slender awns of the flowers, and it is a doubtful species.

Timothy Grass (*Phleum pratense*) is said to have been an abundant yield in the United States, and prices are low there. The German crop is backward. The Wood-meadow Grass (*Poa nemoralis*) is a smaller crop than last year, though the seed is heavy and well developed, but the colour is not good. The smooth-stalked Meadow-grass (*P. pratensis*) is reported a short crop in the United States, and prices advance, but the quality is exceptionally fine. The rough-stalked Meadow-grass (*P. trivialis*) is a small crop, the acreage having been considerably reduced within the last few years; prices are certain to increase.

Clovers.—It is reported of all Clovers that the crops suffered more or less from the weather, with the exception perhaps of Alsike and White Clover, of which there are good yields. Sainfoin has, so far, only appeared in moderate quantities, and it is too early to pronounce a definite opinion as to the possible yield. The crop of Trefoil is said to be smaller than that of last year, though moderate prices prevail; the quality of the seed is somewhat indifferent in regard to development. The Italian crop of Lucerne has suffered severely, and is very indifferent both as to quality and quantity; and the same is reported in reference to the yield from Hungary; but prospects are better in Provence.

The harvest is generally late. Of Red Clover there appears to be but a limited crop in Germany; unsatisfactory reports have come from all the Rhenish Clover districts. It is the same in Silesia and Bohemia; and there is a small yield in Russia. From some parts of Hungary better reports are coming in, but as the results are not yet complete, nothing certain can be ascertained. Some samples of new Bohemian and Hungarian seed which have come to hand, show small grain of indifferent colour. *Pisum*.

AMERICAN NOTES.

QUEBEC POMOLOGICAL SOCIETY.

THERE are a great many state and provincial horticultural societies on this continent, and nearly all of them are strong and useful societies holding enthusiastic and valuable meetings once or twice a year. It is always a delight and a profit to me to attend these meetings whenever and wherever I can, but a special interest attaches to such a meeting as that recently held by the Pomological Society of the province of Quebec. As a whole this province is north of the generally-accepted fruit-growing zone. The methods and the varieties which are everywhere else more or less successful among Apples, Pears, Plums, and other temperate latitude fruits, cannot at all be depended on in Quebec, but in spite of this fact, the energetic land-owners of the province have been steadily developing varieties, and working out a system of fruit-culture of their own. For example, at the recent meeting, Mr. W. W. Dunlop, Secretary of the Society, exhibited a large collection of Plums many of them seedlings of his own growing, and much hardier than varieties in general cultivation. Some of these were of excellent quality, and find ready sale in the Montreal market. His seedlings were chiefly of the "domestica" type, though he is reported to have given it as his opinion that the type best suited to the climate of Montreal is the native *Prunus americana*.

The President, Mr. Auguste Dupius, in his address, announced the establishment by the provincial government of several fruit experiment stations, where many different varieties of fruit will be tested as to their adaptability to different parts of the province.

Many other valuable discussions were held at this meeting. One of the liveliest was as to whether Apple orchards should be kept under cultivation, or should be seeded down to grass. Another dealt with the preservation of Grapes over winter. Extended practical orchard notes were given. These meetings are held semi-annually in different parts of the province, and have a considerable influence in arousing an interest in fruit culture, and in disseminating a knowledge of proper horticultural methods.

THE HORTICULTURAL CLUB.

A small coterie of horticultural teachers and experimenters met in Boston last winter, and decided to organise a Horticultural Club. We all thought at that time that this name was new in its simplicity, but we soon remembered that London has long had its Horticultural Club. Ours is somewhat different in plan and organisation. It is intended that the membership of this club shall be quite limited, and that it shall comprise, for the most part, the teachers of horticulture in New England or within easy reach. A simple constitution was adopted at a meeting recently held in Boston, and Professor B. M. Watson, of Bussey Institute, Harvard University, was made president; and Professor W. M. Munson, of the University of Maine, secretary-treasurer.

AILANTHUS GLANDULOSA.

I wonder if this odd tree has found as many friends in Europe as in America. It seems to be hardly about as far north as northern New York. I have recently seen some good specimens loaded with fruit in Ithaca, N.Y. The tree was extensively used in some of the timber planting experiments on the great plains of the Mississippi valley, where it developed some few good points. It was a rapid grower, and made fence posts rapidly, though it has never

shown itself suited to the production of large timber. In that strange old town of Salt Lake (Utah) there is a fine row of *Ailanthus* about the Temple Square, where, amid other odd surroundings, they make a very agreeable impression on the visiting stranger. In a few places I have seen *Ailanthus* planted in groups or borders, or for screens, where it was cut back to the ground every two or three years. Treated in this way the effect is very fine.

GOSSIP.

Professor J. L. Budd, for many years in charge of the horticultural work in the Iowa Agricultural College, and notable for his connection with the spread of Russian fruits in this country, has resigned his position. Professor John Craig, formerly horticulturist at the Central Experimental Farms, Ottawa Ont., has been elected to succeed him. Professor Bailey has just returned from a vacation in Europe. Professor B. E. Fernow has resigned his place as chief of the forestry work in the U.S. Department of Agriculture, and has taken charge of the new school of forestry at Cornell University. Mr. Gifford Pinchot takes Dr. Fernow's place in Washington. Many papers of considerable horticultural interest were presented at the recent meeting of the American Association for the Advancement of Science at Boston, and also at the meeting of the Society for the Promotion of Agricultural Science. These papers will all be duly accessible in the publications of the respective societies. *F. A. Waugh*.

CACTUS DAHLIA "FANTASY."

(FIG. 65).

AT the meeting of the Royal Horticultural Society held on September 6, a very pretty variety with threadlike florets, incurving at the upper end in a confused manner and of a scarlet colour, was remarked in a collection of Cactus varieties shown by Messrs. J. Cheal & Sons, Lowfield Nurseries, Crawley. It is figured as a distinct novelty.

HOME CORRESPONDENCE.

STREET TREES IN BATH.—The residents of Bath are concerned about the trees in their Pulteney Street. Some of them are certainly in a parlous state. They are of varying sizes, the Planes being by far the largest, and they appear at irregular intervals. The City Council have been discussing what is best to be done; some are in favour of filling up the gaps in the line on either side, others favour the more sensible plan of removing the trees entirely, and planting young ones in the autumn. Pulteney Street is bounded by lines of houses of a pattern of one hundred years ago, severely formal in their primness, and needing such relief as trees afford. Along the sides of the street can be seen Planes in clean and vigorous leafage; Sycamores in a deplorable condition through the ravages of insects and other causes; Poplars and Limes which have well-nigh shed their leaves; and mop-headed Acacias. The Planes have grown out of all proportion to the size of the others; and the Robinias, which are the youngest and smallest, do remarkably well, and have dense heads of green leaves. It would be best to replant, using either Planes wholly or Robinias wholly. The present trees stand just along the verge of the road, and not on the pavement, as is generally the case. One advantage gained is, that through the trees being near the channels by the roadsides, there is greater certainty of rain reaching the roots than when they are planted on the pavement. The Mop-headed Acacias seem to harmonise with the style of architecture of the houses, and the green of their leaves appears to be both more striking and persistent than that of the Planes. Street planting appears to have been perfunctorily and injudiciously performed in some of the main thoroughfares of this delightful western city, and a good opportunity is now afforded to replant Pulteney Street, and establish a standard of selection and planting. *H. D.*

THE ROYAL HORTICULTURAL SOCIETY'S FRUIT SHOW.—"H." is in too much of a hurry. My remarks were directed not to the full schedule of the Society, but to a supplemental one dealing as I stated with the Special District County Prizes for Fruit, and which has been largely circulated by itself as a

separate sheet, apart from the general schedule, and especially to provincial newspapers; and it was owing to coming before me in an editorial capacity that I was led to pen the remarks you published on the 10th inst. The two points I raised are legitimate and necessary matters for discussion, as they are involved in some obscurity. *Cor.*

RUDBECKIA BICOLOR, NUTT.—As the introducer of this species some twenty-two years since, you will perhaps allow me to state, in reference to R. Dean's enquiry, that there can be no question of its annual duration, and as little that the interesting new variety *superba*, which, it may be stated *en passant*, is a wild form, and not a garden variety, shares this character with the type. It appears to vary considerably in its coloration, some of the plants having the base of the ray-florets spotted with rich deep brown, the spots varying much in size. In other specimens the colour is more or less diffused over the entire ray, and is of a dingy shade. The

that its constant misuse demands a strong protest. It is not too much to affirm positively that in the hundreds of gardens, great and small, that I have seen lately, blue *Lobelia* is used as an edging to three-quarters of the beds that are filled with summer bedding plants, and yet there is never a broad mass of rich blue to catch the eye and fill it with a sense of repose! Take even the London parks, where sometimes one sees what wonders really good taste can work, and yet, how often will you see a bed edged with blue *Lobelia*, which not only "swears" generally with the flowers it surrounds, but invariably disturbs the eye where it touches the green grass. Modern milliners no doubt have been busily trying to persuade us that grass-green and a hard blue are fashionable as a combination, but they cannot convince us it is good taste and a thing to be admired. What a pity then it should be so constantly reproduced in our gardens! A really pale shade of blue is beautiful on grass, as the spring *Forget-me-Nots* show us, but the fully

now vulgarised by a constant repetition of reds, yellows, and blues! and what a satisfaction it would be if anyone would just plant half his garden in the way I have indicated, and the other half in the usual blue-edged uniform. I feel sure the difference in beauty and brilliancy would be so great that another year I should have converted him from the error of his ways! *E. H. W.*

KEW GARDENS.—These beautiful gardens are a credit to the nation and to those who manage them, and are also a boon to the general public, making Kew and the neighbourhood an attractive residential district. As a public park for the masses, Kew is unrivalled. As a botanical college for students and scientific gardeners, it perhaps cannot be surpassed. The question, however, to ventilate is, does it spread among intellectual people generally as much botanical knowledge as it might be made to do, considering the great teaching facilities the gardens afford? The museums in the gardens are crammed with exhibits and curiosities carefully labelled, collected from all parts of the world, and these are viewed by hundreds of people, though only as curiosities. A student going in for a course of botany for scientific purposes, medical or otherwise, no doubt finds all he requires at Kew in the way of help. If you send a plant or product to the Curator it will be named for you, and a courteous letter sent in reply. This applies to the British Isles, the colonies, and other countries, and no doubt the gardens benefit somewhat by this foreign correspondence and exchange of information. The other day the writer was at Kew Gardens, and saw an English herb among the medicinal plants, and he wished to know where he could gather this plant growing wild to use for medicinal purposes. He was, however, unable to get this simple information. He saw a gentleman in authority who was courteous enough, and said he had gathered the plant, but he could not recollect where it was to be found. The writer asked—Was there no library of botanical books that might be referred to? He said there were such books in the Herbarium, but only students were allowed there. The writer found from further questions it was like pumping at a dry well, but this gentleman said the botanical books of reference could be got at the British Museum Library, or the Curator of Kew Gardens could be written to. Undoubtedly there must be a distinction made between the student proper, who is studying to make botany or gardening a business, because these students are working practically as men work at a University, and their studies at the Herbarium should not be disturbed by amateur botanists or rudimentary enquirers. But one would think that if an enquirer wanted to know the habitat of an English plant, so as to gather it, an enquiry at Kew Gardens would enable him to ascertain such simple information. Perhaps it is too simple, and too unscientific, as to be beneath notice. It would be useful if there was a small reference library of botanical books at Kew Gardens for the use of the general public, where one of the advanced students in turn could officiate. No doubt it will be said, nobody would use it. The public would use such a library if made acquainted with it, and it was not hidden away in a hole-and-corner position. People who do not keep a scientific gardener at times want advice as to the selection of plants; why should they not go to Kew for such advice? Kew people might thus widen the growth of many plants now neglected or unknown. This would not hurt the nursery people, but rather quicken their trade. It is suggested as desirable to add on to the present teaching at the gardens a popular side as well as the present scientific side. *Edmund B. Ivatts.*

BLIND STRAWBERRY PLANTS.—A good deal has been written recently in these pages about blind Strawberry plants, but here is a phenomenal lot. When I came into this small place in August, 1897, I found some Strawberry plants with numerous runners, so in the following autumn I planted four rows of these young runners on raised ridges. They grew very well. In the spring I manured one row, but not the other three. In the hollows between the ridges, however, I put a good layer of seaweed. In the ordinary fruiting season each plant was simply a bush 2 feet across, but without a single flower! There was no difference between the one manured row and the three unmanured rows. In all, the plants made a splendid growth, with numerous and never-ending runners. What the real cause of this utter blindness is, I must leave for experts to imagine. The soil here is very good. As I did a good deal for these plants, and as they did nothing

FIG. 65.—DAHLIA "FANTASY": COLOUR BRIGHT CRIMSON. (SEE P. 238.)

best forms are certainly very handsome. The so-called *R. texana* referred to in the same note, is properly the *Lepachys columnaris* var. *pulcherrima*, A. Gray. It may be treated as a half-hardy annual, but will often survive several years under favourable conditions of soil and climate, and might therefore fairly enough be exhibited as a perennial. *W. Thompson, Ipswich.*

THE ABUSE OF BLUE LOBELIA.—At this season of the year, when the summer bedding-out is at its best, how often is the effect of what would otherwise be a brilliant and tasteful garden entirely spoilt by one plant, and that a very pretty one in itself! A few years ago men of taste and perception protested loudly against the over use and wrong use of the *Pyrethrum* Golden Feather, which, save in spring-time, is really a plant to be avoided rather than planted for ornament. Thanks, no doubt, to folks' eyes being opened, one sees comparatively little of this plant now, so I need say no more about it to-day; but the blue *Lobelia*, the plant to which I now prefer the grievous charge of spoiling many a pretty garden, is so charming in itself,

rich blue of *Lobelia* next green grass, next red, or next yellow is atrocious, and yet how rarely is it otherwise used! Do let us stir up those who have eyes to see and tongues to talk, to protest against this misuse of blue *Lobelia*, which is really at the root of the dislike to summer bedding, which is growing day by day on account of the carelessness and bad taste so often displayed by those who should know better. Nothing is more charming than a broad mass of blue when properly treated, but full rich blue absorbs so much light that it requires plenty of white, or still better, cream-colour to set it off. There are now plenty of dwarf white-flowered or creamy-foliaged plants suitable for edging blue *Lobelia*, why not use them for an edging, and put the blue inside? A rich orange, or a tawny-brown flower, such as *Gazania*, or brown *Calceolaria*, make most effective contrasts near blue when the latter is edged with a creamy-toned plant. *Echeverias* with their bright flowers left on are particularly suitable for edging *Lobelia*; white and blue in mixture, or white grouped or dotted on blue is always admissible. What a relief to the eye would be a good mass of blue and white as a central object in small gardens,

for me, I uprooted them all, and made them over to the rubbish heap. *E. Bonavia, M.D., Worthing, September 8, 1898.*

LIATRIS SPICATA.—Familiar as are the tall spikes of purplish flowers of the *Liatris* in the hardy plant borders, but few are aware that both *L. spicata* and *L. pycnostachya* (Kansas Gay Feather) make very useful and showy pot plants for using in the decoration of the dwelling-house or for the conservatory. They may be grown in small pots, and their flower-spikes, rising some 3 or 4 feet, render them very useful for indoor decoration, especially where the width of the arrangement is restricted. In more massive groups they form telling objects, with their spikes standing above the group alternately with the slender spikes of the white *Francoa*. A number of them are grown in pots for decorative purposes by Mr. P. McArthur, of Maida Vale, London. *J. O'B.*

CROWN FORESTS.—Mr. A. C. Forbes, in his communication relating to this subject (p. 213), has surely forgotten that the figures relating to the financial results of the Crown Forests are published every year. *D.*

MONTBRETIAS.—Referring to Mr. Martin's additional notes in your last issue on the cultivation of Montbretias, I contend it is quite unnecessary to ripen the bulbs over hot-water pipes, and to nurse the bulbs in frames, instead of planting them again directly. If planted at once, there are very few of the small bulbs that would not flower the following summer. My opinion is, that if the bulbs are dried off in the autumn, and then placed in boxes and started in a frame in February and planted out in April (as advocated by Mr. Martin), they would then have made 5 or 6 inches of growth and a quantity of roots, which would be damaged and receive a check when planted. They could not possibly do so well as autumn-planted bulbs, which would then be well established and pushing through the soil (especially so in the event of a spell of dry weather). I imagine that very few of the many successful cultivators of Montbretias practice this ripening-off system recommended by Mr. Martin. *T. F. Conway, Ham House, Richmond.*

BAD SETTING OF GRAPES.—A short time ago I was asked to look at a vinery planted with Lady Downes seedling Vine, on which the bunches had set very badly. I have thought a great deal about it since that visit, wondering if we have quite understood the cause of this, and other varieties of the Vine, amongst others, Muscat of Alexandria, and other Muscats, Mrs. Pince, Black Morocco, &c., often producing small undeveloped berries. Many reasons have been given for this, such as lack of ventilation, heat, &c., but I am not prepared to criticise the common methods of practice at the time of the setting of the fruit. The good or bad setting properties of the different varieties of Grapes have also been attributed to the position of the anther heads around the stigma, those which set their fruit badly having their anther-heads deflexed from the pistil, and those anther-heads of the free-setting varieties standing quite erect. I think we may now fairly consider this matter still further. Kerner and Oliver (*Distribution of Sexes*) have extended the Phanerogamic classification of plants of the division of sexes, viz., hermaphrodite, monœcious, dioecious, and polygamous flowers, and placed them in fifteen different groups, according to their fertilising properties. The Grape-vine they evidently place in two, or perhaps three of these groups. 1st, Group X., which embraces those varieties which develop true hermaphrodite flowers on one plant, and pseudo-hermaphrodite female flowers on another, as here the cultivated Vine (*Vitis vinifera*) is distinctly mentioned. 2nd, Group XI., in which are placed those plants which develop true hermaphrodite flowers on one plant, and pseudo-hermaphrodite male flowers on another. "Many species of Vine" are here mentioned, but on a previous page (Vol. iv., p. 295), in speaking of the varied gradations in the class of pseudo-hermaphrodite pistillate and staminate flowers they say of the Vine (*Vitis vinifera*) in conjunction with other plants:—"All develop imperfect flowers, which are liable to be mistaken at first sight for truly hermaphrodite. They have plain, well-developed ovaries and stamens, in whose anthers pollen grains are formed in greater or less numbers; but experiments with this pollen have shown that when deposited on the stigma it emits no pollen-tubes, and consequently the flowers are not in reality truly hermaphrodite, but only apparently so." This does not seem to me to be very clearly expressed with

reference to the Grape-vine, especially in Groups X. and XI. We know in practice that many bunches in themselves produce fully-developed and imperfect berries also, and there are few indeed, however well individual bunches may set their fruit, but what produce some imperfect berries. Group XV. gives "Three kinds of flowers, distributed in four different ways on different plants, so that they can be divided into four varieties." A species of Vine (*Vitis cordata*) is mentioned here. If this would apply in the case of our English hothouse Grapes, it would perhaps simplify matters very much. At any rate, in practice we know that, pollinate as much as we like, and in whatever way we like, in some varieties some of the bunches will still set their fruit very badly. Whether the ovaries are imperfectly developed, or whether the pollen grains will not emit pollen-tubes, on the same or on different plants, the results are still the same. Some rods, and even some branches on the same rod, develop their fruit much better than others, and it might possibly become a consideration whether a proper and judicious selection of eyes for propagating purposes, might not greatly influence the setting properties of our "badly setting" varieties of Grapes. P. [The forms of the perfect hermaphrodite and the imperfect hermaphrodite flowers are shown in Mr. A. F. Barron's *Vines and Vine-culture*, which indicate how fertilisation takes place with facility with the former kind of flower, and how difficult and uncertain it must necessarily be in the latter, owing to the shorter and deflexed anthers. Ed.]

FLOWERS OUT OF SEASON: WHY NOT.—I read with a good deal of interest the very sentimental protest on "Flowers Out of Season" in your issue of September 17, and am glad that my love of the beautiful in Nature is not confined to such time limit as our variable climate naturally imposes. To us poor London dwellers, who have no opportunities to daily watch the opening beauties of woods, fields, and gardens, the full-blossomed fragrance of summer, or the varying tints of ripened autumn, the poetry of Nature loses much of its charm, and we have to content ourselves with our favourites of the floral world when they are brought to us. To one a Lily, to another a Rose, to a third a Carnation, is an especial subject of delight, and we make up for the successive beauties the countryman enjoys, by asking daily for supplies of a particular kind of flower that we welcome all the year round, without regard to methods of production. Much as we admire the Love of Nature, so evident in the tender and touching poetry of dear old Burns, and much as we delight in rural scenes and sentiments, when for a few days we have the opportunity to indulge in them, I really cannot see any logic in connecting Burns's regret over a crushed Daisy with forcing flowers for market. Why not protest against the mower who cuts off millions of Daisies, or the seller of naturally-raised posies? Had Burns been a Londoner, and visited Covent Garden, I question if his delightful song in praise of flowers would have gone beyond the pure enjoyment of them, and I doubt very much if the man who prolonged the period during which their beauties could have been enjoyed would have come in for the wholesale condemnation the writer supposes. Then, how about other forced and unseasonable articles of commerce. Are we to destroy all our greenhouses, and have nothing but natural productions? If I may grow Grapes all the year round, why not Lilies and Roses? If "a thing of beauty is a joy for ever," why not for ever grow that thing of beauty? But says the protestant, this forcing is destructive of the plant! well, doubtless the Laws of Nature cannot be strained with loss. How many millions of humanity live in our London under hothouse and forced conditions, and what remedies are effectively carried out for their being transplanted into more free and naturally healthy surroundings? If sympathy and sentiment are to be exerted that flowers shall not be forced, why stop at flowers? Why not extend to human seedlings? Why not begin there? Then with regard to the dust-heap as the premature grave of forced flowers. Are forced flowers the only ones to be so consigned? Is not the faded flower commonly quoted as an emblem of our own frail mortality? But I think I have heard that forced flowers properly managed keep even better in London dwellings than naturally-raised ones; so, if flowers for decorative purposes may be cut at all, the argument is in favour of forcing. Then, again, the story of Nansen's birds, if rigidly applied, seems to show that after a prolonged absence the heart more fondly hails the re-appearance of old familiar faces. Truly, absence makes the heart grow fonder; then, to be

logical, we ought to retard the growth of flowers to better enjoy their re-appearing. Well, this is just what is done with the Lilies of the Valley which are marketed in August. They are cased up in ice for a long period, as Nansen was; yet are we forbidden to welcome them because the climate they have been living in was arctic? To be consistent, we ought to feel more ecstasy over these delayed reminders of "life and spring." Now, Sir, much as we should delight in the opportunities happily enjoyed by the writer of your "protest" article of watching Nature's efforts, we cannot but think that, were he otherwise circumstanced, he would hail with delight at all times and in all seasons such of Nature's sweetest and best gifts as man can collect for him without limits of season or climate. We live in an age when means of locomotion annihilate distance, and when all the products of the earth can be enjoyed by rich and poor almost regardless of season. We Londoners think this a great blessing, and our appreciation of it is shown by the way in which the markets where such products are brought for distribution are patronised. To say that an English cultivator shall not enter into competition with a foreigner because, forsooth, he has to create a different climate to that which Nature provides, is to put a stop to progress and a limit in production which, thank God, it is quite impossible for sentimentalists to accomplish; indeed, to my mind, the bare idea is preposterously absurd. No individual can claim a monopoly of sentiment for flowers. Let us have them at all times and at all seasons—all the "Gems that in earth's firmament do shine"—if we can get them, whether they be Orchids from equatorial regions, sweet-scented beauties from the Riviera brought to our doors, Narcissus from the Scilly Isles, natural flowers from English gardens, wild flowers from English hedgerows, or the much-despised forced flowers, which at present form the staple of the London flower-trade; as well as those foliage-plants which assist in the ornamentation of London homes. Nothing so much demonstrates the value of our modern education, and the advance in national taste and refinement, as the increasing love of, and demand for flowers. Let us hope that the douche of cold water so lately poured over them may have no effect in diminishing their supply and use. *A Lover of Flowers.*

VEGETABLES.

THOSE who require a first-rate early Marrowfat Pea should sow Early Morn. It develops quickly, and has large pods. Plants from spring sowings come into bearing in about eight weeks. Such quick-growing Peas are excellent for small gardens, or where the cropping has to be very close, as they allow of two or three crops to be grown on the same piece of land in one season.

THE BRITISH ASSOCIATION.

BIOLOGICAL EXHIBITION, ZOOLOGICAL GARDENS, CLIFTON.

It was determined, on the suggestion of Dr. Harrison and Mr. E. J. Lowe to add to the attractions of the British Association meeting, by holding a biological exhibition of animals and plants. This exhibition was arranged as a museum; there was no competition, except a few classes for cut blooms, i.e., wreaths, bouquets, &c., which were judged by ladies, under the presidency of Lady Llangattock; exhibitions in each department consisting of the various classes of plants, flowers, fruit, and vegetables, together with hybrids and crossed varieties. Lord Llangattock was the President, and Sir John Lubbock opened the show. The best growers in the different classes were selected, and with one or two exceptions all responded to the appeal.

The especial object was to do something worthy of Bristol that would induce others to aid in starting a biological station for work in aid of agriculture and horticulture, by the investigation of biologists, physiologists, and chemists, in order to find out improvements for the benefit of the farmer and the gardener; to make new crosses in animals and plants, calculated to increase productiveness and beauty. With the farmer, it is important to increase the produce of corn and grass, &c., and this at a moderate expense; with cows, to increase the quantity and quality of milk, by cross-breeding. Mr. Richard Stratton is crossing Keries with a Shorthorn bull; Mr. E. J. Lowe Jerseys and Shorthorns with a Dexter bull; testing the effects both through the male and female, treating them as the seed-bearer in plants—and illustrations of them were exhibited. These and other branches of enquiry require work in a biological station, and we hope that Bristol will be one of the first to commence these important experiments.

Commencing with the plants, Messrs. Kelway of Langport showed 150 spikes of magnificent Gladioli, for which they received a certificate, as also for three seedlings named Lady Llangattock, Mrs. Harrison, and Mr. E. J. Lowe.

Lord Llangattock had a collection of hot-house fruit (T. Coomber, gr.). It would be impossible to excel the quality of this collection, Pines, Grapes, Melons, Peaches, Nectarines, &c., were all equally good, and well deserved the certificate. The Marquis of Bute (A. Pettigrew, gr.), had another group of fruit, his collection contained a fine display of enormous Apples and Pears, Melons, Grapes, Peaches, Nectarines, &c., for which he received a certificate, and another for his seedling Melon, and a third for wine of 1885 and 1887 from the Glamorganshire vineyard.

Mr. John Basham, of the Bassale Nurseries, near Newport, showed fifty dishes of Apples and Pears, and pyramid fruit-trees loaded with Apples—such a wonderful exhibition shows what can be accomplished in Monmouthshire; these were backed by a collection of Pompon Dahlias. Certificates of Merit for the fruit, and also for the admirably trained pyramid Apple-trees.

Mr. Vincent St. Ames, Cote House, Clifton (gr., W. H. Bannister), was selected to represent vegetables; his abilities in the growth of fruit and vegetables are too well known to require mention that he well won the certificate; his collection was large and of excellent quality, and to these he added Peaches, Nectarines, Figs, Apples, and Pears.

Messrs. Dobbie & Co., Rothesay, had a large and choice collection of Cactus Dahlia, for whose excellence and effective arrangement a certificate was awarded, as also for varieties Arachne, Night, Daffodil, and Britannia.

In the large plant tent, Messrs. Veitch, of the Royal Exotic Nursery, Chelsea, had a grand display of Pitcher-plants and Sarracenias, and also hybrids, amongst which were *Lutlo* × *Cattleya* var. *callistoglossa ignescens*, and many *Dendrobiums* and *Cypripediums*. Twenty-four lovely hybrid *Rhododendrons* (*javanicum* × *jasminiflorum*), *Nepenthes* hybrids (with both the parents shown), *Anthurium Andreanum* hybrids, *Anthurium Rothschildianum*, *Bertolonia* hybrids, eighteen *Canna* hybrids, *Begonia Eudoxa*, with parents; *Streptocarpus* hybrids in great variety.

Hybrid Ferns, with their parents—amongst these was one marked *Polypodium Schroderi* (a cross between *Polypodium vulgare* and *P. aureum*), which was much admired, and received a certificate, as did also the Pitcher-plants, hybrid *Rhododendrons*, and hybrid *Cannas*. Such a collection had never been seen in Clifton before. Mr. F. W. Moore, Glasnevin, had a certificate for a very choice collection of twenty-four distinct *Sarracenias* from the Royal Gardens, Glasnevin.

Mr. F. W. Burbidge, Royal Botanic Gardens, Trinity College, Dublin, exhibited an exotic Dockweed, *Azolla filiculoides* (certificate); and Mr. James Moly, Langmoor, Charnmouth, received another for *Azolla pinnata* and *Pontederia crassipes*. Mr. C. Bucknall, Clifton, obtained an award for coloured drawings, and Mr. Wollaston, for a specimen, a new British plant, *Stachys alpina*, first found in June, 1897, at Wootton-under-Edge.

Mr. Cypher, of Cheltenham, had a collection of choice plants arranged for effect, which occupied the whole of one side of the centre of the great tent, amongst which were *Lælia* × *Cattleya* Cypheri, *Bougainvillea* Cypheri (new, and gaudily coloured), *Acalypha Sanderi* (new), and many fine *Crotons*, *Palms*, *Bamboos*, and *Ferns*. This collection was very effectively arranged (certificate).

Messrs. W. & J. Birkenhead, Fern Nursery, Sale, showed a collection of 500 exotic Ferns (certificate), a collection of British Ferns (certificate), and also another for a remarkable *Polystichum plumoso-divisilobum* named *plumosissimum*, with fronds covered with a growth resembling the fertile fronds of a *Selaginella*, which possibly may be due to apospory.

Mr. Joshua Saunders, of Sutton House, Clifton, arranged for effect a choice collection of Orchids, foliage plants, &c. The arrangement was considered perfect, and did great credit to his gardener (certificate). Mr. Garaway, of Clifton, also took a certificate for another arranged group.

Mr. E. J. Lowe, F.R.S., Shirenewton Hall, Chepstow, exhibited a collection of about 200 hybrid and crossed varieties of British Ferns, many of large size. These were examined and reported upon by Mr. Moly and Mr. Birkenhead. Mr. Moly was selected as one of our oldest British Fern authorities, who has for many years had a large collection of found plants at Langmoor, near Charnmouth. Mr. Moly stated it to be the finest collection ever brought together, and it was awarded a certificate. Other certificates were awarded for thirty-six different varieties of "multiple-parentage of *Scolopendriums*;" for *Polystichum angulare* var. *Mayi* Micklethwait, adding "this is the finest British Fern yet raised;" it is one of the *plumoso-divisilobes*, not only is it imbricate, but the imbrications lie one above the other in long curtains; for hybrid *Scolopendrium* "Prof. Marshall Ward"; for *Scolopendrium vulgare* (a crispum) Mrs. Doughton; for *Polystichum angulare* var. *Sir John Lubbock*, another of the *plumoso-divisilobes*, remarkable for its great breadth; for *Scolopendrium* hybrid Lady Llangattock; for a *Polystichum* hybrid, *Effie*; for a variety of *Polypodium cambricum* named *R. Cann Lippincott*, and for *Polystichum hybridum*.

The tent contained many hybrids that have been crossed by skipjacks, as Mr. Lowe discovered that they could be utilised, and showed that, twelve days after being impregnated, the fronds appeared. Specimens with infant fronds, that had retained the prothalloid life for two years, had skipjacks introduced on July 12, 1898, and had formed fronds by July 24. These, with the skipjacks, were exhibited under a bell-glass; here also were three plants produced by dividing a

prothallus, and also some curious plants, the result of cutting away the portions containing the organs of generation, and growing on the divisions for eight years, when fresh organs were formed. Mr. Harris, gardener at the Zoological Society, filled a large tent with trained *Fuchsias* that were large and well grown, and received a certificate.

Passing to animal life, in the sheds were a Jersey cow and calf, exhibited by E. J. Lowe, F.R.S.; the cross being with a black Dexter bull; a Kerry cow and calf, the cross with a white shorthorn bull, exhibited by Mr. Richard Stratton of The Duffryn; a bullock from an Angus Poll, crossed with a shorthorn bull, from Mr. A. Gibbs of Tynesfield; wild Turtle-dove, crossed with ordinary Turtle-dove, with two young ones, exhibited by Miss M. J. Jones, Montague Street, Bristol; duck from a double-yolk egg, exhibited by Mr. E. J. Lowe (two had been hatched, but one was destroyed by a rat); a couple of game-fowls, also from Mr. E. J. Lowe, from a hen that had been isolated for five weeks, in the one the egg was laid an hour after being impregnated, and in the other was one of a series of eight eggs, all being impregnated at once, the eggs having been laid from one to ten days afterwards; all the above received certificates, as did also Dr. Norton, for a collection of birds' eggs; Mr. F. G. Richmond, Braunton Fisheries, for specimens of trout, and trout and salmon hybrids, these were all living specimens, and with them were pickled eggs and hatched trout up to a year old; illustrations of hybrids of *Lepidoptera*, mimicry amongst *Lepidoptera*, Indian leaf butterfly, &c., from Mr. G. C. Griffiths; fossil fish from Bishop Bromley; wasps and bees from Mr. H. A. Francis; in this collection were also their parasitic enemies, &c. From Mr. Dunscombe, optician, were microscopes, meteorological instruments, and various instruments used in butter-making, and by biologists, chemists, &c., and these were also considered worthy of a certificate.

The Plymouth Marine Biological Station had a number of tanks, in which were exhibited specimens of marine life in great quantities; these tanks had sea-water brought of proper specific gravity, and they showed contrivances for generating oxygen, and for a constant change of water. These tanks, and those for trout, were arranged in a large room.

SOCIETIES.

ROYAL HORTICULTURAL.

SEPTEMBER 20.—An ordinary fortnightly meeting of the committees was held on Tuesday last in the Drill Hall, James Street, Westminster. On the last occasion there was a meagre display, and considerable surprise was expressed that the exhibits on Tuesday last were so numerous that Mr. Wright and his staff had difficulty in providing sufficient space to satisfy the exhibitors; in some cases, even, it was found impossible to do this. Orchids, of course, on this occasion, formed but an inconspicuous feature in the exhibition, but Awards of Merit were recommended to *Lælia* × *splendens*, *Cattleya* × *intertexta*, *Miltonia* × *Binotii*, and *M. leucoglossa*.

The Floral Committee granted two First-class Certificates, one to *Pandanus Sanderi*, and another to *Ligustrum Walkeri*. The same committee recommended Awards of Merit to seventeen seedling Dahlias, including varieties of the show, Cactus, Pompon, and single-flowered sections. Our Dahlia growers would therefore appear to have been treated with uncommon liberality. The Floral Committee, in addition, recommended Awards of Merit to two early-flowering *Chrysanthemums*, to a variegated form of the Ontario Poplar, *Adiantum Faulkneri*, *Acer Jühlkei* variegata, *Hibiscus totus albus*, and *Gynierium argenteum aurea lineatum*. There were twelve Medals awarded to exhibitors of plants and cut flowers.

The Fruit and Vegetable Committee recommended one Award of Merit only, and this to a variety of the new perpetual-fruited Strawberries. St. Joseph appears to be the best of those already sent out, and is giving much satisfaction to those who have acquired a stock of the variety. There were plenty of collections of fruit to illustrate the lecture given by Mr. Roupell upon "Fruit Cultivation in Suburban Gardens," and several Medals were awarded by the committee to these and other collections of fruit and vegetables. Some extraordinary Onions were shown.

Floral Committee.

Present: W. Marshall, Esq., chairman; and Messrs. Jno. Fraser, H. B. May, W. Howe, Geo. Stevens, Thos. Peed Chas. Jeffries, Jas. Walker, T. W. Sanders, J. D. Pawle, H. J. Jones, Geo. Paul, D. B. Crane, and Ed. Mawley.

Mr. H. B. MAY, Dyson's Lane Nurseries, Upper Edmonton, had a group which included fifty species and varieties of the genus *Davallia*. The method now practised by Mr. May of exhibiting a group of varieties of one genus of Ferns only, offers to visitors an excellent opportunity to compare one with another, and to acquaint themselves with the variation of form to be obtained in them. From the tiny *D. alpina* to *D. ornata*, *D. polyantha*, and *D. fijiensis*, there is endless variation in degree of the division of the fronds and pinnae (Silver-gilt Banksian Medal).

A First-class Certificate was recommended to *Pandanus Sanderi*, several plants of which were shown by Messrs. F. SANDER & Co., St. Albans. This is unlike *P. Veitchi*, in that the variegation is yellow instead of white, but in other respects it resembles very considerably that well-known and popular stove decorative plant. It was exhibited at the last Ghent Quinquennial and figured in our columns at the time.

An Award of Merit was recommended to *Adiantum Faulkneri*, from Mr. THOS. ROCHFORD, Turnford Hall Nurseries, Turnford. It is a form in which the pinnae is tapered off very considerably to the petiole, being leg-of-mutton-shaped. The plant has considerable decorative value. Mr. Rochford also showed plants of a crested *Pteris* named *P. Rochfordi*.

An Award of Merit was recommended to a large early-flowering *Chrysanthemum*, from Mr. H. J. JONES, Ryecroft Nurseries, Hither Green, Lewisham. It is a white Japanese form, with yellow centre, and was certificated by the National Chrysanthemum Society at the September show. *Populus canadensis variegata*, from Mr. J. CARTER, Willow Bank, Keighley, was recommended an Award of Merit.

MESSRS. PAUL & SON, The Old Nurseries, Cheshunt, had several very fine things. They obtained a First-class Certificate for *Ligustrum Walkeri*, showing several plants in pots. The leaves are ovate-acuminate, and have wavy margins. The young stems are reddish, and the appearance of the plant very distinct. An Award of Merit also for *Acer Jühlkei* variegatum, a very ornamental green and white-foliaged Sycamore, and a similar award for *Hibiscus* (*Althæa*) *totus albus*, a pure white-flowering hardy *Hibiscus*. Messrs. Paul & Son staged, in addition to the plants mentioned, a collection of Rose blooms in considerable variety, and a fine lot of hardy herbaceous perennial flowers, and autumn-flowering *Crocuses*. Blooms of *Erythrina crista-galli* were noticed. They had been produced by a plant forty years old, and growing out-of-doors (Silver-gilt Flora Medal).

Mr. Jas. Hudson, gr. to Messrs. DE ROTHSCHILD, Gunnersbury House, Acton, Middlesex, showed about a dozen plants of Messrs. Sander's new *Acalypha Sanderi*. These were in 7-inch pots, and bore from thirty to forty racemes of flowers each. In some cases three racemes were hanging from one node. This plant has never been shown better (Silver Banksian Medal).

MESSRS. W. PAUL & SON, Waltham Cross Nurseries, Herts, made an exhibit of cut Roses, illustrating so many as 100 varieties. These included a fine lot of Teas and Noisettes, Hybrid Teas, and China Roses, and the exhibit was deservedly awarded a Silver-gilt Banksian Medal.

A large exhibit of the early-flowering varieties of *Chrysanthemums* was made by Mr. W. WELLS, Earlswood Nurseries, Surrey. Mr. Wells was recommended an Award of Merit for Louis Lemaire, a light bronze sport from Grunerwald, and previously certificated by the National Chrysanthemum Society. Other varieties conspicuous in the exhibit were Madame Marie Masse, Queen of the Earlies, Mychett White, Ivy Stark (yellow); Flora, a pretty little button-like flower, yellow; and Madame Zepher Livett (Silver Banksian Medal).

A collection of cut spikes of *Cannas*, representing some of the newer varieties, and shown by the Dowager Lady FREAKE, Fulwell Park, Twickenham (gr., Mr. A. H. Rickwood), was recommended a Bronze Banksian Medal.

Mr. J. Hudson, gr. to Messrs. DE ROTHSCHILD, Gunnersbury House, Acton, again showed a fine group of *Salvia splendens* var. *grandiflora*, beautifully flowered and grown. The group was set off by a ground-work of variegated-leaved plants.

A grand exhibit of individually superb spikes of *Gladiolus gandavensis*, G. Nanceianus, and G. Lemoinei, was staged by Messrs. J. BURRELL & Co., Howe House Nurseries, Cambridge. There were fourteen stands of twelve spikes each. The colours were greatly varied, and they must have consisted of almost every conceivable tint, with and without feathering. The G. Nanceianus varieties were, on the contrary, as regarded colour or length of flower-spike, nowhere by comparison, but their compact short spikes and smaller flowers of greater substance, give us the idea of their being better bad-weather flowers than the gayer *Gandavensis* varieties. No variety came in for a special award.

MESSRS. BURRELL showed a few miniature Cactus and Pompon varieties of the Dahlia. A Silver-gilt Medal was awarded.

MESSRS. F. G. FOSTER, Brockhampton Nurseries, Havant, showed a number of cut-flowers of Sweet Peas set off by small Ferns.

Mr. J. H. WIRRY, Superintendent Nunhead Cemetery, put up a semicircular group of *Chrysanthemums* and Maiden-hair Ferns, illustrative, as we thought, of nothing in particular (Silver Banksian Medal).

MESSRS. J. VEITCH & SONS, LTD., King's Road, Chelsea, exhibited some beautiful additions to the forms of *Hibiscus syriacus*, two having double flowers, viz., elegantissima, the ground colour of which is bluish-white, with a deep purple patch at the base of each outer petal—the flower buds are white, banded with a shade of red; and Comte de Hainault, white, with a small purple patch at the base of all the petals. The single-flowered variety was *Ce la Veuve*, a flower with a magenta ground colour, and having a red-purple patch at the bottom of the flower. A plant of each of the following was shown, viz., *Abelia rupestris*, which had been covered with blossoms, now going over; *Bignonia grandiflora*, probably this exhibit consisted of detached flowering shoots stuck into damp soil, in order to show the floriferous character of the species; *Caryopteris mastacanthus*, a charming blue-flowered plant, of erect habit; and three varieties of the Pampas-grass, viz., *Gynierium argenteum Rendatleri*, a plant 9 feet in height; *G. a. aureo-lineatum*, with leaves narrow, and having narrow yellow

margins—a graceful and pleasing variety (Award of Merit); and *G. a. albo-lineatum*, of erect habit as seen, and with white and green leaves.

DAHLIAS.

Mr. THOS. S. WARE, Hale Farm Nurseries, Tottenham, made a grand display with Dahlia blooms of the Cactus and Pompon sections only (Silver Banksian Medal).

Messrs. J. CHEAL & SONS, Lowfield Nurseries, Crawley, had an exhibit of Dahlia flowers of the Pompon, single-flowered and Cactus sections (Silver Flora Medal).

Mr. S. MORTIMER, Rowledge Nurseries, Farnham Royal, staged a grand lot of Cactus and Show Dahlias (Silver Flora Medal).

Mr. C. TURNER, of the Royal Nurseries, Slough, displayed varieties of the Cactus section particularly, and a few Pompons. Messrs. PAUL & SONS, Cheshunt, had also some Dahlias in their collection of Roses and hardy flowers.

It was not surprising there were many new Dahlias, seeing that the soil is still warm and productive. Of new show Dahlias there were but few, but an Award of Merit was made to Dahlia David Johnson, a charming self-coloured variety, in colour salmon, the reverse of the petals delicate purple, each petal tipped with buff, from Mr. GEO. HUMPHRIES, Langley, Chippenham, who had the same award for Cactus Ranji, so far one of our darkest as well as our most refined Cactus varieties, really an improved Masterpiece. Mr. HUMPHRIES had a pretty and promising light Cactus variety, which will no doubt be seen earlier another year, and a promising fancy, named Manxman, came from the same exhibitor. The ground of this flower is bright lilac, flaked and striped with mauve-crimson.

An Award of Merit was made to show Dahlia William Neate, yellow, heavily flushed with reddish-salmon, of the build of Flora Wyatt, and apparently a seedling from it; also to fancy Watchman, which, owing to the lateness of the season, was scarcely so refined as at the Crystal Palace; the ground colour is old-gold, flaked, striped, and splashed with deep crimson—these came from Messrs. KEYNES, WILLIAMS & Co., of Salisbury. There is much need of additions to the fancy Dahlias, as so many of the best of them are showing a tendency to revert to self forms. The Salisbury firm also had some fine Cactus varieties, and Awards of Merit were made to the following:—Clown, with its fluted orange salmon petals amply tipped with white—a striking and distinct variety; Progenitor, crimson, the points of the tubular petals deeply cut and much fringed, the flowers large and full; Countess of Lonsdale, salmon suffused with reddish-mauve, a beautiful variety of the best Cactus type; and Viscountess Sherbrooke, rich golden ground flushed with red, and also with salmon; also to Pompon The Duke, deep crimson, a medium sized flower of exquisite shape, and by comparison quite distinct in colour.

Awards of Merit were made to Cactus Antelope, which might be described as a crimson Fantasy, having the shape of that distinct variety, but of richer colour; and to Lucius, brilliant orange-salmon, suffused with red, both very fine and quite distinct, from Messrs. J. BURRELL & Co.; also to Pompons Claribel, pale ground tipped with purple; a medium sized symmetrical variety quite distinct in character; and to Iris, old gold, edged with the palest Apricot and delicate pinkish-mauve, a very pretty and distinct variety from Mr. CHARLES TURNER, Royal Nursery, Slough; also to Pompon Demon, shaded crimson, small, perfect in shape; Distinction, cerise-crimson flushed with magenta; and Snowflake white. Of each of these three varieties, ten blooms were shown of singular uniformity and quality; also to single-flowered variety, Leslie Seale, which has a dark-crimson zone round the eye, and a broad margin of silvery-lilac—very pleasing. These came from Mr. F. W. SEALE, Vine Nursery, Sevenoaks.

Other new varieties of Cactus Dahlias consisted of J. F. Hudson, a very distinct variety of the Fantasy type, the prevailing colour carmine-rose, flushed with crimson, on a yellow ground; the centres of the flowers were somewhat imperfect; Lady Edmund Talbot, salmon, suffused with pale cerise, distinct in colour; Miss Gertude Pearson, of the Starfish type, but deeper in colour, not so much orange, but more scarlet, a good Cactus variety; and Lady Pearson, pale cerise-crimson, flushed with magenta; also single-flowered varieties, Sunray and Goldfinch, not shown in the best condition.

The fact that seven Awards of Merit were made to new Cactus Dahlias after a very careful comparison with the best varieties in cultivation may be taken as bearing emphatic testimony to the rapid advance still being made in the improvement of this type.

Orchid Committee.

Present: Harry J. Veitch, Esq., in the chair; and Messrs. Jas. O'Brien (hon. sec.), J. Gurney Fowler, H. Ballantine, H. J. Chapman, J. Gabriel, W. H. Young, H. Little, W. Cobb, W. H. White, J. Douglas, E. Hill, S. Courtauld, H. M. Pollett, and T. W. Bond.

There was a great increase in the number of exhibits compared with the last two or three meetings, and some very interesting things were staged.

The president of the Society, Sir TREVOR LAWRENCE, Bart., Burford, Dorking (gr., Mr. W. H. White), contributed a remarkable group of Miltonias, of which three were natural hybrids, viz., *Miltonia* × *Binotii*, supposed to be between *M. candida* and *M. Regnelli* purpurea, which bore seven spikes of flowers, having the sepals and petals similar in form, and of a cream-white colour, tinged with lilac at the base, and quaintly barred with cinnamon-brown; the lip, which

ad the broadly-ovate form of that of *M. Regnelli*, but cleft and crimped on each side in the middle, was rosy-lilac (Award of Merit). A still prettier novelty was *M. × leuco-glossa*, which may be a hybrid of *M. cuneata*; the sepals and petals were cream-white, with blotches of light violet colour; the lip pure white, except for some slight purple marking around the crest (Award of Merit). The third hybrid was the best form of *M. × Bluntii* Lubbersiana, with handsome flowers of bluish-white, and different shades of rose, and which has been previously exhibited. The species were *Miltonia spectabilis*, of which a fine specimen was shown covered with flowers, and which had been at Burford for some years (Cultural Commendation); *M. s. Morelana*, and *M. Clowesii*, and with them were a finely flowered plant of *Oncidium longipes*, and *O. trulliferum*.

Messrs. J. VEITCH & SONS, Royal Exotic Nursery, Chelsea, staged an effective and interesting group, which secured a Silver Flora Medal. Among the fine things in the group were *Lælia* × *splendens* (purpurata ♀, crispa ♂), the reverse cross of that exhibited by Mr. BOND at the last meeting, but very much resembling it. The hybrid is of interest, as it proves that the old *L. × Exoniensis* was not of this parentage as had been supposed by some, though there is some resemblance in the outline of the flowers of both. The sepals and petals were white, tinged with lilac; the elongated crimped lip being rich reddish-purple, edged with lavender, and bearing a sulphur-yellow patch inside the whitish side-lobes (Award of Merit). Another large and handsome hybrid, which secured an Award of Merit, was *Cattleya* × *intertexta* (*C. labiata* Warneri × *C. Mossiae*), with bright rose flowers, having the front of the lip of a dark purplish-crimson tint; the group likewise comprising *Dendrobium Mirbelianum*, with singular yellowish-green and brown flowers; a fine plant of *Epidendrum Brassavola*, with three spikes, each of eighteen to twenty flowers, with conspicuous white lip, tipped with rose; several of the showy *Lælio-Cattleya* × *Nysa* and its varieties purpurea and splendens; *L. C. × Eunomia*, *Lælia* × *juvenilis*, the rare orange-coloured *Lælia monophylla*, with thirteen flowers; the elegant *Cologyne Veitchii*, with long drooping spikes of white blooms; *Cattleya* × *Patrocini*, *C. × Wendlandi*, *C. × porphyroplebia*, *Lycaste leucantha*, *Oncidium Marshallianum*, *Cypripedium* × *T. B. Haywood*, and other *Cypripediums*, &c.

C. H. FEILING, Esq., Southgate House, Southgate, N. (gr., Mr. F. Canham), staged a very pretty group, made up of some three dozen excellently-grown and profusely-flowered *Dendrobium Phalaenopsis Schoderianum*, the different plants varying from the light-coloured and white varieties tinged with rose, to the dark-tinted forms, the light ones predominating; and arranged with them were several good *Cattleya labiata* Gaskelliana, *C. Gaskelliana* Feilingi being a pretty white flower, with a pale rose-pink flush on the lip. Also in the group were *Cypripedium* × *Bryan* and other showy kinds, the group securing a Silver Banksian Medal.

Messrs. HUGH LOW & Co., Bush Hill Park, Enfield, were awarded a Silver Banksian Medal for an effective group, in which were several good varieties of *Vanda cœrulea*, and good examples of *Lælio-Cattleya* × *intermedia-flava*, *L. C. × Pallas*, *L. C. × Nysa*, *Lælia* × *elegans*, *Cattleya* × *porphyroplebia*, *C. velutina*, *Cypripedium* × *picturatum*, *C. × Palawanense*, *C. × Harrisianum superbum*, *C. × marmorophyllum*, and the large and prettily marked *C. × T. W. Bond*.

JEREMIAH COLMAN, Esq., Gatton Park (gr., Mr. W. King), showed *Cattleya* × *Hardyana* "Mrs. J. Colman," a form with peculiar features, in the purplish-crimson labellum having but very fine orange lines at the base, the lip at a short distance appearing to be almost wholly of a purplish-crimson colour.

Messrs. J. W. MOORE & Co., Ltd., Cragg Royd Nurseries, Rawdon, near Leeds, sent a fine plant of *Vanda cœrulea*, bearing a very stout inflorescence.

C. L. N. INGRAM, Esq., Elstead, Godalming (gr., Mr. T. W. Bond), sent *Lælio-Cattleya* × *T. W. Bond* (*C. labiata* ♀, *L. purpurata* ♂), a large flower, differing somewhat from *L. c. × ximlia* and other crosses of the same parentage previously shown. Frau IDA BRANT, Riesbach, Zurich, sent a good inflorescence of *Angraecum Ellisii*, and spikes of a form of *Odontoglossum Lindleyanum*, with purple front lobe to the lip.

Messrs. F. SANDER & Co., St. Albans, showed two examples of the fine *Dendrobium atroviolaceum*, which they have succeeded in importing in quantity, some plants of *Odontoglossum grande*, and *Cypripedium purpuratum*.

Fruit Committee.

Present: Philip Crowley, Esq. (chairman), and Messrs. Jos. Cheal, A. H. Pearson, J. Wright, Alex. Dean, J. W. Bates, Geo. Wythes, H. Balderson, J. Smith, W. J. Empson, Robt. Fife, and Geo. Reynolds.

An Award of Merit was recommended to the perpetual-fruited Strawberry St. Joseph, fruits or plants of which were shown by Mr. JAS. HUDSON, Messrs. H. CANNELL & SONS, Swanley, and Messrs. GEO. BUNYARD & Co., Maldstone. Mr. HUDSON's exhibit of plants fruiting in pots represented the variety very finely, and it is the best of these continental varieties yet in commerce.

Messrs. JOHN LAING & SONS, Forest Hill Nurseries, London, S.E., contributed a collection of Apples and Pears in about 100 dishes. Among the Pears, varieties showing signs of ripeness were Louise Bonne of Jersey, Clapp's Favourite, Souvenir du Congrès, Duchesse d'Angoulême, and Williams' Bon Chrétien. There were upwards of seventy dishes of Apples, including kitchen and dessert varieties (Silver-gilt Knightian Medal).

Another large exhibit of fruit was made by Messrs. J. PEED & SONS, Roupell Park Nurseries, Norwood Road, London. In this exhibit were excellent Grapes of the varieties Trebbiano, Barbarossa, Syrian, Gros Colmar, Golden Queen, Alicante, Muscat of Alexandria, Mrs. Pince, Madresfield Court, Alnwick Seedling, and Black Hamburg. Of Pears we noticed commendable specimens of Louise Bonne of Jersey, Hazel, Flemish Beauty, Clapp's Favourite, Williams' Bon Chrétien, &c. Of Apples there were numerous varieties, there being of Apples and Pears together about ninety dishes (Silver-gilt Knightian Medal).

Messrs. W. PAUL & SONS, Waltham Cross, Herts, contributed a group of orchard-house fruit-trees in pots, most of them were Apples, but there were a few specimens of Pears, and a Lady Palmerston Peach was included, and several dwarf Fig-trees in fruit. In front of the trees were fifty-two dishes of Apples. The fruits and trees were exceedingly meritorious (Silver Gilt Knightian Medal).

Mr. J. MILLER, gr. to Lord FOLEY, Ruxley Lodge, Claygate, Surrey, again showed a collection of choice hardy fruits. There were ten dishes of Apples, eight of Pears, four of Peaches, three of Plums, one of brown Turkey Figs, and one of Pitmaston Orange Nectarine (a Silver Banksian Medal was awarded this exhibit).

There was a fine collection of Apples from Jersey, which showed how very finely certain varieties do in Jersey. The exhibit was made by F. S. ROBERTS, Esq., Beauvoir, St. Saviour's, Jersey (gr., Mr. R. J. Hamill). The Apples best shown were Emperor Alexander and Mère de Ménage, both of these, the former particularly, being excellent in size and quality. Ribstons, Cox's Orange Pippin, Golden Noble, Worcester Pearmain, and others were commendable. There were twenty-six dishes of fruit (Silver Banksian Medal).

The best exhibit of fruit illustrative of Mr. Roupell's lecture was one from Mr. G. Kelf, gr. to Mrs. ABBOTT, South Villa, Regent's Park. This garden is within two miles of Charing Cross, but the fruit exhibited would have been creditable to a garden enjoying the advantages of a rural site. Alicante and Muscat of Alexandria Grapes were moderate in size, but extremely good in finish; six bunches were shown of each variety. There were four fine Melons, of the varieties Monarch, Blenheim Orange, Holborn Favourite, and another; Coe's Golden Drop Plums from pot-trees; and excellent samples of Tomatos, Peach Blow, Perfection, Golden Jubilee, Sutton's Dessert, and Duke of York. A bunch of fruits of *Musa Cavendishi* completed the exhibit (Silver Knightian Medal).

From W. ROUPPELL, Esq., Harvey Lodge, Roupell Park, S.W., were shown Fig and Persimmon trees in pots showing how Mr. ROUPPELL succeeds in cultivating fruits within the five miles' radius. A collection of fruits from the same garden was most praiseworthy. This included the following varieties of Grapes; Muscat of Alexandria, Gros Colmar, Diamant Traube (a white Grape), and Centennial. Of Tomatos, good samples of seven varieties were shown, and a number of dishes of Apples, including Lord Suffield, Ecklinville Seedling, Frogmore Favourite, Cellini Pippin, Warner's King, Emperor Alexander, and capital specimens of Bietigheimer, a German variety (Silver Knightian Medal).

Mr. WRIGHT showed from the Society's gardens at Chiswick a collection of 100 varieties of Apples, which were intended to illustrate the subject of the lecture. In these gardens the superintendent has to contend with every disadvantage a suburban garden is placed under, and remembering this, the exhibit of Apples was very satisfactory.

A collection of seven dishes of Apples, and of five dishes of Pears, was shown by Mr. W. COLLINS, The Gardens, Chios House, Clapham Park, London. A new Melon, named Foot's Sherbornian, from Messrs. E. FOOT & SON, Half Moon Street, Sherborne, was a white-fleshed variety, but it obtained no award.

Mr. JAS. DAY, gr. to the Earl of GALLOWAY, Galloway House, Gariestown, N.B., showed fruits of the pretty little Apple summer Thorle Pippin. It is described as an early dessert Apple, cultivated largely in Scotland (Vote of Thanks). From Mr. ARTHUR BULL, Cottenham, Cambs, came some extra-sized specimens of Pond's Seedling Plums.

Another exhibit of fruits was shown by Mr. H. Guyett, gr. to Mrs. GABRIEL, Leigham Court Road, Streatham. Of Pears and Apples there were twenty-nine dishes, also two dishes of Crabs, and three bunches each of Gros Maroc, Black Hamburg, and Black Alicante Grapes (Silver Banksian Medal).

From Messrs. de ROTHSCHILDS' garden at Gunnersbury House (gr., Mr. Jas. Hudson), were shown six fine fruits of the same number of varieties of Melons. These were Eureka, Scarlet, Triumph, Hero of Lockinge, Frogmore Orange, and Sutton's No. 69, a nice-looking green-fleshed fruit. Mr. Hudson had also very choice fruits of twelve varieties of Plums, gathered from his pot-trees grown in a cold orchard-house. These were Grand Duke, Coe's Golden Drop, Late Rivers', Prince Claude de Bay, Monarch, Imperial de Milan, Ickworth Imperatrice, Gutrie's Late Gage, Rivers' Orange (new) Transparent, Golden Transparent, and Late Transparent (Silver Banksian Medal).

A nice collection of fruits and vegetables was shown by W. LAWRENCE, Esq., Elsfeld House, Hollingbourne (gr., Mr. T. Robinson), which was recommended the Award of a Silver Banksian Medal. Besides specimens of most kinds of vegetables, there were Black Alicante, Buckland Sweetwater, and Gros Maroc Grapes; seven nice Melon fruits; Princess of Wales, Lord Palmerston, and Sea Eagle Peaches; Pears, Dr. Jules Guyot and Madame Treve; and Peas-good's Nonsuch Apples.

A remarkable exhibit of Mammoth Onions was made by Mr. W. J. EMPSON, gr. to Mrs. WINGFIELD, Amptill House,

Amphill. He had fourteen varieties, and the heaviest bulbs were of the variety Record, eighteen of which were said to weigh 44½ lb., and the heaviest of these was 2 lb. 11 oz.; Bedfordshire Champion, Ailsa Craig, Lord Keeper, Holborn, Cocoa-nut (in shape like a Cocoa-nut), Cranston's Excelsior, Golden Globe Tripoli, Magnum Bonum, Brown Globe, a nice-looking, brown-skinned variety of the Globe section; and Rousham Park Hero were all of exceptional size. A type of the Globe Onion labelled Empson's Selected Champion Globe was a heavy, clean-looking Onion of the best possible shape. The exhibit was a further testimony to the skill of Mr. Empson in producing first-class exhibition vegetables. The Onions shown together weighed something like half a ton (Silver Knightian Medal).

Lecture.

FRUIT-CULTIVATION IN SUBURBAN GARDENS.

Mr. W. Roupell, who delivered a lecture upon this subject, referred in his opening remarks to the main drainage scheme of London. Necessary as this is from sanitary and other reasons, said Mr. Roupell, it has intercepted springs and rivulets, and had robbed the suburban gardens of the moisture that previously rested in the subsoil. In periods of drought the trees suffer greatly—more than formerly. More than this the present system of drainage was severely condemned from the point of view of waste. The great quantity of organic matter carried down to the sea, is not only poisonous to the fishes, but it represents just so much loss of manure to the land—manure that properly belongs to it.

The condition of standard fruit and other trees in suburban gardens is therefore less satisfactory than it should be. Suburban gardening is more difficult than it was thirty years ago. When the old gardens were made they were composed of the original soil of the district, but, latterly the light soil from such sites had been appropriated by the builder, and new suburban gardens were generally composed of clay and a variety of rubbish. In most of the old gardens the surface-soil is exhausted, and generally permeated with fungoid growths and insects. Such gardens, said Mr. Roupell, should be trenched. After rebuking young gardeners for exhibiting a preference for potting-shed work, and for showing a contempt for the spade, Mr. Roupell said that when trenching such ground, it was as advisable to bring a little clay to the top, providing that it be done in a moderate degree. If dressed with lime and left exposed upon the surface for a time, it would be reduced to a condition in which it can be worked. Burnt clay, wood-ashes, &c., may be useful to mix with such soil. The clearings from fowl-houses, dovecote, all the soot obtainable, and other manurial agents, should be preserved and put at the bottom of the trenches. When the soil has been so treated, it should be given a heavy dressing with quick-lime, and in spring some half-inch bones or bone meal may be forked-in. A green crop, such as Tares, should then be sown, and the following season the land will be in good condition for fruit-tree planting. Stable-litter is of use as a mulch, but is not of great manurial value.

In the matter of planting trees, Mr. Roupell had never been able to obtain such perfect pyramid trees from maiden plants as he had grown from trees bought from the nursery when two years old.

In regard to pruning, Mr. Roupell is of opinion that when the foundation of a tree has been laid, the subsequent pruning should consist rather in thinning the growths than in shortening them. Summer pinching, too, has its uses, but a tree reduced to a stunted growth by severe pinchings will never recover itself.

Cordons were next alluded to, and the amateur standard, a form of tree which is permitted to fruit as an upright cordon until a head is formed, and it becomes a standard. Mr. Roupell declared that all his standards are formed in this manner. Next the lecturer rightly insisted that fruit trees should be cultivated and manured as a crop. Tall-growing vegetables ought not to be planted between them. If any of the trees are too vigorous, have them lifted and replant them. Should the specimens be too large, the roots may be pruned, operating upon those on one side of the tree each season.

Mr. Roupell then proceeded to speak of the alleged dying-out or decadence of certain varieties of Apples. Ribston Pippin, said he, could be obtained in thousands of instances upon the Paradise stock, quite free from canker, and in perfect health. Mr. Roupell went on to speak of certain varieties of Apples mentioned by Shakespeare, and that are still existent; also of others described by Parkinson.

Speaking of frost, the lecturer said that generally the crop of fruit for the season depended upon the character of the weather during the period the trees are in bloom. In his own garden this year there was no frost when the Apple-trees bloomed, and he has a crop of fruit; but when the Pear-trees bloomed there was severe frost, and the result is, that only on the most sheltered portions of the trees are there any fruits. Mr. Roupell spoke of Apples, Pears, Melons, Grapes, Peaches, Cherries, Currants, Gooseberries, Figs, Strawberries, Mulberries, and Blackberries, and the suitability of each kind of fruit for cultivation in London suburban gardens. In reference to the uncertainty attached to a crop of Melons, and comparing an indifferent Melon to a good Tomato, to the latter fruits advantage, Mr. Roupell related an amusing anecdote. He said, that in Covent Garden recently there was a consignment of very indifferent Water Melons, and it was difficult to find a purchaser for them, but eventually some person obtained them at a very cheap rate indeed. He in turn, however, had a great difficulty in disposing of them, but at last, despairing of selling them as Melons, he easily and

quickly sold them as Vegetable-Marrows. There was no subsequent complaint from the buyers. Mr. Roupell thought that many indifferent fruits of the Melon might be improved by boiling. The Fig, Mulberry, Blackberry, and Peach-tree were especially recommended to the London suburban fruit-grower as being certain to yield good results. Cherries, unless netted, could not be ripened successfully on open walls; the birds would not allow them to yield a crop. Plums, excepting the Victoria, did not succeed easily near London, but if the trees were unfruitful, much benefit might be done them by lifting the roots, adding a little lime, and replanting them very firmly. The choicest fruits, however, could only be obtained from orchard-house cultivation. Of the Blackberries, *Rubus laciniatus* was by far the best.

Mr. J. Cheal, who presided, said he was of opinion that the main drainage of London had none but good effects. It was impossible to drain such stiff subsoil too effectively. He, however, hoped that a means would be found of using the organic matter now wasted.

SHIRLEY AND SURROUNDING DISTRICTS GARDENERS' AND AMATEURS' MUTUAL IMPROVEMENT ASSOCIATION.

SEPTEMBER 9.—The usual monthly meeting of the above Society was held at the Parish Room, Shirley, Southampton, on the above date, Mr. B. LADHAMS presiding over a fair attendance of members. The lecture was given by Mr. GEORGE GARNER, gr., Cadland Park, Hythe, Southampton.

It was a sound practical lecture on all the up-to-date methods of growing high-class vegetables. Necessarily the instructions given were brief, but at the same time no point of culture was missed. Mr. Garner is a believer in much mulching of crops, and in such a season as the present he is fully justified. At the close of the lecture there was a lively discussion, chiefly as to the value or otherwise of sea-weed as a manure. A hearty vote of thanks to the lecturer closed a very interesting meeting. There was a bright little display of flowers and vegetables—the latter for prizes. C. G. STUART MENTETH, Esq., J.P. (gr., Mr. W. Risbridger), was 1st, for six sorts; and W. T. G. SPRANGER, Esq., the President (gr., Mr. H. Curtiss) was 2nd. In the class for four sorts of vegetables, open only to cottagers, Mr. J. R. COLE was 1st, and Mr. C. CURTIS 2nd. Cannas, Dahlias, and Cockscombs were shown by Mr. E. G. WILCOX; seedling Pelargoniums, Dahlias, &c., by Mr. F. COZENS; and herbaceous plants, by Mr. B. LADHAMS.

ROYAL CALEDONIAN SHOW.

SEPTEMBER 14, 15.—The following special awards were made too late to chronicle in our issue for September 17:—

A Gold Medal to HER MAJESTY THE QUEEN (gr., Mr. Owen Thomas); and a like award to Messrs. J. VITCH & SONS, Ltd., Chelsea, for a group of plants. Silver Medals also were awarded to the undermentioned, viz., Mr. JONES, Lewisham; Messrs. WALLACE & CO., Colchester, for Liliums; Messrs. D. & W. BUCHANAN, Kippen, for a charmingly arranged table of Grapes, Tomatoes, and vases furnished with foliage; also to Messrs. W. THOMSON & SON, for table of plants, Grapes, and Tomatoes. First-class Certificates also were awarded to Mr. W. ANGUS, Norwood Hall Gardens, Aberdeen, for a double-flowered Sweet Pea; to Mr. CAMPBELL, Auchencraigh, Blantyre, for yellow Carnation Miss Alley; and to Messrs. D. & W. BUCHANAN, Kippen, for a new variety of black Grape.

The group of plants and flowers, among which were several masses of flowering Lily of the Valley, from Mr. JOHN DOWNIE, nurseryman, Princes Street, Edinburgh, was omitted from last week's sketch of the show.

HORTICULTURAL SHOW AT CHELTENHAM.

SEPTEMBER 21.—The autumn show of the County of Gloucester and Cheltenham Royal Horticultural Society was opened on Wednesday afternoon at the Winter Gardens, Cheltenham, in veritable summer weather. A tent had been erected on the lawn near the Promenade for the ornamental groups and flowers, and the rink of the building was devoted to fruit, vegetables, table decorations, and exhibits not for competition. One of the chief features of the exhibition was the display made by the four competitors for the substantial prizes offered for ornamental groups of flowering and foliage plants, arranged for effect, to cover 30 square feet. The class was open to all England, but the two leading prizes remained at home, the first having been secured by Mr. J. CYPHER, of the Queen's Nurseries; and the 2nd by Mr. T. P. W. BUTT (gr., Mr. G. W. Marsh); the 3rd was given to W. FINCH, of Coventry; and an extra prize was awarded to Mr. W. VAUSE, of Leamington.

Dahlias made a brilliant show, and competition was keen. For twenty-four distinct blooms, Messrs. HEATH & SON, Cheltenham, were placed 1st; Messrs. KEYNES, WILLIAMS & CO., Salisbury, 2nd; and Mr. W. TRISSEDER, Cardiff, 3rd.

Gloucestershire amateurs were well to the front in a class for twelve distinct blooms, the successful exhibitors being Mr. T. HOBBS, Bristol; Mr. HARRIS, Bristol; Mr. WHITING, Cheltenham.

Col. ROGERS (Mr. Lusty, gr.) beat the Rev. J. P. DAVIES (Mr. Mansfield, gr.) in collections of zonal Pelargoniums, though better had been exhibited.

MARKETS.

COVENT GARDEN, SEPTEMBER 22.

[We cannot accept any responsibility for the subjoined reports. They are furnished to us regularly every Thursday, by the kindness of several of the principal salesmen, who revise the list, and who are responsible for the quotations. It must be remembered that these quotations do not represent the prices on any particular day, but only the general averages for the week preceding the date of our report. The prices depend upon the quality of the samples, the supply in the market, and the demand; and they may fluctuate, not only from day to day, but often several times in one day. Ed.]

POTATOS.

60s. to 85s. per ton. John Bath, 52 and 84, Wellington Street, Covent Garden.

REMARKS.—On Monday morning last a slight frost was general in the Thames valley and Middlesex. The Plums Victoria, and Black Diamond will about finish this week; the Prunes from Bucks have commenced to come in, also the "Switzens" from the Rhine. These Switzens are like our Muscat Plum. Tomatoes are easier in price; the loose Horse Radish from Lincoln and Cheshire is coming in. Many of the Brussels Sprouts are infested with fly, and the best Cabbage supply is coming from the North.

CUT FLOWERS.—AVERAGE WHOLESALE PRICES.

ORCHID-BLOOM in variety.

SEEDS.

LONDON: September 21.—Messrs. John Shaw & Sons, Seed Merchants, of Great Maze Pond, Borough, London, S.E., write that, as might be expected, the sale for Trifolium is now rapidly falling off. New English Winter Tares are cheap, good, and abundant; Rye, however, being in short supply, and much wanted, is dearer. Sowing Rapeseed realises full prices. New home-grown white Mustard exhibits fine quality. For Blue Peas and Haricot Beans there is more inquiry. Canary, Millet, and Hemp seeds present no fresh feature. The new English Broad Beans come good and cheap.

FRUIT AND VEGETABLES.

GLASGOW: September 21.—The following are the averages of the prices recorded since our last report:—Grapes, English, 9d. to 1s. per lb.; Muscats, 1s. 6d. do.; Scotch, 1s. 3d. do.; Guernsey, 4d. to 5d. do.; Apples, American, 16s. to 20s. per barrel; do., Canadian, 16s. to 20s. do.; do., English, 10s. to 20s. per cwt.; Plums, Victoria, Cambridgeshire and Kent, 14s. to 20s. per cwt.; do., Edinburgh, 2s. 6d. per sieve; Lemons, Naples, 16s. to 25s. per case; Melons, home, 2s. to 2s. 6d. each; Pears, Havre Williams, 5s. to 6s. per case; Oranges, 1s. 6d. to 2s. per dozen; Onions, Valencia, 4s. to 6s. per case; do., Dutch, 3s. 3d. do.; Cucumbers, 2s. to 3s. 6d. per dozen; Tomatos, Scotch, 6d. to 8d. per lb.; English, 4d. do.; Guernsey, 3d. do.; Cabbages, 7d. to 10d. per dozen; Cauliflowers, 2s. 6d. per dozen; herbs, 1d. to 2d. per bunch; Mint, green, 6d. to 9d. per bunch; Parsley, 1s. to 1s. 6d. per stone; Potatos, best, 1s. do.; Lettuces, 6d. to 9d. per dozen; do., Cos, 9d. do.; Radishes, 1s. 6d. per dozen bunches; Horseradish, 1s. 6d. per bundle; Mushrooms, 6d. to 1s. per lb.; Beetroot, 4d. to 5d. per dozen; Mustard and Cress, 3d. per punnet; Turnips, white, 2d. to 3d. per bunch; Celery, Scotch, 1s. 6d. per bunch.

LIVERPOOL: Sept. 21.—St. John's: Potatos, 10d. to 1s. per peck; Grapes, English, 1s. 6d. to 3s. per lb.; do., foreign, 4d. do.; Pine-Apples, English, 4s. to 5s. 8d. each; Damsons, 3d. per lb.; Cob-nuts, 10d. per lb.; Cucumbers, 3d. to 4d. each; Mushrooms, 1s. per lb.; do., 1s. per basket. Wholesale Vegetable Market: Potatos, Giants, 1s. 6d. to 2s. 2d. per cwt.; Main Crop, 2s. 4d. to 3s. do.; Bruce, 2s. to 2s. 6d. do.; Turnips, 6d. to 8d. per dozen bunches; Carrots, 6d. to 8d. do.; Parsley, 4d. to 6d. do.; Onions, English, 6s. to 7s. per cwt.; do., foreign, 2s. 6d. to 3s. 3d. do.; Cucumbers, 1s. to 2s. 6d. per dozen; Cauliflowers, 8d. to 1s. 6d. do.; Cabbages, 6d. to 1s. 2d. do.; Celery, 1s. to 2s. do.

CORN.

AVERAGE PRICES OF BRITISH CORN (per imperial qr.), for the week ending September 17, and for the corresponding period of 1897, together with the difference in the quotations. These figures are based on the Official Weekly Return:—

GARDENING APPOINTMENTS.

MR. H. ATTFIELD, for the past seven and a half years Gardener to the Right Hon. Lord STANLEY, at Cowarth Park, Sunningdale, as Gardener and Bailiff to Sir GEORGE FROST, Bart., Warfield Grove, Bracknell, Berks.
MR. T. JIGGLE, as Gardener to ENGLISH HARRISON, Esq., Q.C., Gosmore, Hitchin, Herts.
MR. E. HERRING, late Gardener at Rous Leuch Court, as gardener to J. T. FORMAN, Esq., Wilford House, Wilford, near Nottingham.
MR. F. W. CAVILL, of Derwent Lodge Gardens, Cockerinmouth, as Gardener to H. B. MILDWAY, Esq., Flete, Ivybridge, South Devon.
MR. T. T. WHITTELL, until recently at High House Gardens, Orford, as Head Gardener to H. D. PALMER, Esq., Stour Bank, Nayland, Colchester.
MR. J. MACK, for sixteen years at Drayton Manor Gardens, Tamworth, has succeeded Mr. RYE as Head Gardener to Lord HARRIS, Belmont, Faversham.
MR. WM. WALLACE, late Foreman of Clumber, Worksop, Notts, has been appointed Head Gardener to HUGH COLINS SMITH, Esq., Mount Clara, Rushampton, Surrey.

NOTICES TO CORRESPONDENTS.

ADDRESS WANTED: If H. S. will kindly send his full name and address, not necessarily for publication, but to constitute his *bona fides*, we may insert his article on Cactus Dahlias.

ARAUCARIA IMBRICATA GUMMING: J. H. We fear that unless you can very effectually drain the land under and around the tree, or remove it to a dry place, or raise it on to a mound 2 or 3 feet above the surrounding level, the tree will succumb to the gumming. Araucaria imbricata dislikes a wet impervious soil.

BEGONIAS: G. Tourret Grignan. Flowers such as you mention are by no means uncommon, and have been noted in these columns and in teratological works.

BOOKS: Milner's Landscape Gardening: J. W. The publishers are the Messrs. Simpkin, Marshall, Hamilton, Kent & Co., Stationers' Hall Court, London. We do not know the price of the work.

CHRYSANTHEMUM FLOWER-BUDS SPOILED BY INSECTS: W. T. Before we can tell you the name of the insect or insects which occasion the damage, you must catch some and send them to us for identification. There are various plant-bugs which sometimes injure the flower-buds, and the earwig is a pertinacious offender in this respect, as is also the caterpillar of the Dot moth, Noctua persicaria.

CHRYSANTHEMUM LEAVES AFFECTED WITH FUNGUS: A Lady Gardener should read the note which appeared on this subject in our issue for Saturday last, p. 228, 1st column, under similar heading to the above. See also *Gardeners' Chronicle* for October 9, 1897, pp. 256 and 260.

CUPRESSUS ERECTA VIRIDIS: R. E. Cuttings of most species of Cupressus root with difficulty. When the cuttings have formed a callus, they should be re-bedded in a fresh sand-bed, or in pots, the change accelerating the formation of roots. In the case of cuttings put in last autumn, this operation would be called for in the spring. A mild degree of bottom-heat hastens both callusing and rooting, but it should not exceed 75°. Cuttings of Cupressus having a total length of 6 inches should not be inserted to a greater depth than 1½ inch.

CUTTING BACK ROSE SPOCKS: Sceptic. The stocks (Briars) should be kept denuded of all growths (unless the stocks are weak), excepting the two or three that are budded, which should not be shortened until all danger of the inserted buds starting to grow is at an end, when a slight shortening, in order to prevent injury by wind may be performed; or they may, instead, be bundled up together. In the spring the wilding shoots should be cut close back to the buds.

FRUITING OF STEPHANOTIS FLORIBUNDA: Rex. The fruiting of this stove-creper is by no means uncommon. The fruit is poisonous, as doubtless are other parts of the plant.

GUMMING OF A PLUM-TREE: Oak. The gumming is probably set up by hard pruning following excessive growth of shoots. If that be so, root-pruning will check this exuberant growth, and the resultant better cropping of the tree will tend still further to do so. Mix with the staple when replanting, after pruning the roots, a good proportion of mortar-rubble and charred soil, and afford no manure. Sometimes gumming is induced by a fungus, Nectria ditissima, which enters the tissues at the wounds caused by the knife in pruning. It is then difficult of cure, but by cleaning out gummed places, and using a thick paint of sulphur, clay, and soft-soap in the winter, it can be eradicated in a season or two. Trees liable to gum should have most of the pruning done to them in the early summer months, so that in the winter there is little pruning with the knife necessary.

INSECTS: W. Treseder. 1, The mining larvæ of Gracilaria syringella, a minute moth, found also on Lilac and Ash; 2, a young Noctua larva, not recognised; 3, Agrotis segetum, or exclamationis, both very common and destructive; 4, an ichneumon fly, parasitic on larvæ feeding in wood; 5, not recognised. R. McL.

NAMES OF PLANTS: Correspondents not answered in this issue are requested to be so good as to consult the following number.—J. Kemp. Phytolacca decandra, the Virginian Poke-weed.—X. Y. Z. 1, Gesnera zebrina; 2, Begonia corallina; 3, Dracæna hybrida; 4, Dichorisandra vittata, so far as

we can judge from a discoloured leaf; 5, send flowers; 6, Peperomia argyræa.—Capt. S. S. Stanhopea oculata. Interesting on account of its being flowered from an imported seedling.—M. E. 1, Torilis anthriscus; 2, Tordylium maximum; 3, Poterium officinale; 4, Centaurea nigra; 5, Stellaria uliginosa; 6, Leontodon hispidus.—J. Hibiscus Manihot.—H. D. 1, Cratægus, not recognised; 2, Rhamnus Frangula.—A. S. Cuscuta European Dodder.—W. J. T., Exeter. Lobelia fulgens.—F. H., Sheffield. Eonymus macrophyllus argenteus.—H. V. 1, Polystichum angulare, quite hardy British Fern; 2, Helianthus decapetalus; 3, Helianthus doronicoides; 4, Helianthus rigidus; 5, not found; 6, Stachys lanata; 7, Corydalis lutea.—C. M. 1, Polygonum orientale; 2, specimen insufficient; 3, Clerodendron Bungei; 4, Selaginella Wildenovi; 5, Allium cepa var. aggregata (Potato-Onion).—G. W. Arctotis aspera var. arborescens, illustrated in Bot. Mag., t. 6528.—E. S., Woking. Erythraea centaureum.—Sceptic. Colchicum autumnale.—T. B. Cratxgus coccinea.

NAMES OF FRUITS.—Applications to name fruits are so numerous at this season, as seriously to hamper us in the exercise of our editorial duties. They entail an expenditure of time, labour, and money, of which our readers can have little idea. We are most desirous to oblige our correspondents as far as we can, but we must request that they will observe the rule that not more than six varieties be sent at any one time. The specimens must be good ones, just approaching ripeness, and they should be properly numbered, and carefully packed. We do not undertake to send answers through the post, or to return fruits. Fruits and plants must not be sent in the same box. Delay in any case is unavoidable.

D. N. R. Apples: 1, Warner's King; 3, Hawthornden; 5, Yorkshire Beauty; 4 and 9, Dumelow's Seedling; 6 and 7, Lord Derby; 8, Emperor Alexander; 10, Yorkshire Beauty; 11, Warner's King; 12, Worcester Pearmain; 13, Gloria Mundi; 14, Wareham Russet. Pears: 2, Pitmaston Duchess; 4, Durondeau; 5, Hesse; 7, Summer Fran: Real; 8, Beurré Diel; 10, Williams' Bon Chrétien. Some of these Pears were too ripe.—Thos. F. Webb. Plum: Mitchelson's. Apple: 2, Pomme de Neige. Pears: 1, Bergamot d'Esperen; 4, Comte de Lamy; 5, Beurré Bachelier.—Yeatman. Large Pear is Catillac; small one not known.—Lawrence & Sons. The Pear-shaped Apple you send us must proceed from the stock. It is quite distinct from Keswick Codlin, being quite acid; whilst Keswick Codlin is sweet and pleasant eating.

THERMOMETER: Frost. The thermometer will of course only indicate the temperature of the place where it is exposed, provided always that it registers correctly.

TOPPING THE "GRASS" OF CARNATION LAYERS: Correspondent. It is probably performed with the idea of checking the flow of sap to the leaves, and assisting thereby in the formation of a callus, and subsequently of roots. It serves also to indicate the layered shoots. But seeing that layers grow just as well when untopped, and other means can be used to mark the layers, the practice is uncalled for.

WOODLICE: Frere & Co. The simple remedy of pouring boiling water into their haunts is as good as any if followed up. All litter and light rubbish likely to afford hiding-places should be cleared away. Richard's XL-ALL, which is fatal to all insects, might be tried.

COMMUNICATIONS RECEIVED.—H. G. H.—R. P. B.—E. Webb & Sons.—D. T. F.—D. Nicoll.—R. C. J. & A. J. G.—H. R. W.—G. Fry.—F. Twyford.—W. R.—A. Long Subscriber.—H. H.—E. S. G. B. M.—W. S.—D. Kidd.—W. L., Glasgow.—G. S.—J. S. W.—G. D. W. B.—L. K.—W. S. A.—H. W.—J. B. & Sons.—Lay, Kent.—S. S.—X. Y. Z.—Constant Reader.—M. E.—T. W. W.—Amateur.—J. Shaw.

PHOTOGRAPHS, SPECIMENS, &c., RECEIVED WITH THANKS.—H. W.—C. R. De la Salle (acknowledgment delayed).

DIED.—On September 2, 1898, at Woodhouse, Loughborough, Leicestershire, JAMES MACLEAN, in his eighty-sixth year. Formerly head gardener at Beaumanor Park for forty years, retiring in 1885.

CONTINUED LARGE INCREASE in the CIRCULATION of the "GARDENERS' CHRONICLE."

Important to Advertisers.—The Publisher has the satisfaction of announcing that the circulation of the "Gardeners' Chronicle" has, since the reduction in the price of the paper, MORE THAN DOUBLED, and that it continues to increase weekly. Advertisers are reminded that the "Chronicle" circulates among COUNTRY GENTLEMEN, and ALL CLASSES of GARDENERS and GARDEN-LOVERS at home, that it has a specially large FOREIGN AND COLONIAL CIRCULATION, and that it is reserved for reference in all the principal Libraries.

(For Weather, see p. xiii.)

THE

Gardeners' Chronicle.

SATURDAY, OCTOBER 1, 1898.

ANOTHER FRUIT ENEMY.

A newly-introduced Scale-insect (*Diaspis (Aulacaspis) amygdali*), its Introduction, Description, Distribution, and the Means of Combating it.

IT may be well to state at the commencement that this pest is quite distinct from the San José scale-insect (*Aspidiotus perniciosus*, Comstock) of the American fruit-growers, which up to the present moment has engaged the attention of the whole fruit-growing industry of the world. But it belongs to the same destructive family of scale-insects (Coccidæ), and being of western Asiatic origin, inhabiting a region with a climate somewhat resembling our own, gives us far greater cause for alarm than did its sub-tropical relative—the San José scale. We, therefore, beg to lay before the British public an account of its introduction into this country, together with a description of the insect, of its general distribution in other parts of the world, and of its destructive character, in the hopes that by such means we may not only assist the fruit-growers in identifying the insect, but gain by their united efforts in the speedy destruction of this newly-introduced pest.

HISTORY OF INTRODUCTION.

In January of the present year a consignment of several hundred Japanese Cherries (*Prunus pseudo-cerasus*) was imported into this country from Japan, which ultimately fell into many hands, and were disseminated over the British Isles without any knowledge they were badly infested with scale. In the following April two of the plants from the consignment were submitted to the writer for the purpose of identifying the insects upon them, which proved to be the destructive scale-insect, *Diaspis amygdali*, of Tryon.

On enquiry it was found that the greater number of the plants of this particular batch (100) had been planted outdoors since the time of their arrival; and, as the examination proved, the insects were not in any way affected by their change of climate, but appeared in a perfectly healthy condition. Information was at once forwarded to the correspondent as to the serious nature of the pest, with a request that the plants be at once destroyed. This, however, was not carried out; but measures were taken to destroy the insects by dipping the whole 100 plants in a hot paraffin emulsion, in the hopes the insects would not survive such drastic treatment. And so the matter rested until June 3, when the correspondent again informed the writer that a recent examination of the plants had been made, when it was found the insects

were still living, and it was thought another application of the insecticide would have completely destroyed them; but instead of temporising, the plants were all burnt. This was much the wiser plan, as we have the satisfaction of knowing the insects on this particular batch of plants are completely destroyed, and this, too, before the young ones (larvæ) had time to

should be taken to prevent any further importations of infested plants into this country, which can only be done by an inspection of them on arrival, and before they have been dispersed throughout the country.

DESCRIPTION OF THE INSECT.

To the unaided eye the scale or covering-shield of the female (puparium) is more or less circular, and closely resembles the common Rose-scale (*D. rosæ*); but is of a dusky white, the old examples being smoky grey or ochreous, and harmonising with the colour of the bark. They are of the size of an ordinary pin's head, and measure from 1 to 2 mm. (fig. 66, A, B). Beneath this scale the wingless, legless, inert, fixed body of the female undergoes its transformations, lays its eggs, and dies. For the purpose of identification it will be necessary, briefly, to describe the salient characters of the female (fig. 66, D), which alone affords us the means by which we can separate it from the numerous allied species belonging to the same sub-family. It is necessary first of all to boil the insect in caustic potash, stain, and ultimately mount in Canada balsam, when we shall find the margin of the tail (pygidium, fig. 67), which is composed of several segments, to be curiously fringed with spines and lobe-shaped organs. In the central position above is the anal orifice, and a number of cylindrical tubes connected with the derm, and it is through these latter that the scale-covering, or shield, is secreted. On the ventral surface is the vaginal opening, and surrounding it are five groups of circular spinnerets. As none but the expert student can discern the minute structural differences between species and species, it is useless here entering further into detail concerning them.

The covering scale of the male (fig. 66, C) is pure white, narrowly elongate, and much smaller than that of the female. Within this covering which somewhat resembles the finger of a glove, the insect undergoes its transformations, appearing in due season as a very tiny two-winged fly, having an orange-coloured body.

FIG. 66.—DIASPIS AMYGDALI (Tryon).

A, Insects of real size on branch of food-plant; B, Scale of the female, magn. 15 diam.; C, Scale of the male, magn. 20 diam.; D, Female removed from the scale, magn. 20 diam. (Original.)

hatch and migrate to other plants. In whose hands the remaining plants have fallen, has yet to be discovered,* and we earnestly appeal to all those who purchased Japanese Cherries from the same consignment to at once com-

FIG. 67.—DIASPIS AMYGDALI: TAIL (PYGIDIUM) OF THE FEMALE, MAGN. 250 DIAM. (Original.)

municate with us, at the same time sending examples of the insect for identification.

But numbers of foreign nurserymen import Japanese Cherries, &c., and in order to prevent a repetition of this, the most stringent measures

* Privately, I have ascertained the name of one firm who imported large quantities of the plants.

DISTRIBUTION.

It was originally discovered by Professor Tryon in Australia on the Peach. Mr. Green records it from Fiji, and says that in Ceylon it feeds on many species of plants, but that it is partial to the Pelargonium. Professor Cockerell found it injurious to a large number of plants in Jamaica, including the Grape

and Peach. The same author also received it from Trinidad. It was in 1892 that it first attracted attention in the United States, where it is a serious pest to the Plum and the Peach. It was also found there on a dwarf-flowering Almond and fifty Teabushes imported from Japan; the latter were destroyed (*vide Psyche*, March, 1898, pp. 190, 191). Professor C. Sasaki, of the Agricultural College, Tokyo, describes it (under another name) as a pest to the Mulberry-trees in Japan. Seeing that the insect was originally discovered in Australia, it might be suspected to be indigenous to that country; but I agree with Dr. L. O. Howard and the late Dr. C. V. Riley (*Insect Life*, vol. vi., pp. 287-295), that Japan is very probably the original home of the species, as we have now three authentic instances of its occurrence on freshly-imported plants from that country.

REMEDIES.

As the examples found in this country withstood the severe treatment of the hot paraffin emulsion, and as we are informed by the United States entomologists that it will survive anything but pure kerosine, our wisest course by far is to burn the infested plants. Undoubtedly the insect must be regarded as a dangerous species, which, if once established, would be difficult to eradicate, owing to the diversity of food-plants, and its decidedly hardy nature. *Robert Newstead, Grosvenor Museum, Chester.*

SEEDLING CAMELLIAS.

Now is the time to make sowings in broad pots or deep pans filled with sandy loam three-quarters, leaf-mould one quarter, and having a moderate amount of drainage materials in the bottom, as an excessive quantity renders the soil too dry for the vegetation of the seeds. The seeds should be dibbled in about half-an-inch deep, and 1 inch apart, the soil being made at the same time quite firm in every part, as well as smooth on the surface. The pans may be placed in a shady part of a cold pit, wherein frost is not allowed to enter, and the soil kept uniformly moist. The seeds will germinate by the arrival of spring, when a light place near the glass may be afforded them, taking the precaution to shade them from strong sunshine. Such plants form in two or three years excellent stocks for carrying grafts of named varieties; or to grow on, under ordinary greenhouse treatment, for flowering purposes.

THE EFFECT OF THE GRAFT ON THE FLAVOUR OF THE FRUIT.

The influence of the graft on the Grape-vine was discussed in these columns a short time ago, and a correspondent suggested the record of observations relating to the effect of the operation upon the taste of the fruit.* It is a suggestive and an instructive fact that no further information on this point has been published, for, however difficult it may be, by means of carefully-conducted experiments, to trace the reciprocal effect of the scion on the stock, and *vice versa*, as regards accurate results in general, still more difficult is it to obtain authentic data relating exclusively to the sense of taste which, in this connection, is so easily deceived by the eye and by the imagination.

That the graft does exert some influence on the taste of the fruit appears indisputable from the classic experiments of M. Daniel, to whose work reference has frequently been made in this journal. He has recorded, for instance, that when the black Belgian Haricot, whose pod has an agreeable taste, is grafted on a Soissons Haricot, which has a particularly disagreeable flavour, the Bean which is produced on the grafted plant acquires to a pronounced degree the taste of the fruit of the plant which has been used as the stock. Similarly, he has shown that when the Savoy Cabbage is grafted on the Turnip, the former acquires the very characteristic taste of the latter plant.

In each of these cases, however, the observer dealt with a plant possessing a particularly marked

taste, which was consequently the easier to detect; hence it is much more difficult to trace the effect of the graft in relation to plants the taste of whose fruit has a certain affinity, and which has not, as in the case of, say, the Onion family, any marked and distinguishing characteristic.

The most interesting work, as regards the importance of its results, which has ever been undertaken in horticulture in connection with the graft, is undoubtedly that which relates to the reconstitution of vineyards destroyed by the phylloxera. Certain American Vines whose roots resist the attacks of the insect are employed as stocks, whereon are grafted native Vines, which, thus protected, continue to yield fruit "after their kind." Now, it is an important and admitted fact that, apart from certain other results to which allusion need not now be made, the graft of European on American Vines does not alter the quality of the wine. The soils which gave noted wines under the old *régime*, says M. Ravaz, the Director of the Viticultural Station at Cognac, yield the same product with Vines grafted on imported stocks, and nothing is changed from this point of view. Similarly, in his work on *The Principal Varieties of Vines*, M. Cazeaux states that whilst grafting on American stocks may deepen the colour of the Grapes, and of the red-wine produced therefrom, whilst the maturity of the fruit may thereby be improved and hastened, the operation of the graft does not affect the taste, or the perfume, or the bouquet of the produce; and other authorities might be quoted to the same purpose.

It does not, however, follow that the operation of the graft has no effect whatever on the taste of the fruit, merely because the quality of the wine which is produced retains its old established reputation, inasmuch as recent experiments with other plants tend to show that one of the effects of the graft, when suitably applied, is indeed to ameliorate the savour of the fruit. A full account of experiments which corroborate this statement has been recorded in these columns,* where it was stated that "fruit-trees in general, and certain Pear-trees in particular, undergo changes according to the nature of the stock. The taste of the fruit, for instance, varies when the scion is grafted on Pear-stock, and when it is grafted on the Quince."

It must, moreover, be remembered that the theory of the graft has been completely altered during the present decade. The orthodox opinion on the subject implied that hereditary variation was purely of sexual origin, and, in a text-book which was published less than seven years ago, one of the most distinguished European botanists stated that the graft is a valuable means of fixing and conserving all the variations introduced into the embryo, because the process itself does not produce the slightest variation.

A very important communication on this subject was read at the recent horticultural congress in Paris, and afterwards at the Académie des Sciences. The author, M. Daniel, gives a *résumé* of all the experiments which he has made relating to the reciprocal influence of the scion on the stock, and *vice versa*, including the effect on the taste and quality of the fruit.

The fact which gives so much value to M. Daniel's experiments is due to their comparative character, that is to say, the grafted plant has in each case been grown side by side with a normal plant. Now, however interesting any single result of the graft may be, it loses all its value, says M. Daniel, unless it be compared with a control plant, grown under exactly the same conditions as the grafted plant (the operation itself excepted), hybridisation being of course avoided. This factor, however, implies an amount of labour and patience—not to mention expense—which are quite beyond the means of the ordinary horticulturist, and it is to the absence of this comparative element that M. Daniel attributes "the old-established legend of the graft, the outcome of contracted observation, of results wrongly interpreted."

However it may be, M. Daniel has grown his plants and conducted his experiments in the full light of day, under the eye of well-known scientific men who

bear witness to the genuineness of the work. It is not possible to give more than the following abstract of the results, which have, moreover, been published in detail in the *Mémoires* of the National Horticultural Society of France:—

1. The reciprocal influence of the scion and of the stock cannot be denied, even though it may not always act with the same intensity.

2. This influence may bear on the general nutrition of the plant, and indirectly on its size, vigour, and resistance to parasites; or it may affect the internal and external morphological character of the plant including its organs of reproduction, e.g., the fruit.

3. Those variations are frequently of an hereditary character, and appear during the course of the second generation.

4. This effect of the graft offers several practical advantages, viz., the production of larger and "better" fruit and vegetables (such as an improvement in their taste); and the direct production of new varieties, e.g., a modification of the colour of flowers, of the shape of fruit, &c.

5. The effect is more marked in herbaceous than in ligneous plants, and on the progeny of the grafted plant than on the plant itself.

6. The graft, which produces variation in the seed, may be employed to produce new varieties. The variation may frequently be diverted culturally, so as to impart, almost assuredly, after repeated graftings, certain qualities (taste, shape, colour, &c.), to a plant which did not originally possess them, and which varies easily under cultivation. As regards other plants, the graft still affords the means of obtaining variation, however difficult it may be; and as soon as the change is observed, it can be pursued in the desired direction, and with good results. *Scion.*

HARDY BAMBOOS.

(Continued from p. 212.)

PHYLLOSTACHYS FULVA, *Mitford* (fig. 68, p. 247).—A most pleasing Bamboo newly-introduced from Japan, having the colouring of *Phyllostachys aurea*, with the graceful habit of *P. Henonis* and *P. Boryana*. The native name is Ogon-chiku ("the golden Bamboo"). As the name "aurea" has already been taken, I have chosen "fulva," Virgil's epithet for gold, as being nearest in touch with the native name. In the *Shoku-butsu-Mei*, a synopsis of Japanese and scientific plant nomenclature, published by Mr. Matsumura, Professor of Botany in the Imperial University at Tokio, *Phyllostachys sulphurea* is given as the equivalent for Ogon-chiku; but the plant to which the name *P. sulphurea* has been given by Rivière (*Les Bambous*, p. 285) is quite distinct—at any rate from Ogon-chiku in a young state. The characteristic yellow colour of the stems is not fully developed until their second year, as is the case with the black stems of *P. nigra*. *A. B. P.-M.*, September 13, 1898.

THE CULTURE OF MELONS IN FRANCE.

ALTHOUGH claimed to be of East Indian origin, the Melon, whose botanical name is *Cucumis melo*, is to be met with in all warm and temperate climates. It is the form of the fruit and its skin that have led Melons to be divided into two general classes by the French, namely, "Cantaloups" and "Brodès." It is said that it is to some Armenian monks that Europe is indebted for the introduction of the fruit. They brought seeds to Europe in the middle of the sixteenth century, and sowed them in the Papal Palace Garden of Cantaluppi, at Rome. A century later the Melon became known in France. Columbus is said to have taken seeds of the Melon to America.

The wide range of varieties of the Melon may be best understood from the fact that its fruit varies from the size of a table Orange up to a weight of 66 lb. Owing to the facility with which the flowers can be crossed it is difficult to preserve any type pure for any length of time, no matter what precautions be exercised. If two varieties be raised near to one another, they will cross. Hence the origin of the multitude of varieties. The Cantaloups are generally large fruits, having deep furrows which divide the

* *Gardeners' Chronicle*, vol. xxiii., June 25, 1898, p. 397.

* *Gardeners' Chronicle*, March 27, 1897, p. 206.

cortical part into segments. These are covered also with protuberances, and raised lines that differ both in form and colour. The flesh is succulent, perfumed, sweet, and of an agreeable flavour. The hybrids are all fertile, and the plant bears male and

deep green spots on the rind. The Cantaloupe d'Algers is longer than it is broad, and the fruits are produced varying from 4 to 7 lb. It is of a dark green colour on a white base, and the surface is full of inequalities. The Cavaillon, from Avignon, is

loam, consisting of silicious sand, clay, oxide of iron, and carbonate of lime, suits the plant. When grown under frames or bell-glasses, the soil ought to possess a temperature of 70° to 80° Fahr. The market gardeners about Paris prefer manure from the stables of

FIG. 68.—PHYLLOSTACHYS FULVA. (SEE P. 246.)

female flowers. In the region round Paris the Cantaloupe variety is preferred by the market gardeners, the Prescott variety especially, which has generally a diameter of 12 inches. The black "Des Carmes" Melon, a plant of rapid growth, and adapted to forcing, has a diameter of 6 to 7 inches, and displays

an open-air variety, and is peculiar to the south of France. Its shape is oval, and its colour deep green; the flesh is either white or green, firm, melting, and sugary. It is a late variety, like the Malta.

Even when well manured the Melon does not succeed on a very light soil; a rich friable soil, such as

the omnibus company, as it ferments readily, but decays slowly, while maintaining an equable temperature. The manure of the ass, mule, poultry, and sheep is also good. Place some heather or bracken in the heap, so as to allow air to enter, and let one-fourth of the manure be fresh, so as to induce heat.

Tree leaves may be mixed with the manure, but no leaf-mould should be used in the soil of which it consists. The beds are made up at the end of the month of December; in any case, the beds ought to be prepared eight or ten days before sowing the seeds, so as to allow the first rank heat to subside. Melons can only be raised round Paris under glass, because in order to vegetate and fructify they require a constant, high temperature. Thus forced, they succeed, but only if the temperature is not permitted to fall below 77° to 86°, as to do that would ruin the crop.

Melon seed will retain its vitality for seven years at the least. Around Paris the seed is sown in the course of the month of January, chiefly towards the close, when the bed or frame has parted with its first heat, that is, diminished by about 9°. Earlier sowing does not lead to success, as the young plants suffer from lack of light. The frames are made either of Oak or iron; the latter have the advantage of folding up, and of being easily stored away when no longer in use, but they are colder than wood. To have a succession of Melons, the sowings are continued in the middle of the months of March and April, early and semi-early varieties being sown, so as to secure a succession of fruits. The seeds are sown three times more than are required in two shallow parallel drills made in the soil of the bed, and covered over with 1 inch of leaf-mould; thick matting is placed over the glass till germination takes place—a matter of six to eight days. If the heat be well distributed, the plants will make rapid progress, and develop the terminal shoot between the two cotyledons. Then transfer with great care the delicate plant, whose roots are very fine, either into a separate frame, or into 3-inch wide pots. The plan is very general to sow the seeds directly in small pots sunk in the bed, and then to repot into other pots of a larger size, observing carefully not to break the ball of earth, and thereby injure the roots. The main stem should have the tip nipped or cut off with a penknife above the third leaf, to induce branching out, the branches will soon become covered with flowers, both male and female. After pinching or cutting off a branch, scatter a little dry earth or ashes over the wound. The Melon is affected by cold and humidity together. Regulate the admission of air with much care, or the flowers will fall prematurely. When the fruits appear, the most promising are selected, and two per plant are generally allowed, and on opposite sides. One plant to 4 square feet under a frame is sufficient.

When the fruit commences to swell, the soil of the bed is covered with a thin layer of straw, to prevent a too rapid loss of moisture, and the quantity of water afforded is moderate, any excess producing decay. Underneath the developing fruit, a piece of slate or tile is placed, and air is freely admitted to the frame, only it is gradually increased in amount, and in accordance with outside conditions. Without fresh air the blooms will not set, and without sunshine the fruits have no flavour. In the South of France and Algeria, the Melon-plants are dibbled out directly from the nursery-beds into the fields, just like Cabbage-plants. Young Melon-plants should neither be too near nor too distant from the glass, and much humidity must be avoided by opening the frame for a little while daily. In cold weather the case must be covered with straw mats, then a layer of litter, and lastly, with a coarse straw mat. In this state the plants may remain, if necessary, for a month. Execute the work of transplanting, whether into pots or otherwise, during fine weather; if humid or wet, wait a day or so. After removing from the pot, cover the young plant with earth up to the cotyledons; many growers pour a little water over each plant, and envelop the frame with matting till such time as vegetation be resumed—a matter of eight days. Others, again, pile fresh manure round the frame, so as to secure extra heat. When the stem of the Melon commences to lengthen, the bed is covered over with a few inches of fresh manure; this process is said to secure heat around the roots, as the latter tend to rise to the surface of the bed.

Southerly winds are favourable to the culture of Melons, and as the fruit increases in volume, so turn it on the slate or tile every three or four days, in order to let it benefit all round by the sun's rays. When the frame is removed for good, select the close of a dull, cloudy day, first acclimatising the plants gradually to full exposure. A border having a southern aspect, and situated at the foot of a wall, is considered as a good site for Melon-beds. Fifteen years ago the market-gardeners at Doulon, near Nantes, in the west of France, cultivated the Cantaloupe and Brodé varieties of Melons in the open fields, but the culture has been abandoned. At the end of February the soil was turned up by the plough, and in April the Melon-seed was sown on heaps of manure, 2 to 2½ feet thick; all was covered over at night with matting. This was the nursery. Early in May the Melon-plants were dibbled into the re-ploughed and freshly-manured land; a few rough pinches to the stems were given in due course, and the reaping-hook cut away the stems when too entangled. In August and September the crop was ripe. The variety sown and grown in this rough manner belonged to the Brodé group, known as the Sucrin de Tours; it was a delicious fruit, of a powerful odour, but if the autumn chanced to turn out wet the Melons split, and the whole turned out a failure.

At present, in the south of France, the Melons grow in the open fields, no special care being given to their culture, and that is precisely what impairs their quality. Melons intended for export are gathered three days in advance, just when ripening commences. A Melon seldom keeps beyond a week, but if wrapped up in a moist cloth, and placed in a cool situation, it will remain fresh for a month. The plant is attacked occasionally by insects; however, a solution of tobacco soon extirpates them.

A good Melon ought not to be either too green nor too yellow: if the former, it is not ripe; if the latter, it is evidently too ripe, and will be devoid of flavour; if light, it is hollow, and juiceless. Before eating a Melon, let it lie in fresh water for a few hours. A Melon is mature when the colour becomes clear, and the odour perceptible.

At the close of June the season for Melons commences; then an excellent fruit, medium-sized, will readily command 25 francs. The close of the season is the first week in September, when the best Melons can be had for 1 franc. The Melon is not a fruit intended for either delicate or anæmic stomachs; but all persons requiring a stimulant, naturally robust, and capable of digesting liqueurs, can safely indulge in the fruit. In France, Melons are eaten either with pepper and salt, or with sugar; Dehaën recommends to mix or add "a little tobacco"! From its laxative virtues (its mucilage and essential oil), the fruit is accepted as excellent against constipation. *Edward Conner.*

THE ROSARY.

AUTUMN-FLOWERING ROSES.

THOSE Roses can hardly be described as true perpetuals, which do not bloom freely during the autumnal months. There are, unfortunately, not a few whose capabilities in this direction are extremely small; they are for the most part indifferent growers, and consequently are quite valueless from a floral point of view at this season. Horace Vernet, for example, which has been so highly and justly estimated for its beautiful colour, grows so very badly that it is of no service, at least in my own garden, after its first efflorescence, and might almost be accounted for this special reason a summer variety. On the other hand, such excellent hybrid perpetuals as A. K. Williams, Crown Prince, Charles Lefebvre, Duchess of Bedford, Madame Victor, and Margaret Dickson, which may be regarded as representing the *élite* of this important and extensive class, are finer at present than they have been this year.

Perhaps the most valuable of all autumnal Roses are the hybrid Teas. Their flowers for the most part are large, handsome, richly coloured, fragrant, and

abundantly produced. This is especially characteristic of La France; it is even more expressive of Caroline Testout, surely one of the most prolific varieties in existence, which by reason of its impressiveness—I can use no better term—should be included in every collection. A friend of mine who recently introduced it into Oregon, U.S.A., on my recommendation, tells me that he has been greatly impressed, alike by its marvellous growth and the dimensions of its blooms. I cannot but regard it as one of the greatest acquisitions of any kind we have hitherto received. It has, however, two very formidable rivals—Margaret Dickson and Gloire Lyonnaise. These are also magnificent Roses, whose value as autumn bloomers can hardly be over-estimated. Madame Pernet Ducher and Gustave Regis, though somewhat defective in central petals, are exquisite in bud, or even when half-blown. Viscountess Folkestone, which has a very charming salmon-pink colour, is also very productive in September and October, unless when grown in a shady situation. I have attempted to cultivate this highly-perfumed variety in such a position, for the sake of making its somewhat transitory flowers more enduring; but without success. Where, on the other hand, it has been planted in an open and sunny situation, it flowers luxuriantly; but its floral treasures are almost as evanescent as those of Bardon Job, whose velvety-crimson petals are so extremely attractive as to make its cultivator greatly regret that there are not more of these.

Few of the varieties accomplish anything worthy of consideration at this period of the year; the Teas, on the other hand, are, for the most part, splendid autumnal Roses, among the most conspicuous being Marie Van Houtte, Madame Hoste, Medea, Hon. Edith Gifford, Bouquet d'Or, Papa Gontier, Princess Vera, Madame Elie Lambert, Catherine Mermet, Souvenir d'un Ami, and its beautiful derivative, Souvenir de S. A. Prince. He who adequately cultivates these will not lack Roses during the autumn months. *David R. Williamson.*

ROSES AT FRANKFURT.

"Rosen, Rosen—überall Rosen," is the motto which occurs on an early page of the official catalogue of the great Rose exhibition, held at Frankfurt during the past summer. A vast garden was planted picturesquely with some 1600 sorts belonging to various groups. The catalogue contains the names of these several kinds, with other particulars relating to them. The whole is so well arranged that the booklet will form a useful permanent addition to the library of the rosarian. It may be had for a few pence (pfenniges) from Herr C. P. Strassheim, the Bureau der Rosen Ausstellung, Sachsenhausen, Frankfurt-a-M.

CULTURAL MEMORANDA.

EXACUM MACRANTHUM.

THIS pretty blue-flowering warm-house annual from Ceylon is seen very rarely in gardens, though most people appear to appreciate its beauty when they do see it. The bright yellow of the stamens, the blue of the petals, and the plant's dark green foliage, afford contrasts in colour which are most pleasing. A good plant in a 6-inch pot is capable of producing 200 to 300 blooms. The cultivation, though generally considered difficult, offers little difficulty when properly understood. Obtain some good strong cuttings, 3 inches in length, during October, or even in November; insert these cuttings round the sides of 2½-inch pots, putting about five or six cuttings in each pot. Use a compost of two parts fine loam, one part leaf-soil, and one part fine silver-sand; cover the compost in each pot with a layer of sand, so that when the dibber is inserted, the sand will trickle down the base of the hole in which the cutting will be inserted. Put the pots in the propagating-case, and keep the atmosphere moist, when nine out of ten will probably strike. When the cuttings have become well rooted, pot them singly into 3-inch pots, using a compost a little rougher

than that in which the cuttings were struck. Place the plants on a shelf near the roof-glass in a house of intermediate temperature, where they should remain until February or early in March; they may then be given their final shift into 6-inch pots. At this stage, use a compost consisting of good fibrous loam, which should be broken up into pieces about the size of walnuts, one part good Oak-leaf soil, and one part coarse silver-sand, with a sprinkling of soot, and a little chemical manure. Syringe the plants frequently through the growing season, and on no account allow red-spider or thrips to obtain a footing on the plants, or they will completely spoil the flowers.

In April, when the plants have become well established, they may be placed into a little cooler temperature, but close to the glass, and in a position free from draught or chill. At this stage they require a slight shading during the hottest part of the day, and twice a week a little stimulant may be given them. I have used liquid-manure from the cow-sheds and soot-water in a clear state with great advantage. Should the plants not break naturally when about 5 inches high, remove the tips, and repeat this as soon as the shoots are again 4 inches in length. They will require pinching three times to make nice bushy plants. In June, when the flowers commence to expand, take the plants into the greenhouse or conservatory, where they will keep up a succession of bloom for fully three months. Should thrips be troublesome, fumigate once a week with the XL-All vaporiser. Nice plants may be had for furnishing flowers the last three months of the year by striking cuttings in early spring. I much prefer winter-struck cuttings, but those struck during spring are very acceptable, as they bloom when small decorative plants are scarce. Plants in flower during summer should be shaded. H. H.

THE AMERICAN BLACKBERRY AND DEWBERRY.

RUBUS.—Of this extensive genus no fewer than twenty-five or more species are indigenous in the United States of America, where they are called by the various names of Raspberry, Blackberry, Dewberry, Cloudberry. Most of them are shrubby or suffruticose briers, with astringent roots and edible berries. Some have annual stems, without prickles. The only officinal species are *Rubus canadensis* and *R. villosus*, which are closely alike.

R. canadensis, Gray.—The Dewberry, sometimes also called Low Blackberry, or Creeping Berry, has a slender, somewhat prickly stem, which runs along the ground, and occasionally puts forth roots. The leaves are composed of three or five leaflets, which are ovate or ovate-lanceolate, generally pointed sharply, serrate, thin, and nearly smooth. The flowers are large, white, and arranged in racemes, with leaf-like bracts. The plant grows abundantly in old fields and neglected grounds in the Northern, Middle, and Southern States—in fact, it is found in almost all parts of the United States, and its cultivation extends all over America also.

Rubus villosus, or the Tall Blackberry.—The stem of the Blackberry is somewhat shrubby, from 3 to 7 feet high, branching, more or less furrowed and angular, and armed with strong prickles. The smaller branches and young shoots are herbaceous; the leaves are ternate or quinate; the leaflets ovate, acuminate, unequally and sharply serrate, and pubescent on both sides; the foot-stalk and mid-rib usually armed with short recurved prickles. The fruit is first green, then red, and when perfectly ripe is of a shining black colour, and of a most pleasant taste. It is a compound berry, consisting of numerous pulpy one-seeded drupes attached to the receptacle. The flowers are large, white, and in erect racemes, with a hairy, prickly stalk. The calyx is short, with acuminate segments. This species of *Rubus* is perhaps the most abundant of those indigenous of the United States of America. It is found growing in old neglected fields, along fences, on the borders of woods, in forest glades, and wherever tillage or too much shade and moisture

do not interfere with it. Its flowers appear from April to July, according to the climate, and its fruit is ripe in June to August, according to the climate. There are many cultivated and improved varieties or plants of this species. There has been a great improvement made by taking the wild plants and cultivating, crossing, and selecting the plants, until the American cultivated varieties are very numerous, and go by many different names designating the different berries.

The following are improved varieties, Dallas Blackberry, Kittatinny, Spaulding, Ohmer, Eldorado, Child's Ever-bearing Tree Blackberry, Sugar Plum (a new berry of recent introduction), Ancient Briton, Agawam, Erie, Lawton, Early Harvest, Minnewaski, Snyder, Taylor, Wilson, and Wilson Junior.

Dewberries.—In common speech, the word Dewberry is applied to any trailing species. There are several distinct types of trailing Blackberries, only three of which we need to concern ourselves with at present. It looks as if the Dewberries could be distinguished from the true, or bush, or tall Blackberries by their trailing habit, but there are some forms of wild Blackberries which are low and decumbent. There appears to be no true trailing form of the bush or common Blackberry. The best distinction between the Dewberries and the tall bush Blackberries lies in the inflorescence, or flower cluster. In Dewberries the flower clusters are cymose, the centre flower opening first, and the flowers are few and scattered. In Blackberries, on the other hand, the clusters are essentially corymbose or racemose, the lower or outer flowers generally opening first, and the flowers are usually borne in rather dense clusters. The Dewberries are also distinguished by propagating from "tips," while the Blackberries propagate by suckers.

The three most common species of Dewberries of the United States of America are *Rubus canadensis*, *Rubus hispidus*, and *Rubus trivialis*. The first two are northern species, and grow in the northern parts of the United States of America.

R. trivialis is known to be a southern species of the United States of America. *R. hispidus* is a very slender plant, rarely rising at all above the surface of the ground, and growing both in swamps and upon barren sand. The leaflets are obovate, stiff, and shining above; the flowers are few and very small; the fruit small and usually red. The species appears to possess no value as a fruit, and yet it is often confounded with *R. canadensis*, which is the parent of some of our cultivated varieties. *R. canadensis*, to which the term Dewberry is usually restricted in the North, is much like the Southern Dewberry, *R. trivialis*, in appearance. The chief distinguishing points are these: *R. canadensis*, or Northern Dewberry, main stems or canes rather sparsely and slightly prickly; leaves thin and deciduous, rather destitute of prickles, or bearing only weak ones, and more or less hairy; leaflets ovate; sepals often prolonged and leaf-like, sometimes lobed.

R. trivialis, or Southern Dewberry.—Main canes mostly thickly beset with stout prickles; leaves firm, and nearly or quite evergreen, smooth, or very nearly so, the petioles or midribs usually bearing stout prickles; leaflets oval-oblong, or almost lanceolate, and small; sepals not prolonged nor cut. This species is common from Delaware to Florida and Texas, on the sandy lands. The canes often grow 10 or 15 feet high. It is variable, and attractive varieties are often found; some forms have even been mentioned as possessing value as ornamental plants. The Lucretia, subtype variety (*roribaccus*), as compared with *R. canadensis* proper, is a much larger and stronger grower, leaves large, and the margins doubly serrate with small teeth, and more or less notched or jagged, leaflets broad at or below the middle, sometimes triangular-ovate; peduncles or flower-stems much longer, straighter, and stouter, more erect, habitually more numerous and more conspicuously over-topping the leaves; flowers very large and showy, often 2 inches across; sepals uniformly larger, some lobed, sometimes becoming an inch long and wide; fruit much longer and larger as a rule, and more or less thimble-shaped.

Strong forms of *R. canadensis* itself often look much like this in foliage, but I have never seen any in which there was such a development of long flower-stems, large flowers and fruits, and large sepals. This species was founded by Linnæus. It seems that Linnæus apparently founded the species upon two distinct plants, one of which is the form of Dewberry under consideration, and the other being a bush Blackberry. Linnæus' description applies to a trailing plant, and must therefore be taken as the type of *R. canadensis*, and in this sense I think it is understood by our American botanists.

The Bartel sub-type, or var. invisus.—This form of *R. canadensis* is particularly distinguished by the large and nearly simple teeth of the leaves, canes stout and stiff, often partially ascending; leaflets much larger than in the species, broad and thin, smooth, or very nearly so; the teeth usually very large, simple, and often rounded, and terminating in a minute point; peduncles or flower-stems long and straight; young flower-buds commonly bearing a prominent tip, formed by the connivent ends of the sepals, flowers larger than in the species.

Wild Dewberries are common on poor sandy lands throughout the territory east of the Mississippi, at least it is well known that they are variable in appearance and in the character of the fruit. Many fine varieties are found and cultivated, large, fine-fruited, and very productive varieties. In many parts of the United States Dewberries are thought to be better than Blackberries.

The following are some of the old varieties and the names of the State from which they were introduced, also the scientific name, Windorn (*Rubus canadensis*), of Minnesota; Lucretia's Sister (*Rubus canadensis*), of Ohio; Geer (*Rubus canadensis*), of Michigan; Lucretia (*Rubus canadensis*, var. *roribaccus*), of West Virginia; Bartel (*Rubus canadensis*, var. *invisus*), of Illinois; General Grant (*Rubus canadensis*, var. *invisus*), of New York; Never Fail (*Rubus canadensis*, var. *invisus*), of Ohio; Fairfax (*Rubus trivialis*), of Virginia; Matabele (*Rubus trivialis*), of Florida; Bauer (*Rubus trivialis*), of Arkansas; Wilson's White (*Rubus trivialis*), of Texas. Texas has furnished many of the Dewberries, and is still producing some of the finest varieties of improved kinds. The Austin Improved Dewberry (*Rubus trivialis*), a noted Texas variety. It originated at Pilot-Point, in the county of Denton, the State of Texas, by J. W. Austin, of that place, some years ago. It is said to be one of the finest in cultivation. There are many other varieties. There are various methods of cultivating them; but the plants are generally set at about the same distance as Blackberries—3 by 7 or 4 by 7 feet—and the canes are allowed to lie upon the ground, being headed-in when they reach about 3 feet in length. A mulch of straw beneath the canes keeps the berries clean, and renders picking much pleasanter. A wire trellis like the one used for Grapes may be used also. They should be kept cut back, so as to make fruit, and from four to six runners to the plant; ploughed, and kept perfectly clean, if you have to use the hoe. Wm. L. Moore, Pilot-Point, Texas.

FLORISTS' FLOWERS.

CACTUS DAHLIAS.

THE admirable illustration given at p. 239 of that undoubtedly quaint *Dahlia Fantasy* may help to educate those persons in remoter districts who are sometimes called upon to judge Cactus varieties, but are ignorant of the properties of the section. But *Fantasy* is, after all, but one of several distinctive forms, and there is more to be learned respecting Cactus character than that one variety evidences. We see in the crab's-claw form of the narrow-pointed petals, distinctive as well as novel development. Such charming forms as *Arachne*, *Lucius*, *Antelope*, and *J. F. Hudson*, quite a magenta-coloured *Fantasy*, serve to indicate that this section is a growing one. The character of the flowers may be termed incurved, as the petals seem to contract towards the centre. Some day, perhaps, we shall hear of the *Fantasy*

section quoted as evidence of the imitative power of flowers to assume the form of the crab, or spider, or even the tentacled octopus. It must not be forgotten, however, that the originator of Fantasy is Mr. Burrell, of Cambridge, who is in the van in Cactus Dahlia raising. Beyond what were so recently honoured by the Floral Committee, as many more probably have received awards elsewhere, and it may be no matter for surprise if fully a score new ones, all really good, be put into commerce next spring. Thus the new dark maroon Manfi will displace Matchless and Night, as the pretty Island Queen has excelled the lovely but flat-petalled Delicata and the darker-hued Beatrice. Mr. Stredwick's remarkably fine Magnificent should excel Britannia, and Mr. Burrell's Lucius and Antelope, others of similar hues of colour. Charles Woodbridge, one of the very best in commerce, rich crimson, is a typical flower of a section, the converse of that represented by Fantasy, for its petals stand out from the centre quite horizontally, are perfectly straight, twisted, and finely pointed. Its best light-coloured companions are Magnificent, and the beautiful Starfish runs it hard for form. Some day, perhaps, the straight-petalled and the incurved-petalled Cactus Dahlias may have to be put into diverse classes. A very fine dozen of varieties in commerce are Arachne, petals white, edged with crimson; Britannia, pale salmon, lilac shaded; Charles Woodbridge, bright crimson; Daffodil, pale yellow; E. J. Deal, rich scarlet; Harmony, reddish-bronze or deep apricot shade; Island Queen, lilac-mauve; Mary Service, rosy-heliotrope; Keynes' White, so far the best white; Night, the best deep maroon; Starfish, pure orange-scarlet, and Tillie, salmon, shaded rosy-mauve. A. D.

NURSERY NOTES.

GEO. BUNYARD & CO.

WE usually speak of Kent as being a county particularly favourable for the cultivation of hardy fruits, and never were we more convinced of the fact than on the occasion of a recent visit. But Kent has not been exempt from the effects of the exceptional drought any more than other counties. Indeed, her condition has been even worse than some. It does not need so long a journey as that from London to Maidstone to help one to this conclusion. Long before Maidstone is reached, the withered brown appearance of the fields, the dry, almost flagging look upon the trees and shrubs, have convinced you. The only occasional glimpse of green the country afforded on September 9 was that of the plantations of trees; other than this, there was brown and white, scarce anything but brown and white, the brown of the burnt grass, and the white of the chalk. But in the Allington Nurseries of Messrs. G. Bunyard & Co. the visitor fails to find such eye-wearying evidences of suffering vegetation. "But," says the reader, "nor should we expect to do so." The nursery is a highly cultivated piece of ground, and, should necessity arise, the plants and trees are given "root-waterings." If this were correct, the explanation would be a very simple and natural one; but it is otherwise. The extent of the nursery renders such treatment impossible; there is not the water to give them, to say nothing of the amount of labour necessary to apply it over so large an area.

THE EXPLANATION.

It is not this at all, but the disparity of condition between the Allington fruit-tree nursery, and many a fruit and Hop-garden not far distant, is to be explained in large measure by the superior methods of tilling the soil. We say in large measure, because a good-hearted soil has much to do with the degree in which the trees will withstand drought, and it is proof that the Allington Nurseries are well looked after in this respect.

We have previously had occasion to refer to Messrs. Bunyard's excellent means of fighting drought, but never has there been a more striking illustration of its value than in the present year. By the frequent

use of the valuable little cultivator, many times described in these pages, Messrs. Bunyard maintain over the whole surface of the ground a thick "crumb" of soil that is a natural mulch; a sort of non-conductive covering, that prevents, to an astonishing degree, the evaporation into the atmosphere of what moisture the ground already possessed, and promotes capillary flow from below upwards.

We have dwelt upon this feature of the nursery, because at the end of such a season as the present one has been, it is a proper moment to reiterate the value of conserving moisture that cannot be replaced. Another point is this—this natural mulch does not prevent aëration. It does not stifle the land, and keep from it the needed sunlight and air, as do heavy mulches of half-rotted manure; though during such a summer as 1898 this is not of great importance. Having written so much upon the extraordinary degree to which the trees upon the whole have withstood the trying season, a few words should follow as to the individual appearance of the different kinds of fruit trees.

The Pears and Cherries have fared less well than the other sorts. From the many specimens of the Pear slug-worm our correspondents have sent to this office during the season, it is clear that the pest has been unusually prevalent, and Messrs. Bunyard have found it to be their worst enemy. It eats away the upper surface and soft substance of the leaves, and renders those so attacked of little or no value to the tree. They attack Cherry-trees in a lesser degree, but the slug-worm finally develops into what is known as the Cherry saw-fly. The best means to kill the slug-worm is to dust over it some lime or other caustic powder. The operation should be repeated after a very short interval, and before the slugs have forgotten the first dressing. Messrs. Bunyard's excellent manager, Mr. Buss, however, says that he has found one dressing of lime sufficient to kill them; and that he thinks the best remedy that might be made available for them is Hellebore-powder, but it requires to be reduced to a finer degree than at present.

Apples are looking capital. The growths may be less in length than in a more genial growing season, but they are very healthy, the leaves firm and leathery, and the growths are ripened almost as they proceed. It is astonishing to stand for a moment and look along the lines of some of these Apple-tree maidens; the growths are as regular as if brought to a line and topped at a certain height. This is said to be the case more frequently after grafting than budding. Peaches, trained trees, have made fine growth, and they will probably finish better this season even than usual.

FRUITING-TREES IN TRIAL-GROUND.

Every reader of this Journal has probably read at one time or another a description of the Allington Nurseries, and a circumstantial account of the trial-ground, an area planted with fruiting-trees of 200 or so, new, or standard varieties, most in fact of those considered worthy to be catalogued. We do not intend to write such a description now, but to give a few of the more interesting facts concerning the condition of the trees this season. Neither will we make use of a quantity of notes at our hand (taken under an umbrella during tropical sunshine) upon really standard varieties of Apples and Pears, that we happened to observe carrying a full crop of fruit. All such varieties may be found on reference to Messrs. Bunyard's catalogue, where they are described with greater precision and detail than our space or time will permit. But there are several of the newer Apples, and of older but not sufficiently well-known varieties that it may be useful to mention in a note such as this.

In the first place, it may be stated that there was no lack of fruit in the trial-ground for inspection or comparison. The weight of fruit produced by these trees this season is estimated as being considerably above the average, but the size and colour of the fruits have suffered a little. Further, whilst a few of the standard bearers have failed, many out-of-the-way sorts, shy fruiters, and others have a full crop. Messrs.

Bunyard have for several seasons recommended Golden Spire Apple to planters (see fig. 70, p. 253), and during the same period we have enjoyed facilities for seeing the trees most seasons in the nursery. It succeeds admirably in the Maidstone district and is there a splendid and reliable cropper—little cordons, trees with nine fine fruits upon them, large trees, with crops proportionate. In Allington Pippin Messrs. Bunyard have an excellent dessert Apple, that was certificated by the Royal Horticultural Society under the name of South Lincoln Beauty. When the stock was acquired by the Maidstone firm, the name was changed to that it now bears. It is said to be a cross between King and Cox's Orange Pippin; the fruits are of slightly conical shape, of medium size, with deep-set eye, and slender stalk. It has fine flavour, and crops splendidly at Maidstone, and it is claimed for the variety that it will succeed in many places where Cox's Orange fails. On the Paradise stock it fruits extremely early, almost in the manner of another excellent Apple, Bismarck, is known to do so (see fig. 73, p. 257). James Grieve, an Apple given an Award of Merit last October by the Royal Horticultural Society, is another of the Cox's Orange type, and is sometimes described as an Early Cox's, being ready for use in ordinary seasons at the end of September. It is of Scotch origin, and is said to be hardier than the splendid fruit it resembles. A very different type of Apple is James Welch, described as a cross between Lord Suffield and Ecklinville Seedling; it produces fine kitchen fruits of the type of Lord Suffield, but in growth is freer and less subject to mildew and canker, in fact resembling in growth that of Ecklinville. We mention Seaton House because it is such an invariable cropper, and although fit for use in September, may be kept in condition until May. Belle de Pontoise was bearing a capital crop, and is excellent for kitchen or table use. The new Apple, Mrs. Phillimore, and several others, were seen; they will be heard of at a future time. One of the best late kitchen Apples had almost escaped remark: Chelmsford Wonder, new in 1891, and a First-class Certificate variety of the R.H.S. (see fig. 72, p. 257), is not only a good bearer, but it keeps well, and is one of the varieties exhibited from these nurseries so well at the Temple Show.

A new Filbert-nut, known as Early Prolific, was ready for the table. Ordinary varieties would be a fortnight or three weeks first. It is exceedingly prolific, and the husks are prettily frilled.

ORCHARD-HOUSE TREES.

We have never seen a finer-fruited lot of orchard-house trees at Maidstone than there are this season. About 150 Apple-trees in pots were protected from birds, &c., by a kind of 1-inch mesh wire archway. The framework consists of iron pillars that spring from the ground and extend half-way across the roof, where they are rivetted to others from the other side. There is a doorway that can be locked, and is high enough to enter without inconvenience. On the day described, the sides were partially covered with garden-mats—no doubt, to keep a part of the strong sun from them. The trees were capital, extremely healthy in appearance, and most of them heavily cropped, especially such varieties as Twenty Ounce, Emperor Alexander, Worcester Pearmain, King of Tomkin's County, Mother, Gascoigne's Scarlet Seedling, The Queen, &c. Newton Wonder is a variety that succeeds less well than many under this sort of treatment. The trees had then been removed from the house three weeks. The Pear, Peach, and other orchard-house trees were likewise good. A houseful of fine young Fig-trees in pots should be mentioned, because it contained choice varieties like Bourjassotte Grise (fig. 69, p. 251), which though known for more than thirty years, is seldom seen in gardens; it has capital flavour. Also Pingo de Mel, Col de Signora Blanca, &c., that should oftener be seen in gardens, not in place of, but companions to, Brown Turkey.

A NEW REMEDY FOR AN OLD COMPLAINT.

Even more than usual has the American blight infested Apple-trees this season. Hot weather is favourable to it, and we have had several hot

summers. Messrs. Bunyard drew our attention to a cure for this troublesome pest, in which they are just now considerably interested. Procured for another purpose altogether, we believe, this article was used upon Apple-trees infested by the bug, and with such results that it has been determined to offer it as an article of commerce. We were shown old cankered trees that had been dressed with it, and they appeared to quite bear out what our guide described. It had killed the bug, and apparently the fungus in the canker also—for the old dead bark was falling away, and the wounds healing over. Our experience with it is quite insufficient to warrant our writing it up as one of the best washes for the purpose, but Messrs. Bunyard's experienced foremen are firmly convinced of its merits. We hope it may be all that is claimed for it, and more. When it has become distributed we shall doubtless hear from fruit cultivators how far it is effective, and whether it is convenient of application.

duced freely; and if the seed-pods are removed as soon as they are formed, the plants continue to flower throughout the summer. The seeds should be sown in 6-inch pots, and six seeds may be put into each pot. The plants will flower in the same pots. This annual is a native of Jamaica.

PHYLLOCACTUS HOOKERI.

I have a large plant of this species growing in a stove-house containing Caladiums, Alocasias, Eucharis, &c. As the house is carefully shaded, and a moist atmosphere is maintained, it is remarkable that the Phyllocactus should thrive so well. The plant is rooted in a compost of loam and brick-rubble, close to hot-water pipes, and makes broad, clean growths, from 2 to 3 feet long, which flower profusely. It has two flowering seasons (May - June and in September), and produces about thirty flowers each season. The flowers are pure white, and measure 5 inches across, with a stem-like tube 6 inches long. It is one of the

formed leaves, some of these being more or less cordate at the base, some abruptly abbreviated, others regularly and broadly egg-shaped, with an extended apex; whilst in others the leaves had short, toothed, or blunt lobes. The leaves on their underside show in the nerve angles, the glands of *C. ovata*, but they certainly resemble those of *C. bignonioides* in the much lesser degree of hairiness, in which species the hairs are longer than in the case of *C. ovata*.

The form and colouring of the flowers do not essentially differ from the last named; whilst the flowers in reference to size are similar to those of *C. bignonioides*. As this hybrid variety coming from the Japanese *C. ovata* possesses greater hardiness, it is possibly better suited to rough, cold climates than the more tender *C. bignonioides*, a native of the southern United States which is apt to be injured by great cold, and seldom unfolds its blossoms in such climates.

ROUND MAIDSTONE.

(Continued from p. 232.)

BARHAM COURT.—From notes of this interesting place that have appeared in these pages from time to time, many of our readers are probably aware that Barham Court is about 3 miles out of Maidstone, and but one from Watlingbury Station on the South-eastern Railway. We did not approach it from Maidstone, however, but from Linton Park, and to Mr. McKenzie's courtesy we are indebted for a drive from the latter place through Coxheath village and West Farleigh to Watlingbury. Once inside this very extraordinary fruit garden, it was difficult to understand that the present season's fruit crops are below average. The evidence at Barham Court was distinctly opposite, and here is a curious circumstance. In the district generally the crops are light enough, to be sure; the large market growers have crops much below average. Roger Leigh, Esq., who owns Barham Court, does not reside there, and the yield of fruit above the needs of the absent owner is sold. "Never," said Mr. Geo. Woodward, "have I sold a greater weight of fruit than this season," proving the crops to have been unusually good.

Were it convenient, an inspection of the Barham Court fruit garden would, doubtless, be most agreeable and interesting to many who have read of Mr. Woodward's success in exhibiting hardy fruits in London. It is generally known that the interest of the garden lies principally in its fruit trees, but probably only those who have visited it have a correct idea of the importance of this feature. It is not a vegetable garden with fruit trees around the brakes and upon the walls merely, but the brakes themselves are in most cases exclusively appropriated by fruit trees. The majority of the trees were planted by Mr. Haycock in the early seventies, but some were there previous to that date, and, of course, many have since been planted by Mr. Woodward. In Mr. Haycock's days it was intended evidently to maintain the garden with strict regard to neatness and a certain amount of trimness, and the fruit trees were trained in great measure in the French styles. Upright, horizontal, and oblique cordons, espaliers, and such-like trees, that are capable of producing extra-fine fruits, rather than heavy crops, and that necessitate a large amount of attention to pinching, pruning, &c., were the types of the trees. But other times, different methods, and for several reasons (prominent amongst which is a desire to maintain the gardens with as little labour as is necessary, and at the same time to increase the yield of fruits) Mr. Woodward has adopted a very different policy. The result is singular. Trees that were originally cordons have been permitted to grow quite out, and have even produced bush-shaped specimens. Here is one of the noteworthy characteristics of Mr. Woodward's management of the garden. His sole aim is to produce the maximum amount of fruit possible, subject only to the quality being of the highest class. Rather than restrict the growth of the trees that they may become shapely, well-balanced specimens, he permits them in large measure to grow as they may. If a fine growth be produced from a certain side of a tree, and that growth develops more

FIG. 69.—FIG BOURJASSOTTE GRISE. (SEE P. 250.)

RASPBERRIES AND STRAWBERRIES.

We did not go to the farm at Chiltern, where the Raspberries and Strawberries are grown, and various plants for seeding are cultivated; but Mr. Bunyard informed us that there he has 100,000 Superlative Raspberries, and six acres of Strawberries. Nor did we visit the home nursery, where a large number of houses are utilised chiefly in connection with the florist and local trade. The Allington Nurseries are to be still further increased by the addition of about 18 acres of land now being prepared for fruit-trees.

PLANT NOTES.

IPOMŒA QUAMOCLIT.

GROWN as a pot-plant on a small balloon trellis, this pretty climber is very effective. It bears erect, axillary, ruby-red, star-shaped flowers, about half an inch across. These are thrown into relief by the finely-pinnate, light green foliage. The plant is of very slender growth, and requires a house with an intermediate temperature, and light shade. The flowers last only for a single day, but they are pro-

night-flowering species, beginning to unfold about 7 P.M., collapsing at daybreak next morning. It would be found especially valuable as a cut flower for dinner-table decoration. Geo. B. Mullett.

CONTINENTAL NOVELTIES.

CATALPA HYBRIDA, HORT.

UNDER the above name, Mr. L. Späth, nurseryman, Rixdorf, Berlin, describes in the *Gartenflora* of September 15 last, a hybrid which flowered in his arboretum in 1897. The illustration of a leaf and flower-spike accompanying his descriptive note, shows a handsome loose spike of flowers, white as regards the ground, which is densely sprinkled over with crimson spots. From all appearances it would seem to be a cross between *C. ovata* of G. Don (Kämpferi, S. et Z.), and *C. bignonioides*, Walt. (syringifolia, Sims.), but which resembles most the first-named species.

The bush which flowered about 12 feet in height, with somewhat erect growing branches, showed the brownish twigs of *C. ovata*, with very irregularly

rapidly than the remaining part, it may do so. One matter only will receive Mr. Woodward's attention. It will be properly supported. It may be by a stout stake, or possibly by a wire stretched from a point to the nearest wall. Thus, over the entire garden are instances in the Apple and Pear trees where growths have taken quite unexpected courses, and Mr. Woodward has followed them with all the attention of an enthusiastic fruit-grower. The espalier-trees will be replaced by degrees with bushes. It may be pointed out here that Mr. Woodward's exhibition fruit is not exclusively or mainly produced by very young trees, or by cordons, &c., but by free-growing bushes, and even standards. The position, which has a gentle slope to the south, is not an elevated one, being little over 100 feet above sea-level. The soil is a fairly rich loam, and rests on limestone.

APPLES.

There can be no doubt but the soil and situation is eminently favourable to the cultivation of the Apple, and being so, Mr. Woodward has little trouble in the matter of pruning the trees. Under other climatic and geological circumstances, where the trees are prone to make strong growths rather than to fruit freely, root-pruning is part of the year's work. Mr. Woodward seldom, if ever, attempts such work. This fact of suitability of soil and climate, together with a knowledge of Mr. Woodward, of his enthusiasm for fruit-cultivation, and his skill in its practice, is quite sufficient to explain the production of such Apples, Peaches, Pears, &c., as he has frequently exhibited. As the report of the Palace fruit-show will be in our reader's hands not later than this note, it behoves us to be very careful in the matter of prophesy. Though it might be better to shun so dangerous a practice entirely, we cannot forbear to mention that Mr. Woodward will stage some capital fruits again this season. Whether he will win as many 1st prizes as usual will, of course, depend upon other people's exhibits as well as his own.

We saw some excellent fruits of Emperor Alexander, Cox's Orange Pippin, Golden Spire (whose merits Mr. Woodward is always ready to extol, and an illustration of which we give in fig. 69), the New Allington Pippin, Peasgood's Nonsuch and—but a mere enumeration of the varieties would be tedious. In two respects the fruits may be a little less good than they would have been had the drought been less severe. These points are colour and size—admittedly important ones.

PEARS.

Pears may be seen in abundance at Barham Court, but to our mind they are not so surprising as the Apples. They thrive well, for we remember Mr. Woodward with specimens that weighed 1 lb. 11 ozs. each. But they require more care than the Apples, and the trees are not finer specimens than those in the gardens at Cardiff Castle. Nevertheless, they are grown in large quantity, and the produce is of the highest quality.

PEACHES.

Peaches are no less a feature of the gardens than the Apples, for 12,000 to 14,000 fruits are ripened in a year. In every position and in countless instances, the trees thrive splendidly. Dozen of trees on September 10, when we had the privilege to see them, were studded with perfect fruits, almost or quite ripe. The loveliest of pictures these trees afforded. We have been speaking of the Peach-trees upon the walls out-of-doors; but to a visitor it is exceedingly interesting to inspect the two large span-roofed houses, that are filled with large standard Peach and Nectarine trees. Always appearing in the best of health, these trees bear heavy crops of fine fruits every season. It is claimed that the standard tree furnishes more fruits per area than trellis-trees; that they give less trouble; and that as the fruits at the top of the tree ripen first, each tree furnishes a long succession. The fruits at the base of the tree ripen as fully and as perfectly as those nearer the glass. To us the picture of these standard Peach-trees laden with fruits is one so grateful that it can never be forgotten.

But there is another circumstance anent the Peach-trees. Some time ago, when re-arranging the standard trees, one of them was discarded. Rather than throw it away, however, the tree was planted in the open between the two houses. When we saw it there were something like eight dozen Peaches upon it, all of them ripening perfectly.

Another great crop with Mr. Woodward is that of the Tomatos. The plants are to be seen inside and upon the walls outside. The weight of the fruit produced is wonderful. On the outside walls also were choice Plum-trees and Green Gages just ripening, a rare lot of luscious fruits.

Apart from the fruit, there are 800 Chrysanthemums grown in pots, and well did they appear, beside miscellaneous plants that are generally to be found in a gentleman's garden.

As we thank Mr. Woodward for the courtesy extended to us, and bid him good-bye (and also the "hoppers"), we cannot help wondering how he manages to keep a garden so full of fruit-trees in the condition he does, with the small amount of labour employed in it. P.

THE WEEK'S WORK.

HARDY FRUIT GARDEN.

By W. H. DIVERS, Gardener to the Duke of Rutland, Belvoir Castle, Grantham.

Pruning Standard Trees of Apples and Pears.—As soon as the fruit has been gathered is the best time in the year to effect this operation. Do not allow the trees to remain unpruned from year to year, and thus become so thick with unthinned growths that it will be impossible to obtain good fruits from them. The foliage requires light to elaborate the sap, or the fruits will be small, and of poor flavour. But large trees do not require to have the branches shortened annually; an occasional thinning being all that is required. The foliage is a safe guide in regard to the health and strength of the tree, and if pruning be left until winter it is gone. Moreover the trees are then wet and slippery, and difficult for the men to get about. The work can be done most expeditiously and with greater convenience in the autumn. All of the small wood in the interior of the tree should be cut away first; strong upright shoots springing from the lower branches must also be cut out, and all decaying wood. The remaining branches should be thinned, so that a fair amount of light and air may circulate around their extremities. All shoots that cross and are likely to chafe each other must also be taken away. Large branches, however, should not be cut off if they are sound and healthy, as the wounds so occasioned take a long time to heal over, and the main stem of the tree often decays in consequence. Many orchards have been planted too thickly at first, and the grower has not subsequently had sufficient courage to cut out the supernumerary trees. It is impossible to correct such an error now by pruning, and the only satisfactory plan is to cut away the weakest and least valuable trees entirely. This may cause a deficiency in the crop for a year or two, but in the end the remaining trees by their renewed vigour, and the better quality of their fruit, will more than compensate for this. Standard trees on the free stock should never be less than 30 feet apart each way. Any varieties that are out-of-date and worthless should be noted, so that they be headed down and re-grafted in the spring. If weak or unhealthy, however, they should be grubbed out. Many of the smaller dessert kinds, such as Court of Wick, Braddick's Nonpareil and others, are not worth growing, because larger and better-flavoured varieties may be easily obtained.

PLANTS UNDER GLASS.

By W. MESSENGER, Gardener to H. C. BERNERS, Esq., Woolverstone Park, Ipswich.

Bulbs.—The principal batch of flowering-bulbs for forcing should now be potted-up, and a further quantity may be so treated in November. This will ensure a succession of flowers well into the spring. A compost that will be suitable for most kinds, including Hyacinths, Tulips, Narcissus, Jonquils, Crocus, and Iris (Spanish), should consist of two-thirds fibry-loam, and one-third good rotten manure and leaf-mould, in equal proportions. To this may

be added a liberal quantity of sharp sand. As a quantity of pots in various sizes will be required, they should be prepared beforehand. They should be perfectly clean, and need to be carefully drained, as the bulbs will require a large amount of water when in active growth. Obtain sufficient painted labels, and a site where the pots may be plunged in coal-ashes or cocoa-nut fibre refuse.

Hyacinths.—Remove all small bulbs or offsets from these before potting is done. Fill the pots nearly to the rim with compost, and place the bulbs therein. Press them a little, and leave the apex of the bulb just above the surface of the soil. Make the soil firm after placing the bulb in position. Pots 4 to 5½ inches will be quite large enough for the largest single bulbs. If desired, 7-inch pots may also be used, and three bulbs placed in each. Roman and Italian Hyacinths will not require so much root-room, and if intended for cutting only they may be grown in boxes or pans to economise space. It is a good plan to sprinkle a little sand on the surface of the soil in the pots, and the ashes or covering material may then be readily removed when the plants are required for forcing. Give the newly-potted bulbs a good soaking of water, and allow sufficient time for the soil to drain before plunging the pots. If it is intended to cultivate any of the Hyacinths in glasses, these should be filled with soft water containing in each glass two or three grains of salt, to keep the water clear. Change the water when it has become foul, and in giving a fresh supply use water heated to the temperature of the air in which the bulbs are growing. Place them in a dark cool room or cellar until the bulbs have made a fair amount of roots, when they may be removed to a light position, but not near to a fire, or in an otherwise dry or draughty place. Single-flowering Hyacinths are best for cultivation in glasses.

Tulips may be potted up considerably closer together than Hyacinths, more especially varieties of the Duc Van Tholl section. Most of the early-flowering varieties develop less amount of foliage than those which flower later. If a quantity be grown to provide flowers for cutting, the bulbs may be placed thickly in pans, pots, or boxes, and from such receptacles it is convenient to lift bulbs in flower that may be required for dinner-table decoration, &c. It is most necessary that the roots should be active before the bulbs are removed to the forcing-house.

Narcissus, Jonquils, &c.—The size of the bulb is a good guide as to what number should be placed in each pot. A few of the stronger varieties prove useful when placed singly in small pots, but for general use, 6, 7, and 8-inch pots are chiefly used. The smaller varieties and Jonquils are useful for decorative work if potted into 4, 4½, and 5-inch pots.

Miscellaneous.—Spanish Iris, Crocus, Gladiolus The Bride, Snowdrops, Chionodoxas, &c., may all be treated in a similar manner to the kinds already alluded to.

THE KITCHEN GARDEN.

By J. W. McHATTIE, Gardener to the Duke of Wellington, Strathfieldsaye, Hants.

French and Runner Beans.—Any French Beans in flower-pots, standing in the open air, should now be given the protection of a Melon or Cucumber-house. French Beans growing on the open border may be protected from frost by covering them at night with mats, or dressed canvas covers. Make another liberal sowing of the variety Syon House or Osborne's Forcing Bean, and place the pots in a temperature of 45° or 50°. Gather a quantity of Runner Beans before they become damaged by frost, and place them on the floor of a cool cellar, where they will remain fit for use for a considerable time. It would pay to protect a portion of this crop by covering it up on nights when the thermometer falls to 32°.

Cauliflowers.—Examine plants of Autumn Giant that are nearly fit for use, and break a few leaves off the plants, placing them over the flower-heads to protect them from frost and sun. Encourage later plants by giving them some liquid manure, so as to get them forward in good time. They may then be removed to a position where frost and moisture cannot damage them. Continue to prick out young plants into handlights, and cool pits and frames, but do not place the lights over them, unless 10° or more of frost is probable.

Vegetable-Marrows and Ridge Cucumbers.—Plants that are maturing a crop will require to be covered at night when frost is likely. Cut any Marrows that

are fit for use, and store them in the vegetable-shed till required for use. All the fruits should be removed from the Cucumbers in the open, unless protection can be given from frost. The larger fruits may be kept fresh by placing the stem and part of the fruit in water. The small fruits may be pickled.

Tomatos in the Open.—Frequently examine these plants, and gather any fruits that are colouring. Place these in a warm-house, where they will fully ripen. In the event of severe frost it will be best to cut the plant at the ground level, and suspend the stems bottom upwards in an airy warm-house, where, if the fruits are full-sized, they will colour, and keep for a long time in good condition.

Forcing-pits and Soils.—It is time that pits should be prepared for forcing Asparagus, Seakale, French Beans, Early Potatos, and Rhubarb. Suitable soils for these crops may also be prepared. It is best to make these preparations beforehand.

THE ORCHID HOUSES.

By W. H. WHITE, Orchid Grower to Sir Trevor Lawrence, Bart., Burford, Dorking.

Intermediate House.—The rare *Cœlogyne Sandneriana* is now growing rapidly, and should be kept thoroughly moist at the roots. It should be placed at the warmer end of the house, in a light position, but one free from direct sunshine. *C. elata* has already completed its growth, and the flower-spikes will be almost inactive for some considerable time, but the plant will require frequent supplies of water until the flowers commence to open. *C. barbata*, having a very similar habit, requires identical treatment. The flower-spikes of both species are very susceptible of injury, and it is well to select a safe position for the plants. The spikes of the pretty *C. ocellata maxima* are also at a comparative standstill; keep the plant well supplied with water, or the pseudo-bulbs will shrivel. The latter remarks apply also to *C. Micholitzii*, which is now commencing to develop its flower-buds. *C. cristata*, and its several distinct varieties, are fast completing their new pseudo-bulbs, and until these are fully made up, the plants require more water than at any other period of the year. Plants of *Miltonia vexillaria* that have passed the summer with the cool *Odontoglossums*, should now be removed to the coolest end of the intermediate-house. *M. Bleuana* × and *M. Endresii* will require a similar position, and being in full growth should be given every encouragement to produce strong flowering growths. *M. Roezli* and *M. Phalænopsis* are also growing freely in a warm moist corner of this house; plants of both species that have filled their pots with roots will require a thorough watering two or three times a week. The varieties of *M. spectabilis*, *M. Moreliana*, *M. Bluntii*, *M. B. Lubbersiana*, *M. virginialis*, *M. candida grandiflora*, *M. Clowesii*, *M. Russelliana*, the new *M. Binotii*, and *M. leucoglossa*, make a very pleasing show at this season. After the flowers have faded, place the plants in the coolest part of the house, and afford them very little water, so as to give them a short season of rest. *Oncidium ampliatum majus* having commenced to grow again should be removed to a shady position in the warm-house. During the earlier stages of growth the plants need but little water. Such *Lycastes* as *L. aromatica*, *L. Cobbiana*, *L. Rossiana*, *L. fulvescens*, *L. candida*, *L. trifoliata*, *L. Lawrenceana*, *L. plana*, *L. p. Measuresiana*, *L. Skinneri*, and its numerous varieties, are commencing to make new pseudo-bulbs, and will therefore require considerable water and a gradual increase of light. Such of the spring-flowering *Cattleyas* as *C. Trianaei*, *C. Mendeli*, *C. Schroderae*, *C. gigas*, and *Lælia tenebrosa*, as have completed their growths, should be given less water at the root, and exposed to all the sunlight possible, so that the newly-formed bulbs may be properly matured. The principal object should be to induce these plants to make many roots, but not growths. If any of the plants have grown too large for their pots, and are likely to suffer for want of rooting-material, they may be afforded more rooting-space at this season. Care must be taken not to disturb the old roots more than is unavoidable. The operation should be commenced as soon as young roots become visible at the base of the current season's growth. Break the pot and take away as much of it as is possible without interfering with the drainage, then place the whole into a pot of convenient size, filling in around the plant and nearly up to the rim with drainage material, and surface with peat and sphagnum-moss. After repotting afford water very sparingly. The coolest part of this house is the most suitable

place for the distinct *Dendrobium subclausum*. As it is liable to red-spider the plant should be syringed overhead occasionally, and the small leaves carefully wiped over with a soft sponge. In a similar position *Maxillaria Sanderiana* thrives luxuriantly, and should always be allowed to become properly dry before being again watered.

Shading materials.—In addition to the lattice-wood blinds, garden-mats have been used during the past summer for shading the *Odontoglossums*. These mats may now be dispensed with altogether, the extra light through the open blinds will tend largely to strengthen and solidify the young growths. These remarks apply to span-roofed houses which are fully exposed to the sun's rays; lean-to houses facing north will need very little, if any, shading.

FRUITS UNDER GLASS.

By G. NORMAN, Gardener to the Marquess of Salisbury, Hatfield House, Herts.

Tomatos for Winter Use.—Plants growing in pots that have already developed a sufficient number of trusses of flowers to produce a crop of fruit, should be stopped to one leaf-joint beyond the last produced

FIG. 70.—APPLE GOLDEN SPIRE: COLOUR GOLDEN-YELLOW.
(Reduced).
(See p. 250, col. c.)

truss of flowers. In the case of Tomato-plants in the border, and that have an unlimited length of trellis to cover, they may be permitted to extend so long as the weather is sufficiently genial. Remove the side-shoots as soon as they are produced, and confine the plants to one stem. In order to assist the setting of the flowers, maintain a freely ventilated, dry atmosphere. The fine weather experienced of late has rendered fire-heat unnecessary; but duller and colder days may now be expected, and heat must be obtained in the hot-water pipes, to maintain the temperature from 55° to 60° by night, and 65° by day, with a rise of 10° to 15° from sun-heat. Do not permit the plants to suffer from drought, nor water them before they need some. Weak manure-water may be given occasionally after the plants have set a crop of fruit. If Tomatos are required to ripen as early next season as April or May, seeds should now be sown. Choose a free-setting variety, and to those growers who have not a favourite variety, I would recommend *Conqueror* for the purpose; it is of medium size and good shape. *Frogmore* selected is also a good one for early forcing. Sow the seeds in a pot or pan, using fine light soil, and cover them about a quarter of an inch deep. Carefully water the newly-sown seeds, and place them near the glass in the house where Tomatos are still in flower. Moisten the soil as often as it shows signs of dryness. When the seedlings have made the first pair of leaves, pot them off singly into 3-inch pots, and when these have become full of roots, re-pot the plants into 5 or 6-inch pots. Keep them con-

stantly near the glass, and plant them into the borders or into fruiting-pots next January.

Grape-vines.—Vines that it is intended to start about the middle of November, in order to furnish ripe Grapes by the middle of May, should now be pruned and dressed. The wood-work and glass must be thoroughly washed with a scrubbing-brush and soft-soapy water. Wash the walls with a lime-wash, containing a quarter of a pint of paraffin-oil to 1 gallon of wash, and leave nothing undone that will help to free the vinery of insect pests. The method should be something like the following: Prune the Vines, and remove the prunings; next wash the house; then let down the Vine-rods, and suspend them from the trellis a convenient height from the border, that they may be easily cleaned and dressed. Remove all loose bark, wash the rods with soap-suds, using 8 oz of soap to a gallon of water. Next paint them with some soap-suds, and YL All Liquid Insecticide added at the rate of one-fifteenth part. By the addition of sulphur, clay, and cow-manure, make it of the consistency of paint, and with this smear the Vines, taking care not to damage the buds, or screw the rods while down. When the dressing has dried, re-tie the rods very loosely to the wires with tar-string. Remove the surface-soil from the border down to the roots, and replace with a top-dressing of loam, lime-rubble, and burned soil, to which may be added a little bone-meal, at the rate of a 6-inch potful of bone-meal to a barrow-load of soil. Keep the vinery as cool as possible until starting-time.

THE FLOWER GARDEN.

By H. WALTERS, Gardener to Lord Gerard, Eastwell Park, Ashford.

Amaryllis Bella Donna.—There are but a few autumn-flowering bulbs that equal this beautiful *Amaryllis*. The bulbs should be planted in a sunny position in light sandy soil, and will rapidly increase there if allowed to remain sufficiently long. During September and October they will furnish a grand display of flowers useful for cutting. The colour of the flowers is white edged with pink, and frequently shaded with purple. The plants give a much better effect if planted in clumps or rows, rather than as isolated specimens.

Crocus and Colchicum.—The autumn-flowering *Crocuses* will succeed in any good garden soil. They are very effective when planted in masses. The corms should be left undisturbed from year to year, and they will considerably increase in number.

Hepaticas should be planted during this month or next. Ordinary garden soil is generally sufficient for them. They may be planted at the fronts of herbaceous borders, or for edgings of beds. The height of the plants is rarely more than 4 inches.

General Remarks.—The time of the year has now arrived when a constant use of the broom will be necessary to maintain the garden in a neat condition. The leaves as they are swept up should be put in some out-of-the-way place to form leaf-mould. Gather up sticks and branches as they fall, and burn them. If weeds or moss be growing upon any of the walks these may be dressed with a weed-killer, which will keep them clean for the rest of the year. In the continued absence of rain, Dahlias will need to be frequently watered—indeed, most autumn-flowering herbaceous plants, including *Michaelmas Daisies*, will require to be given abundant waterings. All creepers against walls should be heavily watered, especially the *Ampelopsis*, which is colouring prematurely, and from which all the beauty of colouring in mass will be lost if not attended to in this respect. Nail up shoots of creepers, and remove long straggling shoots before the autumn storms begin. Continue the pulling or hoeing of weeds in any portion of the garden where they may exist. The autumn-flowering *Chrysanthemums* will need water, and should be supported by neat sticks. Proceed without further delay with the putting in of *Viola* and *Pansy* cuttings. Pay every attention to plants it is intended to put in the flower-beds next month to flower during next spring. Many of the subtropical plants, including *Cannas*, must be lifted from the open ground and potted-up before frost sets in. *Calceolarias* from which cuttings will be required next month should be given water, to encourage growth. Stir the soil around *Violets* in the open border, and if red-spider is still attacking them, syringe the plants with diluted carbolic soap, as advised in a previous Calendar; they will need to be well watered also. Remove annuals as soon as they cease to be ornamental,

APPOINTMENTS FOR OCTOBER.

TUESDAY,	OCT. 4	{ Scottish Horticultural Association, Meeting.
TUESDAY,	OCT. 11	{ Royal Horticultural Society's Committees. National Chrysanthemum Society's Exhibition (3 days).
MONDAY,	OCT. 24	{ National Chrysanthemum Society's Floral and General Committees, Meeting.
TUESDAY,	OCT. 25	{ Royal Horticultural Society's Committees.
MONDAY,	OCT. 31	{ National Chrysanthemum Society's Floral Committees, Meeting.

SALES FOR THE ENSUING WEEK.

MONDAY,	OCT. 3	{ Dutch Bulbs, at Protheroe & Morris' Rooms.
TUESDAY,	OCT. 4	{ Dutch Bulbs, at Protheroe & Morris' Rooms. Important Sale of 135,000 Gooseberries, at Heath Field Farm, Swanley, by order of Mr. John Wood, by Protheroe & Morris.
WEDNESDAY,	OCT. 5	{ Dutch Bulbs, at Protheroe & Morris' Rooms. Continental Plants, Roman Hyacinths, Liliun Harrisii, &c., at Protheroe & Morris' Rooms. Unreserved Sale of well-rooted Nursery Stock, at the Tunbridge Wells Nurseries, Tunbridge Wells, by order of Messrs. Thos. Cripps & Sons, by Protheroe & Morris (2 days).
THURSDAY,	OCT. 6	{ Dutch Bulbs, at Protheroe & Morris' Rooms.
FRIDAY,	OCT. 7	{ Dutch Bulbs, and Imported and Established Orchids, at Protheroe & Morris' Rooms.

AVERAGE TEMPERATURE for the ensuing week, deduced from Observations of Forty-three Years, at Chiswick.—53.7°.

ACTUAL TEMPERATURES:—

LONDON.—September 28 (6 P.M.): Max., 61°; Min., 46°.
PROVINCES.—September 28 (6 P.M.): Max., 58°, Dungeness; Min., 48°, Aberdeen.

As these pages are passing through the press, the Royal Horticultural Society is holding its great fruit show at the Crystal Palace. The show has now become an annual institution, and we may hope that it may long continue to be so. There is no question whatever that, speaking generally, and allowing for certain exceptions, British-grown fruits, like British-grown vegetables, are superior to those produced in other climates. The general public, being badly served in the matter, hardly realises this, and therefore great shows like the present are very useful as object-lessons. If the Society could get together the greengrocers and restaurant-keepers of London, and make them see what fruit and vegetables ought to be, no doubt good results would ensue; and if the cooks, who so generally spoil the best of our vegetables, could also be included in the party, the diffusion of science—that is, of knowledge—would be markedly promoted, and the digestion of the lieges improved. In the meantime, the education of the public must eventually exert its influence on the purveyors and on the cooks.

The Conferences and shows held of late years by the Royal Horticultural Society and other bodies, have unquestionably promoted the increase of fruit-culture, and enhanced the general quality of the product. This is rendered evident by comparing the illustrations given in our columns in former years with those of the same variety as now shown. The Society, too, deserves the thanks of the community for its efforts to diffuse a knowledge of fruit-culture, and for its strenuous endeavour to

facilitate the recognition of the different varieties, as well as to establish a definite nomenclature.

If, now, it could ensure the extinction or banishment of half or two-thirds of the varieties whose names encumber our lists, it would render even greater service. This, we fear, is impossible. Something, however, is being done by proving to demonstration which varieties are best for particular purposes and for particular localities, so that in course of time the comparatively worthless varieties may be eliminated. The importance of careful handling, packing, and judicious "marketing" has been insisted on, and we believe with some success. Fruit growers are beginning to realise that if it is worth while to do a thing at all, it is better worth while to do it well.

The schedule, of which more than three thousand copies have been distributed, is defaced by intrusive advertisements, which should have been relegated to their proper place at the end. It is divided into two divisions, the first applying to fruits grown under glass or otherwise, and exhibited by gardeners or amateurs only. Here the great interest centres in the collections of twelve dishes of ripe dessert fruit, of six kinds at least. Smaller collections of a similar character are to be displayed, besides various classes for Grapes, in which the competition is sure to be keen.

The second division is open to nurserymen only. In this class collections of fruit-bearing trees in pots, as well as of fruits, are asked for, and will certainly be forthcoming.

A third division added at the special request of the market gardeners, comprises classes for Grapes and other fruit grown by market-gardeners, for market purposes. Amateurs or gardeners who merely sell their surplus fruit are not admitted to compete in this division.

Division IV. is devoted to outdoor fruit as grown by gardeners and amateurs.

Division V. is intended for the encouragement of gardeners and amateur growers on a small scale, and not only are prizes offered in these classes for Apples or Pears, but the successful exhibitors will also have their third-class railway fares in one direction paid. This division also includes classes for growers in various counties. Kent has a class all to itself; the other counties being grouped according to their geographical position.

The sixth division contains various classes for representatives of particular varieties of dessert Apples and dessert Pears, and corresponding classes for Apples, &c., used mainly if not entirely for cooking purposes.

We believe there are about one thousand three hundred entries, those for collections being more numerous than heretofore, whilst those for single dishes are fewer. Forty-one judges are appointed, with six referees, in case of differences of opinion. Most of the great fruit-growers are represented, among them being Messrs. McINDOE, WOODWARD, RIVERS, VEITCH, BUNYARD, LAING; and Messrs. SUTTON & SONS show a remarkable collection of Tomatos. For more detailed information we must refer to our report, which will be as full as the time at our disposal will permit.

Horticulture in the Transvaal. AN old correspondent, much given to the ferreting out of statistics relating to horticulture in all parts of the cultivated globe, has found it necessary apparently for his peace of mind to inquire into the present condition of things under Mr. President KRUGER's rule, and his good

and true men in the Transvaal, and so "E.C." (the correspondent in question) writes to us to the following effect: "From friends at the Cape, at Kimberley, and in Johannesburg, I had been having very contradictory, altogether unsatisfactory accounts of horticulture and agriculture in the Transvaal. To get at the truth I determined to go to headquarters in Pretoria, and ask from Mr. President KRUGER how crops were distributed in the Republic—what was the general outcome?—what the prospect? Time passed on, and I became weary, and I wished that I had not troubled the worthy President. But at 9 o'clock to the tick on the evening of Saturday last came the man from St. Martin's-le-Grand, and all the information obtainable by the Government House people in Pretoria. From this communication it appears that my inquiry had been referred to the Agricultural Society of the State, and that body had endeavoured to tabulate statistics founded upon their inquiries, but had not succeeded in doing as the *Gardeners' Chronicle* does with its Fruit Crop statistics year by year; and this was a matter of regret. There was much trouble in getting at what crops were found to be suitable for land at various altitudes. Some succeeded; others failed, or were not quite a success. Fruit suited to the soil paid for growing, and the area of growth was to be extended. Cereals suited to the country had been a success, and the area of cultivation would be extended when circumstances permitted, when results were sufficiently encouraging. The general trend was to extension of area of cultivation, and to an endeavour after higher cultivation. On the whole, we think our correspondent is to be congratulated upon the success of his enquiry—that Mr. President KRUGER, his Secretary, and the Agricultural Association above alluded to, deserve thanks for what has been vouchsafed, and for what in the future we may reckon upon receiving.

HOOKER MEDAL.—The subscribers to the Medal presented to Sir JOSEPH HOOKER, in the name of the Linnean Society, have received a copy in bronze. The likeness is excellent and characteristic, and the production artistic and highly satisfactory. The work was executed by Mr. PINCHES, of the Haymarket.

THE CHINA ASTER.—In the *Botanical Magazine* for last month, Sir JOSEPH HOOKER gives a figure and a description of the wild form of the China Aster. The great variations that occur in this plant are, we may add, all seedling variations, inasmuch as there is but one species, so that crossing is not possible. Again, as the plant is an annual, it produces no winter-buds, and "sporting" does not occur. "The indigenous form," says Sir JOSEPH, "appears to be common in the rocky hills of northern China, from the neighbourhood of Peking to the Yang-tse-Kiang. There are also specimens in the Kew Herbarium from eastern Turkestan, western Tibet, and Afghanistan; but in the more western of these localities, it is no doubt only known as a cultivated plant, as it is in Japan. According to Aiton it was introduced into England by PHILIP MILLER in 1731; and DILLENUS, who received seeds from Prof. VAN ROYEN, of Leyden, figured it in 1732. The specimen here figured flowered in the herbaceous grounds of the Royal Gardens, Kew, in October, 1897, but did not mature seed. It was raised from seeds presented in 1896 by the Messrs. VILMORIN & Co. They were obtained from the Abbé FARGES, who collected them in eastern Szechuan."

PROF. AXEL BLYTT.—We regret to announce the death, in his fifty-fifth year, of the Professor of Botany in the University of Christiania. Dr. BLYTT was well known for his researches in the Norwegian flora. He was a member of the Botanical Congress in London in 1866.

FIG. 71.—VIEW IN THE CATLEYA-HOUSE OF JOSEPH BROOME, ESQ., LLANDUDNO. (SEE P. 256.)

THE FERTILISATION OF PEAR FLOWERS.—

From the *Proceedings of the American Pomological Society* (twenty-fifth session, September, 1897), we take the following résumé of a paper prepared by Mr. M. B. WAITE, dealing with the pollination of Pear flowers, and which has a most important bearing on the question of the fertility or barren condition of certain varieties:—"An orchard of about 22,000 trees of Bartlett Pears (Williams) was planted in Virginia, and although seventeen years old, the trees had never borne a satisfactory crop of fruit, though they blossomed freely year by year. A few trees standing near Pear trees of another variety had borne good crops of fruit, but the Bartletts, on the whole, were unfruitful. The results of Mr. WAITE's investigations brought out the fact that while many kinds of Pear trees are self-fertile, the pollen of each tree fecundating its own flowers, the Bartlett was practically self-sterile, and its flowers must be fecundated by the pollen of some other variety to produce a full crop. The curious fact was also brought out that while the pollen of the Bartlett is impotent for its own flowers, it readily fertilises other kinds. The attention seems to have been directed more to the influence of the cross-pollination than to the potency of the pollen. The nature and properties of the pollen itself would seem to demand attention."

A "CORNER" IN FRUIT.—Whence comes all the fruit now meeting with so ready a sale in London streets, and at so cheap a rate? Every urchin with a halfpenny or a penny to spare can regale himself with wholesome fruit from the Continent, Spain, America, or from English Orchards. There is just now a little "corner" in the Farringdon Road, between the Metropolitan Railway station and the Corporation Fruit and Fish Market, where Covent Garden is represented in miniature. It is a great place for youngsters. Plums sell here at from 1½d. to 4d. per lb., Pears at 1d. to 4d., Apples 1d. to 3d., Oranges at two for 1½d., English Grapes may be had from 8d. per lb., and foreign Grapes from 3d. to 6d. per lb.; Bananas meet a ready sale at 1d. each, or seven for 6d.; fine Damsons are sold from 2d. per lb. If some vegetables are scarce or dear, there is an abundance of wholesome fruit.

NATIONAL CHRYSANTHEMUM SOCIETY.—In view of the devastation among plants of Chrysanthemum, caused by the Chrysanthemum-rust, the executive committee of the National Chrysanthemum Society have arranged for a Conference Meeting to take place on October 11 next, at 6 o'clock in the evening, in the St. Stephen's Hall of the Royal Aquarium, Westminster. A paper will be read by Mr. P. WATERER, setting forth the effects of the rust from the cultivators' point of view; and Mr. GEORGE MASSEE will also read a paper dealing with its scientific aspects, when a discussion will follow. Full particulars will be announced by circular.

HELPING OUR CHARITIES.—We are gratified to learn, that by kind permission of A. MORDAN, Esq., the gardens of Stone House, Reigate, were recently thrown open to the public on behalf of the Gardeners' Royal Benevolent Institution. Mr. STEER, the Head Gardener, has thus been able to forward upwards of £20 in aid of the funds of this charity.

OLD GARDENING BOOKS.—We have more than once referred in these columns to the increasing interest in, and consequently the enhanced value of, old books on gardening. This more especially applies to books having finely-executed coloured plates, and to those issued up to the beginning of the eighteenth century. The *desiderata* list of an eminent London bookseller issued a day or two ago includes a considerable percentage of books relating more or less directly to gardening.

THE SOCIETY OF AMERICAN FLORISTS' proposes to add to its title in future the words "and Ornamental Horticulturists." We may therefore expect in future that the gardeners from the States will be distinguished for their good looks, as well as for their earnestness and ability. It is often difficult to frame a concise and accurate title; the designation

of the Gardeners' Orphan Fund, for instance, might lead to the inference that only the orphans of Royal gardeners were entitled to relief!

"THE JADOO ALBUM" (The Secretary, Jadoo, Limited, Palace Gate, Exeter; and Directeur de l'Usine de Jadoo, Margaux, France), with a Preface by Colonel HALFORD THOMPSON.—The success which has attended the introduction of Jadoo fibre, and the extent to which the employment of it has developed, have warranted the makers and the inventor of it in issuing a volume containing a brief account of the substance, illustrated with various pictures of plants grown with its assistance. To quote from the *Album*, "Jadoo was originally intended to be used merely as a substitute for earth in large towns, where loam was difficult to get—and in some cases unattainable.... The discovery that it had the effect of quickening the germination of seed, of increasing the number of seed that germinated, and above all of making cuttings "strike" with greater certainty and greater rapidity, opened up for it uses in all parts of the world." Continuing, we read that the new factories at Margaux are to supply Jadoo to the Vine-growers, that it is used for tobacco plantations, and also for Orange trees, Tea, Coffee, and other crops in various countries and colonies.

ROMAN HYACINTH.—Messrs. E. H. KRELAGE announce the distribution of a variety with pale mauve-blue flowers, which it is alleged flowers forty-five days earlier than the ordinary varieties.

THE ANATOMICAL METHOD.—M. CRÉPIN, who for forty years has devoted himself to an exhaustive study of the species of Rosa whether living or preserved in herbaria, comments in the last number of the *Bulletin* of the Royal Society of Belgium on the anatomical method of discriminating species. M. Crépin's remarks go to show that until anatomists have the power and the means to make comparative studies of plants grown under varying conditions as systematic botanists do, their researches must lack the completeness and authority attaching to the best morphological work. To suppose that a laboratory student, however diligent and intelligent, can in the course of two years attain to the knowledge of a genus possessed by one who has given a lifetime to its study, is obviously absurd. The anatomical characters are very valuable, but they require to be employed with the same judgment as other characters.

CHIONODOXA LUCILIAE.—Messrs. E. H. KRELAGE & SON, of Haarlem, offer among their novelties a variety with rose-coloured flowers.

AMERICAN TREE SEEDS.—The peculiar circumstances of the case induce us to depart from our usual course of merely announcing the publication of Trade Catalogues. The list of seeds of American trees and shrubs issued by Messrs. THOMAS MEEHAN & SONS, of German Town, Philadelphia, is a document of unusual importance, and both nurserymen and tree-lovers who often experience difficulty in obtaining such seeds will be interested in it.

ELEMENTARY BOTANY.—The Michigan Agricultural College publishes a series of elementary studies of Beans, Peas, and other plants, for the use of beginners. The plan adopted by Mr. BEAL is to provide the requisite materials for the pupils, and then to leave them to observe for themselves the phenomena of germination, &c. Little or no assistance is given till the pupil begins to handle, see, and compare. When this is done, the aid of the teacher is given to facilitate the work, direct it into proper channels, correct errors, and give explanations. The first thing to do is to get the scholar to see properly.

GORDON'S GARDEN AT KHARTOUM is thus described by the special correspondent of the *Daily Mail*, who visited it after the battle of Omdurman:—"Here was an Englishman doing his duty, alone, and at the instant peril of his life; yet still he loved his garden. The garden was a yet more pathetic ruin than the palace. The palace accepted its doom mutely; the

garden strove against it. Untrimmed, unwatered, the Oranges and Citrons still struggled to bear their little hard green knobs, as if they had been full ripe fruit. The Pomegranates put out their vermilion star-flowers, but the fruit was small and woody, and juiceless. The Figs bore better, but they, too, were small and without vigour. Rankly overgrown with dhurra, a Vine still trailed over a low roof its dwarfed leaves and limp tendrils, but yielded not a sign of Grapes. It was all green, and so far vivid and refreshing after Omdurman. But it was the green of nature, not of cultivation; leaves grew large and fruit grew small, and dwindled away. Reluctantly, despairingly, Gordon's garden was dropping back to wilderness."

BEGGAR-WEED (*Desmodium tortuosum*).—This plant has the reputation of being a valuable forage plant for tropical countries. At Saharunpore, to which garden seeds were sent from Kew, the plant is reported to grow well, but the cattle refuse to eat it.

DAVIDSON PLUM.—This name is applied to the fruit of an extraordinary saxifragaceous plant (*Davidsonia pruriens*, F. v. M.). It was introduced to our gardens through Mr. W. BULL, and was figured in our columns on June 30, 1877. The fruit, which is figured by Mr. F. MANSON BAILEY in the *Queensland Agricultural Journal*, is like a Plum of medium size, but covered with fine hairs, readily removed by a cloth. The colour is purple, the flavour acid. It is used by the settlers for the purpose of jam-making and other purposes. No doubt the fruit is capable of improvement at the hands of the gardener. It is almost needless to say it is not a Plum.

"PROCEEDINGS OF THE AMERICAN POMOLOGICAL SOCIETY."—This publication, if no longer brightened by the fluent eloquence of the late MAXSHALL WILDER, at any rate shows that the zeal and energy he infused into the Society are not exhausted with his death, albeit a cell is made for a larger infusion of young blood. The present number contains a record of the transactions of the year 1897, including those of the annual meeting held at Columbus, Ohio.

BOTANICAL EXCHANGE CLUB.—We have before us the reports for 1896 and 1897, that for the latter year edited by Mr. G. CLARIDGE DRUCE. The number of specimens contributed for exchange is above average, and the members enjoy the privilege of having the "critical" species named by an expert. A new British sedge, *Carex chordorhiza*, has been distributed, as well as the doubtful plant known as *C. helvola*.

THE ENDEAVOUR RIVER PEAR.—This is a fruit originally described by Baron VON MUELLER, and now figured in the *Queensland Agricultural Journal* by Mr. F. MANSON BAILEY, the colonial botanist. The fruit is rosy-red, Pear-shaped, flesh white, and delicately flavoured. It is used by the colonists for jam and cooking-purposes. It is hardly requisite to say the popular name is inaccurate—the shrub bearing it is no Pear, but a Myrtaceous plant, *Eugenia eucalyptoides*.

CATTLEYA LABIATA SCHRODERÆ, &c.

We welcome the opportunity afforded by the fine view in the Cattleya-house of Joseph Broome, Esq., Sunny Hill, Llandudno, to call attention to the beauties of the fragrant *Cattleya labiata* Schroderæ, for such is its most fitting title; although, probably from want of sufficient material, it was originally named by Professor Reichenbach *Cattleya Trianaei* Schroderæ, and was described in the *Gardeners' Chronicle*, April 16, 1887, p. 512. In the same issue, at p. 522, is the record of its having been certificated to Baron Schroder at the Royal Horticultural Society on April 12.

As soon as it became more plentifully represented in collections, it became evident that it was as distinct from *C. labiata* Trianaei as *C. l. Mendeli*, *C. l.*

HOME CORRESPONDENCE.

FIG. 72.—APPLE CHELMSFORD WONDER. (SEE P. 250.)

Mossiae, and the other sectional representatives of *C. labiata* are, and that by its beauty, the delicate tint of its flowers, and its fragrance, it was entitled to rank as one of the best and most distinct of them.

But *C. labiata* Schrodæ has never been plentiful in gardens, and few collections could boast of such a noble display as that shown in the photograph taken in Mr. Broome's Cattleya-house this summer, the greater part of the flowers seen in the picture being of that type, and among them a good specimen of the white *C. Schrodæ alba*, some fine *C. Mendeli*, *Lælia purpurata*, both dark-coloured and white-petaled forms; *Lælio-Cattleya* × *Schilleriana*, *Lælia cinnabarina*, *Oncidium sarcodes*, and *O. leucochilum*,

Dendrobium chrysotoxum with sixteen spikes, *D. crepidatum*, *D. crystallinum*, *D. thyrsiflorum*, *D. densiflorum*, *D. Brymerianum*, *D. superbum giganteum*, *Cypripedium Lawrenceanum*, *C. villosum*, &c. With them are arranged some foliage plants, *Anthuriums*, &c., the most prominent of which is the fine *Anthurium Andreanum giganteum*.

Mr. Broome has been an enthusiastic amateur gardener for many years, and from his gardens at Didsbury, Manchester, many years ago, was one of the earliest exhibits of good hardy herbaceous perennials and Orchids. Mr. A. C. Axtell, Mr. Broome's gardener, is also a clever cultivator of Orchids, to which the fine result seen in our illustration (fig. 71, p. 255) will amply testify.

FIG. 73.—APPLE BISMARCK. (SEE P. 250.)

BEEES IN A JAM FACTORY.—I have just read in the *Dartford Chronicle* that Messrs. T. Wood & Son's jam-factory, at Swanley Junction, has been besieged by bees, until the factory became on more than one occasion unbearable to the workers. They settled upon the jams and syrups till the place was literally covered with them, and the factory had to be closed for a time. The men, women, and girls, it is stated, were severely stung, and the bees for a time took possession of the place. They were as speedily as possible stupefied, and subsequently, on one occasion during the week, upwards of three bushels of bees were swept up. Now this to my mind involves a very serious matter; as for instance, not only the intolerable nuisance and mischief done at the factory, but the owners of the bees must suffer very considerable loss, itself a very serious item at this season of the year, unless the bees recovered after they had been removed from the factory, and had not been destroyed. I opine to obviate similar visits from these useful and industrious little insects, some arrangement could be made by having strong canvas or gauze placed over all the ventilators and windows, and temporary doors made of the same material, of sufficiently fine mesh to admit air and yet keep out these busy intruders. *G. F.*

PLUNGED POT PLANTS.—This is a somewhat alliterative heading to a paragraph, but it indicates exactly what I am referring to. In no garden have I seen plants of so many diverse kinds and descriptions used for garden decoration grown in pots and plunged in the turf or elsewhere as at Sandhurst Lodge. Certainly they may be counted by hundreds. There is one group so plunged on a lawn slope, with trees and Yews for a background, each plant fully 4 feet from the other. They are in most cases large, and include Ivy-leaf Pelargoniums, *Solanum jasminoides* flowering profusely; fibrous Begonias, tall Plumbagos, beautiful white and red Swainsonias, *Diplacus glutinosus*, *Habrothamnus*, yellow and red; Marguerites, Fuchsias, and other plants. Close by is a large group of Fuchsias. On another point of the lawn is a lot of fine Cape sweet-perfumed Pelargoniums. Just in front of the gardener's cottage are noble bushes of charming Fuchsias literally masses of bloom, 5 feet high and as much through. These are really noble specimens, and nine years old. Dropped into the turf or in the long grass of the wild garden lower down in the grounds are numerous fine plants of the Coral-bush, *Erythrina crista-galli* carrying huge spikes of bloom. *Solanum jasminoides* is again here abundant, and singularly beautiful. But the plants of Cloth of Gold Fuchsia are very effective. So, too, are Agapanthus in full bloom. *Habrothamnus Newelli*, 5 feet in height, in profuse bloom, as also *H. aurantiacus*, 3½ feet high, carrying numerous spikes of yellow flowers. Pelargoniums are also specially charming. The places of these tender plants are in winter filled with hardy ones, and these serve to give a pleasing aspect to these portions of the gardens during a dull season. *A. D.*

TOMATOS AND MELONS.—The remarks by Mr. K. D. Long on p. 200, respecting the successful cultivation of Tomatos and Melons in the same house, although very interesting, was scarcely an answer to "C. J. P." Tomatos planted in a vinery or Peach-house offer widely different conditions to Tomatos cultivated with Melons. During the past four seasons I have had to meet a heavy demand for Melons, and have been unable to spare a whole house for Tomatos, therefore I have cultivated them in a part of a house with mid-season Melons. My practice has been as follows:—Early in March I put out strong plants of an early variety of Tomato, and give them fairly generous treatment. They are not given unlimited root room, however, and by the time my Melons (which are planted some ten days later) are set, I get a good set of fruit on the Tomatos. When the smallest of these Tomatos have attained the size of a Walnut (some fortnight later), I pinch out the top of the plant, and induce the crop to ripen as soon as possible. When the main part of the crop is ripened, I cut out the old plants, and after slightly renovating the soil, immediately put out other strongly-grown plants. By the time the Melons are finished, the second crop of Tomatos is nearly set, and the plants generally afford plenty of fruits until the end of the season. The reasons I plant twice are two-fold. In the first place, the Tomato plants, if grown throughout the season generally become badly

diseased, the treatment necessary for the Melons being unsuitable to Tomato cultivation. After the first good set of Tomatoes, which is obtained while the Melons are making their early growth, the Tomato plants begin to dwindle, and from this they would never recover. By double planting, the second batch of plants is setting fruits when the Melons are ripening, and the conditions of the house being then suitable to them, they amply repay for the extra trouble. *Frederic Tugwood.*

THE CULTIVATION OF CACTI.—In reply to many questions addressed to me by Cactus lovers, I give the following details concerning my method of growing these plants:—I never shade those which are under glass from the sun. Even during the recent extreme heat I did not whiten the glass, but gave as much air as possible. This plan I have found to answer very well, and I have now again in bloom many plants which usually flower but once, and I attribute this second flowering to the ardent rays of the sun. I naturally water more than usual, even twice a day during the exceptionally hot weather, and I have never known a summer in which my plants have grown so well. If the house cannot be sufficiently ventilated, I think it would be wise to whiten the lights slightly, and in that case to water less. To those who ask me how I keep my plants clean, I answer, it is more especially in summer that insects (mealy-bug) have to be guarded against. If I see that a plant is attacked I syringe it vigorously with clean water. I wash it, so to speak, completely, roots and all. I then let it dry thoroughly, repot it, and the plant is none the worse. Advantage should be taken of a very fine day to effect this washing, and it should not be done in the winter. I have tried everything that has been recommended in this way as an insecticide, but with no result. In winter I kill insect pests with a little stick pointed like a pencil, or with a pin. *F. Laet, Contich, Belgium.*

HARDY BAMBOOS.—It is very gratifying to note the increase that has been made in Bamboo planting during the past few years. As the hardness of the Bamboos becomes more generally known, we may yet see the stiff and heavy-looking Laurel (*Cerasus*) and Privet, offensive to the eye from constant repetition, entirely ousted from our ornamental shrubberies. More especially is this desirable in the vicinity of London, where the evergreen shrubberies are ever dull and dirty from the continual deposit of soot and dust. The graceful, arching growths of such plants as *Arundinaria nitida*, *Phyllostachys aurea*, *P. Henonis*, *P. nigra*, *P. flexuosa*, and *P. viridiglaucescens* occurring occasionally in the foreground; with *Arundinaria Simoni*, *Phyllostachys mitis*, and other columnar species planted here and there in the background, would do much to render the whole artistic and cool to look upon. Planted in association with dwellings, provided with verandahs and other forms of subtropical architecture, and with ornamental water, the Bamboo is at home and in harmony with its surroundings. As a background for such plants as *Lobelias* of the cardinalis group, or other tall-growing plants, whose flowers range in colour from pink to deep crimson, or intermixed with ornamental foliage shrubs typified by *Prunus Pissardi*, rose-coloured Maples, crimson-stemmed *Cornus*, &c., it would be difficult to find any plant more suitable than the Bamboo, the light rich green of which would greatly intensify the colours of those plants. It is, however, as single specimens on lawns that we see them at their best; those species of flexuose habit are especially beautiful as such, if a cool site be selected for them, with shelter from cutting east winds. They are not difficult to suit in regard to soils, provided it is fairly good and well trenched. If it be very poor it is best to take out a small area and fill in with rough fibrous loam, mixed with well-rotted kitchen-garden refuse, road-sweepings, and, if available, the clearings of a shallow pond sweetened by exposure, the more half-decayed leaves there are in it the better. At Isleworth they grow remarkably well in a light, dry soil if given copious supplies of water during the summer months. The leaves quickly curl and turn yellow if the plant is allowed to become dry at the roots. It is advisable to slope the surrounding soil towards the plants, so that they get the full benefit of storm-water. Many of the hardier species make useful decorative plants in pots for balconies, &c., placing the pots in shallow pans containing just the amount of water the plants will absorb in a single day. During very hot weather, plants treated in this way keep in good condition throughout the whole summer. The quickest way to propagate Bamboos is to sever the suckers from the parent stool as soon as they have formed independent

roots, and to pot them up, keeping them in a warm-house till they are established. *George B. Mallett, Isleworth.*

WHAT IS THE CORRECT NAME OF THE "OLD DOUBLE-WHITE" PRIMULA?—Is *Primula sinensis* correct? [Yes, as far as it goes. ED.] If so, why cannot nurserymen, &c., catalogue it as such? And if that is an insufficient description, add "old double-white," or "double-white" after the Latin specific name. I find some nurserymen catalogue it as *Primula*, double-white, which is rather an indefinite description, as there are double-white of the Chinese section; and I have seen it received from the trade under the name of *Primula prænitens* (a synonym of *sinensis*). If *P. double-white* is definite, how do we describe the different kinds of colour (i.e., from white to pink) of the same species? I should be glad if any one would give a definition of these synonyms, as I am sure there are many that would be glad of the information. And it taxes one's powers of plain speech to describe it to any one not acquainted with it; and even mistakes are made when ordering it from the trade. *Thos. Appleby.*

THE PERFECT TOMATO.—Although we have long had a "Perfection" Tomato in cultivation, no one seems to regard that, or perhaps any other variety, as being the "perfect" one. I fear, judging by the samples sent to the Drill Hall from time to time, that some ignorance still exists as to the merits, and very high ones, too, of dozens of so-called distinct varieties in commerce. Certainly in cropping qualities, and in capacity to produce fine fruits of rich colour, none others can well hope to excel them. The grower who has a Tomato that he finds to be very productive, and thinks it distinct, quite forgets, if he did know, that scores of other growers also have wonderfully productive varieties, indeed, all varieties are fairly productive if only properly grown. The primary need to create the perfect Tomato is not size or colour, or abundant cropping. We have these features in abundance; indeed, so far as size is concerned, we have rather too much of it. Then too many of the fruits are, if broad, yet too flat, thus holding too much vapour in solution, otherwise moisture; and the presence of that on the upper or stem side of the fruits does much to hasten cracking of the skins, just as too much accumulation on the lower or flower side helps to promote that fungoid disease called black-spot. Then there is the common evil found in the broad flattish fruits of a broad spot on the skin, radiating from the floral centre, a product of partial fasciation, or of imperfect fruit formation. Thus we get nearer to the perfect Tomato in the medium-sized, rounder forms. Mr. W. Roupell was kind enough the other day to give me a remarkably handsome sample fruit of his selected *Chemin Rouge*, $4\frac{1}{2}$ oz. in weight, round as a ball, and devoid of split or speck, and very solid in flesh. Such a variety, if a good cropper, and having real flavour, would be a first-class one indeed. *A. D.*

HIBISCUS SYRIACUS (SYN. ALTHÆA FRUTEX).—Generally speaking, this hardy species and its numerous varieties are not cultivated so frequently as their merits warrant. The "Syrian Mallow" was introduced from Syria in 1596, the type being purple in colour with a crimson blotch at the base of each petal; but there are now fully a score of really good varieties, both single and double, with pure white, pink, red, blue, and the intermediate shades of colour. I have had no experience with this shrub in light soils, but in a moderately heavy soil it has stood this summer's prolonged drought wonderfully well, and I recently saw some bushes quite 6 feet in height flowering freely under the shade of Plane and Copper Beech Trees. *A. C. B.*

MONTBRETIAS.—I have never advised that the bulbs should be dried over hot-water pipes, as suggested by Mr. Conway on p. 240. But I did suggest in the *Gardeners' Chronicle* for August 27 that they be lifted in October or November, and placed in boxes, working some potting-soil round them; afterwards to be removed to a Peach-house or vinery near the hot-water pipes. All cultivators of these plants are not favoured as Mr. Conway evidently is at Richmond in the matters of climate and soil. To those growers who have a cold retentive soil, I would specially recommend that the bulbs be lifted each season, and treated in some such manner. In such an exceptionally dry, hot autumn as the present, the bulbs will doubtless ripen well in the open, consequently the bulbs may be taken up and stored for the winter in the same way as the *Gladiolus*

are stored; but such a season as 1898 has been, rarely happens. About twelve months ago, a neighbouring gardener asked my opinion respecting a large bed of *Montbretias* growing in an open south-west aspect. The soil was light and good, and the bulbs had been planted three years, during which time they had grown luxuriantly, but had produced no flowers. Being offered some of these bulbs, the roots of which, by the way, were much matted together, I gladly accepted them. On arrival they were put into boxes and treated as recommended by me on p. 166, and with most satisfactory results. The bed has been admired by a great many visitors during the summer. The varieties are *M. Pottsi* and *M. crocosmiflora*. The position in which I planted the bulbs is exactly similar to that in which my friend has them, and the soil is similar. Why should they flower so well with me, and not with him? The reason is obvious. By the winter treatment the bulbs were given, they became the better matured. *H. T. Martin, Stoneleigh.* [Our correspondents live in widely separated localities, and some of the details necessary to the perfect cultivation of *Montbretias* in Warwickshire may not be so essential in the Richmond district, where Mr. Conway resides. It is gratifying to know that both cultivators are disposed to lift the bulbs annually or biennially. If this be not done, they become so closely packed through the rapidity with which the bulbs increase in number, that the growths are too weak to flower satisfactorily. Whether it be necessary to keep the bulbs inside during winter, or more desirable to re-plant them at once in the open, will depend upon the locality, and the soil and sub-soil. During August we happened to visit Stoneleigh Abbey, and the *Montbretias* there, as Mr. Martin states, were then giving a glorious display of bloom. ED.]

—It is interesting to note that whilst some growers of these hardy bulbs seem to regard annual lifting, drying, and replanting as essential, others should treat them with somewhat scant respect. Thus, recently I saw, both at St. James', West Malvern, and at Madresfield Court, huge masses of *Montbretias Pottsi* and *crocosmiflora* that had been planted some two years, and were as dense in stems, leaves, and bloom as it was possible for these plants to be. I have nowhere else seen such huge clumps as were here grown. Amongst hardy plants for massing in this big way, comprising thousands of roots, few present more striking or pleasing effects than these *Montbretias* do. It will be, perhaps, needful to lift and replant the bulbs in the winter, when, if the same spaces be utilised, no doubt the soil will be removed, and be replaced by fresh, then the finest bulbs planted thickly, will soon refurnish the huge beds. At St. James', a very large collection, comprising apparently all the varieties in commerce, is grown for trial and comparison. The quantities in each case vary, but there are plenty of plants, and abundance of flowers. Besides *Pottsi* and *crocosmiflora*, there is *Bouquet parfait*, *Reine d'Or* (fine orange), *Eldorado*, *Transcendent* (orange-red), *Etoile de Feu* (rather deeper in colour), and several others. Those mentioned seemed to be amongst the best. If the clumps or masses remain too long undisturbed, they become so thick or dense that very weak growths and fewer flowers result. The two-year-planted masses at the places named were, earlier in the month, glorious in colour, and wonderful in quantity. Pleasing as the spikes are when set up in vases, they always look best on the plants. *A. D.*

RIPENING OF CANNA INDICA SEED IN THE OPEN AIR.—There are doubtless many proofs in our gardens of an unusual season, but I fancy that the fact of a *Canna* seedling and ripening in the open air is as striking as any. This particular plant was potted and placed in the garden, where it bloomed in July. I send you the actual seed-pod; one seed I have removed in order to get a seedling next year as a memento of a record season. I may, of course, be mistaken about the rarity of the occurrence. *S. Gibson.*

LONICERA HILDEBRANDIANA.—Mr. Moore is to be congratulated on being the first to flower this plant in Europe. He sent a flowering branch to Kew, produced, he said, by a plant that had been grown in a cool-house, where it had plenty of light and air, and rather restricted root-room. At Kew, plants have been tried under various conditions, from the open border to a tropical house, and whilst plenty of growth has been obtained, no flowers have been developed, notwithstanding alternations of liberal treatment and comparative starvation. It will be remembered that Sir Henry Collett described the plant in the *Journal of the Linnean Society*,

vol. xxviii, p. 6, as "a conspicuous shrub, with large dark glossy leaves, and fine crimson flowers 7 inches long, and by far the largest of any known species of Honeysuckle." Mr. Hildebrand, Superintendent of the Southern Shan States, after whom the plant was named, sent seeds of it to Kew in 1893, and plants raised from them were widely distributed. Some were tried out-of-doors at Kew, but they were either killed or severely crippled by the first winter. In a note from Dr. Henry, published in *Garden and Forest* in 1897, this *Lonicera* is described as occurring wild in China, and as having flowers of a deep yellow colour. In the same year Mr. Hildebrand wrote of the grand display made by some plants of it in his garden in Burma, and described the flowers as cream-yellow, becoming darker with age. The flowers forwarded to Kew by Mr. Moore were certainly apricot-yellow, and not "brilliant orange-scarlet" as described under the excellent illustration published in the *Gardeners' Chronicle* on September 17, p. 219. This plant will probably succeed best in such places as the Riviera, California, and South Africa. So far it has been as disappointing as a garden plant as its

peculiar reddish-green. The berries grow singly and somewhat sparingly, and present upon the summit a curious little crater, the floor of which is flat, the persistent style standing like a pillar in the centre, and the margin representing the remains of the calyx. When newly ripe, they are covered, like Plums and Grapes, with a beautiful glaucous "bloom," and are filled with juice resembling port wine. The height of the plant seldom exceeds 30 inches, and is usually much less; the branches are angular, wiry, and very tough. *R. D.*

THE MYRTLE FRUITING.—Has it come under the notice of any that the common Myrtle is fruiting this season in the open? It will do so during dry summers in the southern counties of England. I have a note to the effect that in 1865, when the summer was warm and dry, Myrtles growing out-of-doors at Appley Towers at Ryde, in the Isle of Wight, not only bloomed with great freedom, but during autumn and early winter they were quite covered with fruit. At that time the Myrtles at Appley Towers formed a sort of avenue; they were then 10 to

SOCIETIES.

ROYAL HORTICULTURAL. BRITISH-GROWN FRUITS AT THE CRYSTAL PALACE

(See also p. 254).

September 29, 30, and October 1.

THE Royal Horticultural Society is again holding an exhibition of first-rate British grown fruits at the Crystal Palace. Only a veritable specialist could see any indication there that 1898 is an indifferent fruit season. There are a few more exhibits than in 1897, and the falling off in colour and size of Apples and Pears, though a fact, is only to be seen after very careful inspection. The new features included in the schedule are referred to in another column, and Sir TREVOR LAWRENCE, in a speech to the judges after luncheon, gave good reasons for the additions that have been made. The market growers' classes, and those in which fruit growers from certain counties meet under similar conditions were well responded to, and will be popular and useful in the future.

On this occasion the Society has awarded the first two of the new fruit-medals that have been established in memory of the late Dr. Hogg. One of these was awarded to a characteristic exhibit from Messrs. T. F. RIVERS & SON, and the other to a collection of fruits from Messrs. JAMES VEITCH & SONS.

The toasts at the luncheon included "The Crystal Palace Company," proposed by the Chairman, and the "Judges" proposed by Mr. H. J. VEITCH, who stated that in all his experience he had never seen more satisfactory judging. The toast was responded to by Messrs. J. MCINDOE, A. H. PEARSON (Chilwell) and PETER KAY (Market grower).

As showing how the Maidstone district again accounted for itself, it may be mentioned that Mr. GEO. WOODWARD succeeded in winning no fewer than forty-three first and eleven second prizes.

The arrangements are good, and the management at the Crystal Palace, that of the Secretary of the Royal Horticultural Society, of Mr. WRIGHT and Mr. HUMPHREYS from the Chiswick Gardens are worthy of all commendation.

DIVISION I.

GARDENERS AND AMATEURS ONLY. COLLECTIONS OF FRUIT.

THE most important class for a collection of fruits fell to the redoubtable Mr. McIndoe, gardener to Sir JOS. W. PEASE, Bt., Hutton Hall, Guisborough, Yorks. He had twelve first-rate dishes, and they consisted of the following varieties:—Gros Maroc and Muscat of Alexandria Grapes, both varieties being shown in excellent condition in regard to colour and finish, and the bunches of moderate but sufficient size. Of Peaches there were Admirable and Sea Eagle, Nectarines, Pitmaston Orange; Pears Souvenir du Congrès, and Williams' Bon Chrétien; Apple Lady Sudeley; Bryanston Green Gage; Figs, Brown Turkey; a Champion Melon, and a Queen Pine. A capital lot of choice fruit, every dish of which was in the most perfect state of consumption.

The not less well-known fruit exhibitor, Mr. J. H. Goodacre, gr. to the Earl of HARRINGTON, Elvaston, Derby, was 2nd, and the only other exhibitor in this class. His Muscat Grapes were bigger in bunch, and less highly finished. His Black Grapes were Hamburgh, his Queen Pine smaller, but his Apples and Pears, Melons, Peaches, Plums and Nectarines, completed an exhibit of great merit.

The best collection of eight dishes was shown by Mr. Jas. Dawes, gr. to M. BIDDULPH, Esq., M.P., Ledbury Park, Ledbury. Excellent fresh looking Gros Maroc Grapes, good in bunch and berry, were staged in this exhibit; and rather less choice bunches of Muscat of Alexandria. He had Worcester Pearmain Apple, Williams' Bon Chrétien Pear, Princess of Wales Peach, Pine-Apple Nectarine, a Seedling Melon, and Jefferson Plum. Next in honour in this class was Mr. Tidy, gr. to W. K. D'ARCY, Esq., Stanmore Hall, Middlesex, in whose exhibit there was very meritorious Humboldt Nectarines, Sea Eagle Peaches, Royal Favourite Melon, and Grapes Muscat of Alexandria and Alnwick Seedling of moderate size, colour, and good finish. The 3rd prize was won by Mr. F. Cole, gr. to Sir CHAS. RUSSELL, Bart., Swallowfield Park, near Reading, and this exhibitor

FIG. 74.—APPLE LORD HINDLIP: ONE OF THE NEWER APPLES.

countryman, *Rosa gigantea*, an equally remarkable plant in Burma, but a failure in gardens here, where it grows stronger than the strongest briar, but never flowers. *W. W.* [The colour of the specimens sent to us was much deeper than apricot-yellow. *ED.*]

THE WHORTLEBERRY.—When at the Taunton flower-show in August last, I tasted tarts made of Whortleberries, and the fruits in a stewed form also. It was said that in August the women and children go out on to the Somersetshire hills and downs, and gather from this hardy little shrub the purple berries about the size of Peas, bring them into the town, and sell them to the dealers. The berries are but little esteemed in a raw state, but made into tarts or puddings they make a very agreeable change, and though somewhat astringent, and apt to leave a stain on the lip, they have one advantage—they are largely destitute of the seed-grains. Mr. Leo Grindon gives us an attractive picture of the Whortleberry in its home:—"Usually growing in large patches, and often occupying immense areas of moor and mountain surface, for, like the heather, and some among ourselves, it rejoices in great solitudes, that have never felt the plough, the bright green of the foliage never fails to give pleasure. The flowers are pretty, being bead-like, almost globular, waxy in texture, and of a

12 feet in height, and several fully as much in diameter. The season of 1865 was very similar to that of 1898, for during the preceding winter there was no frost to hurt the specimens, and as their wood was well ripened owing to the autumn having been fine and dry, they bloomed and fruited freely. Mr. Leo Grindon intimates that Myrtle-berries are prized for eating in the Levantine countries; and Miss Beaufort, afterwards Lady Strangford, in her book on *Egyptian Sculptures and Syrian Shrines*, published in 1861, says: "While staying at Damascus I made my luncheon of the perfumed berries of the Myrtle." Dr. Lindley says of the fruit of *Myrtus communis*, that they "have a sweetish powerfully aromatic taste, are eaten in a fresh state, or dried and used as a condiment." *Eugenia Ugni*, which was introduced in 1845, is now classed with the Myrtles. It was thought at the time that its fruit, much esteemed in Chili, would be acceptable in this country, as they possess an agreeable aroma and pleasant taste. Mr. Grindon says that "the berries make an excellent tart, or the juice may be expressed and mixed with water, to make a delicious cool drink, with odour of rosemary; or they may be made into jam. So penetrating is the aroma that it clings to the fingers after gathering." But it can scarcely be expected to fruit in the open elsewhere than in south-west Britain. *R. D.*

had capital Black Hamburg Grapes and several other dishes of fine fruits. There were two unsuccessful exhibitors in this class.

GRAPES.

In the class for six distinct varieties, two bunches of each, the best prize was obtained by an exhibit from Mr. J. H. GOODACRE. He had, of black Grapes, Alnwick Seedling, Gros Colmar, Madresfield Court (rather poor in size of bunch), Black Hamburg, and Black Alicante. His only white variety was Muscat of Alexandria, two fine bunches. Generally the exhibit was one of serviceable, well-coloured bunches of moderate exhibition size. Mr. F. Cole, gr. to Sir CHARLES RUSSELL, Bt., Swallowfield Park, Reading, who was 2nd, had also some capital Grapes. His Foster's Seedling were large in bunch, though not in berry, and the finish was grand. His Muscats were good in size, but lacked the best finish. Then he had nice specimens of the new Grape, Appley Towers, Cooper's Black, Black Hamburg, and Black Alicante.

More extraordinary Grapes than those in either of the two exhibits already mentioned were shown by Mr. W. Taylor, gardener to C. BAYER, Esq., Tewkesbury Lodge, Forest Hill, London, S.E. Several of these bunches were abnormal in size and shape, but it must be encouraging to suburban fruit growers to see such a collection of Grapes shown from a district only a good walk from Charing Cross. There were four exhibitors in this important class.

The class for four dishes in three varieties was won by Mr. JAMES DAWES. He had very long thin bunches of Muscat of Alexandria with good berries, good bunches of Gros Maroc, and specimens of Black Alicante that would have been larger in berry had the bunches been thinned more severely. The 2nd prize was taken by Sir E. H. CARBUTT, Bart., Nanhurst, Cranleigh, Surrey (gr., Mr. A. Belcher), whose exhibit was very close in merit to the one already noticed. The 3rd prize exhibit from Mr. J. Jones, gr. to Mrs. F. NEED, York House, Malvern, contained finely berried bunches of Gros Maroc, Madresfield Court and Gros Colman. There were two unsuccessful exhibits.

In the Black Hamburg class, there were seven exhibits of three bunches each, and generally these were most satisfactory for the season. The best were from Mr. F. COLE, the finish on whose Grapes was beautiful. Mr. W. Mitchell, gr. to Mr. J. W. FLEMING, Esq., Chilworth Manor, Romney, was 2nd, and Mr. J. H. GOODACRE, 3rd.

Of Madresfield Court there were fewer collections shown, there being four only. Mr. W. MITCHELL had the best, and these were not remarkable from the exhibition point of view. Mr. J. JONES was a fairly close 2nd, and Mr. J. H. GOODACRE was 3rd.

Of Gros Maroc there were some fine exhibits, the bold bunch and large highly-coloured berry characteristic of this variety being very effective on the exhibition tables. Those from Mr. W. Allan, gr. to Lord SUFFIELD, Gunton Park, Norwich, represented the variety capitally from the point of view of size, but the finish and colour were better developed in the specimens from Mr. W. Mitchell, who was 2nd. Mr. George Reynolds, gr. to the Messrs. DE ROTHSCHILD, Gunnersbury Park, Acton, W., was 3rd, and there were four unsuccessful exhibitors. The above class was one for Gros Maroc or Gros Colman, but the former variety won all of the three prizes.

Black Alicante was exhibited as well as any of the varieties. There were six exhibits of three bunches each, and those from Mr. WM. ALLAN were remarkable for extra size, in which the shoulders so characteristic of the variety were fully developed, and for fine colour; a capital trio for 2nd place came from Mr. Wm. Howe, gr. to Sir H. TATE, Park Hill, Streatham. Mr. F. COLE was 3rd.

Of Lady Downes (Black) there were four exhibits, and some of these though almost ripe, lacked the finish so necessary in an exhibition. The best were from the London suburban garden of C. BAYER, Esq., Tewkesbury Lodge, and were most commendable. The 2nd prize exhibit came from Mr. W. H. Bacon, gr. to Sir MARCUS SAMUEL, Mote Park, Maidstone; and Mr. JAS. DAWES was 3rd.

The "any other black class" was won by very large, moderately even, bunches of finely coloured berries of Mrs. Pince's Muscat. This exhibit was from Mr. W. MITCHELL. The variety, Appley Towers, shown by Mr. GEO. REYNOLDS, was placed 2nd; and Mr. TIDY, with Alnwick Seedling in good condition, was 3rd. There was no other variety than mentioned exhibited in this class.

The best Muscats of Alexandria came from Hillington Court, Uxbridge, the gardens of LORD HILLINGTON (gr., Mr. A. R. Allan), a son of Mr. Allan of Gunton Park Gardens, Norwich. These bunches were mammoth in size, with large berries also. They were not of the very best finish, but well merited the prize awarded them. The 2nd prize was won by Mr. G. DUNCAN, gr. to C. J. LUCAS, Esq., Warnham Court, Horsham, who had also very large bunches, and such as would frequently win first honours. There were seven other exhibitors of Muscats.

The variety Mrs. Pearson was best shown by Mrs. WINGFIELD, Amptill House, Amptill (gr., Mr. W. J. Empson), and he was followed by Mr. GEORGE REYNOLDS and Mr. G. Lane, gr. to Miss RIDGE, Highfield, Englefield Green, Surrey. There were four exhibitors.

Chasselas Napoleon proved to be best in the "any other white" class. Three very fine bunches of this variety were shown by Mr. G. REYNOLDS. Mr. G. LANE, with larger, less well-coloured bunches of the same variety was 2nd; and Mr. WM. ALLAN, with a moderate exhibit of the variety Duke of Buccleuch, was 3rd. Foster's Seedling was also shown in this class.

FIGS.

There were only two dishes of Figs shown, and both were of the variety Brown Turkey. Mr. W. MITCHELL won 1st prize.

COLLECTIONS OF HARDY FRUITS.

In these classes there were excellent collections of fruits, and most satisfactory competitions. In the principal class for fifty dishes to be grown entirely in the open there were five competitors. The best exhibit came from Mr. R. POTTER, gr. to Sir MARK W. COLLETT, Bt., St. Clere, Kemsing, Sevenoaks. This exhibitor had covered the board with white tissue, and between the dishes had trailed Ivy shoots, sprays of the Cape Gooseberry, and other berries. Of Apples in the collection were splendid specimens of Annie Elizabeth, Warner's King, Stone's Pippin, Grenadier, Mère de Ménage, Cox's Orange Pippin, Ribston Pippin, Lane's Prince Albert, &c.; good Pears, were Beurré Bachelier, Duchess d'Angoulême, Souvenir du Congrès, Pitmaston Duchess, Beurré Hardy, Comte de Flandres, &c. Then there were Peaches Lady Palmerston; Nectarines Royal George, Princess of Wales, and Dr. Hogg; Plums, Dymond, Pond's Seedling, Cox's Golden Drop; Fig, Brown Turkey; Mulberries, Kent Cob Nuts, Warrington Gooseberries, &c. The 2nd prize was very well won by Mr. John Powell, gr. to Col. BRYMER, M.P., Ilslington House, Dorchester. He had even greater variety than the 1st prize-winner, for in the collection were remarked Sweetwater Grapes, Red Currants, Damsons, Nuts, Plums, Peaches, Nectarines, Morello Cherries, White Dutch Currants, &c., besides the Pears and Apples.

The remaining collection of hardy fruit was for thirty-six dishes distinct, grown partly or entirely under glass. The exhibits capitally represented orchard-house cultivation. The 1st prize was won by Mr. R. POTTER, who was 1st in the class just mentioned. The fruits in this class were of course finer in size and quality, but we must forbear to particularise to a great extent. He had excellent Gros Maroc Grapes, also Black Hamburg and Foster's Seedling. Then there were Apples, Pears, Plums, Peaches, Figs, &c., all very fine, large, mellow, and of most tempting colour. Mr. MCINDOE, who in this case was 2nd, had an exhibit that at a superficial glance would certainly have appeared equal to that from Mr. Potter. His Grapes were certainly better. He had Alnwick Seedling, Foster's Seedling, and Gros Maroc, and they were all capital. The excellence of the collection generally is a first class testimonial to the exhibit that was placed before it.

DIVISION II.

NURSERYMENS' COMPETITIVE CLASSES.

Collection of Fruit-trees bearing Fruit in Pots.—The only exhibitors in this class were Messrs. RIVERS & SON, Sawbridgeworth, to whom the premier prize (Gold Medal) was awarded. The exhibit was in the usual high-class style characteristic of the firm, the colouring of the several kinds of fruit, their large size, and profusion of bearing, were all most remarkable. The central plant were a dwarf standard, yellow-fleshed Peach (seedling, not named), heavily cropped; smaller Peaches comprised Lord Palmerston, Albatross, Gladstone, and another seedling of high colour and great promise. Plums consisted of the new Rivers' Late Orange, extra fine in colour, and laden with fruit; President, a late purplish-red variety; Cox's Golden Drop, and Pond's Seedling. Pears comprised Conference, a beautiful russety fruit; Marie Louise, good for pot culture; Louise Bonne of Jersey, and Pitmaston Duchess. Apples of Blenheim Orange, highly coloured; Emperor Alexander, also good; Bismarck, Melon Apple, very pretty fine fruits; and Bijou. Dwarf Figs were also included with ripening fruit upon them. (It is regrettable that other competitors do not enter the lists in this class).

For a collection of hardy fruits, grown partly or entirely under glass, to illustrate orchard-house culture, Messrs. BUNYARD & Co., Maidstone, were in this instance the only exhibitors, taking the Society's Gold Medal. Pot trees were included here, being fine samples of culture; these comprised, of Pears, Durondeau, extra fine, and of high colour (this is a first-rate dessert Pear for pot-culture); Pitmaston Duchess and Doyenné du Comice were also included. The picked fruits of Pears comprised grand examples of

Emile d'Huyet, Beurré Rance, Beurré Hardy, Pitmaston Duchess, Durondeau, Marie Benoist (very fine), Conference (very large, but not russety). The finest Apples were Washington (large and fine), Gascoigne's Scarlet Seedling (unusually fine in colour), Peasgood's Nonsuch (similarly good, with a rich bloom suffusing the fruits), Cornish Gillyflower, Wealthy, Cox's Orange, Stone's Apple, and King of Tomkins' Co. Plums were well shown also, the best being Magnum Bonum, Pond's Seedling, Victoria, Cox's Golden Drop, Monarch, and Late Black Orleans. The best Peaches were Princess of Wales, Sea Eagle, Gladstone, and Nectarine Peach, all well developed. Some Figs in pots were also shown, Bourjassotte Grise being in excellent character.

For a collection of not fewer than thirty, or more than fifty, distinct varieties of hardy fruits, in baskets or dishes, grown entirely in the open air, 24 feet by 3 feet table-space allowed, Mr. G. MOUNT, Canterbury, won quite easily, adding another triumph to Kentish-grown fruit. The finest examples here were grand piles of Bismarck (extra fine), Cox's Orange Pippin, Peasgood's Nonsuch (large), Worcester Pearmain, and Gascoigne's Scarlet Seedling, with dishes of high-class quality of Lady Sudeley and Royal Jubilee; the entire collection being well-coloured, and the fruit betokening a hardihood most desirable. The 2nd prize in this class was awarded to Mr. HOLWELL, All Saints Road, Sidmouth, this, too, being a first-class exhibit; some very superior examples of Pears were staged here, the finest being Marie Louise (extra fine), Pitmaston Duchess, Souvenir du Congrès, and Doyenné du Comice. The best of the Apples were Annie Elizabeth, Golden Noble, Ecklinville Seedling (of extraordinary size and finish), Peasgood's Nonsuch, Tibbett's Pearmain, Mère de Ménage, Vicar of Beighton, American Mother, Autumn Pearmain, and Tyler's Kernel; other good dishes were Cox's Golden Drop Plum, and Late Orleans, with Brown Turkey Figs. The 3rd prize was awarded to Mr. JOHN BASHAM, Bassaleg, near Newport, Mon., the fruits being of medium size, the best Pears being Williams' Bon Chrétien, Emile d'Huyet, and Beurré d'Amanlis; and the best Apples, Ecklinville Seedling, Lane's Prince Albert and Mrs. Barron.

For a collection of from thirty to thirty-six distinct varieties of Pears in baskets or dishes, grown entirely in the open air, arranged on a table space of 24 ft. by 3 ft., Mr. H. BERWICK, Sidmouth Nurseries, Sidmouth, Devon, was awarded the 1st prize, many of the examples being very fine, notably King Edward (a grand exhibit), Pitmaston Duchess, Gratioli of Jersey, Williams' Bon Chrétien, and Durondeau. No other exhibitor competed in this class.

For a collection of fifty distinct varieties of Apples in baskets or dishes, grown entirely in the open air, arranged in a similar space, Mr. J. B. COLWILL was 1st in a good competition, a central basket of Gascoigne's Scarlet in the centre was very brilliant in colours, the fruits of medium size; others in plates, &c., comprised extra fine fruits of Sandringham, Reinette d'Osnabruck, Bramley's Seedling, Tibbett's Pearmain, Golden Noble, Alfriston, Lady Sudeley, Jubilee, Twenty Ounce, New Hawthornden, Roundway, Magnum Bonum, Lady Henniker and a grand mound of American Mother, the finest in the show.

The second in this class was awarded to Mr. JOHN BASHAM whose exhibit bore too many traces of the use of fish-netting in supporting the fruits, many being very much marked; the best dishes were Tower of Glamis, New Hawthornden, and Stirling Castle. The third prize in the same class was awarded to Messrs. PAUL & SON, of Cheshunt, whose fruits were fine in size but lacking in colour.

For a collection of not fewer than seventy-five nor more than a hundred distinct varieties of Apples and Pears, with other hardy fruits in baskets or dishes, to be grown entirely in the open air, Messrs. BUNYARD & Co., Maidstone, won quite easily, with a grand display of Apples and Pears of remarkable quality and general excellence, both the fruit and the arrangement were in the usual style of this well-known firm. A central grouping of Apples in distinct colours had a good effect. Around this were grand dishes and baskets of high-class fruit. The finest Apples were Gascoigne's Scarlet Seedling (very brilliant), Allington Pippin (extra fine), Ecklinville Seedling, Castle Major, Withington Fillbasket, Gold Medal, Stone's Apple, Duchess of Oldenburg (extra fine), Bismarck, Bramley's Seedling, Cellini Pippin, Mère de Ménage, Pott's Seedling, Cox's Orange Pippin, and Stirling Castle. Of the Pears, the finest dishes were Durondeau, Marguerite Marillat, Doyenné du Comice, Emile d'Huyet, Beurré Mortillet, and Dr. Jules Guyot. Plums, too, were shown well here. Mr. H. BERWICK was 2nd in this class, with a first-class exhibit, which was, however, overweighted by the Maidstone display; his finest dishes were of Apples, Peasgood's Nonsuch, Gravenstein, Autumn Pearmain, Warner's King, and Waltham Abbey Seedling; and of Pears, Grosse Calebasse, Pitmaston Duchess, and Golden Russet. Plums here were also good, and so were the Peaches.

DIVISION III.

OPEN TO MARKET GROWERS ONLY.

These classes can scarcely be said to have brought anything new in design or practice which may be termed improvements upon our ordinary methods. There was the ordinary box, the market sieve, and baskets, and beyond that the only illustration of a package which may be said to surpass the modes at present employed was that from Mr. Basham, Newport, Mon., which is fully described in one of the following classes.

Class 23 was for 12 lb. of Hamburg Grapes in a single layer, arranged in a baby-basket. But one was forthcoming; it contained ten bunches of Grapes, of somewhat poor colour. No exhibitor's name was attached; it is reasonable to conclude the judges did not deem it worthy an award.

Class 24 was for any other variety of Black beside Hamburg, and there were three competitors, the 1st prize going to Messrs. W. E. WELLS, Hattonhurst, Hounslow, who had ten bunches of Gros Colman, finely-coloured, and laid into the basket in so excellent a manner, that the rich silvery bloom was not disturbed. In this case the baby-basket was dropped into a wooden box, just large enough to take it, to indicate how it could be sent a long distance without harm. Mr. J. GORE, Polegate, Sussex, had ten bunches of Gros Maroc, and, unlike Messrs. Wells, each bunch fastened so as to keep them secure. The bunches were good, the berries well-coloured, but no second award was made. Three baskets competed.

There was but one basket of White Grapes in class 25, for 12 lb. of any white variety also in a baby-basket; they were White Muscats, poor in colour and uneven in berry—the conclusion is they were passed over by the judge.

In class 26, for Grapes packed in any other way than a baby-basket, there was but one exhibit from Mr. J. GORE. This was in an ordinary wicker market-basket, and it contained seven bunches of Gros Colmar Grapes, weighing 11½ lb. The basket was lined with tissue paper, and the bunches of Grapes hanging down the sides, were so securely fastened that they would have travelled hundreds of miles without taking harm. The berries were large, and of good colour; it was deservedly awarded a 1st prize.

In class 27, for four varieties of cooking Apples, about 42 lb. nett of each, in baskets or boxes, the 1st prize was awarded to Mr. E. BASHAM, Griffin Gardens, Bassaleg, Newport, Mon. Each basket was oblong in shape, with lids, the baskets 9 inches in depth. Probably the exhibit was intended to show only the method of packing. Each basket contained two layers of Apples in six lines of six Apples each from back to front, with paper-wool. The sorts were Bismarck, Ecklinville, Lane's Prince Albert, and Lord Derby, the fruit very fine. There is a layer of wool at the bottom, then a layer of Apples, one of paper, and a second layer of Apples with paper, and a layer of wood-wool. These baskets travelled many miles by rail, and then from Paddington by road to the Crystal Palace. The cost of the basket is half-a-crown; with fair use weekly, they will last for six years or more, and they are returnable at the rate of sixpence per hundredweight as empties. The 2nd prize went to Mr. A. WYATT, Hatton, Hounslow, who had his fruit in stout ordinary market-sieves, and lined with ordinary blue paper. The fruit was excellent, the varieties, Stone, Stirling Castle, Golden Noble, and Manx's Codlin. A 3rd exhibit was similarly packed.

Class 28 was similar, with the exception that dessert varieties were inserted, and the weight limited to 20 lb. net. Mr. A. WYATT having the usual market wicker sieve, the varieties excellent in all respects, viz., King of Pippins, Duchess Favourite, Cox's Orange Pippin, and Worcester Pearmain. Mr. G. TEBBUTT, Isleworth, had his similarly packed, but the fruit was not of such high quality. Worcester Pearmain was the best. There were three entries.

Class 29 was for a basket or box of 42 lb. of any Cooking Apple, there being six entries. The 1st prize went to Mr. G. TEBBUTT, who had an ordinary market-sieve filled with very fine fruit of Lady Henniker. 2nd, Mr. A. WYATT, who had a very fine lot of Wellingtons in a market-sieve; a box of about eighty fine fruits of Peasgood's Nonsuch from Messrs. CAMPBELL & GETTING, Glewston, Ross, Hereford, found many admirers; the Apples were in two layers in a box 2½ feet by 1 foot 9 inches, packed with soft paper.

Class 30 was for 20 lb. of a dessert Apple in a basket or box, the 1st prize going to W. MCKENZIE BRADLEY, Esq., Leylands, Meopham, Kent, who had very fine Cox's Orange Pippin in an ordinary market sieve. Mr. JAMES JENNER, Roughway, Tonbridge, was 2nd, having very fine Cox's Orange Pippin similarly packed.

Messrs. CAMPBELL & GETTING had a box of fine Ribston Pippin. There were six entries.

Class 31 was for about 42 lb. of any variety of Apple so packed as to show an improved form of packing for market. There was but one exhibit from W. GALPIN, Esq., Horwood,

Wincanton, just an ordinary wooden box, having three layers of Blenheim Orange Apples laid upon each other without any material between, but with a layer of wood-wool on the top. No award was made. The box contained just over 100 apples.

Class 32 for 42 lb. of Apples, showing an improved system of packing, brought no entry.

Class 33 was for two varieties of Pears in two packages of 20 lb. of each. Here again Mr. WYATT took the 1st prize with fine and ripe Williams' Bon Chrétien and Pitmaston Duchess in ordinary market-sieves; Mr. G. TEBBUTT was 2nd with good Williams' and Beurré Bosc, similarly packed. There were three entries.

Class 34 was for Pears, from twenty-four to forty-eight fruits, according to size, of any one choice dessert variety, suitably packed for market. Mr. A. WYATT was 1st with fine, even fruit of Beurré Bosc, thirty fruits being shown in an ordinary wooden box, laid on wood-wool, in a bed of pink paper; Messrs. W. & E. WELLS were 2nd with twenty-four fine fruit of Souvenir du Congrès, similarly packed.

Class 35 was for a basket or box of about 28 lb. of one variety of Plums. Mr. J. DARLING, Ightham, Kent, was 1st with a small, oblong basket of Pond's Seedling, very fine; and Mr. G. TEBBUTT, 2nd, with some fine fruit of Sandall's Plums.

Class 37 was for a basket or box of about 28 lb. of Damsons, Mr. J. DARLING being 1st with very fine Farleigh Prolific; Mr. A. WYATT was 2nd, with the same variety.

Class 38 was for twenty-four fruit of Peaches packed in a suitable box. Mr. J. GORE was placed 1st, with a very fine dish of [what appeared to be] Sea Eagle, each fruit in tissue paper and packed in paper shavings. An extra prize was also recommended, probably on account of the fineness of the fruit. Mr. J. MILLER, gr. to Lord FOLEY, Ruxley Lodge, Esher, was 2nd, with twelve fruits each of Barrington and Yellow Albatross.

Class 39 was for about 20 lb. of Filberts or Cob Nuts, suitably packed. Mr. JAMES JENNER, Tonbridge, was placed 1st with some very fine Kentish Cobs, in a small oblong basket lined with blue paper; Mr. J. DARLING was 2nd with the same variety similarly packed.

The best basket or box of 12 lb. of Tomatoes, shown in Class 40, came from J. GORE, Esq., in two layers in an ordinary handled market basket. The Frome Fruit and Flower Company were 2nd with capital fruit of The Cropper similarly packed.

DIVISION IV.

FRUITS GROWN IN THE OPEN AIR.

There was one exhibit only of twenty-four dishes of Apples distinct, including sixteen cooking and eight dessert varieties. Mr. Geo. Woodward, gr. to ROGER LEIGH, Esq., Barham Court, Maidstone, was the exhibitor, and the dishes were one and all very fine. No conception of an indifferent fruit-year could have been entertained whilst looking at such Apples as the specimens of Belle de Pontoise, Alfriston, Waltham Abbey, Ecklinville Seedling, Mère de Ménage, Stone's, Lord Derby, Bismarck, Tower of Glamis, &c.; or such dessert varieties as Worcester Pearmain, Baumann's Reinette, Washington, Gascoigne's Scarlet Seedling, Ribston, Wealthy, Mother, or Cox's Orange Pippin. Mother and a few others were perhaps smaller than we have seen them from the same garden previously, but the collection was a fine one.

The class for twelve dishes, distinct, eight cooking and four dessert, was won by Mr. B. MILLER, gr. to F. W. HARTUP, Esq., West Farleigh, Maidstone, and a grand lot they were, though perhaps not a great deal finer than those that won 2nd prize for Mr. W. G. PRAGNELL, gr. to J. R. D. W. DIGBY, Esq., Sherborne Castle, Dorset. There was also a fine collection from Geo. CHAMBERS, Esq., Mereworth, Maidstone, who was 3rd, and three exhibitors were unsuccessful, though showing fruit of first-class quality.

Mr. JAMES DAWES, already mentioned as the winner of many prizes, was the best exhibitor in the class for nine dishes of Apples, distinct; six cooking and three dessert. He had Warner's King, Ecklinville Seedling, Lord Suffield, Beauty of Kent, Tyler's Kernel, Hollandbury, Cox's Orange Pippin, Blenheim Orange, and Ribston Pippin of capital quality generally. The 2nd prize collection was a good one from Mr. W. Slogrove, gr. to Mrs. CRAWFORD, Gatton Cottage, Reigate. An exhibit from Mr. T. W. HERBERT, gr. to J. T. CHARLESWORTH, Esq., Nutfield Court, Redhill, Surrey, was 3rd.

In the class for six dishes of cooking Apples, Mr. Geo. Woodward had a capital collection of the following varieties:—Lord Derby, Peasgood's Nonsuch, Emperor Alexander, Belle Dubois, Stone's and Warner's King. Mr. G. LOCH, gr. to B. H. HILL, Esq., Newcombes, Crediton, Devon, was 2nd. This exhibitor had also some fine fruits, but there was a remark in pencil upon the ticket, and apparently made by the judges, "Too highly polished." It is true, they shone wonderfully. There were several unsuccessful exhibitors in the class.

In the class for three dishes of cooking Apples, there were as many as eleven collections, and the 1st prize was awarded to Mr. A. MAXIM, gr. to Col. H. WALPOLE, Heckfield Place, Winchfield, who had Warner's King, Lady Henniker, and another.

DESSERT APPLES.

Nine collections were shown in the class for six dishes of dessert Apples distinct, and Mr. GEO. WOODWARD was 1st, showing really beautiful specimens of Washington, Wealthy, Worcester Pearmain, Ribston Pippin, Cox's Orange Pippin, and American Mother. Mr. B. MILLER showed well for 2nd prize.

The best collection of three dishes of dessert Apples was from Mr. A. PENTNEY, gr. to A. J. HOWARD, Esq., Worton Hall, Isleworth, who had American Mother, Ribston Pippin, and King of Pippins.

There were thirteen exhibits in this class.

DESSERT PEARS.

The best collection of twelve dishes distinct was shown by Mr. GEO. WOODWARD. Some of the finest of these were Duchess d'Angoulême, Doyenné du Comice, Beurré Mortellet, Triomphe de Vienne, Durondeau, and Gansell's Bergamot. A very commendable exhibit won 2nd prize for Mr. W. ALLAN, and the 3rd prize was taken by Mr. W. H. BACON, gr. to Sir MARCUS SAMUEL, Moto Park, Maidstone.

For a collection of nine dishes, distinct, the best exhibitor was Mr. W. G. PRAGNELL, Beurré Diel, Marguerite Marrillat, Pitmaston Duchess, Beurré Bachelier, Beurré Superfin were all good in his exhibit. The 2nd prize was won by Mr. JOHN POWELL, gr. to Col. BRYMER, M.P., Ilington House, Dorchester.

The best six dishes, distinct, were from Mr. G. H. SAGE, gr. to the Marquis of Camden, Bayham Abbey, Lamberhurst. There were ten exhibits in the class, and Mr. W. A. COOK, gr. to Major HENEAGE, V.C., Compton Bassett, Wilts, was 2nd.

Mr. RICHARD EDWARDS, gr. to G. H. FIELD, Esq., Beechy Lees, Otford, Sevenoaks, won 1st prize for three dishes, showing Mme. Treve, Triomphe de Vienne, and Pitmaston Duchess.

There were also classes for three dishes and one dish of cooking Pears.

PEACHES AND NECTARINES.

A very fine display of outdoor Peaches was made, filling one entire table. In the class for three dishes, eleven collections were staged, and not an inferior dish could be found among them. Mr. WOODWARD gained the coveted award with fine Princess of Wales, Nectarine Peach and Sea Eagle; 2nd, Mr. A. MAXIM, gr. to Col. H. WALPOLE, Heckfield Place, Winchfield, with precisely the same varieties; 3rd, Mr. PENTNEY, gr. to A. J. HOWARD, Esq., Isleworth, with fruits, almost equal to the preceeding.

Eighteen exhibitors staged in the single dish class, the 1st prize going to Mr. WYTHES, gr. to the Rt. Hon. EARL PERCY, Syon House, for very fine and highly coloured Sea Eagle.

For three dishes of Nectarines, three exhibitors entered, the 1st prize going to Mr. WOODWARD for excellent Humboldt, Rivers' Orange and Pine-Apple. 2nd, Mr. EARL, gr. to O. GOLDSMID, Esq., Somershill, Tonbridge. Seven single dishes competed, the 1st prize going to green unripe fruit of Victoria.

A fine and ripe dish of Pitmaston Orange, from Bighclere, in this class was apparently overlooked by the judges.

PLUMS.

Class 60, for four dishes of Dessert Plums, brought eleven exhibitors, all staging well. Mr. J. VERT, gr. to Rt. Hon. Lord BRAYBROOKE, Audley End, came 1st with fine Golden Drop, Jeffersons, Cox's Violet and Transparent Gage. 2nd, Mr. W. KING, gr. to J. COLMAN, Esq., Gatton Park, Reigate.

For one dish, not Gages, twenty exhibitors competed, the 1st prize going to Mr. VERT for fine Golden Drop; 2nd, Mr. POPE, gr. to the Rt. Hon. Lord CARNARVON, Highclere, with Jeffersons.

Thirteen competitors staged in class 62, one dish of Gage Plums; 1st, Mr. KING, with very fine River's Transparent Gage; 2nd, Mr. POWELL, with rather green Claude de Bavay.

The class for four dishes of Cooking Plums brought fifteen competitors, all very good. 1st, Mr. POPE, with Victoria, Grand Duke, Monarch, and Pond's Seedling; 2nd, Mr. VERT.

Twenty-three competitors staged in the single dish of Cooking Plums, a very fine lot. 1st, Mr. CAMM, gr. to the Duchess of CLEVELAND, Battle Abbey, with very large white Magnum Bonum; the 2nd prize going to large Pond's Seedling. Prunes and Bullaces brought eight dishes, that do not call for special comment.

DIVISION V.

THE NEW SPECIAL COUNTY PRIZES.

The classes which invited fruit grown only in the open air, with the competition open only to amateurs and gardeners, appeared in the Schedule for the first time, and excited a

great amount of interest. With the exception of Ireland, from which country there was no entry, all the groups of counties sent Apples, and all Pears with the exception of the Midlands and Wales, Kent, the south and western counties, and the home counties, including Gloucester, sent very fine Apples and Pears, the most brilliantly-coloured and finest finished culinary Apples were from Devon. It would perhaps be invidious to particularise, to judge accurately, as to the relative value of these collections, some information is necessary as to the circumstance and conditions under which they were grown, but these were not forthcoming.

In the class open to KENT growers there were three entries of six dishes of Apples, four to be cooking, and two dessert, the 1st prize went to Mr. W. STOWERS, 10, Harold Road, Sittingbourne, whose very finely finished and well coloured examples of Peasgood's Nonsuch, Lane's Prince Albert, Bramley's Seedling, and Emperor Alexander, with Worcester Pearmain and Cox's Orange Pippin, were very fine indeed. Mr. G. H. Sage, gr. to the Marquis of CAMDEN, Bayham Abbey, Lamberhurst, was 2nd with good but not quite so large or so bright fruit as the foregoing; he had of culinary Apples, Peasgood's Nonsuch, Ecklinville, Warner's King, and Lord Derby, with Ribston Pippin and Baumann's Red Reinette.

Mr. PAGE was the only exhibitor of six dishes of Pears, staging a very good lot of fruit, consisting of General Todtleben, Pitmaston Duchess, Doyenné du Comice, Beurré Bachelier, Souvenir du Congrès, and Williams' Bon Chrétien.

In Class 67, open to Surrey, Sussex, Hants, Dorset, Somerset, Devon, and Cornwall, there were eight entries of Apples; but the award in this class must have occasioned a good deal of surprise. The 1st prize was awarded to Mr. William Camm, gr. to Her Grace the Duchess of CLEVELAND, Battle Abbey, Sussex, who had good Stirling Castle, Warner's King, Peasgood's Nonsuch, and Mère de Ménage. With finely-coloured Ribston Pippin and Cox's Orange Pippin, Mr. G. Lock, gr. to B. HILL, Esq., Newcombes, Crediton, Devon, who had magnificently-coloured Peasgood's Nonsuch, large in size, and very symmetrical; splendid Emperor Alexander, also brilliant in colour; Stirling Castle and Warner's King were also very fine. The dessert varieties were Gascoigne's Scarlet Seedling, and Ribston, both brilliant in colour. In respect of this collection, Devon beat Kent for finish in the most unmistakable manner.

There were seven collections of Pears, and here Surrey triumphed. Mr. W. Slogrove, gr. to Mrs. CRAWFORD, Gatton Cottage, Reigate, was 1st, with finely-finished and handsome fruit of Pitmaston Duchess, Fondante de Cocurme, Beurré d'Amanlis, Souvenir du Congrès Beacon, and Louise Bonne of Jersey; Mr. J. Webb, gr. to H. CHADWICK, Esq., Manor House, Horsham, who had very good even fruit of Beurré Diel, Pitmaston Duchess, Marie Louise, Beurré Superfin, Maréchal de la Cour, and Marie Louise.

In Class 68, open to WILTS, GLOUCESTER, OXFORD, BEDS, BERKS, BEDS, HERTS, and MIDDLESEX, there were ten collections of Apples, the 1st prize going to Berks, being won by Mr. F. Turton, gr. to Mrs. G. GARDEN NICOL, Maiden Erlegh, Reading. Mr. Turton had very fine culinary Apples in Peasgood's Nonsuch, Warner's King, Mère de Ménage, and Loddington Seedling; and dessert, Ribston Pippin, and Cox's Orange Pippin; 2nd, Mr. W. J. Empson, gr. to Mrs. WINGFIELD, Amphill House, Amphill, Beds, who had very fine Mère de Ménage and Peasgood's Nonsuch, Stone's and Warner's King, Lady Sudeley, very good, with Worcester Pearmain, rather small, but very bright. There were eight collections of six dishes of Pears, the 1st prize in this instance going to Mr. W. A. Cook, gr. to Major HENEAGE, Compton Bassett, Calne, Wilts, who had fine, clear, bright, even fruit of Williams' Bon Chrétien, Pitmaston Duchess, Doyenné du Comice, brightly coloured Marie Louise, Louise Bonne of Jersey, and small Beurré Diel; 2nd, Mr. R. Chamberlain, gr. to F. M. LONAGAN, Esq., Cressingham Park, Reading, who had Pitmaston Duchess, unusually brown; Doyenné Boussoch, Clapp's Favourite, Williams' Bon Chrétien, Doyenné du Comice, and Fondante de Cocurme.

In the class open to ESSEX, SUFFOLK, NORFOLK, CAMBRIDGE, HUNTS, and RUTLAND, five collections of six dishes of Apples were staged, and here Norfolk came to the fore, the 1st prize going to Mr. J. Bowery, gr. to H. H. HURNARD, Esq., Gurney's Manor, Hingham, Norfolk, who had very fine Warner's King, Loddington Seedling, Bramley Seedling, Peasgood's Nonsuch, with very fine Ribston Pippin and Cox's Orange Pippin; 2nd, Mr. J. C. Tallack, gr. to E. DRESDEN, Esq., Livermere Park, Bury St. Edmunds, who had fine Warner's King, the old Catshead Codlin, Emperor Alexander, Dumelow's Seedling, very fine and bright Ribston Pippin, and rather small Cox's Orange Pippin.

There were but two lots of Pears. Mr. A. Andrews, gr. to the Hon. W. LOTHIAN-CAMPBELL, Campsea Ash, Wickham Market, who had very good Souvenir du Congrès, Pitmaston Duchess, Williams' Bon Chrétien, Doyenné du Comice, Maréchal de la Cour, and Beurré Hardy; 2nd, Mr. J. Nichol, gr. to J. W. MELLE, Esq., Sewardstone Lodge, Seward-

stone, who had smaller fruit but bright, the varieties, Beurré Diel, Pitmaston, Duchess Durondeau, Doyenné du Comice, Rivers' Princess and Beurré Bachelier.

In the class open to LINCOLN, NORTHAMPTON, WARWICK, LEICESTER, NOTTS, DERBY, STAFFORD, SHROPSHIRE, and CHESHIRE, there were three collections of six dishes of Apples; Messrs. LEE & SONS, Contractors, Higher Bebbington, Cheshire, were placed 1st with remarkably good examples of Warner's King, Ecklinville Seedling, Peasgood's Nonsuch, Alfriston Brilliant, Worcester Pearmain, and very fine King of the Pippins, very fine fruit indeed for Cheshire. Mr. W. H. Divers, gr. to His Grace the Duke of RUTLAND K.G., Belvoir Castle, Grantham, who had fine culinary Apples in Gascoigne's Seedling, Stirling Castle, Peasgood's Nonsuch, and Warner's King, all very clean and bright; Cox's Orange Pippin, fair; and Worcester Pearmain, small, bright in colour.

Two collections of Pears only were staged. Mr. THOMAS BENNETT, Shavington Gardens, Market Drayton, with remarkably good, bright, even samples of Pitmaston Duchess, Beurré d'Amanlis, Doyenné du Comice, Williams' Bon Chrétien, Marie Louise, and Louise Bonne of Jersey; 2nd, Mr. W. H. DIVERS, with duller, but good even samples of Williams' Bon Chrétien, Doyenné du Comice, Beurré d'Anjou, Beurré Hardy, Beurré Superfin, and Emile d'Heyst.

Class 71 was open to growers in WORCESTER, HEREFORD, MONMOUTH, GLAMORGAN, CARMARTHEN, and PEMBROKE. There were but two collections of Apples, and no Pears. Mr. RICHARD M. WHITING, Credenhill, Hereford, was 1st with six dishes of Apples, having richly-coloured and even Peasgood's Nonsuch, fine Lord Derby, grand Bramley's Seedling, Stirling Castle, with medium-sized, bright-coloured Cox's Orange Pearmain, and Worcester Pearmain. 2nd, R. E. BATEMAN, Esq., Mount Villa, Rylands Road, Leominster, who had good Peasgood's Nonsuch, Beauty of Kent, bright Queen Caroline, Bismarck, Gascoigne's Scarlet Seedling, and Cox's Orange Pippin.

Class 72 was for other counties in WALES, and here there were but two collections of Apples, and both in size and brightness they fell much behind anything previously shown in this division. Mr. G. J. SQUIBBS, gr. to the Dowager Lady W. WYNN, Llangedwyn, Denbighshire, who had Lord Suffield, Tower of Glamis, Gloria Mundi, Mère de Ménage, with Ribston Pippin and Cox's Orange Pippin, both relatively better than the culinary varieties. Mr. H. Austin, gr. to L. P. PUGH, Esq., Abermaide, Aberystwith, was 2nd. He had Maston Seedling and Winter Hawthornden as his best culinary varieties, and King of the Pippins.

There were two collections of Pears from this group of counties, and they were better than the Apples; though small, they were clean and bright. Mr. J. SQUIBBS was again 1st, with Beurré Rance, Beurré Diel, Doyenné du Comice, Williams' Bon Chrétien, Fondante d'Automne, Marie Louise; 2nd, Mr. H. AUSTIN, with Pitmaston Duchess, Flemish Beauty, Beurré Clargéau as his best.

Class 73 was open to growers in the six northern counties of England and the Isle of Man, and here, as might be expected, the produce was small. There were two collections of six dishes of Apples, the 1st prize going to Mr. W. J. Jeffrey, gr. to the Earl of HAREWOOD, Harewood House, Leeds, who had good Lord Suffield, Alfriston, Stirling Castle, Potts' Seedling, with Worcester Pearmain and Cox's Orange Pippin, small. Mr. R. J. HIRD, Roslea, Formby, near Liverpool, was 2nd, his best dishes were Lord Suffield, Warner's King, Lord Derby, and Waltham Abbey Seedling.

SCOTLAND

Sent but one collection of six dishes of Apples in class 74, but they were clean, bright, of good size, and well coloured. The 1st prize was deservedly awarded to Mr. W. J. Day, gr. to the Earl of GALLOWAY, Galloway House, Garliestown, who had Warner's King, Peasgood's Nonsuch, The Queen, Stone's, or Loddington, with James Grieve and Worcester Pearmain, both very bright and even. There was but one collection of six dishes of Pears, a very good lot indeed, consisting of Doyenné Boussoch, Pitmaston Duchess, Madame Troyve, Williams' Bon Chrétien, very good Jersey Gratioli and Louise Bonne of Jersey.

There was nothing whatever from Ireland.

DIVISION VI.

SINGLE DISH CLASSES. DESSERT APPLES.

These began with Adams' Pearmain, which had eight dishes the best, singularly pretty samples coming from Mr. P. Locke, gr. to B. H. HILL, Esq., Crediton. They were, however, not large. Allen's Everlasting was a poor lot, and does not seem worth scheduling. Allington Pippin was better, there being seven dishes, Mr. WOODWARD, of Barham Court, being 1st, and Mr. J. POWELL, gr. to Col. BRYMER, Dorchester, being 2nd. Baumann's Red Reinette, with nine dishes, made a rich-coloured show, Mr. WOODWARD again having the best. There were sixteen dishes of the famous Blenheim Orange, some exceptionally good, such as were the samples from Mr. SLADE, gr. to Lord POLTIMORE, Exeter, and Mr. WHITING,

Hereford, who came 1st and 2nd. There were but six dishes of Brownlee's Russet. Mr. G. CHAMBERS, Mereworth, Kent, having the best of Claygate Pearmain. Mr. Whiting was first, with such good samples that they might have passed for Ribston Pippins. Cockle Pippin was not in great force, but the finest dish, which was from Barham Court, was not in favour, smaller, rather more highly coloured fruits, being preferred. There were some capital samples of Court Pendu Plat, the best coming from Mr. J. C. TALLACK, gr. to E. DRESDEN, Esq., Livermere Park, Suffolk. Mr. J. Vert, gr. to Lord BRAYBROOK, Audley End, Essex, being 2nd, with good samples. Such a popular variety as Cox's Orange Pippin brought twenty-five dishes, Mr. King, gr. to J. COLMAN, Esq., Gatton Park, Reigate, being 1st, with beautiful fruit, Mr. WOODWARD running him hard for 2nd place. This variety merits more prizes. Duke of Devonshire, a flattish russety fruit, brought Mr. G. H. Sage, gr. to Marquis CAMDEN, Lamberhurst, Kent, to the front, with a nice dish; and with the little-shown Egremont Russet, Mr. Earl, gr. to D. E. AVINGDON GOLDSMID, Tonbridge, was 1st. Fearn's Pippin, generally rather small, gave the 1st to Mr. STOWERS, Sittingbourne, with fair samples. Gascoigne's Scarlet had several dishes of absurdly large samples for dessert purpose, and were quite out of place in this section. The best—very fine and richly coloured—came from Mr. STOWERS; Mr. LOCK coming a close 2nd. Of James Grieve only two dishes were shown; King of the Pippins made a moderate show, only nine dishes being staged, Mr. CHAMBERS having the best. There were but four lots of King of Tomkin's County, one of these being of doubtful form. Mr. WOODWARD's sample was very fine, but lacking the high colour usually seen on this variety. There were eight dishes of Mannington Pearmain of moderate quality. The old Margil was better represented, Mr. WOODWARD having the best, and Mr. SLADE the 2nd best dishes. American Mother Apple from Barham Court was the best in its class. There were sixteen dishes of Ribston Pippins, all very good, some specially so. Mr. HALL was placed first, and Mr. CHOPPING, Sittingbourne, 2nd. Scarlet Nonpareil was poor, but Worcester Pearmain gave grand colour, and was first-rate. Singularly beautiful were the samples staged by Mr. KING, from Reigate; Mr. WOODWARD coming 2nd. Twenty-one lots of any other varieties were shown, a singularly beautiful sample of Mabbott's Pearmain coming 1st, and the golden russety variety, St. Edmund Pippin, 2nd. Other good varieties were Wealthy and Scarlet Pearmain.

KITCHEN APPLES

Started with Alfriston, the best samples coming from Mr. WOODWARD, and Mr. J. HUDSON, Gunnersbury. With Beauty of Herts, capital samples, Mr. WOODWARD was again 1st, being close run by Mr. C. HERRIN, of Dropmore, 2nd.

Bismarck: the samples generally fine, yet showed some fungus under the skins. The best came from Mr. SWEET, whose samples were excellent. Bramley's Seedling, a broad, flat, and deeply-indented Apple, cutting much to waste, had through the kindness of Messrs. MERRYWEATHER & Co., Nottingham, three prizes; the samples generally were large. Out of eighteen lots, Mr. STOWERS was placed 1st, Mr. C. MOSS, Welford Park, Newbury, was second, Mr. BEVERLEY, Westbury-on-Trym, coming 3rd. Cellini Pippin was in moderate form, but Cox's Pomona, another ungainly fruit, was represented by fourteen dishes, Messrs. WOODWARD and POWELL having the best.

There were ten dishes of Dumelow's Seedling, or Wellington, the best coming from Mr. CHAMBERS, Mr. W. H. GODDEN being 2nd. Ecklinville Seedling was very fine generally, Mr. WOODWARD and Mr. B. MILLER, gr. to F. W. STARTUP, Esq., Maidstone, taking the prizes. The samples of Emperor Alexander from Barham Court were superb, the rest poor. With Frogmore Prolific, Mr. TURTON, Maiden Erlegh, Reading, was 1st, having capital samples, whilst the finest Golden Noble came from Mr. WOODWARD, who also had very handsome and large Golden Spire. Grenadier was not largely shown, the best coming from Mr. B. MILLER; whilst Mr. WOODWARD was again 1st with grand samples of New Hawthornden. That superb late Apple, Lane's Prince Albert, was well shown. Mr. E. CHOPPING had the finest. Mr. H. C. PRINSEP, Buxted Park, Uckfield, coming 2nd with handsome samples of a more conical form. There were fifteen lots of the fine Lord Derby, those from Barham Court being well 1st, and a very handsome sample from Mr. BASILL, Weybridge, coming 2nd.

Lord Grosvenor was poorly represented, but there were eleven lots, generally very good, of Lord Suffield, Mr. W. G. FRAGELL having the best; Mr. W. LEWIS, gr. to P. OLIVERSON, Esq., Maidstone, being 2nd. Mère de Ménage brought grand fruits, richly coloured, Messrs. WOODWARD and SLADE coming 1st and 2nd. New Northern Greening was poor, but Newton Wonder was better; Messrs. J. R. PEARSON & SONS, Chilwell, Notts, offering three prizes in this class. The best dish came from Mr. THOMAS, Polegate, Sussex. Peasgood's Nonsuch was very fine, the fruit from Barham Court

being exceptionally fine; Mr. LEWIS coming 2nd also with finesamples. Potts' Seedling was but moderately represented. Mr. C. ROSS had the best Sandringham; Mr. WOODWARD, the finest Royal Jubilee and Spencer's Favourite, whilst Mr. ROSS was 1st for Stirling Castle, as also with Stone's Pippin; a very fine dish from Barham Court being oddly overlooked. Many beautiful samples of The Queen were shown. Mr. WOODWARD and Mr. MILLER taking the prizes, whilst the former and Mr. Howard, gr. to Sir M. SUTTON, Beenham Park, Newbury, had the finest Tower of Glamis. Warner's King was represented by 14 dishes, Mr. WOODWARD having the best; he was 1st in the class for any other variety of Cooking Apple with superb Belle Dubois, the 2nd dish being Dutch Codlin.

DESSERT PEARS.

These were necessarily much less attractive than the Apples, and generally competition was smaller, telling too plainly the nature of the season. There was but one dish of Beurré Bosé, and but four of Beurré d'Anjou, the best coming from Mr. G. H. SAGE. Messrs. W. G. PRAGNELL, and C. WYTHES, Syon House, Brentford, had the best Beurré Diel. Mr. WOODWARD took 1st place with good dishes of Beurré Hardy, fruits well coloured, as also with Beurré Superfin. Comte de Lamy was fair, but Conference much better, capital samples coming from Barham Court and from Mr. THOMAS, Doyenné du Comice was but moderately shown, the best coming from Colonel BRYMER, whilst Mr. WOODWARD staged the 1st prize Emile d'Heyst and Fondante d'Thirot. Mr. PRINSEP was 1st with good Fondante d'Automne; Josephine de Malines was in moderate form, and Le Lectier brought but two dishes, the best coming from Mr. W. JONES, Carshalton. There were but seven dishes of Louise Bonne of Jersey, the best coming from Mr. W. CAMM, gr. to the Dowager Duchess of CLEVELAND, Battle Abbey. Mr. WOODWARD had the best Madame Treyve.

There were but five baskets of Marie Louise, Mr. W. ALLAN, Gunton Park, having the finest; he was also 1st in a larger competition with Marie Louise d'Uccle. The best Marguerite Marillat came from Barham Court, and out of nineteen dishes, Mr. LOCK had the finest Pitmaston Duchess; whilst samples generally were good, all the fruits were more than usually russety. Seckle was small, Mr. PRINSEP having the best. Souvenir du Congrès was very fine; Mr. C. HERRIN having the best, and Mr. A. COLEMAN, Stinchcombe, Dursley, was 2nd. Thompson and Winter Nelis were in poor form. Finally in the class for any other dessert varieties, Mr. WOODWARD was 1st with very fine Triomphe de Vienne, Clapp's Favourite coming 2nd out of twenty dishes. Several classes in this section had either no representatives to note, or but one dish or so.

NON-COMPETITIVE EXHIBITS.

Messrs. J. VEITCH & SONS, Ltd., Royal Exotic Nursery, Chelsea, contributed an extensive exhibit, comprising 100 dishes of Apples, and the same number of Pears, also some well-fruited trees in pots of Pears and Figs, the whole covering a table of considerable size. Many of the principal varieties of Apples were set up in boxes, of about thirty to forty fruits in each. Conspicuous among the Apples were Peasgood's Nonsuch (very fine), and Lord Derby.

Of Pears, five baskets were shown of Pitmaston Duchess, Beurré Fonqueray, Souvenir du Congrès, Williams' Bon Chrétien, Charles Ernest (new), Gratioli of Jersey. Very showy also in this exhibit were boxes of the John Downie and Dartmouth Crabs, fruiting sprays of Rubus laciniatus, the best of the Blackberries and plants in pots (60's) of the Strawberry St. Joseph, a perpetual bearing variety, carrying some nice fruits. In the centre of this stand a collection of Gourds were a source of attraction. The Hogg Medal was awarded this exhibit.

Messrs. J. CHEAL & SONS, Crawley, set up a large table, artistically arranged, of Apples and Pears, with a few fruiting-trees of Apples, interspersed with stands of cut Dahlias. In this exhibit a large stand of Bismarck Apple was noticeable, also Jubilee and Lord Grosvenor, and also some fine dishes of Pears (Silver Knightian Medal).

Messrs. J. PEED & SONS, Roupell Park Nursery, S.E., set up some handsome baskets of Apples. A feature of this stand was the four Vines in pots trained from the four corners (Silver Knightian Medal).

From Messrs. SPOONER & SONS, Hounslow Nurseries, Middlesex, came a varied collection of Apples and Pears, 150 dishes (Silver Banksian Medal).

The HORTICULTURAL COLLEGE, Swanley, Kent, contributed an interesting exhibit of bottled fruits, and several dishes of Apples, Nuts, and Plums (Silver Banksian Medal).

Messrs. T. RIVERS & SON, Sawbridgeworth, set up a second stand, in which were some marvellous examples of Peasgood's Nonsuch, Ribston Pippin, and Cox's Orange Pippin Apples; Pitmaston Duchess and Souvenir du Congrès Pears; Monarch, Admiral, Grand Duke, and Golden Transparent Plums; Sea Eagle and Princess of Wales Peaches; Gros Maroc

and Alicante Grapes, with pot trees in fruit of Pears and Plums as a central relief, a very fine exhibit. A Hogg Medal was awarded this exhibit.

Messrs. J. LAING & SONS, Forest Hill, arranged a table with a huge pyramid of Apples as a central piece. Notable dishes in this exhibit were among Apples, Bismarck, Peasgood's Nonsuch, Ecklinville Seedling, Alfriston, Emperor Alexander, Worcester Pearmain, Lord Suffield, Prince Albert, and Bramley's Seedling.

Well fruited Apples and Pears in pots were also contributed, and with handsome dishes of Pears, including Pitmaston Duchess, Beurré Superfin, Doyenné Boussoch, Brockworth Park, and Williams' Bon Chrétien, an admirably arranged exhibit (Silver Knightian Medal).

Mr. R. C. NOTCUTT, Wood's Nursery, Woodbridge, sent 50 dishes of Apples and Pears (Silver Banksian Medal).

From the Lady Dowager WILLIAMS-WYNN came 43 varieties of Apples, and 27 varieties of Pears from Cordon trees, all of moderate quality (Silver Banksian Medal).

Messrs. WM. CUTHRUSH & SON, Highgate Nurseries, staged sixty dishes of Apples arranged in combination with circular groups of Carnations, Bouvardias, and Begonia Gloire de Lorraine.

Messrs. SUTTON & SONS sent sixteen varieties of Tomatos grown and ripened in the open air, nice baskets each filled with a distinct variety. Notable were Perfection, Best of All, Earliest of All A1., among red, Sunbeam, Prince of Wales, and Golden Nugget; among yellows, Peach Blow, and Tender-and-True, a distinct type similar to the Peach in colour (Silver Knightian Medal).

Mr. W. HORNE, fruit-grower, Rochester, Kent, sent twenty-five dishes of fruit (Bronze Banksian Medal).

Mr. W. TAYLER, Hampton, twenty dishes of Apples (Bronze Banksian Medal).

Messrs. J. VEITCH & SONS also contributed an imposing bank of Bamboos.

Messrs. J. LAING & SONS arranged by the orchestra a miscellaneous group of plants, including Begonias, Palms, interspersed with a few choice Orchids.

Messrs. H. CANNELL & SONS staged some fifty varieties of Cannas, a very showy group, that proved very attractive to visitors.

Messrs. T. S. WARE, Ltd., staged a handsome group of cut Dahlias and double Begonias, lightly arranged with foliage plants.

A very interesting exhibit was staged by Mr. Beckett, gr. to Lord ALDENHAM, Elstree, which comprised fruiting sprays of eighteen varieties of Ricinus.

BRITISH MYCOLOGICAL IN DUBLIN, 1898.

THE second annual meeting of this Society has been recently held in Dublin. It may be characterised as having been a week of hospitality and hard work. So eager were some of the members to see what Ireland could produce in the way of fungi that the Secretary, Mr. Rea, Mr. Rose, Mr. Stretton, and the acting President, appeared in Dublin three days before the advertised time. They were met on their arrival by the local secretary, Dr. T. Johnson, and by the veteran Irish mycologist, Mr. Greenwood Pim. On the following day the Yorkshire contingent arrived, Messrs. Crossland, Soppitt, Clarke, and Bearstow, followed shortly after by Mr. G. C. Hughes, of Chesterton, and Dr. Peacock of Malvern. Monday, September 17, saw the party en route for Howth, an estate on which the front door of the mansion always stands open. Legend has it that in bygone days one of the native queens needed hospitality, which being refused, the heir of the house was carried off; since then the front door has stood open. A ramble in a damp glen was soon rewarded by finding Hydnum, udum, a tuber, probably Hydnotria Tulasnei, but it was not quite mature; Cynophallus caninus, Naucoria erinaceus, a group of magnificent specimens of Lepiota acutesquamuosa, gave the mycologists an indication of what the Irish woods could produce.

In the evening a meeting was held in the Botanical Laboratory of the Royal College of Science, where the work of naming the specimens was begun in good earnest, microscopes and text-books being in considerable demand. Mr. Swann exhibited a magnificent series of photographs of the Saprolegnia; Mr. Greenwood Pim showed some specimens and photographs, and Dr. McWeeney exhibited various cultures of fungi. It was, in fact, a general réunion of kindred spirits. The last words the present writer heard that evening were those of certain enthusiasts trying to make arrangements for getting to work at 6 A.M. next day.

On Tuesday, the 20th, the party, now augmented by the members of the Dublin Naturalists' Society, started off under the guidance of Dr. Johnson, in search of Gyrodon rubellus, which Mr. McQueeny had found some few years previously. The spot was found, but not the fungus. The party, however, saw some waterfalls instead, and had a pleasant drive of eighteen or twenty miles through a lovely country. A few stopped behind, and examined the ravages caused by Poly-

porus fomentarius upon some splendid Beech-trees. It was interesting to compare the effect of P. fomentarius on Beech with what we saw last year at Workshop of P. sulphureus on Oak. P. sulphureus gets into a tree, and destroys the middle of the trunk, leaving it sound outside. P. fomentarius seems to vent its energies in destroying the exterior of the tree, fine trunks having a third or a quarter of their circumference killed from the ground upwards from 10 to 15 or 20 feet. Numerous specimens of the Polyporus were in situ, some of which Mr. Clarke, of Halifax, photographed. The rare Polyporus Wynnei was also found, as well as the beautiful Marasmius Hudsoni.

A good company dined in the evening at Russell's Hotel, and adjoining to the large theatre of the Royal College of Science, the chair being taken by Mr. R. L. Praeger, the President of the Dublin Naturalists' Field Club. The regrettable absence of the President of the British Mycological Society, Mr. G. Massee, tended to damp the whole proceedings—we missed his lively footsteps, his whimsical sayings, and his facile determination of fungi species. It fell to the lot of the writer to take his place, which he did to the best of his ability; but, after all, he was only a *locum tenens*, and although the society did him the honour of electing him their President for the ensuing year, yet he felt that after all he was but a poor substitute for the "rare original." Not only was his presidential address dry, but some of the audience said the seats were so uncomfortable that they could not "drop off," as is the custom during presidential addresses.

Wednesday morning was spent in working at the herbarium, in opening consignments of fungi which now came to hand from all parts of Ireland, and from some parts of England as well. The afternoon excursion to Brackenstown, near Swords, was nearly marred by the overturning of an outside car, on which Mr. and Mrs. Rea, Mr. Pim, and the Rev. H. W. Lett. For the moment the sight was positively sickening, to see one's friends shot in a heap on the ground, with the car coming over upon the top of them, but fortunately they escaped with a few bruises. The Rev. W. L. W. Eyre and Miss Eyre, from Hampshire, joined the party. As soon as the grounds were entered the rain began to come down at first gently, then steadily, then heavily. But it made no difference to the workers—for as the Secretary put it, "I am wet through, so we will just go on." Sphaeria mammiformis, Agaricus pisciodorus, Polyporus obducens and vitiosus, were our rewards. At the evening meeting Mr. Wagers' paper was read, as well as Mr. Crossland's communication on "The Mycological Flora of a Discarded Hearth-rug."

Thursday was spent in the grand Woods of Avoca, some of the party walked to see the "meeting of the waters," eulogised by Moore; others did not, contenting themselves with finding Boletus parasiticus, Russula lepida, Agaricus jubatus and pantherinus, and Helotium ceruginosum in magnificent fruit. Owing to the exertions of the Secretary, the train was "held for a minute or two" at one of the minor stations to enable us to have five o'clock tea. In the evening more papers, including an "Epitome of Eriksson's Researches on the Cereal Rusts" [which will be given in our next issue. Ed.]

Friday morning was devoted to work in the museum; the afternoon to an excursion to Lucan, where the find of the day fell to Dr. Peacock, of Malvern, in Agaricus strobiliformis. Mr. Soppitt also picked up Cortinarius fulgens, new to Ireland. The tired fungologists were refreshed by afternoon tea through the considerate kindness of Miss Hopkins, of Lucan. In the evening, Dr. E. J. McWeeney read a paper on the "Sclerotium Disease of Potatoes"—a malady which, he said, was very widespread in certain districts, especially along the western and north-western seaboard of Ireland. This disease assumed two distinct forms—one characterised by large sclerotia hanging loosely in the pith-cavity of the affected Potato-plant—the other by small crumpled inconspicuous sclerotia firmly adherent to the epidermis of the leaves and stem. On planting the sclerotia belonging to the first-named species, they gave rise to one or several upright stalks, each supporting a small brown Peziza. This was usually about the size of a threepenny-piece. If planted on a Potato, the spores gave rise to threads which penetrated into the plant, and produced after awhile tuft-like masses of mycelium, the central part of which became hard and black—in other words, became a sclerotium. The affected plants soon die. The smaller variety of sclerotium when planted produces not a Peziza, but a mouse-grey Botrytis. This mould seems to be capable of attacking living Potato plants. After killing them it produces its minute sclerotia on their withering stems and leaves. It never develops into a Peziza, nor does the other Peziza-producing sclerotium ever produce a Botrytis. By these studies, mostly carried on in the laboratory at the Albert Model Farm, he had succeeded in demonstrating the existence of two separate diseases of the Potato—both characterised by sclerotia, and both eminently preventible. The proper course to take was to carefully destroy by fire the withered remains of the Potato crop each autumn, and not to grow Potatoes on the same plot for several consecutive seasons. Deep cultivation also, with a view to burying the sclerotia out of harm's way, was advisable. He concluded by saying, that though neither of these diseases was so much to be dreaded as the Phytophthora, yet in certain districts they did a great deal of damage to the crop.

Mr. Greenwood Pim exhibited some lantern-slides of fungi, which were greatly admired. Mr. Soppitt made a communication on the Gooseberry Ecidium, a much commoner disease in Ireland than in England. The life-history of this fungus he has been working at for some years. Mr. Rea read a paper on the "Different Names applied by English and French mycologists to one and the same Basidiomycete."

The Saturday excursion was to be to Dunragh, where Mr. Paterson had found Boletus porphyrosporus, but the writer was unable to take part in this.

And so ended our happy week. Our welcome was hearty, our entertainment perfect; every minute detail affecting our comfort was looked after by Dr. Johnson and his colleagues, but in return we had to work. Charles B. Poyright, M.D.

POTATOES.

60s. to 85s. per ton. John Bath, 32 and 34, Wellington Street, Covent Garden.

CAULIFLOWER: A Long Subscriber. We do not know that the variety is more prone to "sport" than others.

CHRYSANTHEMUM: T. D., De B. C., C. H. Snook, and Others. The leaves are affected with the Chrysanthemum-rust. Burn the affected plants, and syringe the others with sulphide of potassium, $\frac{1}{2}$ oz. to a gallon of water.

CHRYSANTHEMUMS DISEASED: Amateur. The leaves sent are attacked by a leaf-spot disease due to a fungus. A similar case was dealt with in this column on May 7, 1898. Fungicides, such as sulphide of potassium or weak Bordeaux Mixture, will probably be useful as remedies, but we cannot say yet what results have followed this treatment. As one variety only is affected, it indicates unhealthy cuttings, or the variety is one that is more susceptible than others to the attacks of fungus.

FERN: X. We cannot tell you where you may purchase a herbarium. You had better advertise.

FLORIDA BEAN: G. This has been identified by Mr. F. Manson Bailey as *Mucuna pruriens* var. *utilis*. It is not likely to be of any use here, but may be serviceable in some of our colonies.

GRAPES SPOILED: W. S. A. The fruit is attacked by the fungus *Gloeosporium laticolor*, which causes the so-called "spot" disease in Grapes and other fruits. There is no known cure. It has been frequently noticed in these pages.

MAGGOTS IN GARDEN: M. W. M. We do not know what particular maggot your garden is infested with, but a capital means of ridding the soil of a number of such pests is to encourage the starling and other insect-eating birds. Frequently fork over the ground, and give the birds a chance by exposing the insects. You might also give the land a dressing with gas-lime in autumn, but do not crop land so treated until spring.

MOSSY LAWN: C. G. P. If the mossiness of the turf is due to the presence of an excessive quantity of moisture in the land, you must drain it with rubble-drains, laid 3 feet deep; if it be due to over-much shade from trees, perhaps something may be done by thinning the trees or the heads, and thus letting in the sunshine. In any case, with a closely-set iron rake scratch up all of the moss possible; then prick up the surface a little, and lay down a thin layer of heavy loam, and sow lawn grass-seeds, together with a little seed of *Trifolium minus* and *T. repens*. It will soon grow with the warmth at the present time in the soil, especially if you apply water several times, if heavy rain should not fall. The less mossy patches may be sown with Grass and *Trifolium*, sprinkling loam and woodashes, the latter forming one-eighth of the whole. Indeed, the entire lawn would be the better for a dressing of the same.

NAMES OF FRUITS.—Applications to name fruits are so numerous at this season, as seriously to hamper us in the exercise of our editorial duties. They entail an expenditure of time, labour, and money, of which our readers can have little idea. We are most desirous to oblige our correspondents as far as we can, but we must request that they will observe the rule that not more than six varieties be sent at any one time. The specimens must be good ones, just approaching ripeness, and they should be properly numbered, and carefully packed. We do not undertake to send answers through the post, or to return fruits. Fruits and plants must not be sent in the same box. Delay in any case is unavoidable.

—G. Dixon. Apple, Crimson Queen; Pear, not known.—W. Burgess. Apple New Hawthornden. G. S. 1, Reinette du Canada; 2, Gloria Mundi; 3, Minshall Crab; 4, Golden Noble; 5, Annie Elizabeth; 6, Dumelow's Seedling.—R. Kennard. 1, Worcester Pearmain; 2, Scarlet Nonpareil; 3, not known; 4, King of the Pippins; 5, 6, Reinette de Caux.—R. J. B., Taunton. You have greatly exceeded the number we undertake to name at any one time. You might send a contribution to one or other of the gardening charities. On future occasions send six varieties only. 1, Rosemary Russet; 2, Beauty of Kent; 3, Hawthornden; 4, King of the Pippins; 5, Emperor Alexander; 6, Ribston Pippin; 7, Dumelow's Seedling; 8, New Rock Pippin; 9, Court Pendu Plat; 10, Ribston Pippin; 11, Waltham Abbey

Seedling.—J. B. & Sons. Northern Greening.—Kent. 2, Ecklinville Seedling; 1 and 3, Golden Noble; 4, Gloria Mundi; 5, Worcester Pearmain.—T. H. Lay. 1, Easter Beurré; 2, Marie Louise; 3, Bergamotte d'Esperen. Apple not known, worthless.

NAMES OF PLANTS: Correspondents not answered in this issue are requested to be so good as to consult the following number.—W. L. Disandra prostrata.—R. F. G. 1, not recognised, no flowers; 2, Planera Richardi; 3, Polygonum Bistorta; 4, a Potentilla, no flowers; 5, Veronica chamædrys; 6, Berberis vulgaris; 7, tuber, not known. Wretched specimens badly packed, and the numbers mostly obliterated. We do our best.—A. S. 1, Euonymus europæus, common Spindle Tree; 2, Cannabis sativa, cultivated Hemp, introduced with foreign seed.—E. J. 1, Narthecium ossifragum; 2, Senecio Jacobæa; 3, Achillea millefolium, rose-coloured form; 4, wretched scrap, probably a Potamogeton; 5, Eriophorum polystachyum (Cotton Grass); 6, a moss, Fontinalis antipyretica.—F. Yates. We cannot tell without flowers.—W. Y., Brentford. Stanhopea Wardi, var. venusta, figured in *Lindenia*, vol. vii., t. 315.—N. Devon. Phytolacca decandra.—H. R., Watford. Masdevallia maculata; 2, Cattleya Harrisoniana; 3, Epidendrum fragrans.—T. T. 1, Cymbidium aloifolium; 2, a leaf probably of Sophronites, no flower found; 3, Loasa lateritia; 4, Solidago canadensis; 5, Achillea eupatorium.—Palms. 1, Hibiscus rosa-sinensis fulgidus plenus; 2, Hibiscus Cooperi; 3, Dipladenia boliviensis; 4, Begonia foliosa; 5, Cyperus laxus; 6, Anthericum lineare variegatum; 7, Plumeria bicolor.—W. H. Bennett. 1, Arundinaria falcata var. glomerata (worth figuring if yours is a good specimen); 2 and 3: we are unable to distinguish these from each other; slight differences are to be seen, but there is nothing in the specimens you send to constitute even a variety. They both appear to us to be Arundinaria Falconeri.—S. B. C. A species of Agave, but which we cannot say, in the absence of complete specimen.—Bricknell. Cratægus Carrièrei, hort., Gard. Chron., February 20, 1897.—A. M. Tecoma jasminoides.

NURSERY NOTES: X. We may visit and note your establishment if we think it of interest to our readers to do so, but to offer us a bribe in the shape of an advertisement forso doing is discreditable. If it answers your purpose to advertise, we shall be pleased to accept your advertisement, but absolutely unconditionally. Our responsibility ends with the insertion of the advertisement. As business men, you must see that this is the only course a respectable journal could follow without loss of reputation.

PAINTING THE INTERIOR OF A HOUSE CONTAINING PLANTS: Palms. If the house be properly ventilated during the time the painting is being effected, and until the worst of the smell has passed, no injury will ensue. For a few days, leave a small amount of top ventilation open during the night.

ROYAL GARDENERS' ORPHAN FUND: We acknowledge with thanks the receipt of two shillings from Mr. W. Young, Brantford. This amount has been transmitted to the secretary of the Fund.

SPOTTED PELARGONIUMS: J. Shaw. The leaves sent are affected by the fungus referred to in this column on July 2, 1898.

TOMATOS: A. R. P. The roots of your plants are very badly infested with eel-worm, so often described and figured in these columns. Burn the plants and start afresh with new soil. As most loamy soil contain these creatures, it will be well to soak the soil in boiling water before using it.

THE

Gardeners' Chronicle.

SATURDAY, OCTOBER 8, 1898.

THE CACTACEÆ OF THE GALAPAGOS ISLANDS.

THE death of Dr. G. Baur, at the comparatively early age of thirty-nine, was announced in the current volume of the *Gardeners' Chronicle*, p. 32, where it was intimated that some particulars of his writings on the natural history and origin of the Galapagos Islands might follow that brief notice. But first of all a few of the principal events of his life. He was born in 1859, at Weisswasser, in Bohemia, and after the usual educational course, and some teaching on his own part, he went to the United States (in 1884) as assistant to the eminent Palæontologist, Professor O. C. Marsh. Finally, he went to the Chicago University, where he held an appointment as Assistant-Professor of Comparative Osteology and Palæontology.

In 1889 his attention was directed to the study of the Galapagos Islands by the arrival at Yale of a big land tortoise from the miocene of Nebraska, as it reminded him of the gigantic forms of these creatures which inhabit that group of islands. He at once conceived the idea that these islands originated by subsidence, rather than by upheaval; that they were formerly connected with each other, and with the mainland of America; and thenceforward he had a great longing to visit the islands to investigate their formation and natural productions. After many difficulties he succeeded in obtaining the necessary funds for the purpose, and was thus enabled to spend six months there—May to October—in 1891. He was accompanied and assisted by Mr. C. F. Adams, who predeceased him; and both the botanical and zoological collections were far more extensive than any previous ones from the islands. Dr. Baur and other specialists published the results, or some of them, in various periodicals, but not all of them came under my notice; and in an article on the Cactaceæ of the Galapagos Islands,* I commented on the absence of any additional knowledge of this family since Darwin's time. This article came under Dr. Baur's notice, and he very courteously sent me two photographs, one of which is reproduced on p. 266,† and the substance of some notes which he had published on the subject. But as the Cactaceæ play an important part in the natural history of the Galapagos, I will give a brief historical account of their discovery. I may mention, that apart from the genus *Rhipsalis*, which is represented by indigenous species in remote islands in the Old

World, the Galapagos are the only remote islands in which other Cactaceæ are indigenous, to say nothing of constituting an important and conspicuous element in the flora.

Although several travellers, including James Macrae and David Douglas, collected in the islands before Darwin, he was the first, I believe, to collect and comment on the Cactaceæ, and call attention to their abundance and utility. It was in 1835 that he was there, and on specimens which he obtained, the Rev. Prof. Henslow founded *Opuntia galapageia*.* Darwin also alludes to another Cactus, resembling *Cereus peruvianus* in habit; but he collected no specimens, as he did not find it in flower. He dwells particularly on the facts that the *Opuntia* grows in rough lava, where nothing else will grow; that it and an *Acacia* were the only trees that afforded some slight shade in the coast region of the islands; and that the Cacti are the only source of water during long droughts. Our illustration (fig. 75, p. 266) conveys, better than words could, the nature of the home of this giant Cactus. In the notes accompanying Prof. Henslow's description, it is stated that it attains to the form of a tree, averaging from 6 to 10 feet high, with a trunk about a foot in diameter, perfectly cylindrical, or very slightly tapering, and densely armed with rigid, deflected spines, so that no animal can ascend it. But Dr. Baur informed me that the largest he saw were about 20 feet high, with a trunk 2 feet in diameter. Any person who has cut up a Cactus will be able to form some idea of the large quantity of water stored up in these huge *Opuntias*; and there is no doubt that they play an important part in the natural history of the islands. Darwin observed that the succulent branches that had been blown off were eagerly devoured by the gigantic tortoises, by the lizards, and by various other animals. Lizards 4 feet in length were easily enticed whenever he threw them a piece of a branch; and small birds would come within a few feet of him, and peck at one end, whilst a lizard was eating at the other end.

Andersson, a Swedish botanist, who visited the islands in 1852, and published an account of his collections,† says of *Opuntia galapageia* that it abounded in all the islands, and adds that, at least, four or five species of Cactaceæ inhabited the islands. In his own words: "Sine dubio plures adsunt species Cactacearum his insulis propriæ, quas quidem observavimus ipsi, nec tamen ob angustias temporis eas rite colligere vel depingere licitum fuit. Quatuor vel quinque certe distinctas saltem vidimus."

It is still very uncertain how many distinct species of this family inhabit the islands, but judging from Dr. Baur's observations the prevailing Cactus is *Opuntia galapageia*, and this varies in stature and other particulars in the different islands. On this point he communicated to me the substance of an article of his, which appeared in a German publication.‡ On Barrington, Indefatigable, and South Albe-marle, it develops a very tall trunk; on Charles and Hood a relatively short but thicker trunk; on Jervis a very short trunk, branching from very near the ground; and on Tower Island it forms no stem at all, and appears as a dwarf bush. Dr. Baur attributed these modifications to the varying degrees of humidity, the greatest development occurring in the driest climate. The last statement is highly instructive from the gardener's standpoint. Mark! the

greater the aridity of the climate, and apparent sterility of the medium in which this Cactus grows, the greater the development.

Opuntia galapageia is remarkable in its genus alike for its colossal stature and the smallness of its flowers, which are not more than three quarters of an inch in diameter. Andersson states that the flowers are succeeded by a pretty red fruit, which doubtless also serves as food for some of the animal inhabitants of the islands.

Concerning Dr. Baur's theory of the origin of the islands by subsidence rather than by upheaval, I may mention that it has met with derision in some quarters, more especially by geologists; whilst some zoologists and botanists, without actually accepting his views, find them strongly supported by biological facts. Long ago Dr. A. Guenther, the President of the Linnean Society, suggested a possible former land connection,* and in his presidential address last May he went somewhat further in support of it. Personally, after many years investigation of remote insular floras, I am more than ever inclined to the view that I expressed† many years ago, that all the known means of dispersal of plants are insufficient to account for the present floras of remote islands, except in the low-lying Coral Islands. W. Botting Hemsley.

NEW OR NOTEWORTHY PLANTS.

DEUTZIA CORYMBIFLORA.

(SEE FIG. 76, ON P. 267.)

LET me first account for the name which we gave to this species without the authority of a botanist; a few words on the origin of this *Deutzia* will explain matters.

We owe its introduction into France to M. Maurice de Vilmoren, the well-known dendrologist, who received seeds in 1895 from the Abbé Forges, a French missionary. These seeds came from western Tse Tchuen, China. They germinated freely, and some of the pricked-out plants showed bud in November of the same year, and were flowered in April, 1896, by M. Boucher, a Paris nurseryman, to whom they were sent, and who the following year, on April 8, 1897, showed a flowering plant under the name of *Deutzia corymbosa* (?) before the Société Nationale d'Horticulture de France. After mentioning the origin of this new shrub, M. de Vilmoren explained the reasons which caused him to adopt the specific name of *corymbosa* provisionally.

The illustration given in the *Laubholzkunde* of Dippel for *Deutzia corymbosa* (Royle, after Robert Brown) seems, he says, to apply to this plant. The *Index Kewensis* refers *D. corymbosa*, R. Brown, to *D. parviflora*, Bunge. M. Franchet, of the Museum, also identified as *D. parviflora*, Bunge, the flowering branches sent to him by M. de Vilmoren.

M. Maurice de Vilmoren, he adds, noticed a marked difference in precocity at Barres in 1896 between the two plants, not to mention certain characteristics of growth, and MM. Lemoine, père & fils, of Nancy, unhesitatingly declared that the plants of which they were shown herbarium specimens, were not *D. parviflora*.

The *Handbook* of the Kew Arboretum, some five or six years subsequent to the *Index Kewensis*, did not join the two species *D. parviflora*, Bunge, and *D. corymbosa*, R. Br. It is, therefore, probable that they are sufficiently different to justify their position as distinct species, and that M. Boucher's plant is *D. corymbosa*, R. Br., as M. Maurice de Vilmoren decided after seeing the herbarium specimen and the Kew plants.‡

In examining the description of *D. corymbosa*,

* *Nature*, viii. (1895), p. 31.† The other represents the *Cereus*, referred to further on, growing abundantly among low bushes, and rising above the surrounding vegetation.* *Magazine of Zoology and Botany*, vol. i. (1837), p. 467, plate 14.† *Om Galapagos-Öarnes Vegetation*.‡ *Biologisches Centralblatt*, xi., 1892.* *Nature*, xii. (1875), p. 297.† *Botany of the "Challenger" Expedition*, Introduction, p. 51, and elsewhere.‡ *Journal de la Société Nationale d'Horticulture de France*, April, 1897, p. 334.

R. Br., it is to be noticed that this plant possesses, as does *D. parviflora*, Bunge, rounded petals with quincuncial aestivation, and that it differs in having rather larger flowers, the filaments of the stamens sharply toothed (instead of being indistinctly so), and glabrous petals; those of *D. parviflora* being pubescent on the outer surface. These characteristics appear to us sufficient to establish *D. corymbosa* as a simple variety of *D. parviflora*. Nothing, on the contrary, justifies us in identifying it with our plant, which has pointed petals, and a valvate, induplicate aestivation.

It is also impossible to refer it to *D. corymbosa*, Lindley, which is no other than *D. staminea*, R. Br., a species from the Himalayas and Eastern India, with bicoloured leaves, very late flowers, and which is not sufficiently hardy in our climate. There is still less reason to ally it to *D. corymbosa*, Hort., which is merely a form of *Philadelphus inodorus*, L.

Conclusion: the title *corymbosa*, whether given by Robert Brown, Lindley, or the florists, should not be applied to our plant. No hitherto described species can be identified with it; the three nearest are:—

1. *D. staminea*, R. Br.—We have seen in what particulars this differs; furthermore, a single glance is sufficient to show the distinctions.

2. *D. Fargesii*, Franchet, from Eastern Tse Tchuen which is unlike it in being of small stature, with thick leaves glabrous on both surfaces, with hard and reddish dentations; the petals are obtuse, the filaments of the stamens with teeth longer than the anthers, &c.

3. *D. setchuenensis*, Franchet, from Eastern Tse Tchuen. M. Franchet, after having grouped the plant under discussion with *D. parviflora*, Bunge, concludes by referring it to *D. setchuenensis*, Franchet; but the description he himself gives of this latter species prevents us from identifying them. Indeed, he mentions small leaves (3 centimètres in length); pauciflorous inflorescences; petals twice as long as the stamens, furnished outside with starry hairs, brown in the centre, none of which characteristics apply to our plant; consequently, we believe ourselves justified in giving the name *D. corymbiflora*, a specific term unappropriated in *Deutzia* nomenclature, and recalling sufficiently clearly the name under which the plant was first brought before the public.

It is a shrub of moderate size, attaining 4 feet in height, much branched, and very elegant. The new shoots are erect, round, with bronze-green bark, covered with many fine starry white hairs; the internodes moderately long, the leaves $5\frac{1}{2}$ inches long, nearly sessile, or with a petiole not over half-an-inch long, oval, lanceolate, pointed, often heart-shaped at the base, bordered with fine and short hairs, wrinkled on both surfaces, the upper surface very dark satiny, green, with single, short and appressed hairs; the lower surface clear green, with starry hairs on all the veins. The branches of the preceding year emit from all their axils divaricating branches, terminating in widely corymbiform panicles in di- or tri-chotomous cymes, on each of which a hundred flowers or buds may be counted in all stages of development. The pedicels are short and slender; the calyx is cupuliform, clear green, with seven triangular lobes, very short, the whole covered with starry whitish hairs. The five petals are valvate induplicate, and pointed at the extremity, with a broad base, and pointed tip; the flowers, when perfectly expanded, are snow-white, and measure three-quarters of an inch across; the buds are spherical. The five large stamens measure scarcely a third of the length of the petals, the five small ones have a very wide winged filament; the anther, inserted directly between the two teeth, slightly exceeds them in length; the three styles are very short, the height of the small stamens which conceal them. The filaments of the stamens form a small, close, and firm column, remaining till the blooming is quite over.

The appearance of the flowers somewhat recalls that of *Solanum jasminoides*; their number is so considerable that they cover the plant like a dome of

snow, and that during more than a month. In fact, the normal flowering begins in the second fortnight in June, when the flowers of *D. crenata* and its numerous varieties are nearly over, and, thanks to the numbers of buds which open in succession from the centre to the edges of the cymes the flowering is, at the end of July, as abundant and fresh as at the

THE OLD HALL, SOUTH-BOROUGH.

INTERESTING in every respect is the garden of C. B. Powell, Esq., near Tunbridge Wells; and even in the late hot and dry summer, which affected Tunbridge Wells' gardens more than it did those in most parts

FIG. 75.—*OPUNTIA GALAPAGEIA* (HENSLOW).

(It attains a height of 20 feet, with a trunk 2 feet in diameter. See p. 265.)

beginning. Oftentimes the new shoots are, in September, again covered with new inflorescences, without weakening the flowering in the following year. Since its introduction this shrub has, in the open ground, perfectly withstood the winters of our climate.

This is, therefore, a very valuable and new attainment, and will be effective as a specimen plant on a lawn or in small clumps at the edges of shrubberies. *E. Lemoine, Nancy.*

of the country, many of the hybrids, which it is Mr. Powell's study to evolve, are making a good show. For example, the hybrid *Gladioli* of the *G. Lemoinei* and *G. Nanceianus* class, which have been independently worked up at Southborough, are very beautiful, the long beds of them being brilliant with fine spikes of large flowers of very fine substance, and varying from cream coloured to yellow, red, purple, scarlet, crimson, and all intermediate hues, their beauties being greatly enhanced by the dark crimson,

purple, yellow, and other rich colours displayed in the lower segments, and contrasting well with the lighter colours of the rest of the flower. Taken throughout, many of the varieties may not differ much from the Continental ones, but in the slate-blue, blood red, claret-coloured, yellow, and unusual colours in the class, there is decided novelty, while all the flowers have unusually good substance. The

and *C. longifolium*, which, if it be as hardy as *C. x Powellii*, should be a very fine plant; and opportunity is only waited to cross *C. campanulatum* and other species.

In the border adjoining the house were some nicely-flowered *Alstroemerias* in variety. Out of *A. pelegina* and *A. aurea* it is thought some very desirable new garden flowers may be secured.

how bad the season may be for gardening generally, if such plants are judiciously selected, a good show may be obtained. There were, in addition to the *Gladioli*, the double scarlet *Mule Pink*, *Napoleon III.*, and some of other forms of *Dianthus*, which were very fine. The *Eryngiums*, *Montbretias*, *Gypsophilas*, *Helianthus*, *Phloxes*, and many other of the showier perennials were very bright, and not affected by the drought, except in shortening their period of flowering.

THE ORCHIDS

are well cared for at Southborough, both Mr. Powell and his gardener, Mr. Dupont, taking great interest in them. A general collection is not attempted, though a large number of *Odontoglossums*, *Cattleyas*, *Lælias*, *Cypripediums*, and other showy species, are cultivated, and some of the more difficult of them with more than ordinary success.

In the *Cattleya*-house some very fine examples of *Cattleya Warscewiczii* were noted, superbly grown, as also some nice plants of *C. Lawrenceana*, examples of all the showy *Cattleyas* of the "labiate" group. On one side was a small lot of hybrid *Cypripediums*, and in bloom were *Calanthe veratrifolia*, *Cœlogyne Massangeana*, *Cattleya intermedia*, *C. Gaskelliana*, *Lycaste Skinneri alba*, *Brassavola Perrini*, *Maxillaria tenuifolia*, &c.

In the next intermediate-house, in flower, were *Sobralia macrantha*, *S. leucoxantha*, *Anguloa Clowesii*, *Odontoglossum bictonense*, *O. Uro-Skinneri*, *Oncidium curtum*, *Epidendrum vitellinum majus*, *Masdevallia ignea*, and a few others; while on one part of the stage was a very bright lot of the floriferous *Begonia Gloire de Lorraine*, and a number of neat plants of the variegated *Sibthorpia europæa*, and the red-berried *Nertera scapanoides*, both of which grow admirably well here. On the other side was a good and thriving lot of *Odontoglossum crispum*, *O. Pescatorei*, and other *Odontoglossums*, some few of them being in flower, and with them the scarlet *Cochlidia Noezliana*, and the mauve-coloured *C. vulcanica*.

Another house had *Oncidium Lanceanum*, *Vanda tricolor*, and some others, in flower; and in the greenhouses were some noteworthy well-bloomed plants of *Saintpaulia ionantha*, a number of species and varieties of *Lilies*, *Amaryllids*, and a very well-grown collection of *Crotons* and other decorative plants.

The Apple crop appeared to be sadly affected by the drought, and the trees which promised to be bearing a good crop had in many cases dropped the greater part of their immature fruits.

KEW NOTES.

CATTELEYA superba is now flowering nicely at Kew, a batch of plants of it, and *C. Lawrenceana*, having lately been forwarded by Mr. Jenman, of the Georgetown Botanic Gardens, Demerara; these two species being natives of British Guiana. The first named is not easily kept in health in this country, failure in many cases being, I believe, due to insufficient heat; but even under the best of treatment no one can keep the plant in health longer than three or four years. The following note from Mr. Jenman may therefore be useful as indicating the essential conditions of growth for this as well as for *C. Lawrenceana* in Demerara. He says, "I send you plants of our two native *Cattleyas*. In a wild state they grow in the sun on rocks and small stunted trees in districts where rain falls heavily almost daily for over half the year (spring to autumn), and for the rest the sun blazes all day long on the plants and rain scarcely ever falls." The best plants I have seen at Kew were grown for several years in the tropical fernery, where they obtained the same treatment as *Adiantums*.

CORYANTHES MACULATA.

This interesting Orchid has been in flower at Kew several times this year, the four-flowered spike now expanded in the tropical Orchid-house being the fifth spike produced since July. The flowers remain fresh only about a week after expanding, but during this time they filled their large bucket-like pouches to the brim with the watery liquid which exudes from the

FIG. 76.—*DEUTZIA CORYMBIFLORA* (LEMOINE): FLOWERS WHITE. (SEE P. 265.)

work is still being continued by crossing *G. oppositiflorus*, *G. cruentus*, and any other distinct species which can be obtained, and doubtless the prolific seed-beds already cropped will give many good things. In like manner, Mr. Powell's first hybrid *Crinum* (*C. x Powellii*) was about to commence a fine display, there being also a number of the pure white variety freely flowering. Mr. Powell has a small lot of another fine new hybrid *Crinum*, raised between *C. asiaticum*

Tuberous Begonias, of which also a special strain exists at Southborough, have done well under glass this year, and they were still very showy, both double and single-flowered; but outdoors they have done badly, and the only one which is really showy is the small dwarf-growing, scarlet-edging *Begonia*, only a few inches in height, raised by Mr. Powell, and always used as an edging plant at Southborough.

In the main, herbaceous perennials and bulbous plants are relied on to furnish flowers, and no matter

base of the column. This liquid is as odourless and tasteless as that secreted by the pitchers of *Nepenthes*. There is a good figure of this species in the *Botanical Magazine*, t. 3102, prepared in 1831 from a plant which flowered in the Liverpool Botanic Garden. The flowers are about four inches across, not unlike those of a *Stanhopea* in general effect, and coloured tawny-yellow, with brown spots on the segments. The plant is a native of various parts of South America, the example under notice having come from the neighbourhood of Rio de Janeiro. So far it has done well in a tropical house along with *Nepenthes*.

TROPICAL FRUITS AT KEW.

The new Mexican-house has afforded suitable conditions for the satisfactory fruiting of various tropical fruits which had not previously done well owing to lack of proper accommodation. The best of them all, best for the palate that is, and the most decorative when the fruits are ripe, is the Tree Tomato, a plant which has been recommended again and again, but which has found more detractors than admirers. One of these, a colonial friend, was at Kew the other day, and pooh-pooed the Tree Tomato from experience, as he said; but after tasting a Kew fruit he declared it could not be the same plant as that he had grown, and at once asked for seeds. At the present time there is a grand specimen of the Tree Tomato, *Cyphomandra betacea*, bearing about 200 of its egg-shaped, dull orange-coloured fruits which, when ripe, are as delectable as one need wish, a kind of combination of the qualities of a Tomato and a Grenadilla. This plant is scarcely two years old. In my opinion it is worth the attention of English growers of fruit for market. The Mango ripened its fruits last year, as also did the Japanese Peach, *Diospyros Kaki*, the Loquat, the Papaw, the Indian Fig, *Opuntia*, and *Psidium Cattleianum*.

HIBISCUS CANNABINUS.

This plant is known chiefly as the source of a serviceable fibre known as Deccan or Kanaff hemp, and it is said to be wild or cultivated in most tropical countries. Judging it by examples now flowering at Kew, it has considerable merits as a garden plant, as in a few months it has formed a shapely bush a yard high, with slender prickly branches clothed with long-stalked, palmately-lobed leaves from three to five inches across. The flowers, which are axillary as well as terminal, are large, say five inches across, and coloured deep yellow with a large crimson blotch at the base. Whilst this description would almost serve for *H. Manihot*, there is really a wide difference between the two plants. The Kew examples were raised from seeds obtained from British Central Africa, where the plant is said to be wild, and its fibre is used by the natives. The fibre is said to be strong and durable, and as the plant is easily grown it would not be difficult to cultivate on a large scale in warm temperate regions. Sir Joseph Hooker describes it as annual or perennial, and says that all parts of the plant have an agreeably acid taste.

CALLISTEPHUS HORTENSIS.

Whilst the garden forms of this, the China Aster, have been a failure this year, the type has been most successful. It is by far the most attractive of the annuals which have been flowering in the borders at Kew for the past few weeks, where many, whose opinions are entitled to respect, have declared it to be a much more beautiful plant than the best of the many varieties which are generally cultivated, and which have been raised by cultivators since 1731, when, according to Miller, it was introduced by means of seeds sent from China. For its re-introduction we are indebted to Messrs. Vilmorin, of Paris, who sent seeds of it to Kew last year. It grows to a height of from a foot to eighteen inches, branches freely, and is clothed with healthy, elegant foliage, every branch bearing a perfect flower from three to five inches in diameter, having a broad yellow disc surrounded by a single row of broad strap-shaped florets, coloured a glowing rosy mauve. It is a perfect plant for the open border, and it is just as effective when cut and placed in a flower-stand. Market growers might do worse than try it. *W. W.*

CLEMATIS PANICULATA.

In the United States this *Clematis* has for a good many years been regarded as the most beautiful of the small-flowered species, and as the most beautiful of autumn-blooming climbers. It is evidently a sun-loving plant, for with us in Britain it has never yet flowered with the profusion that characterises it under brighter skies. The past summer (in the south of England at any rate) has evidently been to its liking, for it is flowering with greater freedom than I have ever seen before. Some of the plants at Kew are well covered with the clusters of small white flowers, and seen in the mass they are very pretty, besides which they have a sweet strong fragrance almost exactly like that of Hawthorn. It is perfectly hardy, and a vigorous grower even in this country, and will climb to a height of 30 feet. It is allied to *C. flammula*, and its flowers have almost exactly the same charming perfume; the blossoms, however, are slightly larger, and appear at a later date. Although but little known in European gardens at the present time, it has long been known to botanists, Thunberg having discovered it in Japan during the last century. The plant is evidently one that requires to be grown on a sunny wall—not for protection, but for the better ripening of the stems. Flowering in September and October, it has a special value, and is certainly worth trying by anyone who has such a position to spare for it. *W. J. B.*

NOTES ON APPLES.

APPLES in this locality are scarcely an average crop this season, so many of the generally free-fruited varieties are comparative failures. Amongst the latter, Ecklinville Seedling is the worst. As a market Apple this variety is very much overrated. Those who recommended it strongly but a few years since are now regretting their choice. Upon the strength of such a reputation I planted 250 trees, bushes, and standards. From this number I have had extremely poor results during the last four years. Fruiterers in this neighbourhood do not care for the Apple. They complain of the skin being so soft that it will not bear handling. I shall regraft the whole of the trees with Worcester Pearmain, and other reliable sorts. Warner's King failed this year. It is generally to be depended upon, and is a good Apple to grow. Cox's Orange Pippin for the first time is a total failure, partly or mainly owing to the trees having become exhausted, through cropping heavily the two previous seasons. Devonshire Quarrenden is also a failure. Benoni is an Apple I value highly, but it is a failure this season. This variety does not appear to be much known, but it is a valuable mid-season fruit, and ripens after Worcester Pearmain, and before King of the Pippins and Cox's Orange Pippin. In form it much resembles King of Pippins, but is rather flatter on the top. The flavour is superior to that of the latter well known sort. The habit of growth is erect, therefore well suited for close planting.

Lady Sudeley has given but a limited number of fruits, as did also Lady Henniker. The Queen also is disappointing; it is a very much over-rated Apple, and too flat in shape. Mr. Gladstone, Beauty of Bath, and Chelmsford Wonder are also failures this season. At this place, the first-named is not worth its room in the best of seasons. Wealthy, too, has an extremely thin crop, and though showy, it is very liable to canker in strong soil after a wet autumn and severe winter; under such conditions, the bark does not mature sufficiently to withstand severe frost. Calville Rouge Précoce is too uncertain in every respect to be worth growing. Red Astrachan, for a wonder, has no fruit this season. Kitchen varieties that hardly ever fail to give a crop of some sort are valuable. Lord Grosvenor is one, and a grand substitute for Lord Suffield in soil where the latter refuses to grow. Too much praise cannot be bestowed on this Apple, especially where space is limited.

Keswick Codlin is another that is almost certain to bear if there be Apples at all. In point of quality it is hard to beat, but if the trees are too heavily laden, the fruit will be small; it is not at all times possible to thin them. Wormsley Pippin is another free-

bearing kind this year, though the fruit is small; in point of quality it is very good. Royal Jubilee has this year pleased me much; its bright golden colour is attractive, and the fruit is shapely, and of full size. Stirling Castle and Lane's Prince Albert are too well known to need description; they are both bearing well this season. To those who are planting the former variety for the first time, I would say that liberal manuring is necessary to encourage free growth; its constitution is weakly under ordinary conditions, especially if the trees bear heavy crops during the first two or three seasons. Lane's Prince Albert is one of the best varieties to grow as standards or half-standards. Jolly Beggar generally bears heavy crops of good fruit. Cox's Pomona I esteem apart from its size, and the richly-coloured fruits find a ready sale. Lord Derby is a trustworthy sort.

Schoolmaster is generally a free bearer, but the fruit is rather under-sized generally, and this year it is sure to be. Belle Pontoise is bearing extremely well, and the fruits carry a high colour. Magnum Bonum is another of the rich golden-yellow coloured sorts that invariably bears freely, its cooking quality is of the best. Golden Spire (figured on p. 253, *ante*), one of the best of the Codlin type, should be better known in small gardens; the growth is somewhat erect, and not too vigorous. Bismarck is cropping freely on trees judiciously checked in their exuberant growth by root-pruning, otherwise the crop is a scant one. Waltham Abbey Seedling is here prone to growth rather than to fruit-bearing this season, but it is an exception; when a crop can be secured it is a desirable Apple. New Hawthornden and its older *confrene* are both well laden with fruits, small and otherwise moderate in quality, the result, no doubt, of the excessive drought. Hollandbury is carrying but a thin crop, but is a desirable variety to plant. Domino, when established, appears to be worthy a place as a moderately early sort, in even a limited collection. Counsellor, synonymous with Yorkshire Beauty, has a full crop of shapely fruits; and Max Codlin ought to be grown in every garden, owing to its free cropping. I find this Apple succeeds capitally on its own roots. Cuttings, large or small, or even branches, strike root easily, and quickly grow into a bearing state. Many additional sorts might be named of the 135 varieties grown here for trial. Sufficient, however, has been said of the kitchen kinds as a guide to intending planters.

DESSERT APPLES.

Worcester Pearmain I look upon as a sure-bearing sort, and it is this year no exception. Were I confined to the growth of one Apple for market I should choose this. The growth requires but little pruning, as it fruits freely on the point of the shoots. King of the Pippins is also a sure-bearing sort when the trees have become established. This year they are heavily laden with fruit of medium size; if the trees be planted too deeply in strong soil the branches may canker. Blenheim Orange, now that the trees are twenty years old, scarcely ever fails to give a crop of handsome fruits. Beauty of Hants is a free-bearing Apple, resembling Blenheim Orange, except in flavour.

Pine-apple Russet is bearing fairly well this season. Its soft flesh is agreeable to some people, and it has a Pine-apple flavour; but the trees require too much space, as they do not crop freely on trees restricted in growth. Swedish Reinette is a promising variety. Kirke's Fame is but little known; it is conical in shape with a rather broad base, and rough-looking skin, richly coloured on the sunny side. The fruits keep well, and have a peculiar flavour. Baumann's Red Reinette invariably crops freely and colours well, but this season the fruits are undersized. Brownlee's Russet carries a heavy crop of fruit, with a rich, brown, russet tint. Margil is heavily cropped, and the flavour appears to be a mixture of that of Cox's Orange Pippin and of Ribston Pippin. Newtown Pippin has been thoroughly tested here several years without satisfactory results; this season there is an extremely heavy crop of poor fruits—so far it has proved a waste of time to plant this much-prized Apple in our English climate. Peck's Pleasant has a quantity of small fruit. Sturmer Pippin is bearing well, as it

does usually; the growth of this Apple is free, but does not require a great amount of space.

Duchess of Gloucester is giving grandly-coloured fruit. It is a pity this variety is so small. The fruiterers complain of its want of size, and many are in consequence deterred from planting it largely. Okera, a Russian Apple of a peculiar salmon tint of colour, is cropping freely; as a September variety it may be valuable. Allington Pippin bids fair to be a favourite, the shape of the fruit bears a close resemblance to Cox's Orange Pippin, one of its parents. Vicar of Beighton has rosy-red cheeks, and carries a fairly good crop; what it will be in point of quality, has yet to be proved.

Beauty of Stoke bears conical shaped fruits freely; its green skin is profusely dotted with white spots. Washington is good in point of flavour, and for an admittedly delicate cropper and grower is very good this season. Custard is bearing profusely, and the fruits are good though somewhat deficient in colour.

Bowhill Pippin and Caville Malingre are well laden, the former has a showy red cheek that cannot fail to make it a favourite. The latter has never previously borne any fruits but this year it is well laden with handsome fruit; it is an Apple that gives us pleasure when we get a crop, but it is seldom. *E. Molyneux, Swanmore Park, Hants.*

CHRYSANTHEMUM-RUST.

(PUCCINIA HIERACII, Murt.)

THIS very destructive parasite belongs to a group of fungi that have a bad record from the farmers' and horticulturists' standpoint. It includes such species as *Puccinia malvacearum*, the Hollyhock-rust; *P. graminis*, the rust of Wheat; and numerous others, equally injurious to cultivated plants.

All the species are true parasites, and in many instances produce three or four very different-looking forms of fruit, and live on different plants during different seasons of the year. As an illustration may be mentioned the rust of Wheat, which in the spring produces its first form of fruit on the young leaves of the common Barberry; the spores or reproductive bodies of this form are carried by wind, and inoculate the young leaves of Wheat, giving origin to the form of fruit called rust; later in the season a third form of fruit is produced on the Wheat leaves. The third form of fruit rests during the winter, and on the return of spring germinates, the minute spores produced being borne by wind on to the surface of damp leaves of the Barberry, where they germinate and enter the tissues of the leaf, and in about a fortnight's time produce the form of fruit, which in turn again inoculates the young Wheat-plant.

In the Chrysanthemum-rust the life-history of the fungus is somewhat simpler than in the examples described above; it produces only two forms of fruit, and both are developed on the same kind of plant, the Chrysanthemum.

The form of fruit too much in evidence just now on Chrysanthemum-leaves is what is termed the uredo stage, or summer form of fruit. The use of this form of fruit is to enable the fungus to extend its range of distribution as widely and quickly as possible. If a small portion of the powder contained in one of the rust-coloured pustules on a leaf is examined under the microscope, it is found to consist of myriads of pale brown, minutely-warted, roundish cells or spores, each of which is capable of germinating the moment it is mature. As is too well known, when the disease has once appeared, its spread is rapid. The spores are produced in rapid succession throughout the summer; as fast as they become ripe they fall away, and are carried by rain, wind, watering, syringing, the clothes of gardeners, &c., from one plant to another—an easy matter where the plants are more or less crowded together. Every spore that happens to alight on the surface of a damp Chrysanthemum-leaf germinates quickly, pierces the tissue of the leaf, and in about a week's time produces a heap of ripe spores,

ready in turn to continue the work of extending the disease. The above account is no exaggeration of what happens, and will, I trust, make clear to every one interested the manner in which the disease spreads. Later in the season, when the cultivator has lost all interest in the diseased plants, the same mycelium of the fungus which during the earlier part of the season has been producing myriads of summer spores, now gives origin to an entirely different form of fruit called "teleutospores," or winter spores. These latter differ in form from the summer spores, in being formed of two cells, and more especially in the fact that the winter spores will not germinate until after a period of rest, remaining in a quiescent state until the following spring, when they germinate and produce minute spores, some of which find their way on to the Chrysanthemum leaves,

will be seen how difficult it is to check the disease, if the summer form of the fungus once gains a foothold. A single dead leaf bearing teleutospores lurking in a corner is more than sufficient to secure a crop the following season.

Where the disease has previously existed, it would be wise to spray at intervals during the early part of the season with a solution of potassium sulphide—half an ounce to a gallon of water—as a preventive. This solution destroys germinating spores before they pierce the cuticle and enter the tissues of the leaf.

Finally, it must be remembered that the Chrysanthemum-rust is very common on many of our wild Composite plants, Hawkweeds, Burdocks, &c., and care must be taken that the disease is not introduced by this means. *G. Massee.*

RECENT OBSERVATIONS OF PROFESSOR ERIKSSON ON THE RUSTS OF OUR CEREALS.*

By DR. C. B. FLOWRIGHT.

SINCE 1890, Professor Eriksson has been working experimentally on the life-history of the fungi which cause the various rusts of our cereal crops. In July of last year he delivered a lecture at Stockholm to the Scandinavian Congress of Agriculturists, in which he epitomised his nine years' work. In 1894 he, in association with Dr. Ernest Henning, published that large volume, *Die Getreideroste*, in which the authors showed that the mildew of Wheat meant a great deal more than simply *Puccinia graminis* with its aecidiospores on the Barberry. Continued observations have confirmed and amplified the results then obtained. Prior to the appearance of this work the cereal rusts were regarded as being due to three *Pucciniae*, viz.—*P. graminis*, *P.* with its aecidiospores on Barberry; *P. rubigo-vera*, D. C., with its aecidiospores on Anchusa; *P. coronata* Corda, with its aecidiospores on Rhamnus. The authors found that *P. graminis* was divisible into two species—(1) the true *P. graminis*, with its aecidiospores on Barberry; (2) *P. Phlei-pratensis* E. & H., which occurs on *P. pratensis*, and *Festuca elatior* with unknown aecidiospores. But more than this, they found that *P. graminis* occurs in six biologically distinct forms on Rye, Oat, Wheat, Aira, Agrostis, and Poa, which they call *Forma Secalis*, *Avenae*, *Tritici*, *Airae*, *Agrostidis*, and *Poa*. Now these specialised forms, or varieties or sub-species, call them what you like, have this in common—that they all have their aecidiospores upon the Barberry; but the aecidiospores formed, let us say, from *Forma Secalis* on Rye, will not, when placed on Oat, or Wheat, or Poa, or Aira, or Agrostis, give rise to the uredo, but when placed on Rye they will do so. Nor will the uredospores from Rye give rise to the uredo on any of the above-named grasses. Let us go a little further: there is a certain group of grasses to which *Forma Secalis* is confined, this includes not only Rye, but also Barley, Twitch, *Elymus arenarius*, and *Bromus secalinus*, and to these (with one or two closely allied species, e.g., *Hordeum jubatum*, *Triticum caninum* and *desertorum*), it is confined. The next form, *Avenae*, is confined to the Oat, *Avena elatior*, *sterilis*, *Dactylis glomerata*, *Alopecurus pratensis*, *Milium effusum*, *Lamarckia aurea*, and *Triosteum distichophyllum*.

Far and away the most important to us, however, is the form on Wheat, which is confined to Wheat, and does not even go to *Triticum repens*. The importance of this fact is obvious, for in the first place there is no fear of Wheat mildewing adjacent fields of Barley, or Rye, or Oats, or being mildewed by them; nor, in the second place, is there any fear of the Wheat catching the disease from mildewed grasses in the hedge-banks, &c. Bear in mind that, although these six forms are morphologically indistinguishable, either in their aecidiospore, uredospore, or teleutospore stage, yet they are biologically distinct. Briefly, we have to deal with a form on Wheat,

FIG. 77.—CHRYSANTHEMUM RUST: PUCCINIA HIERACII.

A, Leaf affected with "rust."

B, Uredo- or summer-spores, magn. 400 diam.

C, Puccinia-spores, or winter-spores, magn. 400 diam.

germinate, enter the tissues of the leaf, and in a short time give origin to the uredo, or summer condition of the fungus.

Soon after the winter spores are developed, the Chrysanthemum leaves die and fall; when all the leaves have fallen, the plant is absolutely free from disease, that is to say, there is no permanent mycelium of the fungus left in the plant, so that if it commenced to grow the next season it would be perfectly free from disease, and would remain so unless inoculated by the bodies produced by the winter spores as described above.

Summary.—The Chrysanthemum-rust disease is entirely the result of plants becoming inoculated by the resting spores produced by the fungus the previous year.

Too much care cannot be exercised in collecting and burning all diseased leaves, and this should be done early in the season before the winter spores are formed on the leaves. From the above account it

* Being a paper read at the Meeting of the British Mycological Society in Dublin, September 19, 1898.

another on Oats, and a third common to Oats, Barley, Rye and Twitch, the other three forms being of botanical interest only.

In the same way the authors found that *P. rubigovera*, D.C., was divisible into three good species, viz., *P. glumarum*, Sch.; *P. dispersa*, E. & H.; and *P. simplex*, Korn. Let us say a word or two about these *seriatim*.

P. glumarum (Schmidt), the yellow rust or spring rust, as we often call it in England, possesses well-marked characters in its uredo stage, by which it can be recognised with the naked eye, inasmuch as the minute uredospore-beds occur on large elongated yellow patches on the leaves. The teleutospores are scanty in proportion to the uredo, and the sori minute.

This rust owes its chief interest to two things: First, its great abundance and its conspicuousness alarm the Wheat-grower, making him think that his crop is going to be "mildewed," whereas, in reality, it rarely causes any appreciable diminution of the yield. Secondly, because it has the habit of sometimes developing its uredospores upon the chaff (Cosh) of the affected Wheat-plants, hence its specific name—*Uredo glumarum*. When this happens, it does injure the crop, because the uredospores spread from the chaff to the kernels themselves, causing them to be distorted, and more or less abortive. On many of these damaged kernels one can find spore-beds of the teleutospores when the grain reaches maturity.

In a similar manner, *P. glumarum* is met with in five specialised forms, viz., *Tritici*, *Secalis*, *Hordei*, *Elymi*, and *Agropyri*, on Wheat, Rye, Barley, Elymus, and *Triticum repens* respectively.

Puccinia dispersa, E. & H. — The brown rust is not nearly so conspicuous, nor is it so abundant as *P. glumarum*. It is met with later in the season in England, not long before harvest. The *Uredo sori* are like immature spore-beds of the uredo of *P. graminis*, only they are very much smaller. The teleutospores are so like those of *P. glumarum* as to be only distinguished with difficulty. It has its uredospores on *Anchusa* in autumn, those of *P. glumarum* being unknown. *P. dispersa* has four forms—on (1) Rye, (2) Wheat, (3) Twitch, and (4) on the Bromi.

Puccinia simplex (a species first described by Kornicke) has been known for many years. It is confined to Barley, and is common in England; it is easily recognised by the large number of its teleutospores, which have one cell abortive.

Secondly, there are the crown rusts, *P. coronata* and *coronifera*, whose life-history has been worked out by Klebahn. The former has its uredospores upon *Rhamnus frangula*, and is met with in five forms, according to Eriksson, viz., 1, *Calamagrostis*; 2, *Phalaridis*; 3, *Agrostidis*; 4, *Agropyri*; 5, *Holci*. The latter (*P. coronifera*) has its uredospores on *R. catharticus*, and occurs in six specialised forms, viz., 1, *Avenæ*; 2, *Alopecuri*; 3, *Festucæ*; 4, *Lolii*; 5, *Glyceriæ*; 6, *Holci*.

Eriksson draws attention to the fact that the extension of rust (uredo) from plant to plant is after all usually confined to a few yards. For instance, *P. graminis* on Twitch, is one of the commonest forms in Sweden, as it is in England; if one searches in the vicinity of a Barberry-bush one is almost sure to meet with it, but the affected plants are not found many yards from the bush. This form it will be remembered also occurs on Barley and on Rye, but although it is common enough on Twitch it seldom spreads, and then only to a limited extent to the above-named cereals. A further instance, showing how limited these uredospores often are, is given which occurred at the experimental station at Stockholm in 1894, where a plot of Horsford's Pearl, a variety of Wheat specially liable to *P. glumarum*, was grown between five other varieties. On the Horsford the characteristic uredo first showed itself on May 11, and in forty-three days had attained its maximum, but at the end of that period only three of the surrounding plots showed any signs of this rust, and these only to a very slight degree.

The germinating power, both of the uredo and of

the uredospores, is often but small and at best capricious. Eriksson considered, upon reflection, that since Roman times, hot days and cold nights have been considered favourable to mildew, he resolved to try the effect of placing these spores upon ice for some hours, and by doing this he succeeded in arousing them to germination. The distance to which the uredospores are capable of spreading the fungus from an individual uredial host-plant he considers has been greatly over estimated. Julius Kuhn in 1875 thought 100 mètres (120 yards) might be considered the limit, but Eriksson puts it at from 10 to 25 mètres (12 to 30 yards). The dissemination of the mildew in India, for instance, where the nearest Barberry is 300 miles away, on the Himalayas, cannot be effected by the uredospores. He found, too, that in Sweden the uredo on *Triticum repens*, beneath a Barberry-bush, sometimes appears before the uredospores on that bush; or, at any rate, before it had time to originate from the uredospores. Further, the teleutospores on *P. graminis* are capable of germination in spring only, and then only after they have been exposed to the vicissitudes of the previous winter, hence mildewed straw kept in a barn or in a stack is not dangerous. Further, he finds that it is those teleutospores only which have been developed in late autumn that are capable of germinating next spring.

Let us recapitulate these statements:—

1. That there are a multiplicity of different spore forms capable of affecting certain special host plants only.
2. That the uredo and uredospores exhibit a certain degree of obstinacy and capriciousness in germination.
3. The short distance they are capable of extending the fungus.
4. The fact that the uredo has been observed before the uredospores.
5. The limited germinative faculty of the teleutospores.

Taking into consideration the above facts, it is improbable that the general dissemination of rust takes place in the usually accepted manner, viz., from separate centres and by geometric progression.

In Sweden the dominant rust is *Puccinia glumarum*, and this form Eriksson has made the subject of special study, with the particular object of elucidating this question. In the first place he noticed that the uredospores in spring appeared on the young plant of certain varieties four or five weeks after the Wheat had been sown, and in the second place that sunniest parts of the fields were sometimes worse affected than the shady. These observations induced him to try the following experiment: young plants immediately after the melting of the snow in spring, were enclosed in wide glass-tubes carefully packed at both ends with cotton-wool. In from six to eight weeks *Uredo glumarum* appeared upon them. It is possible that this may have resulted from an infection in autumn, although it is not probable, for one would have *cateris paribus* expected had this been the case that the uredo would have shown itself sooner. He therefore sowed seeds of a variety of Barley extremely susceptible to yellow rust in sterilised soil, and properly protected from external infection, yet even then a certain proportion became rusted. He therefore concludes that the fungus arose from "internal germs inherited from the parent plant," which can only be detected just before the eruption of the young pustules. Hence, the fungus lives for a long time a latent symbiotic life as a mycoplasma in the cells of the embryo, and only assumes the visible form of mycelium just before the eruption of the sori. Therefore the severity of an attack of rust (or mildew) depends: (1) On the external surroundings, the environment of the plant, the weather, the soil, manuring, &c.; if these conditions be favourable, the latent mycoplasma ceases its symbiotic existence and develops into mycelium and spores. (2) On the accession of external infective material, i.e., spores from without. The mycoplasmic symbiosis of *P. glumarum* is more energetic in such varieties as Horsford's Pearl, which is especially liable to this rust than in Squarehead, which is practically exempt,

because the symbiotic existence of the parasite with this variety is so languid as to be practically non-existent.

TABLE OF ERIKSSON'S SPORE-FORMS OF THE PUCCINIAE OF THE CEREALS.

<i>Puccinia graminis</i> , P. (<i>Ec. berberidis</i>)	1 <i>Secalis</i>	on Rye, Barley Twitch, &c.
	2 <i>Avenæ</i>	on Oat, Avena sp. dactylis, Alopecurus, &c.

	4 <i>Agropyri</i>	on T. repens.
	5 <i>Holci</i>	on H. mollis and lanatus.

THE WEEK'S WORK.

THE FLOWER GARDEN.

By H. WALTERS, Gardener to Lord GERARD, Eastwell Park, Ashford.

The Planting of Bulbs.—The best time to plant the majority of bulbs for spring-flowering is during October. The work may be done in November, but by that time the ground is frequently very wet and cold, and these conditions are unfavourable to the bulbs.

Hyacinths should be planted in soil which has been well dug, at which time some leaf-mould and short rotted dung ought to be worked into the staple soil. Fresh manure must be avoided, and if old well-rotted dung is not procurable, use a double quantity of leaf-mould. Give the soil a few days to settle down previous to planting, and if it be of a wet or retentive nature, a little sharp sand may be put at the bottom of each hole into which a bulb is placed. These holes should be 4 or 5 inches in depth, and about 1 foot apart; and if planted in rows, the second row of bulbs should be placed in the intervals of the first. In the case of small beds, it is best to plant bulbs of one colour only; but in large beds, varieties of three or more colours may be used. If lines be planted in long borders, each line should be of a separate colour; or a good effect may be obtained by the planting of each separate colour in clumps.

Tulips.—The same kind of soil will suit these as advised for the Hyacinths, and they may be planted at the same depth, but the bulbs need to be planted about 3 inches only distant from each other. Tulips should be planted with due regard to the height of the different varieties, as some of these grow much taller than others. One of the varieties known as the Parrot or fringed Tulip, deserve extended culture, they embrace an endless variety of colours, and the flowers are generally larger than the other varieties. They flower somewhat later also than these.

Crocuses are pretty in clumps in borders, or in turf on banks, or by the side of woodland paths. They bloom much earlier than the other bulbs. Any kind of garden soil will suit Crocuses, and when once planted they will need no further attention, but will increase year by year. Pheasants and mice are very destructive to the bulbs.

Snowdrops are the earliest of spring-flowering bulbs, but they will not succeed in very loose soil. Any position in the garden will suit them, and the longer the bulbs remain in the ground the better they usually become and the freer they flower.

Scilla sibirica is a nice companion to the Snowdrop. The flowers are rich blue, and equally at home in any soil; it deserves to be cultivated in all gardens.

FRUITS UNDER GLASS.

By G. NORMAN, Gardener to the Marquess of SALISBURY, Hatfield House, Herts.

Vines.—In houses where there are Grapes still unripe, continue to maintain a warm, but fresh atmosphere. The hot-water pipes may be heated to keep the temperature about 65° at night and 70° by day, allowing a rise of 10° from sun-heat. Admit a little fresh air at all times, and regulate it according to the weather. Damp the surface of the borders once or twice each day. Do not let the borders become dry, but give them a thorough watering as frequently as required. When the Grapes have ripened afford the borders a mulching of long, dry, straw litter, with a view to maintaining the soil in a moist condition, and of preventing the moisture in same rising into the atmosphere. Vines carrying ripe Grapes, which are intended to hang until the end of the year, require frequent attention. If the Vines become dry at the roots, the berries may shrink. Outside borders, as well as those inside, must be examined, and when the soil approaches dryness a thorough watering should be given. The morning is the best time to do this, and in the case of inside borders remove the straw mulch during the process. Keep the atmosphere of theinery dry and fresh. When the weather is mild and dry admit all the air possible during the day, but close the house during rain or fog. Keep a little warmth in the hot-water pipes during damp, cold nights. At night when there is a slight frost, the temperature of the house should be about 50°, and if the frost be severe 5° lower will do no harm. The warmth in the pipes will prevent damp condensing on the Grapes, which if permitted would cause them to decay. Sudden changes in the temperature are not good, therefore admit and reduce air to the house by degrees. During strong winds the ventilation should not be sufficient to cause the bunches to be swung by it. Remove or push aside any leaves that are so near the fruit as to be liable to rub them. It will be necessary to examine each bunch at least once a week, and remove by means of scissors all mouldy or damaged berries. The least spot of mould upon a berry is sufficient to render its removal obligatory, as it so soon spreads. Lateral growths will need to be removed occasionally, and leaves that are quite dead may be removed also. Fallen leaves should be picked up, as no broom should be used, or anything done that would cause dust to rise. The broom may, however, be used after throwing water about, but such work should be done in the morning. Wasps are not likely to cause much further trouble, and the excluding material may be removed from over the ventilators so soon as it is considered safe. Robins may enter theinery and damage the Grapes, but they may be kept out by netting. They may be easily caught also by closing the ventilators when one is seen inside.

Exhausted Vines.—If any of the Vines are unsatisfactory through the soil of the border having become exhausted, and it is contemplated to afford them a new rooting medium this season, the work should be done as soon as the Grapes are ripe, and while the leaves are still green. The inside border should be renewed first, as directed in a former calendar. If the inside border was removed last season, the renewal of the outside border may be commenced at once; the Vines may then make some young roots, before the season has quite finished.

THE ORCHID HOUSES.

By W. H. WHITE, Orchid Grower to Sir Trevor LAWRENCE, Bart., Burford, Dorset.

East Indian-house.—Varieties of *Lælia anceps*, *L. autumnalis*, *L. albidia*, *L. Gouldiana*, *L. Marriottiana*, and *L. rubescens* (acuminata) now showing their flower-spikes should be placed in a position open to sunlight. Plants of *L. anceps* that have completed their growth will require less water, but other varieties mentioned should be given copious supplies until the new pseudo-bulbs have been fully matured. Some of the plants of *Phalænopsis Schilleriana*, *P. amabilis*, *P. Aphrodite*, *P. grandiflora*, *P. leucorrhoda*, *P. casta*, *P. intermedia Portei*, *P. Sanderiana*, *P. Stuartiana*, and *P. Esmeralda* have now finished making their leaves, and great care is needed in regard to watering them. During the growing season the sphagnum-moss has been kept green and fresh-looking by frequent supplies of water, but it should now be allowed to become almost white in colour before water is afforded. Do not now dip the plants, but merely sprinkle the surface of the moss and around the sides of the basket, using a fine-rose watering-can for the purpose. Allow no water to remain on

the foliage or in the centre of the plants. Any failure to attend to these details may lead to spotting of the leaves. Such species as *P. violacea*, *P. cornucervi*, *P. Marie*, *P. Luddemaniana*, *P. tetraspis*, *P. sumatrana*, *P. speciosa*, &c., are still making fresh leaves, but they must not be kept in a saturated condition at the root. At this season of the year a gummy exudation sometimes appears on the leaves of *Phalænopsis*, especially those of the darker-leaved kinds; if any such exudation be observable, it should be immediately sponged off. The *Pleiones* will now need careful treatment. The pseudo-bulbs are made up, and as soon as the leaves fall off, it will be necessary for a few weeks to give them less water, just sufficient to keep the soil moist. Immediately the foliage has fallen, place the plants in a dryish corner of the house, and treat them as plants at rest. When the flower-buds may be distinctly observed, the plants may again be sparingly watered until the flowers are open, but no longer, or the delicate blossoms will lose their colour and fall. Specimens of *Platyclinis Cobbiana* that are in full growth and producing their flower-spikes, will require abundance of root-moisture. *P. glumacea*, *P. uncatia*, and *P. filiformis*, being at rest, are perfectly safe in a shady part of the intermediate-house until growth re-commences. Syringe well up under the leaves of these plants, so that red-spider may be dislodged. Flowering plants of *Vanda corulea* should be suspended a short distance from the roof-glass, where they will obtain plenty of light, and be kept fairly moist at the root until their flowers open.

Temperatures.—At this season of the year it is a matter of importance that the night temperatures be not subjected to sudden changes. Early morning frosts have already occurred, and following so closely upon the great heat of summer, it is preferable to afford a little more warmth in the hot-water pipes the last thing at night, than have a low temperature in the morning. In the East Indian-house many plants may be permanently injured by a very low temperature, even if it continue but a short time. Such Orchids as *Phalænopsis*, *Angraecums*, *Calanthes*, *Phaius*, *Oncidium Lanceanum*, *O. hæmatochilum*, and *Dendrobiums* that are in full growth, are most susceptible to injury by a cold moist atmosphere. In the Cattleya-house there are also plants whose half-matured growths may be easily checked by a low temperature. It is advisable to see that none of the plants are too near the roof-glass, or they may get chilled. When sharp, early-morning frosts occur (and they generally come without any warning), the temperature of the various divisions may fall a few degrees below the standard temperature, and no watering or damping-down should be done before the proper degree of warmth is reached, as the drier the atmosphere during cold, the less likelihood will there be of injury. The temperature of the East Indian-house at night should be about 70°, that of the Cattleya-house about 65°, and the Mexican or intermediate-house a few degrees less. A fall of about 5° by the morning is permissible in each division. The temperature of the *Odontoglossum*-house should be about 56° or 57° at night, and about 52° or 53° in the morning.

THE KITCHEN GARDEN.

By J. W. McHATTIE, Gardener to the Duke of WELLINGTON, Strathfieldsaye, Hants.

Celery should be earthed up when the weather is fine. Make the soil as fine as possible with the spade, and carefully press it around and between the plants with the hand. On no account bury the hearts of the plants, or let any soil fall into them; earthing up when the soil is wet frequently causes rust or scab on the stems and leaves. It will be well to have in readiness the material wherewith to cover this important crop in the event of severe frost.

Carrots.—Late-sown Carrots in frames and pits, or in the open borders, will require to be thinned out to 2 inches apart. Remove any weeds that may appear among the young plants, and stir the surface of the soil between the rows with a hand-fork or hoe. The main crop of Carrots may be lifted at a convenient time during this month, provided they have finished their growth. The work should be done on a fine day, allowing the Carrots to be exposed on the ground for a few hours before storing them away. Sand is the best material in which to store Carrots. Place a layer of this on the floor of the cellar, next a single layer of Carrots on the sand, and cover the roots with sand again. Repeat this process until the heap is sufficiently high.

General Work.—Potatoes should be lifted and stored on the first opportunity. Prevent weeds growing by

freely using the hoe. Rake and sweep leaves into heaps. Remove any decaying vegetable leaves to vacant ground, to be buried by digging; and endeavour to have the garden and walks clean and tidy.

HARDY FRUIT GARDEN.

By W. H. DIVERS, Gardener to the Duke of RUTLAND, Belvoir Castle, Grantham.

Watering and Feeding.—The prolonged drought, combined with excessive heat for this period of the year, is causing fruit-trees of all kinds to suffer considerably. Recent returns from the Meteorological Office show that the deficiency of rainfall in the southern, south-western, and midland counties of England ranges from 6½ to 7½ inches. This equals 650 to 750 tons of water per acre for the districts as a whole. Individual places have even suffered more than this. Not only is the present crop of fruits of Apples and Pears small in size, but the leaves upon the trees are wilting prematurely, and just at the time they are required in the work of finishing and ripening the trees' growth. Much assistance in these circumstances may be given to the trees by affording root-waterings. [Where the supply renders this possible. Ed.] It will do good to every tree of all kinds, and cannot harm any of them. Trees that are fully exposed to the sun (as those on south walls) and those in very dry positions, or only partially established, should be attended to first. In every case sufficient water must be given to thoroughly soak the soil down to the roots of the trees. Liquid-manure from the farmyard, or house-sewage, applied first, and washed in with a good soaking of water, will be more beneficial than water alone. The growth of the trees, so far as wood-production is concerned, has ceased, and whatever nutriment is taken up by the roots now will go to strengthen the tree for next year's crop. If the surface of the soil be hard, it will be necessary to break it up with a steel fork previous to applying the water, so that it may penetrate. A light mulching of half-decayed hot-bed manure or short litter from the stable will tend to keep the water in, and will supply a little nutriment also. If rain should come before the work be finished, do not relinquish it, for many showers will be necessary before the whole of the roots are reached; and in the case of trees on walls, the roots do not get the full benefit of the rainfall.

PLANTS UNDER GLASS.

By W. MESSENGER, Gardener to H. C. BERNERS, Esq., Woolverstone Park, Ipswich.

Chrysanthemums that were planted out in May should now be lifted and potted-up. Before doing this, however, it will be well to give the soil a thorough good soaking with water, as the plants will then lift more satisfactorily. Prepare pots for them of various sizes, and the compost may consist of loam, one-sixth rotten manure, and sufficient sand to keep the mixture open and sweet. Pot the plants as soon after being lifted as possible, and remove them to the houses or pits prepared for them. Shade the plants heavily for a few days, and syringe them overhead frequently to prevent flagging as much as possible. Plants treated in the above manner, provided the roots are given plenty of water, seldom lose much of their foliage. When the roots have become active, the plants may be staked out. Late varieties grown as bushes in pots may be kept outdoors until the weather renders protection imperative. An erection of stakes with long laths nailed on the top will allow of covering material being used at a minute's notice in the event of sudden frost. Plants cultivated for the production of large blooms ought now to be under cover, but the structure containing them may be thrown open. Avoid cold draughts, however, and when the buds commence to open, do not further feed the plants with stimulants. All decaying foliage should be promptly removed from the plants, and everything done to promote a sweet circulation of fresh air. Should the plants be attacked with the rust-fungus (see p. 269), damp the foliage with a solution of sulphide of potassium, and then dust thoroughly with flowers-of-sulphur. Plants growing close to those affected, even if free of the fungus, had better be syringed every other day with the solution. All decayed foliage should be burned. Green-fly may be eradicated by fumigating.

Allamandas are flowering freely, and will continue to do so for a considerable time if fed with stimulants. Plants required to start early next spring may be kept cooler and drier at the root, so that they will become hardened. A rest of eight or nine weeks will be sufficient for them, and they may then be pruned back, and encouraged into growth.

APPOINTMENTS FOR THE ENSUING WEEK.

TUESDAY,	Oct. 11	Royal Horticultural Society's Committee. Exhibition by the National Chrysanthemum Society, at the Royal Aquarium (3 days).
SALES.		
MONDAY,	Oct. 10	Dutch Bulbs, at Protheroe & Morris' Rooms.
TUESDAY,	Oct. 11	Dutch Bulbs, at Protheroe & Morris' Rooms. Great Sale of 220,000 Fruit-trees and Bushes, at Perry Hill, Cliffe, near Rochester, by order of Mr. W. Horne, by Protheroe & Morris (2 days).
WEDNESDAY,	Oct. 12	Dutch Bulbs, at Protheroe & Morris' Rooms. Continental Plants, Greenhouse Ferns, Carnations, &c., at Protheroe and Morris' Rooms.
THURSDAY,	Oct. 13	Dutch Bulbs, at Protheroe & Morris' Rooms. Absolute Clearance Sale of Surplus Stock, at the Windlesham Nurseries, Bagshot, by order of Messrs. Fromow & Sons, by Protheroe & Morris.
FRIDAY,	Oct. 14	Dutch Bulbs, at Protheroe & Morris' Rooms. Imported and Established Orchids, at Protheroe & Morris' Rooms.
SATURDAY,	Oct. 15	Clearance Sale of Stove and Greenhouse Plants, at the Hooley Nursery, Purley, by order of Mr. A. Hunt, by Protheroe & Morris.

AVERAGE TEMPERATURE for the ensuing week, deduced from Observations of Forty-three Years, at Chiswick.—51° 7°.

ACTUAL TEMPERATURES:—

LONDON.—October 5 (6 P.M.): Max., 61°; Min., 58°.

PROVINCES.—October 5 (6 P.M.): Max., 61°, Valencia; Min., 52°, Aberdeen.

General absence of rain and sunshine. Local frosts.

THE founding of a school of Horticulture in the Belgian Campine is the result of a complicated series of events, which at first sight seem to have no connection with agriculture and horticulture. Its origin shows once more, that one never knows to what ends a useful enterprise, carried out with skill and perseverance, can conduct intelligent and ingenious persons. The original scheme, says our Belgian correspondent, was intended to free the city of Antwerp as quickly as possible from the refuse of the streets. The administration had already provided a formidable flotilla for the removal of the rubbish to divers parts of the Campine (the level land situated on the eastern side of Antwerp, which at one time was as barren as it is to-day fertile). But the mass becoming too voluminous, especially the manurial matter, it was necessary to seek another solution. Burning the rubbish was proposed, but it was not adopted, thanks to the energetic efforts of M. F. X. DE BEUKELAER, Provincial and Communal Councillor of Antwerp. This gentleman lays it down as a principle, that it is a crime to deprive agriculture of the rubbish, or to burn manures, as long as uncultivated sandy and heathy lands exist in the neighbourhood of populous towns.

In 1894 the city of Antwerp purchased at Ryckevorsel (Campine), sixty-three acres of heathy soil at two hundred and twenty francs per acre. The land bordered a canal for a length of four hundred and thirty yards, and had also a steam tramway alongside. The turf and the Heath, the sole products of the soil, were sold at a good price as fuel and stable litter. After due preparation, notably the draining away of the water, the street refuse was deposited directly upon the heather, to the height of eighteen inches; next, the refuse was carefully and evenly spread, and afterwards covered with six inches of the heathy soil. The soil was duly harrowed, and received no more manure.

Next, different kinds of grasses were sown in due season, at the rate of forty-five pounds per acre. All the grasses grew, and proved very nourishing for cattle.

In 1897 a small plot of the land, of about half an acre in extent, where the street refuse was worked into the soil, was sown with Mangels, and yielded over thirty tons per acre.

This satisfactory result induced the managers of the property to persevere in the reclamation of the soil. In three years the property of Ryckevorsel will be completely utilised, and M. DE BEUKELAER has accordingly purchased another estate at Brecht, having an area of three hundred and sixty-eight acres. The purchase has been made on excellent conditions.

This property will be laid out and managed, so that it will in time form a superb estate with fields, pasturages, and woods, with clumps of fine trees, sheets of water, fish-ponds—all as with M. le Sénateur Cools at Ryckevorsel—upon a previously sterile heath!

The grounds at Brecht will also be utilised as a practical school of horticulture and agriculture, where the pupils will receive simultaneously with theoretical instruction practical lessons, so as to enable them immediately to apply their theoretical knowledge. The school will be organised according to the agricultural and horticultural necessities of the sandy regions of the Campine, and provide for the education of cultivators, who will be able to sell their products in the city of Antwerp, and in the populous centres of England.

The establishment of the professional school will be made with the help of the Government, of the province, and of the city. The promoter of the idea thinks of sending to the school a certain number of the inmates of the Communal Orphanage, who, according to him, after leaving school, would be able to find employment as skilled workmen and gardeners. They could enter the service of the public parks and gardens of the city, or obtain situations in horticultural establishments. Not only the material wants of the pupils would be assured, but the fresh air and the life of the country would confer on them good health and moral benefit.

ROYAL HORTICULTURAL SOCIETY.—At the next meeting, which will be held on Tuesday, October 11, in the Drill Hall, James Street, Westminster, a lecture on "Some of the Plants Exhibited" will be given by the Rev. Prof. GEO. HENSLOW, M.A.

THE RUST FUNGUS UPON CHRYSANTHEMUMS.—The injury that is being wrought by this pest in various collections is such, that we would draw the special attention of our readers to Mr. MASSEE's article upon the fungus, on p. 269.

THE GREAT FRUIT SHOW.—We learn that, although the exhibition was in itself highly successful, it, like its predecessors, resulted in so considerable a financial loss, that if sufficient means be not forthcoming in future, the shows will have to be discontinued.

HORTICULTURAL CLUB.—The first dinner and *conversazione* of the session 1898 and 1899 will take place on Tuesday, October 11, at 6 P.M. The subject for discussion will be "The Fruit-crop of 1898 and its Lessons," to be opened by Mr. GEORGE BUNYARD, V.M.H.

PROFESSOR VIRCHOW.—The opening of the session at the Charing Cross Hospital on Monday last was rendered memorable by the delivery of the second Huxley Lecture by the eminent German pathologist. The leading idea was, that the structure and functions of the cell as a unit lie at the base of all physiological action, whether in health or disease.

Alluding, in the course of his discourse, to bacterial germs, the lecturer said the most important of the infectious diseases are the result of the action of minute plants, grouped under the generic name of bacteria, the study of which, headed by KOCH's discovery of the bacilli of tubercle and of Asiatic cholera, has been one of the greatest of recent scientific triumphs. It is important to distinguish these germs from the effects which they produce—effects which depend largely on the reaction of the tissues and organs to their influence. The relation between the smaller parasites and the diseases which they cause is characterised by the term "infection," a word introduced in this sense by Professor VIRCHOW himself. He pointed out, however, that to assume that all infections are the work of bacteria was to go beyond our present knowledge, and was, indeed, likely to hamper further progress. As to the mode of action of bacteria, the lecturer said that this was mainly due to the virulent products secreted by them rather than to their power of consuming the common stock of nutriment, which was the way in which disease was caused by larger parasites. Lord LISTER was in the chair, and Professor VIRCHOW excited the warm sympathy of his audience by the manner in which he bore tribute to the immeasurable service which Lord LISTER, acting on the lines laid down by PASTEUR and others, had conferred on humanity.

FRUIT PACKING.—A correspondent enquires why we cannot have here, as in California, fruit packers—men who make fruit packing a special profession. When we see Plums in fine condition imported from California finding a ready sale, it is time for our fruit-growers to make the best of their produce.

— We find the following in the Twenty-ninth Annual Report of the Fruit-Growers' Association, Ontario:—"Regarding our packing, we can never expect uniformity under the present method of each shipper packing his own fruit. Some will do the thing well, and possibly get a reputation for their brands; but the multitude will do it carelessly, and get a bad name for Canadian fruit. If it were possible to encourage the establishment of packing companies, managed by experts, to do the packing for export, the difficulty would be overcome. Such companies would build cold storage warehouses at central points, and adjoining packing-sheds, and agree with the shippers to receive a certain quantity of fruit per day, and pack the same in the best manner for a given sum per case, loading the same in refrigerator-cars from day to day. Each case would be stamped with the trade-mark of the shipping company, and also with the owner's mark, so that the returns would be made direct to him from time to time."

GARDENERS' AIDS TO MUTUAL IMPROVEMENT.—We have received a copy of the seventh annual Report of the Newcastle and District Horticultural Mutual Improvement Society, a document that bears conclusive evidence of the beneficial work the Society is doing in this northern neighbourhood. Meetings are held monthly, when papers upon horticultural subjects are read and discussed, and exhibits of interesting plants, fruits, and flowers are contributed in competition by the members. The members number over sixty, and the Society possesses a useful library of nearly eighty volumes, including KERNER's *Natural History of Plants*, several of Professor MARSHALL WARD's books, and other scientific and horticultural works. The hon. secretary is Mr. J. ELLIOT, Jun., who would be pleased to impart the experiences of the Society to anyone interested in the formation of similar institutions.

"MUSTERBLÄTTER DER BINDERKUNST," Von J. OLBERTZ, Erfurt.—A portfolio containing some fifty attractive plates, representing floral arrangements appropriate for use at weddings, for table-decorations, funerals, and so on. The grouping is commendable for a lightness of touch too often lacking in our English trophies, and more variety is introduced than we are accustomed to see both in the choice of plants used, and the shapes into which they are arranged. Decorators in general may glean many hints from these pictures, and may also admire the dainty cover in which they are sent out.

THE WANT OF RAIN.—For some time past the weather has been exceptional. The summer has been conspicuous for its heat, and it has been more than usually prolonged. The mean temperature in London for September was 63°, which has certainly not been beaten more than once in recent years, and the mean of all the day temperatures was 75°, which is no less

feature is the persistent dry weather, the total rainfall for the past twelve months, from October 1, 1897, to September 30, 1898, showing a great deficiency of rain in nearly all parts of the British Isles. There is a considerable excess in the Hebrides, and a slight excess at one or two other places in the west; but in most parts the deficiency for the year amounts to several

places the aggregate fall is even less than one-half of the average. At Ardrossan, where the annual average is 37 inches, the deficiency amounts to 14 inches, and every month during the past twelve months has had a deficient rainfall. At Leith, where the deficiency is shown to be 6 inches, there was only one month (April) with an excess of rain, and then the excess

FIG. 78.—*ARUNDINARIA METALLICA*: HARDY BAMBOO. FROM MR. FREEMAN-MITFORD'S COLLECTION. (SEE P. 274.)

than 8° above the average. The summer has also been unusually bright, and in September there were in London 172 hours of bright sunshine, which is 60 hours more than the average. The summer has been exceptionally dry, and September had very little rain in any part of England. In the metropolis the rainfall was less than in any September since 1865, the total fall being 0.3 inch. The most exceptional

inches. The largest and most general deficiency is in the midland, southern, and eastern districts of England, although the deficiency is very great in the north-west of Ireland and the west of Scotland. In the east and south-east of England and in the midland counties the average annual rainfall is roughly about 25 inches, so that the figures show that only about one-half of the average rain has fallen; in some

was only 0.2 inch. At Dungeness, where the fall for the year is considerably less than one-half of the average, May was the only month with an excess of rain. In London we have had during the last twelve months rather more than one-half the average total fall; but, like many other places in England, there is no record of any twelve months from October to September as dry. *Daily Graphic*.

EXPERIMENTAL HORTICULTURE.—At a meeting of the Birmingham and Midland Counties Gardeners' Mutual Improvement Association, held in the Athletic Institute, John Bright Street, on Monday, Oct. 3, a paper on "Experimental Horticulture" was contributed by Mr. LEWIS CASTLE, manager of the Woburn Experimental Fruit Farm. The subject was treated at some length, the experimental work in Great Britain and other countries was reviewed, condensed instructions were given for the formation of new horticultural stations, and the directions in which useful work could be done were referred to. Mr. W. LATHAM, curator of the Botanic Gardens, presided, a considerable interesting discussion followed; a hearty vote of thanks to the lecturer closing the proceedings.

DEATH OF DR. AITCHISON.—We greatly regret to have to announce the death of Dr. AITCHISON, so well-known in botanical circles for his very valuable researches in the botany of Afghanistan and neighbouring districts. Dr. AITCHISON, who was born in 1835, and educated in Edinburgh, entered the Bengal Medical Service, acted as British Commissioner in Laduk, 1872, served with the Kuram Field Force, and was naturalist, under Lord ROBERTS, to the Afghan Delimitation Commission. His publications in the *Transactions of the Linnean Society* and elsewhere, have reference to the botany of the regions he traversed. He paid special attention to medicinal and economic plants, adding greatly to our knowledge of the vegetable productions of the country. Dr. AITCHISON, who latterly resided at Kew, had the misfortune to lose his wife, a calamity which impaired his constitution, and after a period of ill-health, he died at Kew on the 30th ult. He was a Fellow of the Royal Society, and received numerous marks of the appreciation of his services to the Indian Government and to botanical science. Some of his contributions appeared in this journal, and others in the *Transactions of the Botanical Society of Edinburgh*.

CAMELLIAS.—Those desirous of purchasing the standard works on Camellias, viz., the *Iconographie des Camélias*, by the Abbé BERLIOSE (three vols.), and the six volumes published on the same subject, with coloured plates, by the late AMBROISE VESCHAFELT, are advised to put themselves in communication with Mme. MARIE LORENTZ, 19, Avenue d'Orleans, Paris.

BALLOON DESCENT IN KEW GARDENS.—M. AUGUSTE E. GAUDRON, the French aeronaut, accompanied by his wife, made a balloon ascent from the Alexandra Palace on Saturday, at 5 P.M., passing over Waterlow Park, Hyde Park, and Earl's Court to Kew, where they remained stationary over the river for some time, finally descending upon the Palace Lawn in Kew Gardens.

NATIONAL ROSE SOCIETY.—A meeting of the committee will be held at the Horticultural Club, Hotel Windsor, Victoria Street, on Tuesday next, October 11, at 2 P.M.

MISPLACED ADVERTISEMENTS.—The Mayor of RICHMOND has succeeded in inducing Messrs. JAMES CARTER & Co., the seedsmen, to remove a large hoarding, 200 yards long, just outside Richmond Station, which obscured the view of their flower-garden and the orchards beyond. The firm had intended to use the hoarding as a huge advertisement; but yielding to the personal request of the Mayor, backed by a large number of leading inhabitants, they have demolished the structure. We trust other firms will follow the excellent example of the Messrs. CARTER, and confine their announcements to the many legitimate sources of publicity.

AUSTRALIAN ECONOMIC BOTANY: "Native Sago Plant," "Variable Plantain," &c. (*Plantago varia*, R.Br.).—In the latest issue of the New South Wales Government *Agricultural Gazette* appears an article under the title of "A New Indigenous Food Plant," which is alluded to in the *Gardeners' Chronicle*, June 25, 1898. The article in question claims to place on record for the first time the fact that seeds

of *Plantago varia* have been used as food, which is incorrect, as most Australians know. More than ten years ago this plant was figured and fully described in the *Town and Country Journal*, and subsequently described for the Government of New South Wales for the information of the Agricultural Department by Mr. F. TURNER.

M. CROZY, the raiser of so many fine Cannas, has been created "Officier du Mérite Agricole."

COUNT CHARLES DE KERCHOVE.—An imposing monument has been erected in Ghent in commemoration of the municipal and other services rendered by Count CHARLES DE KERCHOVE to the city of Ghent. The Count is well remembered in this country as having been the president of the Royal Society of Agriculture and Botany of Ghent, an office now filled with zeal and consummate tact by his son, Count OSWALDE DE KERCHOVE. The monument takes the form of an elegant column, springing from a well-proportioned pediment, and bearing a bust of the deceased magistrate.

ROSES IN THE RIVIERA.—The *List of Roses now in Cultivation at Château Eléonore, Cannes*, published by Lord BROUGHAM AND VAUX (London: JOHN & E. BUMPUS), gives such a representation of what Roses will do under a congenial climate as may well surprise those accustomed to grow these plants in England only. In Cannes and the neighbourhood there is "stiff red soil with affinity to clay, and a rich loam of great depth," which suit the Roses well, especially with the additional conditions of liberal watering and manuring. There are two flowering seasons, from October to the middle of January, and from the middle of March until the end of May, the latter being the more important of the two. As examples of the size and beauty attained on the Riviera by Roses familiar to us as comparatively tender plants in England, the compiler of this list calls special attention to a plant of Marie Van Houtte seven or eight years old, and 70 feet in circumference; and one of Papa Gontier, grown in cylindrical form, whose diameter is 7 feet, and height nearly 25 feet. Another noteworthy inhabitant of the gardens of Château Eléonore is *Rosa gigantea*, which was flowered therein last April for the first time in Europe. Found in Upper Burma by Sir H. COLLETT, at an altitude of 4000 to 5000 feet; and also found in Manipore, about 2000 feet higher. "A splendid plant, making growths of 40 feet or more, with rambling branches, armed with irregular prickles of moderate size, often in pairs at base of leaves, which are about 3 inches long, and glabrous. The flowers are solitary, about 6 inches in diameter, which size will not unlikely be increased when the plant is older and stronger, of a golden-white with yellow centre, containing an unusual quantity of pollen. Petals large, broad, imbricated, disk large, styles much exerted, free, villous; stamens long. The most desirable, and by far the finest single Rose I have ever seen. It does not seem to be very hardy, and is subject to mildew. The bud is long, larger, but very closely resembles that of Madame Marie Lavallée, and of pure gold colour. This Rose when in flower should obviously be shaded, as the sun soon extracts the gold from the blooms, leaving behind a substitute of dirty white. At a short distance the flowers bear a close resemblance to a Clematis."

MOSQUITOS AND MALARIA.—It is alleged by a writer in the *British Medical Journal* that the mosquitos are affected by parasitic germs (bacteria)? These germs are capable of being introduced into the human frame by the bite of the mosquito, and set up malarial poisoning. It is only some mosquitos that are liable to infection, and only some germs that infest them, so that there are good grounds for believing that as our knowledge increases, it may be possible to devise means for the prevention of malarial fevers. Residence in unhealthy spots in the tropics will then be less dangerous to health than at present.

"SURPLUS STOCK."—Students of language will be interested to know that this expression, partly Latin partly Teutonic, is adopted into French. A

circular before us announces the sale "des surplus stock," thus making use of a plural article and a singular noun. But the vagaries of language are as unaccountable as the fashions themselves.

SAN JOSÉ SCALE.—This is, says Dr. FLETCHER, the well-known entomologist, the most serious pest that has ever occurred in Canadian orchards. We mention this, as there is a tendency to minimise the dangers that may arise from the introduction of this scale. If it breeds so freely in Canada, it may do so here. Fortunately, so far as we know, it has not appeared here in a living state.

THE OLIVE CROP IN SPAIN.—The accounts received as to the baleful effects of the recent inundations in the provinces of Grenada and Seville are very serious. Not only does there appear to have been a great loss of farm stock and of human life, but we are told that the Olive crop has been nearly or quite destroyed. The waters seem to have risen to the height of the Olive-trees, and swept away the fruit. This must prove a great calamity, especially as things now are in Spain; and it is to be hoped that the services of the civil engineer and of the forester may be called in, so that a recurrence of such a catastrophe as that recorded may be rendered, as far as may be, impossible in the future.

"SUNNY JERSEY."—An historical and descriptive guide, edited by PERCY ED. AMY, illustrated with a large number of photographic views, most of which have been taken specially for this work by E. HAMILTON TOOVEY, Jersey. With map of Jersey (Bournemouth: W. MATE & SONS). The scope of this work is well set forth in its title, so that we need only add that it contains plenty of pictures for the money (a shilling) charged for it, and all the information that an intending visitor to the island is likely to require. Jersey has latterly become more and more widely known owing to increased facilities for access, and the book before us is in some measure a record of its increasing status and popularity.

FLOWERS IN SEASON.—Messrs. T. S. WARE & Co. send us from the Hale Farm Nurseries, Tottenham, specimens from the open ground, of the lovely *Amaryllis Belladonna*, and the variety *blanda*, with rounded segments of a pale pink colour. With them came a spike of that remarkable plant, *Hesperaloe yuccifolia*. The leaves are very long, thick, linear, channelled with loose threads at the edges, as in some *Yucca*. The flower-spike is tall, erect, with numerous loose clusters of orange-pink flowers, each flower tubular, and about three-quarters of an inch long. The plant has been blooming since the end of May, and will continue to do so for some time. Some years since a plant of this species at Tottenham flowered continuously from one spike, from June of one year to June of the following year. The plant is a native of North-West America.

HARDY BAMBOOS.

(Concluded from p. 246.)

ARUNDINARIA METALLICA (*Mitford*), Kanéyama-Daké.—This Bamboo, recently introduced by me from Japan (fig. 78), is likely to make a valuable covert plant. It is very like *A. Veitchii* in character, but bolder and stronger, and does not wither at the edges in winter like *A. Veitchii*. It has most rampant rhizomes, and is therefore not suited for anything but woodland work. In a garden it would soon become an ineradicable nuisance; in a covert, on the contrary, it is a most beautiful ground-plant. Being a native of the coldest districts of Japan and of the island of Yezo, it is perfectly hardy. The name *metallica* is a translation of the native Japanese name. *A. B. F.-M.*, September 13, 1898.

[We take this opportunity of figuring a seedling plant of *A. Laydekeri* (fig. 79, p. 275), grown from seed ripened in the open air in the garden of Mr. Freeman-Mitford, which was exhibited by him at the Royal Horticultural Society among a very interesting collection of Hardy Bamboos. Ed.]

THE CULTIVATION OF THE SCOTTISH BRAMBLE.

I HAVE recently visited the gardens at Carron Park, Larbert, N.B., where Mr. Caldwell, the gardener, has been cultivating the wild Scottish Bramble. Mr. Caldwell has two rows of plants, one running east and west, and the other north and south, and they are both laden with ripe, large, finely formed and luscious Blackberries. It is some years since Mr. Caldwell first formed the impression that the wild Bramble might, were it cultivated, take its place amongst the best of table-fruits, and give an adequate return for the time and labour expended upon it. He accordingly procured some plants in the neighbourhood, and with the consent of Mr. Cadell, the proprietor of Carron Park, he planted them in the garden. He first set a row of plants 17 yards in length, and running east and west. The plants were placed 3 feet apart, and were trained up wires running between posts, 6 feet in height. For the first year or two the plants did not answer expectations, but this has been attributed to a too free use of manures. By the third or fourth year, however, the plants had got a firm hold, and ever since then they have flourished. Another row of plants, 22 yards in length, was afterwards planted, but this time the row was run from north to south. Experience has proved this to be the best way, as the plants obtain the advantage of the sun both in the forenoon and afternoon, and the fruits upon both sides of the row are more quickly ripened.

The method of cultivation adopted by Mr. Caldwell is easily described: In the winter-time they are top-dressed with manure, which for the first year or two should be used sparingly, and in the spring a little earth is put on the top of the manure. By the third year the plants are at their best, and may be treated liberally. Beyond ordinary thinning-out they require very little attention. Every year for some time past Mr. Caldwell has had a large crop of excellent fruits. Last year, for instance, he gathered 99 lb. of Blackberries from his two rows, and the crop would have been heavier but for an early and severe frost. It is estimated that the crop for the present season will amount to 160 or 180 lb. Mr. Caldwell thinks that the cultivation of the fruit on a large or small scale would prove highly profitable. The plants take up very little room. The rows of plants can be placed about 3 feet or 3½ feet apart, whilst between the rows, if so desired, vegetables could be planted.

Brambles do not appear to be so subject to the attacks of vermin and birds as other fruits. The Bramble as a fruit is held in high favour for table use, and also for certain medical purposes, and the demand for it is far greater than the supply. What fruit Mr. Caldwell has had to dispose of he has had no difficulty in finding a market for at a good price; in fact, he has not had sufficient to supply the demand in his own district alone. Another excellent feature about the Bramble is, that it continues to fruit for a period of two months. Altogether, Mr. Caldwell is to be congratulated on the success which has attended his cultivation of the Scottish Bramble. W. C. M.

[Where the cultivation of Blackberries is adopted by gardeners, care should be taken to obtain the best forms, such as *Rubus laciniatus* or the best varieties of the common Bramble. There are many varieties, and they possess varying degrees of value. Ed.]

ROUND MAIDSTONE.

(Continued from p. 252.)

LINTON PARK.—This charming country seat lies about 4 miles from Maidstone, and the route from there is through an open country, which rising rather abruptly from the town, is more or less hilly the whole distance. Just before reaching the park-gates, there is the tiny village of Coxheath to the right, where early last century a portion of the Army was encamped, but which now is exceedingly quiet, and with its Hop-fields and fruit-gardens, is suggestive of anything rather than strife or battle.

The ridge on which Linton Park lies has a deep and fertile soil. In the valleys there is not so much

earth, and it is supposed that when these were covered with water the stream created a channel, and washed therefrom much mud, that was deposited layer upon layer on the sides of the ridges. No sooner have we passed the park-gates than the Elm-trees are remarked to be very fine specimens, and the timber generally is indicative of a good staple soil. The present owner of Linton is Mr. F. S. W. Cornwallis, and it is pleasant to record the fact that Mr. Cornwallis, who is a young man, and has only been proprietor for a few years, has sufficient appreciation of the beauties of the place, that he is now engaged in making the gardens more efficient by building a quantity of glass structures. The future of Linton Park, so far as it can now be judged, is particularly bright.

The garden is especially interesting to two classes of visitors. Its two features are the pleasure-grounds, which contain excellent specimens of uncommon species of trees; and the kitchen-garden, where the Apple-trees are grown, and Apples that for many a year the present well-known and exceedingly genial gardener, Mr. J. McKenzie, has exhibited with more or less success.

THE PLEASURE-GROUNDS

were laid out and planted by the late Mr. Masters, of the Canterbury Nurseries, and for many a day the magnificent trees in them will bear testimony to the knowledge and discrimination brought to bear upon that work. There are few places that can boast in a

FIG. 79.—A SEEDLING PLANT OF ARUNDINARIA LAYDEKERI.
(Grown in the open air at Batsford.)
(See p. 274.)

like area such a number of interesting species. In reply to a question, Mr. McKenzie said that very little alteration had been done since the work was first undertaken; nor is it needed, "for the master-hand is evident in every part of it." The effect now would have been even greater than it is had the idea of the landscape gardener been perfectly carried out; but in succeeding years the requisite amount of thinning was not done, and it is now too late.

One of the most interesting of the noble trees is one of the Cork tree (*Quercus suber*), which stands in the middle of a gravel walk, and is encircled by a fence. It was planted by Sir Horace Mann on September 20, 1778. Several feet from its base the magnificent trunk has a girth of about 11 feet, and the tree is a very beautiful specimen indeed. The graceful deciduous Cypress (*Taxodium distichum*) was observed in several nice but not over-large specimens, probably 50 feet high; they must have felt very severely the need of more root-moisture during the present season.

A few yards away there is such a specimen of *Araucaria imbricata* that is seldom seen. About 40 feet high, or thereabouts, the tree is in vigorous health, and as yet, at any rate, is not dispossessed of its lower and larger branches. A Copper Beech is almost as remarkable—indeed, in some gardens it would be a most prominent feature, but it is here surrounded by many Conifers of absorbing interest. The same might be said of several majestic trees of the common Elm, one with a marvellously pretty trunk, and running upwards of 120 feet high. "That specimen of *Thuia gigantea*," said Mr. McKenzie, pointing to a magnificent specimen near

upon 70 feet high, "is that figured in *Veitch's Manual of the Coniferae*," and well does it deserve such an honour. But we move slowly towards the front of the house, and our attention is directed to several splendid specimens of *Magnolia conspicua*, which in April or May must make a wonderful floral display, and shed a delicious perfume for some distance around.

The house was built early in the last century, and commands a remarkable view of the Weald, which lies stretched before it, and from the balcony of the house this view becomes very considerably enlarged. The handsome building itself is partly hidden by various species of climbing plants and *Magnolia grandiflora*. Immediately in front also are Pomegranates, Banksian Roses, Bays, &c. Five flights of steps lead from the terrace down to the flower-garden, and under the terrace are several specimens of the European Palm, *Chamærops excelsa*, one of them apparently over 20 feet in height. These Palms, said Mr. McKenzie, are given no shelter during any part of the year. *Aralias*, and *Myrtles*, too, are sufficiently hardy to flourish here.

Turning to the right of the house, we pause to admire several beautiful specimens of the *Sequoia* or *Wellingtonia*. Roughly speaking, they may be 70 feet high, and are vigorous specimens, though, it may be feared, some of them show indications that ere long the lower portion of the trunks will become bare. As the trees grow high, it is apparently their nature, and especially so in the British Isles, to cast away their lower branches. In some wild and picturesque scenery, such as is very uncommon in England, the trees even then, as they tower above the deciduous species, are still grand.

We are soon in the midst of a group of Japanese Conifers, in which many varieties of the *Cupressus Lawsoniana* are very conspicuous. The *Cupressus* are very fine, and make robust growth; *Retinospora squarrosa*, &c.; *Thuiopsis dolabrata* and others, *Cryptomerias*, &c. *Cryptomeria japonica* is not so happy as most of the others. *C. elegans* looks better than it. In *Veitch's Manual*, already mentioned, some of these Japanese species as they are growing at Linton have been illustrated, and a single specimen of *C. elegans*. Wonderful specimens of *Abies orientalis* and *A. concolor* (*lasiocarpa*) may be seen in these interesting grounds—high trees, with well-furnished pyramidal growth.

From the western side of the shrubbery to the north front of the house, extends an avenue of Elms, rare old monarchs; and parallel with this is an avenue of *Sequoias*. These were planted upwards of thirty years ago, and some of them are probably more than 70 feet high. The majority are vigorous, richly-clothed specimens, but much variation in habit may be noticed in them. One is particularly dwarf, being little more than half the height of the tallest. It is very interesting to observe such differences, which, as the trees become older, are accentuated. The only additional tree we can now mention is a moderate-sized, plumose specimen, of the Maidenhair-tree, *Ginkgo biloba*.

FRUIT AND VEGETABLES.

It is a pity that a kitchen-garden was not laid out at the same time and by the same hand as the pleasure-grounds. It would have been more satisfactory than the present one, which is almost destitute of walls for fruit-trees or for protection. Our remaining time, which was limited, was spent with Mr. McKenzie amongst his Apple-trees. There is no such fruit-garden here as the one at Barham Court, and though Mr. McKenzie has shown splendid Apples at the Palace shows, as last year, for instance, when he won something like "twenty-nine" of the classes for single dishes, and staged some record specimens of Peasgood's Nonsuch—he has not a great number of trees. Nevertheless, his enthusiasm is in his Apple-tree cultivation. The withering drought of the present year was the reason that he was unable to show fruits last week at the Crystal Palace. When these notes were taken, it was not certain whether or not it would be possible, but the trees were suffering terribly, and the water supply had run short, that even had labour been never so plentiful, it could not

be applied. All the supply had to be kept for plants in pots. Such a situation as Linton, high on a ridge, and over the Ragstone, is most perfectly drained, and though generally a favourable circumstance for fruit-growing, it must this year have increased the need for rain.

The secret of the success that attends these Maidstone growers in the cultivation of fruit, lies very much in the fact that they treat their fruit-trees as they would the most important crop. Each of the trees is given almost equal consideration to that an orchard-house tree in a pot requires. It is watched.

Mr. McKenzie knows just what crops each tree ripened last year, and what it has now. Also the growth it made last year, and is likely to make this. He has a very good idea of the state of its roots; he can tell if the tree is suffering from dryness, and if it requires manurial stimulant, in the same way that an experienced Vine-grower gauges the condition of his Vines by an examination of the foliage. Mr. McKenzie's enthusiasm for his Apples may be gathered from his words:—"When once a gardener has undertaken fruit-growing with zest, he can never give it up. The love of it will remain with him to the end. I have grown Chrysanthemums as a specialist, and have been enthusiastic in the showing of other plants; but Chrysanthemums lost their novelty. Fruit has not, nor will it."

GLASS STRUCTURES, &c.

But we must leave the Apple-trees, and mention in a concluding paragraph a few facts about the glass-houses, &c. The whole of those which previously existed here have been taken down, and Messrs. McKenzie & Moncur, of Edinburgh, are engaged at the present time in building a large number of new ones, the woodwork in which is all teak. A new bothy has been completed, and in appearance and convenience it is beyond praise. Plant-stoves, Melon and Cucumber-houses, too, are finished. Then there is a range of lean-to houses, facing south. This is 400 feet long, 18 feet wide, and 16 feet high. It will be divided into eight divisions, and be used as vineries, Peach-houses, &c. The whole will be heated by two powerful Cornish boilers, and the smoke from these will be carried away some distance up the side of the hill. We hope to be able on a future occasion to give more particulars of these houses. In the meantime, we must leave Mr. McKenzie to his work of taking over and furnishing the houses as they become ready; it will serve to detract his thoughts somewhat from the suffering the drought is inflicting upon the trees out-of-doors. P.

HOME CORRESPONDENCE.

COTTAGE GARDENERS' COMPENSATION ACT.—

How far is it safe and prudent to let building land to market gardeners without being called upon for unreasonable compensation? 1. Can a landlord and tenant contract out of the Compensation Act? 2. What notice is required to obtain possession of the land for building purposes? 3. Is the same notice required as in a farm according to the Agricultural Holdings Act? The Act is not explicit. I have land adapted for building purposes, and wishing to benefit poor people in my district, I have let it in allotments, but I have been obliged to take crops useless to me, amounting to several years' rent. I want to know whether a landlord can protect himself without injustice to the tenant? *Philanthropist*. [Such questions can be only satisfactorily answered by a solicitor. ED.]

THE ORANGE-FUNGUS ON ROSES.—"Wild Rose's" experience of the sudden attacks of this insidious pest is all too common. Its origin and life-history are still more or less obscure, and hence probably its check or cure is still beyond the skill of most growers. Prevention, however, would be better than either. The late Thomas Rivers was one of the first to discover that this pest was most virulent on the rougher-leaved Roses, such as Moss, Provence, and spiny hybrid perpetuals. His advice, too, to intercrop Roses with annuals and other crops, aimed rather at growing out red-rust through an increase of vigour in the constitution of the Rose,

than through any curative virtue in the mere change of crop. In this connection, it should however be borne in mind that our great champion Rose-grower, Mr. Benjamin Cant of Colchester, has long adopted the plan of taking a white or corn crop in alternation to his Roses. Mr. Rivers' radical trenching and manuring were powerful auxiliaries in keeping the land full of suitable food throughout the season. Sudden checks arising from gluts or scarcity of food, and floods or famines of water, are the most potent causes or sure forerunners of red-rust on Roses. Excessive and sudden changes of temperature, from extremes of cold to heat, often come immediately before, if they do not produce and foster, the growth of orange-fungus. A loose surface among Roses throughout the growing season is the nearest antidote yet found for the prevention and cure of red or orange-fungus. The intervention of a white crop, the constant use of the hoe on the surface, to keep the roots cool and moist, sweetly and regularly fed, are useful helps. Like "Wild Rose," I have long known that the red-rust seldom or never attacks Teas, Hybrid Teas, Noisettes, Bourbons, Chinese or Banksian, or smooth shining-leaved Roses. Even such Perpetuals as *Boule de Neige*, the *Verdiers*, and other more or less smooth and shining-leaved hybrid perpetuals escape the orange-fungus. Can it be that this pest cannot lay hold of or remain long enough upon the leaves to effect its reproduction? Suppose we try to starve out this fungus by offering it nothing to feed upon but smooth semi-shining varnished-leaved Roses. We need not lose so very many of our very best Roses by adopting such a method. New and smoother-leaved varieties will come at the cultivator's and hybridiser's bidding as readily as new colours, forms, [odours, among our Rose blooms. Little progress has been made for many years in attempts to kill the orange-fungus without injury to the Rose-trees. For example, *Paris Green* and *London Purple* may be used strong enough to kill the fungus, but hardly without scorching, disfiguring or killing the foliage and flowers. A small brush dipped in pure alcohol, methylated spirits, or a strong decoction in solution of smelling-salts deftly and lightly thrust against the fungus, will cripple or kill it, and if cleverly managed, will inflict but little injury on leaf or branch. But should wider experience prove all smooth-leaved Roses fungus-proof, complete deliverance from this pest may be said to be already within sight of cultivators. For every day Teas, hybrid Teas, and climbers are increasing, while the hybrid perpetuals and other rough-leaved rust-inviting Roses are decreasing. D. T. Fish.

CUTTINGS UNDER GLASS, ETC.—It is well known to gardeners and propagators that to be successful in rooting the green growth of hard-wooded plants in propagating-cases or heated houses, the cuttings must be taken from plants growing indoors; but what is the scientific explanation of the difference between such and plants in the open air? The same difference is very apparent also in grafting most deciduous subjects in heat. *Propagator, Cheshunt*. [Cuttings under glass have relatively more cellular and less fibrous or woody tissue than cuttings grown out-of-doors; the structure therefore is more favourable to the formation of callus and of roots. Again, the higher temperature of the propagating-case is more propitious to the growth of roots than is the temperature out-of-doors. ED.]

WATERPROOF PAPER.—I have great pleasure in forwarding you a sample of the Eureka transparent waterproof paper. I should have done so before if I had not been unwell all last week. I will at the same time give you a few particulars re this paper. It is treated with a chemical preparation, which renders it, as you will see, very transparent; and as the preparation is non-evaporating, it is very durable—with ordinary care it will last two or three years. It has stood the test of very strong winds and rains. With regard to light, I must say that it is excellent, as it transmits sufficient to grow any kind of plant to perfection. I have had Cucumbers, Tomatoes, Ferns, and Aralias under it, and they all thrive equally well. I enclose a photograph of a Cucumber-house, which will give you a good idea of its value. It retains the sun-heat longer than glass, and as much as 120° was registered in the Cucumber-house this summer. As a protection against frost, it is invaluable. During the recent frosts the lowest temperature in the same house was 50°; the sides are built of turf. For Ferns, Palms, or any other plant which delight in a light shaded house, this paper is most economical, as it saves the labour and expense

of shading. The cost of the paper per 100 feet run, viz., 1600 square feet, is 38s. 6d., and the whole house can be built for £6. It is my intention to put up 2000 feet run early next spring, chiefly for Cucumbers and Ferns. C. A. Christiansen.

CHRYSANTHEMUM MRS. G. GRUNERWALD.—As a bedding-plant this splendid summer and autumn flowering Chrysanthemum has been one of the best plants of the season, and has presented a mass of flower during the months of July, August, and September, and at this date is quite as beautiful as ever. It will last until cut down with frost. There is a bright future for the summer and autumn flowering Chrysanthemums as bedding-out plants. J. Grieve.

PLUNGED POT PLANTS.—Concerning these plants at Sandhurst Lodge, Berks, referred to at p. 257, Mr. Townsend, the gardener, has written stating that, having had three successive white frosts of 3°, 5°, and 7°, he had found Fuchsias, Begonias, Heliotropes, Pelargoniums, and some other plants quite spoiled, whereas plants usually esteemed to be even more tender, such as *Solanum jasminoides*, a lovely thing in pots trained standardwise; *Swainsonias*, *Habrothamnus Newelli*, *Bougainvillea Sanderi*, and *Cobaea scandens* were unharmed, looking quite fresh and gay. Besides the plunged pot plants referred to, the frost had quite spoiled the ordinary bedding plants. Perhaps because of this evidence as to comparative hardiness, some gardeners may be disposed to give the plants named as escaping injury a trial for bedding purposes. A. D.

RANUNCULUS LYALLI.—The result of an experiment in importing *Ranunculus Lyalli* may be of interest. Sixty plants were packed in earth in a Warden case by Adams & Son, Christchurch, New Zealand, last April or May. Instead of forwarding while the crowns were dormant, they delayed them until July, by which time all had started into vigorous growth. The result is that sixteen were dead, seven doubtful, and thirty-seven are alive and well. A. K. Bulley, West Kirby.

THE CRYSTAL PALACE FRUIT SHOW.—If the Royal Horticultural Society had no other claim on the nation in relation to horticultural work than what is evidenced by the great annual fruit show of home-grown produce, it would still be entitled to great consideration. But seeing that it does every year accomplish so much, and has so largely the confidence of the horticulturists of the kingdom, because of its great work and reputation, it does seem incomprehensible that it should be left to fight as it were single-handed, the great battle of fruit improvements, and that it has received no support in its work from the Government, the County Councils, or even that peculiar body the Fruiterers' Company. In referring to this latter organisation which has so proud an appellation, I remember that there are some whom I highly esteem who are members of it. But with all respect to them, I can but ask why is it not very greatly in evidence, and giving also very material assistance when the Royal Horticultural Society organises these great exhibitions of fruit at the Crystal Palace, of which the late one was far from being the least. If a body of this nature enjoys a pretentious title, let it show that its title is not an empty sound, but that it has the appellation because of its great services to the cause of fruit production at home. But it may well be asked—What of the Government as represented by its Agricultural Department? Is not fruit-culture an important land industry, and as worthy of national support as is the production of Wheat, cattle, or horses? It may be that this Department is so overloaded with responsibility respecting the muzzling of dogs, that it has no time to devote to the consideration of fruit-culture. Of course, I am not oblivious of what it has attempted to do in a somewhat alarmist way in the diffusion of tracts re insect and fungoid pests, but these indictments in any case defy the Department, and are rather more active now than before. If the Department could place a couple of hundred of pounds at the disposal of the Royal Horticultural Society in encouragement of fruit-culture, if but in the form of prizes at its great national fruit-show, some good would be done, and we should then see governmental recognition of the principle that fruit-growing at home is a very important national industry, and merits all possible support. Cannot the various county councils of the kingdom be induced to vote from their Technical Education Grants a sum of £10 each to provide prizes in a class

for hardy representative fruits from each particular county? What wonderful help to the Royal Horticultural Society and its great Fruit Exhibition might be given in this way, and how much more fully might be illustrated the general nature of county fruit-culture, than can be discerned under the present grouping system, which all the same presented a considerable advance on the former state of having no county or district representation whatever. Then, there are the various vegetarian societies, which should be ready to support the great fruit show. Where in all the Kingdom could be found a finer representation of the fruits of the earth such as the vegetarians specially favour as food, than was the Crystal Palace Show. But recently the vegetarian forces assembled at a banquet at the Palace, could they not be induced to hold their annual congress at the same time as the fruit show is held, and thus enable the members of the body from all parts of the Kingdom to see what British fruits really are. Possibly, were the President, Mr. A. F. Hills, of Monkhams, Essex, a fellow of the Royal Horticultural Society, specially approached, he might secure a vegetarian prize at the show annually. It might reasonably be expected that the British fruit trade, as represented by the numerous salesmen, dealers, fruiterers, &c. would also like to lend a helping hand. It should be to the interest of all such to provide the classes for packed fruits with the prizes. There are others also who might help, but I have indicated enough. It is evident that with the immense area of the Crystal Palace at disposal, and everyone has to admit that it is one of the finest places in the world for the purpose, the great annual exhibition of British-grown fruit held there, should be greatly extended and have a prize-list of not less value than £1,000. At present, but for the Royal Horticultural Society, we should have no exhibition whatever. A. D.

APPLES, JAMES GRIEVE AND OTHERS.—James Grieve Apple is a seedling from "Pott's Seedling," and quite distinct from the type of Cox's Orange Pippin, and very much harder, and is in season from September to March. James Welsh (not J. Welch) is a seedling from Ecklinville, and is as free a bearer as Lord Suffield, with the free vigorous habit and growth of Ecklinville. It will be one of our best orchard standards. It is in season from September to December. Bailie Nilson is also an Apple of sterling qualities, and is a seedling from the Gooseberry-Apple; this, and James Grieve, were staged at our September show in splendid form from the Queen's Gardens at Frogmore (gr., Mr. O. Thomas). During my life I have raised upwards of a thousand seedling Apples, and if the later ones turn out as well as the earlier ones, there ought to be a few fine kinds to fruit yet. James Grieve, Redbraes Nursery, Edinburgh.

POLISHING APPLES AT SHOWS.—Prior to the dispersal of the judges to their respective duties at the recent Crystal Palace fruit show, the secretary of the Royal Horticultural Society, the Rev. Mr. Wilks, drew attention to the polishing of Apples seen in many directions, which he advised the judges to be aware of, and to deprecate. That this polishing was very largely to be seen there was ample evidence, but seeing that there was no reference or condition applicable to it in the schedule, the judges could not disqualify fruit so polished found in the competitions. That any sensible fruit-grower should adopt such an unhappy practice is difficult to understand, as the preservation of the fruit bloom in all its pristine freshness should be every exhibitor's aim. But if the council wishes to suppress the practice at its shows, and it would be a proper course to do so, I suggest that in next year's schedule it shall be clearly stated "that any fruits artificially polished will be disqualified by the judges." With such an instruction polishing would immediately disappear. A. D.

SPRUCES DROPPING THEIR LEAVES.—I shall be greatly obliged if you can assist me in a matter which is troubling us over here this season. Nearly all the plants, both young and old, of *Picea excelsa* appear to have been attacked by disease in the counties of Wicklow and Dublin. About May or June the leaves turned brown, and became infested with insect pests, and when a branch was shaken nearly all the leaves dropped off, thus leaving the trees naked and desolate before new growths appeared. The new growths were weak and poor, but they have good buds, so that the trees may survive. The spring was harsh, and growth late. Can you inform me if this disease is known, and if so, what is the cause of it? M. [The young twigs sent were perfectly healthy. Two fine plants of *Picea pungens glauca* in our own garden have dropped their leaves in the same way. We

believe this to be a normal process, accelerated by the hot dry season, which has favoured red-spider and other pests. The stems are likely to be more or less bare in consequence, though new growths may be formed on a small scale. Ed.]

EUGENIA UGNI (p. 259).—This is quite hardy in the open border at Redbraes, and has fruited abundantly for a great number of years. It is also one of the best wall evergreens, and quite the hardest of the Myrtle family; but, strange to say, it is little sought after, and appears to be very little known by the generality of gardeners. J. Grieve.

BIRDS AS GARDENERS' FRIENDS.—In one of the leading papers (*Morning Post*), is an article referring to the destruction of birds. Whoever the composer of the article may be, he has never had much experience of the destruction birds do where their numbers are large. He considered all birds were great helps to the gardener in clearing away insect pests. I admit insectivorous birds may do some good; but I find in this neighbourhood where birds abide in hundreds of all classes, from a robin to a wood-pigeon, that I cannot speak very highly of their assistance, for I have had winter produce, Brussels-sprouts, Broccoli, Kales, &c., literally swarming with caterpillars and fly, which would have rendered the plants useless had they not been checked by hand. The birds did not take the slightest notice of the insects, but would swarm down on the Peas and seeds, and they spoilt a quantity of the best Carnation-blossoms while in the bud. They also cleared away Mountain Ash, and other ornamental berries which help to make our gardens look cheerful in late

FIG. 80.—THE HOGG MEMORIAL MEDAL.

autumn and winter, as soon as they were coloured. Had our friend been handicapped to the extent that a great many gardeners are in preserving their crops, he would not speak so highly of the birds. S., *Abbey Wood*. [Many people prefer the birds, which they cannot purchase, to the crops, which they can buy. Ed.]

FROST IN SHROPSHIRE.—We experienced a rather severe frost in Shropshire on Sept. 24, which did a great deal of mischief amongst the tenderer varieties of flowers and vegetables, especially in some localities. It is interesting to notice the effects in the different localities. All parts of Shropshire were affected more or less, but in some places the frost was exceptionally severe. I enclose some specimens of branches of Walnut, Laurel, and Chrysanthemums from Col. Lloyd's garden, Ashton Hall, Oswestry, injured by frost on the above date. The Walnut was only a side-branch, the branches and Walnuts on the tops of the trees were completely blackened. The Laurel is a fair illustration of the whole sweep of Laurel shrubbery, scarcely a tip of the young growths escaping. The loss amongst the Chrysanthemums was very great. Many have to be cut down. Mr. Thompson, a well-known exhibitor in these parts, had some splendid plants sending up some fine exhibition blooms, and very many are injured, although he had protected them with tiffany. It is noticeable that only the unopened buds are injured, the open flowers escaping. All the bedding plants, Pelargoniums, Heliotropes, Begonias, Dahlias, &c., are completely spoilt. The gardens were beautiful before this very early sharp frost came so unexpectedly upon us. Alfred Gault, Shrewsbury.

THE HOGG MEMORIAL MEDAL.

(SEE FIG. 80.)

AFTER the death of Dr. Robert Hogg, a movement was set on foot to obtain subscriptions from those who valued this eminent pomologist's services, to obtain a medal to be given for meritorious exhibits of hardy fruits. The necessary amount was collected, and Mr. Harry J. Veitch, and the Rev. H. H. d'Ombrain were appointed to make the necessary arrangements. A suitable die was obtained, and placed in the hands of the Council of the Royal Horticultural Society. Two of these medals were awarded last week on the occasion of the fruit show at the Crystal Palace: one to Messrs. T. Rivers & Son, Sawbridgeworth, and the other to Messrs. Jas. Veitch & Sons, Chelsea; in each case a most appropriate award personally, as well as from the exhibitor's point of view. The Society will continue to issue the medals at their discretion, as in the case of the Banksian and other medals.

SCOTLAND.

PERENNIAL ASTERS.

So largely are "Starworts" affected by climate and locality, that in Scotland the flowering of late sorts does not occur in some years at all. Indeed, the indefiniteness they show in this respect drives us to dispense with the latest flowering sorts. The other day in the Royal Botanic Gardens, Edinburgh, I was shown an up-to-date collection, in which some of the sorts were less tall than our own, while almost all of them flowered earlier. I was, however, under the kind direction of Mr. Waite, enabled to procure the names of a number of sorts that I shall be glad to add to our already fair collection. The following include those I saw in Edinburgh, and have experience of here, and in other gardens.

There is nothing finer than *Aster Amellus*, hoary with age, but still as beautiful as the youngest. There are several varieties, but none, as I think, that surpasses *bessarabicus*. The flower is not gay, nor is it dull, but a restful shade of purple-lilac, and with a centre of orange florets. Perhaps equal in beauty is *longifolius* and its variety *formosissimus*, both of which are popular wherever hardy flowers are cultivated. Next in order is the very beautiful *Novae-Angliae*, var. *Wm. Bowman*, a variety that never fails to open its flowers here. *N.-A. roseus* and the type unfortunately do not flower successively every year. They succeed best in a dry, warm soil, and from plants grown in such I have frequently cut blooms in November.

Acris is a pretty and good variety, which in the garden of the leader of the House of Commons at Whittinghame, is effectively employed. *Stricta* bears a resemblance to *Acris*, but I thought it better than that variety. A dwarf species named *spectabilis*, not unlike *Amellus*, which Americans mistake for it, is well worth growing. In *japonicus* we have a species of rather quaint appearance, but nevertheless pretty.

Of the large group now composed of *Novi-Belgii*, I imagine the best are to be found in *Arcturus*, *superbus*, and *Purity*, to which, on account of blooming somewhat earlier may be added *Lady Trevelyan*. *A. versicolor*, somewhat like the two last-named, but later to bloom, is a commendable species.

There is room in most gardens for a number of each of such dwarf species as *Curtisii*, blue; *ptarmicoides*, white; and *linarifolius*. Of the sturdy puniceus, the variety named *lucidulus compactus* is a valuable improvement. *Multiflorus*, *elegans*, *carnosus*, are very common sorts, and to these I shall add only a very few more. *Vimineus*, and its variety, *Cassiope*, and *White Queen*, are invaluable, and nothing at this time of year surpasses in beauty this charming trio. *Ericoides*, in some respects less beautiful, is nevertheless indispensable, because it blooms later in autumn, and its star-like little flowers are very pretty indeed. I also like to grow the species *John Tradescant* brought from Virginia, and named *Tradescanti*, because to it the designation of *Michaelmas Daisy* was long solely

applied. Lastly, we have the medicinal *Linomyrs*, now one of the prettiest of autumnal flowers.

Starworts need little attention. In the case of a very few varieties is support needed, and for those that do need it, a strand of string tied round the soft stalks is generally sufficient; once the stalks have hardened, the strings may be dispensed with, and the shoots allowed to spread out naturally. Starworts may be lifted and transplanted with safety at any time of the year, save during winter; hence the plan of growing a few plants in reserve, in order to fill blank spots in mixed borders in autumn, is one to be commended.

BRAMBLES.

A slight discussion has lately occurred in one of the leading Scotch dailies as to the value commercially of the common *Rubus fruticosus* when cultivated in gardens. Notice was also taken of the Bramble having been for a long period cultivated on walls. There is nothing very novel in either case. In very many gardens in Scotland the Bramble is cultivated, though not often, for the sale of the fruit, but commonly for supplying the household. On walls they are seldom to be found, and are grown for the production of dessert fruits. The Parsley-leaved variety is better than the common form, but where the former cannot be had, the latter may be used as a good substitute. [See also p. 275. Ed.]

THE WINEBERRY (*RUBUS PHENICOLASIUS*)

is comparatively a novel fruit; its qualities having been first discovered in America. Here its progress has been slow. Nevertheless, it is worth cultivating. A delicious jam, thickly sprinkled with its white seeds, is made from its fruit. Here it is much esteemed when used in the same way as the Bramble, either as a tart by itself or mixed with Apples or Currants. As a rule, it comes into use when Brambles are over, but this year the fruit was nearly used up when the Brambles began to ripen. The Wineberry suffers much from drought. It requires good cultivation, and about this time of season it must be pruned, by cutting back the stems that have fruited near to the ground, also all weakly growths. At the same time the young shoots of the current year should be shortened according to their strength. I grow a fair number in the gardens and pleasure-grounds, and can recommend them.

A NEW GRAPE.

The Forth Vineyards, Kippen, under the management of Messrs. D. & W. Buchanan, has for several years enjoyed a reputation for its Tomatos and its Grapes. Its reputation, moreover, may soon be further increased for its seedling Grapes, the first of which was presented at the Royal Caledonian Show, Edinburgh, and under the name of "Diamond Jubilee" it was awarded a First-class Certificate of Merit. Its history is brief. In 1894 four flowers of *Gros Colman* were fertilised with pollen from *Gros Maroc*. The next year the seeds were sown, and in 1896 the year-old seedlings were inarched on fruiting canes of Black Hamburgh. Next year the variety fruited, and because of the year it was named "Diamond Jubilee." This is the best variety that has as yet appeared among the seedlings. The Messrs. Buchanan, in a note, say, "It is a free cropper, sets splendidly; the flavour is good, and the Vine has a good constitution." Last year it kept till Christmas, but if grown in a warmer temperature it is expected to keep longer, and to be improved in flavour. *R. P. Brotherston.*

BELGIUM.

I LATELY noted a new hybrid at the Horticulture Internationale, Brussels, which will take a foremost place among beautiful Orchids. This was *Cypripedium Wiertzianum*, from C. Rothschildianum x *barbatum superbum*. The lip and petals clearly show the Rothschildianum parentage, the standard that of *barbatum*, but it is larger than that of the latter. This hybrid has been two months in flower; the plant is robust, the flower strong and vigorous.

The *Catasetums* are coming into bloom; C. Lin-

deni, splendens punctatum, and Aliciae are delightful among the many forms of *Bungerothi*.

There are now also numerous handsome varieties of *Lælia præstans*, of fine colouring and exceptional size in the flower. I may mention L. p. *Lindenii*, remarkable for its unusually deep colouring and velvety texture—the lip is nearly black, especially towards the upper edge; L. p. *fastuosa* is paler than the above, though still dark—the lip is particularly deep and handsome; L. p. *nobilis*, flower very large, two of the petals measuring 1½ inch across; L. p. *grandiflora*, flower large, paler than the above, the lip ample, the throat tinged with lemon-yellow, in the middle of the purple blade is a large white spot—the habit of this variety is excellent; L. p. *formosa* is of fine habit, the lip dark, throat cream-white; L. p. *mirabilis*, dark in colour, throat cream-white; L. p. *majestica*, petals of good size, and lip almost wholly dark.

There are also in bloom, *Cattleya Warjenowskyana*, lately figured in the *Lindonia*; it bears three very good flowers. *Vanda tricolor Hoveæ*, a unique specimen also illustrated, and now bearing one fine raceme of characteristic flowers; *Oncidium luridum splendens*, a charming variety; *Vanda Sanderiana*, unusually dark; and many fine specimens of *Cattleya Harrisonæ* of rosy tints from pale to dark, the lip in some a beautiful creamy-white. *Ch. de B.*

FLORISTS' FLOWERS.

CHRYSANTHEMUM NOTES.

ALTHOUGH it is somewhat early to judge the character of this season's novelties, I have recently seen a few that will doubtless be exhibited at forthcoming shows. General Paque (Calvat, 1898) may best be described as an improvement on *Golden Gate*; some fine flowers on crown buds were perfect in size and shape. Its colour will prove useful as an exhibition variety, being clear tawny-yellow. The growth of the plant is vigorous, whilst its earliness will render it exceedingly useful.

President Bevan (Calvat, 1898) is a fine Japanese incurved variety; the flower is of good size, solid, and perfect in shape, while its colour is clear buff-yellow. In character it is very distinct.

Mrs. E. Carter is a new Australian variety; the flowers are of good size, perfect in shape and form. The florets are long, slightly incurving towards the centre, and in colour are of a lovely clear yellow shade. It is of good habit, with a vigorous constitution, and the flowers I saw from crown buds were very fine.

Of last season's novelties now in flower, the best is *Madame G. Bruant*, an improvement on *Etoile de Lyon*. When exhibited last season, this variety was much admired. The flowers on crown buds are very large, and in colour bright rose, with deeper margins; the petals are long, and have a silvery-pink reverse. It is perfect in shape and form, dwarf and vigorous in habit, and will rank as a standard variety.

International, although an old variety, is worthy of mention on account of the variability in the colour of its flowers, according to which bud be "taken." The question of "taking" the proper bud is in a great measure the secret of success. On first crown buds the flower is a beautiful creamy-yellow, which is not its proper character. From the second crown buds the flowers are white, tinted rose; while from terminal buds the flower becomes almost of "incurved" form, and variously tinted. *E. S. Woking.*

NURSERY NOTES.

MESSRS. BLANDFORD, OF BLANDFORD.

MESSRS. BLANDFORD have land at several places in the neighbourhood of Blandford, Dorsetshire. The grounds adjoining the seed-shop and glass-houses are devoted principally to small shrubs, herbaceous plants, Carnations, &c. Among the shrubs I noticed recently were numerous and well-grown medium-sized specimens of *Ginkgo biloba* (*Salisburia adiantifolia*), ranging from 8 to 10 feet in height; these are

among the cleanest and best plants I have seen recently of this species. There is also a grand specimen 45 feet high, well proportioned, and of capital colour. Close to these were two other large trees, one a Weeping Lime, 60 feet high, and as much in diameter; and the other a Weeping Ash. Earlier in the season Messrs. Blandford cultivate a fine lot of *Gloxinias*.

Both single and double-flowering tuberous *Begonias* are grown in large numbers, and among the doubles were remarked some fine varieties. A single-flowered one had appeared, with intensely dark purple blooms, and was being carefully preserved to ripen its seed.

Pot-Roses are a great feature, *Maréchal Niel*, *W. A. Richardson*, *Gloire de Dijon* making rods 8 and 10 feet in length. The work of budding is performed in July in the open beds. The plants are lifted in November, potted and stood in cold frames, so that the buds do not make any growth. Early in the spring they are placed in the greenhouses, where they remain for a period of four months; during this time no fire-heat whatever is given. The growths are stout and clean, and progress rapidly with sun-heat alone. During the summer months, when growth is well advanced, the plants are removed out-of-doors, the rods having attained the before-mentioned length, some even reaching longer than the 10 feet. These are securely fastened to stakes.

Border Carnations, and those of the *Marguerite* and *Malmaison* type are grown in large numbers. *Chrysanthemums* are cultivated chiefly as bush plants. The double white *Primula* is much in request here, and the old plants are soiled round in March and April. Root-action soon takes place, and during May the plants are divided and potted-up into 3-inch pots. They have since been removed into 5-inch pots, in which they will flower during winter. Mrs. Leopold de Rothschild *Carnation* is a great favourite. I noticed here the *Cramoisiée supérieure China Rose*, most vivid in its deep crimson, very showy and attractive. Another plot of land near by is full of choice shrubs, ornamental trees, shrubby *Spiræas*, *Prunus Pissardi*, &c.

The nursery on the Dorchester Road is devoted to Roses. Breadth after breadth of plants may be seen. The saleable plants of H. P. and dwarf Teas were carrying splendid blooms of vivid colours. Mrs. Sharman Crawford, *Merveille de Lyon*, *Baroness de Rothschild*, *La France*, Mrs. J. Laing, and in fact every good old variety was included; also *Margaret Dickson*, *Marchioness of Dufferin*, *Marchioness of Londonderry*, *Marchioness of Downshire*, &c. *Blairi No. 2* is not by any means overlooked. For most of the H. P.'s the *Manetti* and the French *La Grifferaie* stocks are used, whilst for the Teas the old Dog Rose is more often brought into requisition. In addition to the Roses young Spruce-trees are grown by the thousand, which are supplied to the trade. Ash, Hazel, young Oaks, Beech, in fact all sorts of evergreen and deciduous trees have separate quarters. The generally healthy condition of everything in the grounds was noticeable. *W. Swan.*

MARKET GARDENING ABOUT RAYLEIGH.

HARDY fruit and vegetable growing has been carried on successfully for many years back in the parishes of Rayleigh, Hockley, Eastwood, Prittlewell and Hadleigh. The produce finds a ready sale in the flourishing and rapidly-growing town of Southend, which is within easy reach of the several parishes. The most extensive fruit farm in Rayleigh parish is Weir Farm. Here Mr. Newman has combined farming with fruit and vegetable growing, and with the result that in each succeeding year more space is devoted to the production of fruit and vegetables.

Mr. Newman grows 12 acres of Black Currants, 6 acres of Raspberries, 8 acres of Strawberries, 4 acres of Gooseberries, and 4 acres of young Damsons, and this autumn he intends planting a few acres with Apple-trees. Norwich Wonder Raspberry is the

variety depended upon by Mr. Newman. As grown at Weir Farm, under generous treatment, it is a prodigious cropper and free grower, the fruit being fine in size and of good flavour. This year the plants have made good strong canes, notwithstanding the unusually long period of drought and tropical heat which we have experienced. A heavy dressing of good farmyard manure is ploughed into the ground intended for Raspberries, Currants, Gooseberries, and Strawberries. In some cases the land is ploughed once before laying on the manurial dressing, which, as already stated, is then ploughed in and well harrowed and rolled before planting the canes in rows 5 feet apart. The plough and horse-hoe are run between the individual rows of canes several times in the year. Mr. Newman has great faith in the efficacy of sprats as a manure, and these are applied to the ground cropped with Raspberries, Gooseberries, and Currants, at the rate of $1\frac{1}{2}$ tons per acre. In the case of Raspberries, a furrow is opened pretty close to the canes on either side the several rows, into which a good dressing of the sprats is put, the soil being returned to the furrows by the plough on the return journey. In the case of Gooseberries and Currants, a trench is opened round them, about 1 foot from the stems, for the reception of the sprats, the soil being afterwards filled in over the manure. An acre of Raspberries thus treated will produce from fifteen hundred-weight to one ton of fruits per acre annually in the absence of spring frosts. All the old canes are cut out every autumn to make room for the canes of the current year's growth; and these, where too numerous, are thinned out and transplanted into ground prepared as described above. The gathering of one ton of Raspberries or Strawberries will cost from £6 to £7, according to the weight of crop, being at the rate of from one halfpenny to three farthings per lb. Currants if the crop be heavy cost 7d. per 24 lb. to pick; if light, 8d. Gooseberries cost about 6d. per 28 lb. for gathering good average crops of, say, three tons per acre.

Mr. Newman allows a space of 5 feet between the rows for Gooseberries and Currants, and the same distance from bush to bush in the row; the plants being set square in all the rows, so as to admit of the horse-hoe or cultivator being run between them both ways (north and south, and east and west) in turn.

Other crops, such as Cabbage, Lettuce, and Cucumbers, as well as Vegetable-Marrows, are grown between the rows while the bushes are young and comparatively small. Two rows of Cucumbers (Stockwood) are grown between the rows of young Gooseberries and Currants, the seeds being drilled in; 5 to 6 lb. of seed being required to sow an acre. Mr. Newman grows four acres of Ridge Cucumbers, but he says it is the most uncertain of all outdoor crops, so much depending upon the weather during the plant's growth. The heaviest crop he has ever picked was six tons per acre. This fine crop was secured from plants growing in fairly deep soil, light in texture, and rendered rich by a liberal dressing of good farmyard manure. Sufficient rain fell in the earlier stages of the plant's growth, and there was high temperature. The plants were well established within two or three months from the time of sowing the seed (which was done in April).

Strawberries are grown in rows $2\frac{1}{2}$ feet asunder, and the plants are ploughed into the ground after three crops of fruit have been taken from them. This year the crops were magnificent in weight, and the size of the berries was good. Laxton's Noble and Sir Joseph Paxton are the only varieties grown.

Several acres of land are devoted to the growth of Cabbages, Savoys, Cauliflowers, Beans, Lettuces, &c., for supplying Southend and Stratford markets.

In addition to fruit and vegetable-growing, Mr. Newman grows 3 or 4 acres of Carrots and 6 acres of Cabbages for seed; and early in the present year he erected a cucumber-house, and from which he has taken two heavy crops of excellent fruit—that is, he exhausted one lot of plants, which he pulled up, and replaced with young plants, and with such satisfactory results, that he is now erecting a much larger house. Mr. Newman freely imparts his valuable experience to those practising, or about to practise, the same business. *H. W. Ward, Rayleigh.*

SOCIETIES.

MANCHESTER AND NORTH OF ENGLAND ORCHID.

SEPTEMBER 22.—Present: Mr. G. Shorland Ball, chairman; and Messrs. G. W. Law Schofield, J. Leemann, H. Greenwood, A. Warburton, W. Bolton, J. Cypher, R. Johnson, and T. Mills (Hon. Sec.).

First-class Certificates were awarded to *Laelia Cattleya* × *elegans* *Statteriana*, from THOS. STATTER, Esq., Whitefield (gr., Mr. Johnson), and to *Cattleya Hardyana*, from JOHN LEEMAN, Esq., Heaton Mersey (gr., Mr. Edge).

The following plants were recommended Awards of Merit:—*Cattleya granulosa aurea*, from THOS. STATTER, Esq.; *Cypripedium Marshallianum*, from H. GREENWOOD, Esq., Haslingden (gr., Mr. Gill); *Cattleya Gaskelliana*, from JNO. LEEMAN, Esq.; *Laelio-Cattleya* × *Nysa*, from R. ASHWORTH, Esq., Newchurch (gr., Mr. Pidsley); *Cattleya gigas*, from W. BOLTON, Esq., Wilderspool (gr., Mr. Cain); *Oncidium Forbesii* *superba* and *Phalanopsis Highburyensis*, from Mr. J. CYPHER, Cheltenham; *Laelio-Cattleya* × *intermedio-flava*, from Messrs. HUGH LOW & Co., Clapton, London; *Cattleya Massaiana*, High View var., and *Laelio-Cattleya* × *elegans* *Lawrenceana*, from Mr. KEELING, Bingley; *Oncidium incurvum album*, *Cattleya Eldorado alba*, and *Cypripedium* × *Lilian Greenwood*, from Messrs. CHARLESWORTH & Co., Bradford.

A Cultural Commendation was awarded to Messrs. CHARLESWORTH & Co., for *Oncidium incurvum album*, and Silver Medals to W. BOLTON, Esq., and JOHN LEEMAN, Esq., for groups of Orchids.

NATIONAL CHRYSANTHEMUM.

SEPTEMBER 25.—A meeting of the Floral Committee was held at the Royal Aquarium on the above date, Mr. THOMAS BEVAN presiding. The attendance was small.

Mr. W. WELLS, Earlswood, Redhill, had an early Japanese Chrysanthemum named *Crimson Pride*, the colour deep chestnut-crimson, with a brownish-buff reverse. Mr. Wells stated that the dozen or more blooms exhibited were cut from plants in the open air. The height of the plant is $2\frac{1}{2}$ to 3 feet. It was commended. Mr. Wells also had a second sport from the deep lilac *Gustave Grunewald*, rosy-salmon in colour, with a slight orange base, paling to yellow in the older flowers; but the committee thought it came too close to *Louis Imaire*, a sport also from *G. Grunewald*, recently certificated by the National Chrysanthemum Society and the Royal Horticultural Society.

Mr. J. H. WITTY, Nunhead Cemetery, sent some plants lifted from the open ground of a singularly dwarf early-flowering variety named *Norbet Purrez*, of a kind of reddish-salmon or coppery-red colour, very free and scarcely more than 12 inches in height. Mr. G. THRUSSELL, Fairmead Nursery, Cheshunt, sent *Yellow Queen*, a clear yellow sport from the white *Queen of the Earlies*, but it was not in good condition. Mr. H. J. JONES, Ryecroft Nursery, Lewisham, sent early-flowering Japanese *Soleil d'Octobre*, a pale yellow flower, with rather drooping broad florets, which failed to gain enough votes to secure an award as an exhibition variety for October. Mr. R. BURGIN, of St. Neot's, and Mr. R. PINCHES, Crown Street, Camberwell, both sent new designs in exhibition tubes, but the were regarded as no improvement upon those already in use.

DEVON AND EXETER GARDENERS'.

SEPTEMBER 28.—The annual meeting was held at the Guildhall on the above date.

The Committee, in their annual report, stated the papers dealt with during the autumn session included such subjects as, "The Qualifications and Duties of a Gardener," "How a Knowledge of Botany is a help to Gardening," "Pruning and the General Management of Fruit Trees," "Herbs, their Cultivation and Uses," and in one or two cases they were made more interesting by practical demonstrations. Following the friendly supper at Christmas, the spring session was opened with a paper entitled "Himalayan Rhododendrons." Then followed a valuable contribution on "Orchid Growing," also papers upon "Four years' experiments in the cultivation of vegetables with and without chemical manures," "Potatoes," "Variety in the Flower Garden," and "Summer Bedding." The summer excursion was to Endsleigh, near Tavistock, the seat of his Grace the Duke of Bedford. The Committee wished to place on record the kindness shown by the President (Mr. E. A. Sanders) and his Worship the Mayor of Exeter. The service rendered to the Association by the Mayor in granting the Council Chamber for the meetings was of the greatest value.

The Hon. Treasurer's report showed a balance in hand of £13 11s. 3d. Messrs. Hope and Mackay were re-elected Hon. Secretary and Treasurer respectively. The Chairman drew attention to the interesting programme of lectures arranged in connection with the Association for the autumn, and suggested that investigations should be made of the qualities and capabilities of different earths, and the plants which they best suited. He looked forward to the time when people would not be using cartload upon cartload of material, but simply the essential earth, &c., which different plants required.

The subjects for consideration during the coming autumn session are as follows:—"Flowers that Bloom in the Spring,"

by Mr. Andrew Hope; "Vine Culture," by Mr. George Lock, Newcombes Gardens; "Deciduous Trees," by Mr. F. Edwards, Honeylands Gardens; "Further Experiments with Chemical Manures applied to Garden Crops," by Mr. F. W. E. Shrivell, F.L.S., Thompson's Farm, Tonbridge, Kent; and "The Honey-Bee, and why it should interest Gardeners," by Col. Walker, Lee Ford, Budleigh Salterton.

WARGRAVE AND DISTRICT GARDENERS' IMPROVEMENT.

SEPTEMBER 28.—At the ordinary monthly meeting, held on the above date, Mr. W. H. Scott, gr. to Capt. COLERIDGE, Twyford, read a paper on "Tomatoes." Full cultural directions were given for raising this popular crop, in houses and out-of-doors. Boxes were recommended in preference to pots. The object in any case must be to keep the roots near the surface, and to get the largest amount of Tomatoes from the smallest amount of wood. The various diseases of the Tomato plant were referred to, and the best methods of treating them.

Mr. W. BAZELEY, nurseryman, Twyford, exhibited well-grown specimens of the following Tomatoes:—*May's Favourite*, Conference, Rochford's, and *Chemin Rouge*. Messrs. T. Haskett, W. Scott, and W. Bazeley were appointed judges for the ensuing month. Mr. W. Pope, gr. to J. P. WHITE, Esq., exhibited a fine collection of Crotons; and Mr. SCOTT was awarded a Certificate for a new *Cactus Dahlia*.

SEED TRADE.

THE LINCOLNSHIRE SEED CROPS.—Lincolnshire, Cambridgeshire, and Essex are among the leading counties in which seed growing is carried on upon a large scale. The rich fertile loam of the former county is well adapted to the purpose. Messrs. W. W. Johnson and Sons (Limited), of Boston, are large growers of seeds in the county of Lincoln, and on the occasion of a recent interview with Mr. Alfred Johnson we were able to glean some information, which, coupled with the conclusions arrived at from personal observation, enable a pretty accurate forecast to be made as to the probable yield of the seed season.

Peas.—This important crop suffered from the cold and treacherous weather which prevailed in May and June. Many of the blossoms fell before they became fully developed, and a large proportion of the pods were either sterile or contained but few Peas. The general crops are likely to be unusually light, the seeds small and dry, but of a good colour.

Broad Beans.—These show a good average crop, well harvested, the produce fine in colour, though smaller than usual in size. On the deep fertile Lincolnshire loams Beans are persistent, but the long-continued droughts told upon the crop, there being such an unusual scarcity of rain.

Brassicas, Cabbage, Kail, Broccoli, &c.—The average crop of these is a medium one, but the seed is of fine quality.

Carrot.—This crop, even in the holding soil of the county, has generally suffered from the drought, and the yield in bulk will prove disappointing.

Mustard.—Lincolnshire and Cambridgeshire are renowned for their plantations of Mustard, and when several acres are in full bloom the rich golden sheen of the blossoms is very striking. Large breadths of White Mustard have been harvested, and the crop is an average one, the seed small in grain but of good colour. Larger breadths of Brown Mustard have been grown than for some years past; the crops are generally good, and it is expected the samples will be of fine quality.

Rape.—But limited breadths of this were sown, but there is promise of a good yield.

Agricultural Root Seeds.—Of Swedish Turnips smaller breadths than is usual were grown, and early in the season the yield was promising, but early threshings prove that the crops are much smaller than was estimated. Of Turnips there was this season but a small breadth of the white-fleshed varieties, which gave promise of a moderate yield. Yellow-fleshed Turnips have done better than usual, and although but a limited breadth was planted for seed, there is the promise of a full average crop of good quality. Of Mangel Wurzel there was also a small breadth planted, and the yield is expected to be an average one. It is of fine quality owing to the crops having been harvested in good condition. *Pisum*.

[The term "accumulated temperature" indicates the aggregate amount, as well as the duration, of degrees of temperature above or below 42° Fahr. for the period named: and this combined result is expressed in Day-degrees—a "Day-degree" signifying 1° continued for twenty-four hours, or any other number of degrees for an inversely proportional number of hours.]

The districts indicated by number in the first column are the following:—

0, Scotland, N. Principal Wheat-producing Districts—1, Scotland, E.; 2, England, N.E.; 3, England, E.; 4, Midland Counties; 5, England, including London, S. Principal Grazing, &c., Districts—6, Scotland, W.; 7, England, N.W.; 8, England, S.W.; 9, Ireland, N.; 10, Ireland, S.; * Channel Islands.

THE PAST WEEK.

The following summary record of the weather throughout the British Islands for the week ending October 1, is furnished from the Meteorological Office:—

"The weather continued fine and dry during the earlier days of the period, but subsequently became decidedly unsettled, with heavy falls of rain in the west and north and in parts of southern England. In the east and south-east of England, however, the rainfall was again very slight, and at some stations almost entirely absent. By the end of the week the weather had again become fine and dry generally.

"The temperature was a little below the mean in most districts, but slightly above it in Ireland, as well as in 'Scotland, N.' and the 'Channel Islands.' The highest of the maxima occurred either on September 26 or October 1, and ranged from 69° in 'England, E. and S.W.,' to 61° in 'Scotland, W.' The lowest of the minima, which were also generally recorded on September 26, ranged from 29° in the 'Midland Counties,' and 32° in 'Scotland, E. and W.,' to 37° in 'England, N.W.' and 'Ireland, N.,' and to 49° in the 'Channel Islands.' Some sharp ground-frosts were experienced over the inland districts.

"The rainfall was again less than the mean in nearly all the English districts, but exceeded it in Ireland and Scotland, and also in 'England, S.' In 'Ireland, N.' the excess was very large. The rain on Thursday night was very heavy in the south locally. The greatest falls at any individual stations being 1.58 inches at Shaftesbury, 1.56 inches at Westbourne (Sussex), 1.13 inches at Hurst Castle, and 0.98 inch at Cranley.

"The bright sunshine again exceeded the mean over the greater part of the Kingdom, but was much below it in Scotland, and considerably below it in 'England, N.E.' The percentage of the possible duration ranged from 57 in the 'Channel Islands,' 47 in 'England, E.,' to 26 in 'England, N.E.,' and to between 19 and 13 in Scotland."

ENQUIRY.

"He that questioneth much shall learn much."—BACON.

Do wasps first attack ripe fruits, or do they merely do so after flies have made an opening for them? Do wasps or flies effect most injury upon fruits? T. B. S.

APPLES: H. Irish Peach for September, American Mother and Pine-apple Russet for October, Cox's Orange Pippin for November to Christmas.

BOOKS: Amateur. Your question is too vague to be answered definitely. *Nicholson's Dictionary of Gardening* is the most complete of its kind. It is in four volumes.—G. M. *Bulbs and Bulb Culture*, by D. T. Fish, published by L. Upcott Gill, London. The other work mentioned by you is out of date, and of little value.

GRAPES UNSATISFACTORY: R. F. We suspect the roots of the Vine have penetrated a cold or wet sub-soil, or that the border itself is not perfectly drained. You will do well to look to the roots during autumn, and bring them to the surface as much as possible, where they will be warmer, and in a more convenient condition for the appropriation of food given to them. Beyond providing a proper and nutriment medium for the roots, it is essential to the perfect colouring of Grapes that a dryish and fresh atmosphere be obtained in the house, by free ventilation. The necessary warmth can be maintained by the hot-water apparatus. From the specimens sent, we should not judge the Grape to be Black Alicante.

INSECT: P. H. *Sirex gigas*, the "Wood-wasp," or Giant Sirex. The female generally lays her eggs in Pine or Fir-trees that are past their prime, or from some reason are weak (see fig. 81).

FIG. 81.—SIREX GIGAS.

LAPAGERIAS SPOTTED: S. M. T. The flowers have apparently been injured by the puncture of thrips or other insect.

MANURES: W. H. *A Treatise on Manures*, by A. B. Griffith (Whittaker & Co.). We do not know the price—a few shillings, probably. Most of the books on gardening have a chapter on the subject, and they will probably be more useful to you than any special book.

NAMES OF FRUITS.—Applications to name fruits are so numerous at this season, as seriously to hamper us in the exercise of our editorial duties. They entail an expenditure of time, labour, and money, of which our readers can have little idea. We are most desirous to oblige our correspondents as far as we can, but we must request that they will observe the rule that not more than six varieties be sent at any one time. The specimens must be good ones, just approaching ripeness, and they should be properly numbered, and carefully packed. We do not undertake to send answers through the post, or to return fruits. Fruits and plants must not be sent in the same box. Delay in any case is unavoidable.

—T. F. W. The box containing your Pear was quite smashed. You are correct in regard to the name of plant. The J. should have been T.—R. K. 1, Cox's Orange Pippin; 2, Stirling Castle.—P. C. P. Apple, Landsberger Reinette.—Rogers Brothers. Your seedling Apple appears to be New Hawthornden.—J. J. & Co. 1, Beurré Clairgeau; 2, Duchesse d'Angoulême; 3, Vicar of Winkfield; 4, Beurré Diel; 5, Beurré Bosco; 6, Comte de Lamy.—John Kitney. 1, Alfriston; 2, Queen Caroline.—Cecil H. Perceval. 1, Scarlet Nonpareil; 2, Norfolk Beefing; 3, Dumelow's Seedling; 5, Cockpit; 6, Col. Vaughan.—J. L. Newfield. 1, Cox's Pomona; 2, Alfriston; 3, Hawthornden; 4, Brabant Belle-

fleur; 5, Reinette de Caux; 6, Court of Wick.—W. Chambers. 1, Ecklinville Seedling; 2, Pott's Seedling.—W. Watt, Cupar. 1, Cellini; 2, Court Pendu Plat.—M. W. M. 1, Souvenir du Congrès; 2, not sure of; 3, Easter Beurré; 4, Beurré Diel.—W. Tee, Greenhill. 1, Mabbot's Pearmain; 2, not known; 3, Cellini; 4, Cox's Pomona; 5, Pott's Seedling; 6, Dumelow's Seedling.—H. Kent. 1, Cellini; 2, Cox's Pomona; 3, Scarlet Nonpareil; 4, Gloria Mundi; 5, Cellini; 6, Warner's King.—J. Humphries. 1, Cellini; 2, Gloria Mundi; 3, Not known; 4, Warner's King; 6, Blenheim Orange.

NAMES OF PLANTS: Correspondents not answered in this issue are requested to be so good as to consult the following number.—J. F. 1, *Dactylis glomerata variegata*; 2, *Geranium sanguineum*; 3, one of the greenhouse *Rhododendrons*, garden variety; 4, *Oenothera Youngi*; 5, *Chrysanthemum uliginosum*; 5A, *Helianthus rigidus*.—J. A. 1, *Juniperus recurva*; 2, *Cupressus Lawsoniana*; 3, *Cupressus nootkatensis variegata*. Apples, next week.—F. W. *Catasetum macrocarpum*.—W. T. *Davallia (Microlepia) platyphylla*.—W. P. *Juniperus sinensis*.—A. S. *Benthamia fragifera*.—L. G. R. 1, *Trachelium coeruleum*; 3, *Asparagus officinalis*; 6, one of the seedling *Veronicas*—perhaps *Ander-sonii*; others not enclosed.

NEMATOID WORMS: R. W. D. There are no such worms either in the leaves or on the roots. What you see are minute insects (Julus and mites), which feed on decaying vegetable matter. The appearance of the roots of the Vines is suggestive that the border is not properly drained.

ROYAL GARDENERS' ORPHAN FUND: D. N. Subscribers of 5s. annually are entitled to one vote at each election. A copy of the list and voting papers are sent to each person entitled to vote, at least fourteen days before the day of election. Subscriptions should be sent to Mr. A. F. Barron, secretary, Chiswick, London. It is a most deserving institution, and worthy of every support.

SEEDLING OAKS AS TABLE-PLANTS: Miss L. D. P. Take the plants up carefully, and pot them into 5-in. pots. Two or even three may be put in each pot. Almost any kind of loam mixed with a little leaf mould will answer. Shade the plants after transplantation, and next season when growth has recommenced, remove the tips of the shoots by pinching, so as to induce a shrubby habit. Unless you have a particular reason for utilizing them for the ornamentation of the dinner-table, we can hardly recommend seedling Oaks as peculiarly suited to the purpose.

TWIN APPLES: G. M. Not at all uncommon in flowers and fruits generally. It arises from the union of two flower-buds in a very early stage of development.

YOUR VINES WON'T SET: X. Smear the foot-stalks of the bunches with honey. In other words, attract the insects. This would demand so much labour and time as to be impracticable, you say. Would not thinning take up more?

CONTINUED LARGE INCREASE in the CIRCULATION of the "GARDENERS' CHRONICLE."

Important to Advertisers.—The Publisher has the satisfaction of announcing that the circulation of the "Gardeners' Chronicle" has, since the reduction in the price of the paper,

MORE THAN DOUBLED, and that it continues to increase weekly.

Advertisers are reminded that the "Chronicle" circulates among COUNTRY GENTLEMEN, AND ALL CLASSES OF GARDENERS AND GARDEN-LOVERS at home, that it has a specially large FOREIGN AND COLONIAL CIRCULATION, and that it is preserved for reference in all the principal Libraries.

THE

Gardeners' Chronicle.

SATURDAY, OCTOBER 15, 1898.

TURIN.

ONE of the chief attractions of Turin is, perhaps, the fact that it is one of the few continental places in which it is not easy to lose one's self, all the streets running at right angles. The place is less picturesque than the majority of foreign cities of ancient origin; but the person whose "bump" of locality is only imperfectly developed will regard this "disadvantage" with the most perfect equanimity. The National Exhibition, which opened in May, and closes this month, has attracted many thousands of visitors to this, the capital of Piedmont. The horticultural aspect of the exhibition is, perhaps, one of its weakest points, although there is a committee of "Orticoltura, Floricoltura, and Frutticoltura." Minor exhibitions have been held, notably the *primaverile*, from May 14 to 26, and the autumnal display of fruit, flowers, and ornamental plants, from September 18 to 29; whilst the Esposizione Generale itself will, so to speak, expire in a horticultural blaze, in which Chrysanthemums will be the leading feature. This show will open on October 22, and close on October 29, the two principal prizes being a Gold Medal and 200 lire for the best, and a Silver Medal for the second-best exhibit of not fewer than 150 varieties of Chrysanthemums, in *grandissimo fiore*. From the number of Silver Medals offered for Chrysanthemum exhibits, it is quite clear that this popular autumnal plant has become a favourite with the Italians, but not yet to anything like the same extent as in England. The Italian nurserymen devote a good deal of attention to its cultivation and propagation, and some good varieties have been raised, but so far the English and French varieties predominate in the descriptive catalogues.

The Esposizione is enclosed within the walls of the spacious *giardino pubblico*, which extends from the suspension-bridge at the bottom of the Corso Vittorio Emanuele II. to the Valentino Palace, just as the Great Exhibition of 1851 was contained in Hyde Park. Il Castello del Valentino crowns one of the most picturesque views to be found anywhere in the suburbs of Turin, and the whole place is singularly fitted for exhibition purposes; the castle itself has a long and varied history, the present turreted building dates from the seventeenth century, and is now occupied by the Polytechnic School. Much good taste has been displayed in laying out this new public garden, whilst Nature has been so prodigal in her gifts of soil and situation by this charming resort on the banks of the Po, that the gardener's aid is rendered almost a superfluity. Here Bamboos grow like weeds, and Fig trees rapidly attain to very large propor-

tions. A small and apparently permanent exhibit of Signor G. B. Marsano, of Nervi, near Genoa, in one of the beds, comprises a number of extremely healthy Palms, but even more noteworthy than these are some splendid specimens of the variegated form of *Phormium tenax*, of which two plants were on the point of bursting into flower at the time of the present writer's visit early in August.

The small and unpretentious Botanic Garden is in reality a continuation of the new public gardens, from which it is separated by a wall. Its collection of Cacti is very large, and may be described as one of the chief features of the place. The specimen of *Cereus senilis* is quite 5 feet high; *Cereus peruvianus* var. *monstrosus* is probably one of the oldest plants in Europe; *C. validus* has attained to quite 10 feet in height; whilst very fine specimens of *C. Bonplandi*, *C. caesi*, *C. coerulescens*, *C. pernambucensis*, may be specially mentioned, not only because they are to be seen here in all their native vigour, but because they are species very rarely met with outside botanic gardens in England. Palms also grow with great rapidity, and require little or no attention, the more noteworthy specimens being *Chamaerops staurocantha*, and *Latania borbonica*. The Cycads and Musads are chiefly remarkable on account of a stately specimen of *Ravenala madagascariensis*, *Encephalartos horridus*, and a beautiful plant of *Ceratozamia robusta*. *Pothos crassinervis*, with a fine head of red fruit, and *Sansevieria zebrina*, are also, from various points of view, of considerable interest; whilst *Peperomia resedæflora* makes a very effective show with its little heads of white flowers.

Funkias thrive like weeds, the species grown including *F. lancifolia*, *ovata*, *Sieboldiana*, and *subcordata*. There are graceful tufts of *Stipa splendens*, which grow to quite 4 feet in height; *S. capillaris*, *Andropogon*, *Sorghum*, *Cyperus papyrus*, and *Panicum miliaceum*. Indeed, the Gramineæ are quite a feature at the Turin Botanic Garden, quite a large space being devoted to the various genera. Of the Filices, special mention may be made of a very fine specimen plant of *Alsophila australis*, quite 15 feet high; *Cyathea insignis*—both these plants, owing to imperfect shading, are very badly sun-burnt; *Pteris laciniata*, and *Aspidium nidus*. An unusually fine specimen-plant of *Metrosideros albicans* may be specially mentioned. Cannas in great variety give a brilliancy and colouring to the chief entrance of the garden—a pleasant first impression which a mere stroll round does not by any means fully maintain. If appearances go for anything, botany as a science is rather at a discount at Turin, for the botanic garden is in a sad state of decline and dilapidation. The glass-houses are slowly crumbling away, disused hot-water pipes and other materials are "planted" in various parts of the place, perhaps in the hope that they may raise, or develop, into something novel in the way of botanical specimens! But the most serious defect is in the matter of shading: the sun blazes down with pitiless force for so many months in the year at Turin, that shading ought to be a consideration of the highest importance. It does not seem to be, however, consequently many fine specimen-plants are absolutely ruined; many of the Palms, too, are thickly covered with dust and dirt—in fact, they badly want washing.

At Milan, as at Turin, the Botanical Garden is a much neglected institution. It is, perhaps, another instance of the irony of fate, for the earliest private botanic garden was formed at

Padua by Gaspar de Gabrieli, a wealthy Tuscan noble, in 1525; and the first public botanic garden was instituted at the same place by the Venetian Senate in 1543. This place is still in existence, and is interesting as containing "some of the oldest specimens of exotic trees and plants now common in Europe, the patriarchs of our shrubberies, plantations, and conservatories." As early as 1581, this garden contained 400 different species. Other botanic gardens followed in rapid succession, until every city had its *orto botanico*, most of which are still in existence, but many of which are in anything but a flourishing condition. The exhausted state of the country, from a financial point of view, is doubtless one of the primary reasons for this neglect. The Italians sometimes say that they were happier when they were worse off; or, in other words, that the country was much more flourishing when under the "yoke" of the Austrians than it has been since the whole country has been united under one king. Certainly, the unification has not been an unmixed blessing for botanical gardens.

If a little of that "fierce light" which beats around the doings of the committees responsible for public gardens could be brought to bear on those who have the care of the *orto botanico*, a very rapid change would come over the scene! Within a short walk of the Botanic Garden is the Central Railway Station, and this immediately faces the Piazza Carlo Felice, in which gardening is to be seen at the highest possible point of perfection. The area is probably not more than an acre or so, but the effect of the whole reflects very great credit on the gardener in charge. In spite of the extremely hot summer, the grass is as green as it is possible to be, and as well kept as a billiard-table. It may be urged that this kind of gardening is perfectly easy, given plenty of water and constant mowing. But it frequently happens that the most obvious and easiest means for producing good lawns, are just those which are neglected. This Piazza is the centre of perhaps the busiest part of Turin, and yet the outer world is almost completely shut out by the fine trees and healthy shrubs. There are several fine Magnolias, notably *M. macrophylla*; a variety of Maples, especially *Acer japonicum laciniatum*; also, *A. palmatifidum marginatum* and *atro-purpureum*—but both the latter are small plants, and not very robust; possibly they were only planted in the spring, and the great heat may have retarded their growth. The Beeches include a fine plant of a variety described as *Fagus silvatica purpurea*. There is a most beautiful plant of *Sophora japonica pendula*, one of the most graceful trees obtained from Japan; *Araucaria excelsa* also flourishes well; whilst the graceful *Betula nana laciniata* entirely belies its specific name, inasmuch as a specimen-tree here has attained to a height of 40 feet or more. There are a few small beds gay with Phlox, Dianthus, Begonias, blue Aquilegia, some fine clumps of yellow-flowered Cannas, and a number of Dahlias planted singly in small beds, and edged round with *Coleus* in variety. Altogether, the Piazza Carlo Felice is a perfect "little dream" of a place.

In a direct line from the Piazza Carlo Felice is the Piazza Castello, with the curious, old-world Palazzo Madama in its centre, one of the few ancient buildings now standing in Turin, dating from the latter part of the thirteenth century. The Palazzo is partly covered with Ivy, and a portion of it is railed off, and trees have been planted where at one time a moat probably existed; these trees are

of quite recent introduction, and are a great acquisition. In the few yards of earth between the trees and the railings, Cannas, Marigolds, and double Zinnias, are allowed to flourish at their own sweet will.

A glance through the flower-market—or, rather, the open-air market—of which flowers and potted plants form one of many very miscellaneous features, is not without interest. There is a very marked preponderance of small plants of various sorts of Palms in pots for decorative and window purposes. The ordinary Fig is extensively cultivated as a pot-plant, and, when well trained, it is distinctly ornamental; Caladiums, a Banana (*Musa Ensete*), Chrysanthemums and Pelargoniums are among the plants most generally cultivated for market garden purposes. The Italian love for flowers is unquestionably deep-rooted—it may be said to amount to a passion. They are especially in evidence at public functions, for which the French and Italians have an especial liking, and in which they perhaps excel all other nations. One historian tells us that “favourite princes and generals are received into towns, and even villages, through triumphal arches decorated with flowers; and the ground is also sometimes strewn with them. The lives of Bonaparte, Murat, and Beauharnais afford many examples.” The truth compels the present writer to admit that the triumphal arches erected at the Turin Exhibition were decorated with paper flowers, a fact which, while serving to prove the Italian love for flowers, may be taken more as a proof of their economy than of their taste! A very large trade is done in pots and boxes of Orange-trees, Oleanders, Myrtles, Pomegranates, Sweet Bays, and similar plants, all of which require very little culture, and not much attention, and scarcely any persons are so poor but that they can afford to have some kind of floral decoration in their rooms.

So far as nurseries in the North of Italy are concerned, they are comparatively few, and rarely extend beyond an acre or so. The Italian nurserymen confine their attention largely to producing plants, for which there is always a ready and sure sale. The capital invested in one of the great London firms of nurserymen would probably purchase the stock and goodwill of all the nurseries in Italy put together, and possibly there would then be left a very fair amount for working expenses. *W. Roberts.*

NEW OR NOTEWORTHY PLANTS.

LIGUSTRUM WALKERI (DECAISNE).*

This species is a native of Ceylon, and is remarkable for its pretty foliage (fig. 82). It was shown by Messrs. Paul & Son at one of the recent meetings of the Royal Horticultural Society, and received an award. It is not likely to be hardy in this country. The description in the appended note is taken from Trimen's *Handbook to the Flora of Ceylon*.

* *Ligustrum Walkeri*, Decaisne, *Nouv. Arch. Mus.*, Ser. 2, 11, 27 (1879).—A shrub or small tree, branchlets with copious white lenticels, young parts glabrous; leaves $1\frac{1}{2}$ to 3 in., oval or lanceolate, acute at base, tapering to very acute apex, entire, glabrous, often somewhat conduplicate, thin; lat. veins obscure, petiole short; flowers very numerous, pedicellate, in clusters on the divaricate branches of large pubescent, pyramidal, erect, terminal panicles 4 to 6 in. long; cal. campanulate, lobes very shallow and broad; cor.-lobes oblong-oval, subacute; stam. exserted; drupe about $\frac{1}{2}$ in., ovoid, purple.

Lower mountain zone, 3000 to 5000 feet, rather rare. Haputale and Badulla districts abundant. Fl. Feb. to June; white, sweet-scented. Also in the Nilgiris.

Closely allied to *L. robustum*, Bl., of the Malay Peninsula, Burma, and E. Bengal, and perhaps merely a variety of it.

ORCHID NOTES AND GLEANINGS.

AGANISIA CÆRULEA.

THIS plant, which was described by Reichenbach in our columns, 1876, p. 226, is figured in a recent number of the *Revue Horticole*. The racemes are pendulous, and bear flattish flowers about 5 cent. (2 inches) across. The perianth segments are obovate spatulate, of a pure cœrulean blue as represented, the projecting three-lobed lip being chocolate-brown, edged with yellow. The column is provided with two wings of a similar colour.

FIG. 82.—LIGUSTRUM WALKERI.

ONCIDIUM INCURVUM ALBUM.

A fine plant of this elegant and rare white Oncidium is flowering in the collection of R. I. Measures, Esq., Cambridge Lodge, Camberwell (gr., Mr. H. J. Chapman). The plant bears four spikes, the two already bearing expanded flowers being 5 feet in length, and gracefully displaying their numerous flowers on many branches.

Oncidium ornithorhynchum album, also a very rare albino, in the same collection, is in splendid condition, and sending up fifteen flower-spikes, with flowers about to expand. Many other rare species and hybrids are about to flower, and the whole collec-

tion, despite the long spell of hot, dry weather, is in excellent condition. The fine collection of *Masdevallias* is one of the most complete in cultivation, and contains a large number of the dwarf and frail species.

CATTLEYA × HARDYANA MRS. C. E. CHRIMES.

A flower of this handsome and distinct variety is sent by Mr. Mark Watts, gardener to C. E. Chrimes, Esq., Selwood, Rotherham, the home of the fine collection of the late G. D. Owen, Esq., formed also under the care of Mr. Watts. The sepals and petals have their bases and mid-rib pure white, the remaining portions bright-rose coloured. The lip is Roman

red at the base, with yellow veining, which passes into the bright-yellow colouring on each side of the middle area. The front lobe, which is broad, and finely crimped, is of a rich, dark, rosy-crimson, and differing in colour from most of the other varieties, though probably nearest to that figured in the *Lindenia*, x., p. 75, as *C. × H. Lindeni*. It is a fortunate acquisition, flowering out of a small lot bought as *Cattleya aurea*, from Messrs. Charlesworth & Co., of Bradford.

ONCIDIUM FLEXUOSUM.

This, one of the oldest species in cultivation, having been introduced from Brazil by Messrs. Loddiges

nearly eighty years ago. It is still one of the most elegant. In the earlier days of Orchid exhibiting, large specimens of it often formed the most attractive feature in the collections shown. Later, our old friend got slighted, to allow of the advance of often less beautiful but newer kinds; but again, of late years, the keen perception of the grower of flowers for decorative purposes and for cutting, has re-established it in favour. It is pleasant to get an elegant inflorescence bearing fine rich yellow flowers from Mr. J. G. Wilson, The Gardens, Isle of Rum, Inner Hebrides, as it not only displays a worthy subject, but serves to demonstrate the wide range of Orchids under cultivation, and that they are not confined to the cities and busy haunts of men.

LÆLIO-CATTLEYA × EXONIENSIS.

While all admit that this is still one of the finest, as well as one of the oldest, garden hybrid Orchids,

Lælia crispa was one of the parents. It is doubtful whether *Cattleya labiata* or its variety *Mossiae* was the other. This must remain an open question until another batch of the hybrid duly recorded is raised. It is a beautiful, fragrant and showy flower, coming in at various seasons, but generally late in the year, and a fresh raising of it would be appreciated by lovers of good Orchids. J. O'B.

"LINDENIA."—In the last number of the *Lindenia* we find coloured representations of various forms of the following:—

LÆLIA PRÆSTANS and *PUMILA*, t. DCXXV. to DCXXVII, including a pure white form "candida" of Linden, "amabilis," Linden, white, with the anterior lobe of the lip flushed with pale lilac, and with three parallel stripes of the same or somewhat deeper colour. At the same time M. Linden avails himself of the opportunity to give a summary of the history of the various forms.

ODONTOGLOSSUM VIGERIANUM ×, t. DCXXVIII, is supposed to be a natural hybrid between *crispum* and some other species not identified. The segments are narrow, white,

the different varieties of *Roses* have been mentioned as being specially worthy of note in the reports published by the *Gardeners' Chronicle* of the two most recent exhibitions at the Crystal Palace. For this purpose I have prepared the following list, which, however, does not include the garden varieties:—

Variety.	1897.	1898.	Variety.	1897.	1898.

FIG. 83.—AN AGED CHESTNUT, KNOWN AS "JUMBO-TREE," IN THE GARDENS AT EAST SUTTON PARK. (SEE P. 284.)

there has been from the first considerable difference of opinion about its parentage. It was raised by Dominy for Messrs. Jas. Veitch & Sons, and noted by the late Professor Reichenbach in the *Gardeners' Chronicle*, 1867, p. 1144. Two hypotheses were suggested as to the parentage, of which there was no record. The one was *Cattleya labiata* Mossiæ × *Lælia purpurata*, and the other *Lælia crispa* × *L. purpurata*. The latter suggestion has been disproved by the L. × *splendens*, raised in the gardens of C. L. N. Ingram, Esq., and also by Messrs. Jas. Veitch & Sons, while the former suggestion is settled by L.-C. × *Canhamiana* and L.-C. × *Canhamiæ*, both raised by Messrs. Veitch.

A flower received from Mr. Wagstaffe, Cluses Hall Gardens, Gisburne, Clitheroe, gives an opportunity of examining the pollinia, and that test proves conclusively that it is a *Lælio-Cattleya*; while the peculiarly elongated and crimped lip tells plainly that

much undulated, and heavily blotched with purplish-brown. The disc of the lip is yellow, with raised lines at the base.

CYPRIPEDIUM NIOBEX.—A hybrid between *C. Spicerianum* and *C. Fairrieanum*. The standard is large, white, with purple lines; the petals deflexed, wavy at the edge, with lines and spots of violet and a smooth, bucket-shaped lip; t. DCXXIX.

ODONTOGLOSSUM PESCATOREI VAR. *ROI LEOPOLD*.—A beautiful form, with broad, pointed segments, marked near the tip with large purplish blotches; lip small, anterior lobe cordate, rounded sharply, pointed, white, with short, radiating, violet lines at the base; t. DCXXX.

CATTLEYA TRIANÆI VAR. *SAMYANA*, t. DCXXXI.
LÆLIA ANCEPS VAR. *BALLANTINEANA*, t. DCXXXII.

THE ROSARY.

ROSES AT THE CRYSTAL PALACE.

It may be interesting to some of your numerous readers, writes Mr. Ernest Bewley, of Rathmines, Dublin, to be able at a glance to see how frequently

ROUND MAIDSTONE.

(Concluded from p. 276.)

EAST SUTTON PARK.—This estate lies about seven miles to the south-east of Maidstone; but if the nearest railway-station must be reached, it is necessary to travel from Maidstone up to Paddock Wood, and thence to the little station of Headcorn. From Headcorn, East Sutton is distant about four miles, and in driving this distance the scenery is not specially remarkable, being very similar to that which characterises the greater part of the Weald of Kent. If the scenery was uninteresting, however, our attention was excited by the remarkable cottages that sparsely furnish a short length of the road. They are constructed for the most part of timber, and their picturesque appearance is now uncommon, even in the most rural districts of rural Kent. There were others of more modern build, but most of these could boast of none other than the ground-floor. The hedges are chiefly of Whitethorn, and

on September 23 they bore an unusually plentiful crop of the fast reddening "braes."

The residence of East Sutton Park can be seen nearly the whole distance from the station. It lies just below the extreme top of the hill, on the same ridge that Linton Park is situate upon. The district around is very largely given to Hop-growing, and there is a "garden" of them immediately to the rear of the residence.

East Sutton Park is tenanted by T. Oliverson, Esq., and a charming little place it is. From the front of the plain-looking house there is a most extensive view over the Weald. The South-Eastern trains can be watched clearly for several miles on their way from Tonbridge to Ashford. Far beyond can be distinguished the Sussex hills, thirty miles away, and it is even said that the motion of the waves in the Channel, in the direction of Dungeness, is reflected on a clear day upon the sky.

The larger vegetation of the district does not appear so fine as at Linton. The timber trees are by no means large, if we except some old Chestnuts, to which reference will presently be made. Even the Oak is stunted, and most of the specimens have lost their leaders whilst young. Had more planting been done, especially of Conifers and other evergreen species, it would have given to the pleasure-grounds a feature they now lack, and would have prevented a certain amount of bareness. The ground slopes away very steeply from the front of the house; and at a much lower level, but only a short distance from it, are about six acres of water, which are surrounded by pheasant and other game preserves.

At the back, and higher than the residence, are the only specimens of large timber that we saw. These old Spanish Chestnut-trees are indeed remarkable. It would be difficult to compute their age, but they are very old, and though still alive even almost to the tips, it is evident that they are gradually dying. The boles of several of them are exceedingly pretty, and one in particular. At 5 feet from the ground this one measured 20 feet in circumference. It is clean and straight for some distance up, and the cracks in the bark are as attractive as the finest carving could be. Its neighbour is very different, and has been broken about. One of its limbs, when seen only a short distance away, bears a striking resemblance to an elephant's trunk, and it is known as "Jumbo-tree." This has been photographed (see fig. 83, p. 283), so that our readers may form their own opinion upon it.

THE KITCHEN AND FRUIT GARDENS, &c.

For the past six years or more the gardens have been in the charge of Mr. J. Lewis, who removed here from Leeds Castle in the same county. The methods by which he has increased the utility of the fruit and plant houses, without incurring the expense that the substitution of new ones for them would have entailed, proves him to be a gardener of much ingenuity.

The kitchen-garden is in two portions, and together the area is about three-and-a-half acres. The crops generally were looking as well as could be expected in the midst of such a drought as the district has not known for many years. Much has already been written about the effects of this drought, and we will not prolong the unpleasant topic, but never did we more painfully and fully see its effects than in the pleasure-grounds and park at East Sutton. It is useless to speak of watering, when the quantity requisite even for plants in pots is begrudged.

As in most Kentish gardens, the fruit-trees form an important feature of the kitchen-garden. Many of the bush-trees were removed during last planting season, with a view to replacing them with espaliers, this form of tree being thought to be more in character with the part of the kitchen garden nearest to the house. That these large trees are now looking so well is an indication that great care was taken when removing them. The espalier-trees in this and many other gardens in the county are trained to stout upright stakes, and not to a fence, arch, or other permanent structure. The system appears to answer well. Even

the little horizontal cordons, in an ordinary season, bear splendid crops of fruit. There were capital crops upon some of the Apple-trees even this season, and particularly of the varieties King of the Pippins, Bess Pool, Court Pendu Plat, and Peasgood's Non-such. Mère de Ménage, poor generally this season, was no better at East Sutton, and Lord Derby was also indifferent.

On the garden-walls were trees of the choicest fruits only, Peaches, Nectarines, Plums, Figs, &c. But how greatly were the Peach-trees suffering from —. Try as one will it is almost impossible to avoid repeated allusion to the water-famine. All out-of-door plants show its deadly effects, and it enters into and pre-occupies our thoughts the moment they wander back to garden scenes we would describe.

In the glass-houses there is not this trouble. One of the first we entered has a three-quarter span-roof, it has been so made from an ugly pit. In the spring it now affords a crop of Tomatos; in late summer a crop of Melons, and afterwards miscellaneous plants are housed in it. Besides excellent tuberous-rooted Begonias, mention may be made of a batch of finely-grown plants of Euphorbia jacquiniæflora, and several bright, highly-coloured Codæums. These latter plants are cultivated capitally. Another house is almost filled with them, and such specimens as we saw of the varieties Her Majesty, Morti, gracilis, Chelsoni, &c., are not often excelled in point of decorative quality. In other houses there were capital crops of Melons. The heaviest fruit of the season, Mr. Lewis informed us, was one of Windsor Castle, that weighed 7 lb. 13 oz.

In a comparatively narrow case against the wall was a very heavy crop of Tomatos, planted at 14 in. apart, at the front of the house. They ran about 7 feet high, and bore fruits from bottom to top. Of many varieties grown, the best were declared to be Conference, and a solid, rather large-fruited Perfection type variety, known locally as Barham Court. Some excellent young Peach-trees were grown against the back wall of this house.

The vineries have been converted from lean-to structures to three-quarter spans, and in all of them were good general crops of Grapes; but some of the Vines are aged, and require to be replaced with fresh ones.

The greenhouses were gay with summer and autumn-flowering plants in much variety. Evidently Mr. Lewis is intent upon making the gardens as satisfactory as possible. R. H. P.

GLEANINGS FROM KEW.

LATE ROSES.—Among the numerous Rose-beds at Kew the following are still in beauty: Grace Darling, Viscountess Folkestone, Augustine Guinoisseau, Madame Lambard, and Camoens.

Helmholtzia glaberrima.—This is a plant unknown out of botanic gardens. Nevertheless, its bold foliage resembling somewhat that of the New Zealand Flax (Phormium), and its tall, much-branched, many-flowered panicles of ivory-coloured blossoms, render it an ornamental plant of very high merit. The construction of the flower is also so curious as to interest the botanist. It is in flower in the temperate house for many months of the year.

Amaryllis Belladonna.—Rows of this fine bulbous plant are planted in narrow borders by the side of the Aroid-house, and other houses at Kew. A magnificent form is elsewhere described as A. Belladonna var. Kewensis. The flowers are of a lovely shade of rose-pink, but the absence of foliage is a defect that might perhaps be obviated by a background of small-leaved Euonymus or other dark-leaved shrub planted so as to cover the wall.

Polygonum lanigerum.—A bed of this is very effective. It is a perennial 4 to 5 feet high, with broadly lanceolate, recurved, silvery leaves. It has not suffered from the effects of the drought.

Early Chrysanthemum "Frécocité" is very useful as an edging to herbaceous borders, being of dwarf habit, and bearing a profusion of small flower-heads, maroon on the outer florets, clear yellow in the centre.

The China Aster.—The wild, single form of this has already been mentioned in these columns, but its beauty and utility are such that we desire again to bring it under the notice of our readers. At Kew this year it has been, and still is, very beautiful.

Silene Fortunei is the name of a newly-introduced Chinese species from Tschen Se, now in flower at Kew. It will shortly be described and figured in the *Botanical Magazine*, a circumstance which precludes the necessity of saying more than that it resembles a large form of the Nottingham Catch-fly, but with lacinate petals.

Dianthus sinensis is now in flower. It is specially interesting as the starting-point of Dianthus Heddewigii and other garden forms.

Nicotiana sylvestris is a tall-growing species of Tobacco, with pure white flowers of much beauty. It is now in flower, as is also N. Bigelovii, another white-flowered species, whose blossoms expand at night, covering the plant with a sheet of bloom.

Statice sinensis is a species with silvery calyces and yellow corollas. It is unlike the other cultivated species, and will, we believe, shortly be figured in the *Botanical Magazine*.

Didiera mirabilis.—Among the most treasured plants is a small but thriving specimen of the very curious plant figured in our columns, February 19, 1898, p. 110.

Dendromecon rigidum, a shrub with linear, oblong acute, glaucous-leaves and yellow flowers; when seen from a distance resembles Rosa berberidifolia, or some Cistus. Closer inspection reveals its affinity with the Poppies. It is now in flower in one of the borders outside the economic-house at Kew.

Rudbeckia speciosa.—A bed of this plant commonly but erroneously known as R. Newmanni is very effective just now, the large yellow flowers with dark purple centres being very conspicuous.

The Tree Tomato.—In the new wing of the Temperate-house at Kew is a fine plant—tree rather, of Cyphomandra betacea, with numerous pendent clusters of ovoid red fruit, each as big as a hen's egg, said to be of good flavour.

Diospyros Kaki is fruiting in the succulent-house at Kew. Though the foliage has nearly all fallen, the handsome orange-red fruits are very attractive. They should be thoroughly "bletted" before eating.

CHRYSANTHEMUMS.

CULTURAL NOTES.—The month of October is always a busy season for the cultivator of Chrysanthemums, and his anxious moments are increased if he intends to exhibit the blooms. It cannot be said that the exhibition of Chrysanthemums in any form is on the wane, though many would have had to believe ten years ago that such was the case. The plants should be safely housed by this date. Vineries where the crop has been gathered and otherwise have so often to accommodate the Chrysanthemums that much difficulty is experienced in providing the necessary amount of light and air. This difficulty is increased when the vinery is full of late-keeping Grapes. In this case too much moisture is detrimental to the Grapes when once they are thoroughly ripened, and too much heat and too little air are all against the free and perfect development of the Chrysanthemum blooms.

Where the Vines are cleared of their crop, the removal of surplus lateral growth, or even the shortening of the bearing shoots, does no harm to the Vines, providing maturity of the wood is assured. It is pitiable to see a well-grown collection of Chrysanthemums, with weakened peduncles, increasing in length owing solely to the lack of light after housing. Even in Peach-houses this difficulty is often present. In this case, as many of the leaves as can be spared from the Peach-trees must be removed.

Cultivators should take note of the progress made by the peduncles, as much depends upon the state of this portion of the plant; save there are varieties with exceptionally weak peduncles that do produce good blooms, but such instances are rare. As a rule, varieties of the Japanese section have stout peduncles.

not always of great length; some are extremely short, yet stocky when under favourable circumstances. An important point about the growth of the plants at this stage is that of overcrowding the plants. If they are standing too thickly, there is sure to result an early and premature loss of foliage. This cannot be other than detrimental to the future development of the blooms. The leaves may fall through overcrowding or over watering the plants when housed. Cultivators do not consider the difference in the evaporation of moisture when the plants are out-of-doors, and that when they are under glass. The plants require water twice daily in August, but at the end of October not more than twice each week.

If it be a question of housing 200 plants in a space only large enough for 150, it would amply repay the cultivator to retain the smaller number only. Much care is necessary at this stage of the development of the blooms to supply stimulative food in the right manner, and of the correct nature. Experienced cultivators would not give strong doses of nitrate of

the roots for development of the blooms should be done carefully, and that in doses weak and often. Some writers say, when the colour of the petals is visible, all stimulating food should cease. My experience is that this is a time when aid is judiciously needed. Shade is a necessity to the plants during the time the blooms are expanding. Many blooms are injured in the absence of it, especially if several dull days follow each other. Tiffany or scrim-canvas upon rollers, run up and down according to requirement, is the best means of affording shade, although recourse has to be had sometimes to more primitive methods, such as the use of lime, summer-cloud, and even a mixture of clay and water put on the glass from the outside. It is a mistake to make the shade too dense, as the expanding blooms lose much of their natural colour under such conditions, and in close competition this is an important element.

Free ventilation must be given the plants, avoiding a direct draught, especially when the wind is from the east, and the blooms are three parts expanded or

a fine specimen, but suddenly upon a close inspection several brown specks resembling dust in appearance, are plainly seen. In a short time, the next day perhaps, it will be found that the dust-looking specks have increased considerably, quite half the florets being attacked in the same manner. After the lapse of a few days the damping has spread so rapidly that large holes can be seen in them, and if this continues for a few days the bloom is entirely spoiled.

Unslaked lime in an open vessel placed amongst the plants is useful in preventing the damping of the blooms, as it dries the atmosphere. *E. Molyneux.*

HOOKER MEDAL.

WE have now the opportunity of giving an illustration (fig. 84) of the Gold Medal presented in May last, by the Linnean Society, to Sir Joseph Hooker, in commemoration of his unparalleled and long-continued services to botany. The likeness is a good one, and the execution of the Medal, by Mr. Pinches, all that could be desired. Subscribers to the Medal-fund have been presented with a copy in bronze, which will be highly valued by the recipients.

DENMARK.

DANISH CAULIFLOWERS.—Seedsmen collect their stock from widely differing sources. The chief centres for the seed trade have for several years been Erfurt, Quedlinburg, Paris, London, &c., but if we consider the places where the seeds are actually grown, and not merely stored, we must seek in still more widely-spread localities. Thus, as to Cauliflowers, we shall certainly not find the chief centre of cultivation to be at Erfurt, but in Denmark. It is true the Erfurt Cauliflower was once the best and most famous, especially when a variety had been cultivated there for many years, and suddenly showed an amelioration never before remarked. But the seeds were enormously expensive, chiefly on account of many failures in harvesting. Then, as now, the Cauliflower in the climate of central Germany is often a failure, not only because of the weather but also owing to insect pests, which destroy the crops. Travellers have occasionally visited well-known seed farms, wishing to see good Cauliflower-culture and seed-harvesting. The centre for the best Cauliflower-cultivation is to be found far more to the north—at Copenhagen. All the best Cauliflower-seeds, be they the so-called Erfurt varieties or not, are harvested in Denmark, and especially in the Danish Islands. From there, and particularly from the environs of Copenhagen, fine strains of Cauliflower-seeds are sent all over the world, and seed-merchants in most countries well know that Copenhagen seed is of good value. This also the price of it proves, as Copenhagen Cauliflower-seed often is twice as dearly priced in our seed-catalogues as is that from any other origin. It may interest readers of this paper to know why the Cauliflower-plant is really better developed in Denmark than anywhere else. First, there is an explanation to be gleaned from a study of natural conditions, especially from meteorologic influences.

It is well known, and has often been proved, that many economic plants acquire a better flavour, taste, or scent in northern regions. The long days of the summer have something to do with this, and much has been written on the subject by an author well-known to English readers—the late Professor Schübel, of Christiania. Seeds from northern (Scandinavian, for instance) countries have virtues of their own. Nearly all seeds, save those of Conifers from the extreme North, are larger individually than those from Germany and more southern countries.

It is important for growers to know that experiments made in Denmark have shown that seeds harvested there yield plants which never run to seed too early. The climate is influenced by the proximity of the sea; the plants develop slowly but evenly and well, so that the good properties are matured. The summer-heat is not so injurious as in more southerly countries. The quality of Danish vegetables is

FIG. 84.—THE "HOOKER" MEDAL.

soda to plants that are forward in petal development, although a small quantity given to plants that are backward would hasten their progress, and elongate the sap-tissues, preparing them for future stimulative food.

The state of the roots should guide the cultivator as to the advisability of supplying much stimulant. If there is a lack of surface or other freshly-made rootlets, then strong doses, or even any, would result in ill-effect. The surface-roots of plants are too often injured, when least expected, by the injudicious application of stimulating food when the plants are not in a fit state to receive it.

Rife have been the complaints this season about the premature decay of newly-formed buds. Instead of such buds developing evenly and fast, they attain the size of Peas, then "go off" quite suddenly. Upon close examination the peduncles are found to be woody in texture, caused more probably by strong doses of some stimulating food being given the plants at a time when the soil is exceptionally dry, and thus unsuited to receive supported aid of this kind. A partial, or at times, serious loss of rootlets takes place by such indiscrimination. A thorough soaking of the soil with clear water is the correct treatment at that stage, to be followed later by the stimulant. Whatever is given in the way of assistance through

even less, as such draughts of cold air are a precursor of damping in the blooms, especially if the plants have been freely fed with stimulating food. The excessive employment of fertilisers with a view to enlarging the blooms beyond a fair and reasonable size, is too often the cause of this premature decay known as "damping." As a rule blooms of the incurved section, such as the thick, fleshy-like petals of the Queen of England section, are the most addicted to damping. Even the unfolding buds of Japanese varieties are attacked in a similar manner. Damping is more prevalent in damp, foggy weather.

Again, if the surface of the blooms become exceptionally cold through a great lowering of the temperature of the house, moisture condenses thereon much quicker than where a buoyant atmosphere is maintained. If a bright day follows a dull time, many of the blooms are thus burnt, as it were, especially if no shading be provided. By the aid of artificial warmth the air should be kept in a buoyant state night and day. Warm the pipes, and ventilate freely, but in such a manner that a direct draught is not caused.

For the benefit of the beginner in Chrysanthemum-culture, I will briefly describe the damping of the florets. Take for example a large three parts unfolded bloom of Empress of India. There is the prospect of

therefore, wonderfully good, and this is proved by the large exports of certain of the produce—of Cabbages to America, Cauliflowers to various places, and so on. For a long time Danish growers worked for others. It frequently happened that their Cauliflower seed was sold wholesale to Erfurt firms and returned, even to Denmark, as true Erfurt-grown seed. This is no longer. It is known that the Danish Cauliflowers are the best, especially those raised near Copenhagen, whence the produce is sold at a high price, and sometimes a year in advance.

The reason for this may be traced to natural causes. A good soil is found, especially well suited for Cauliflowers, in the vicinity of Copenhagen. Last but not least, should be mentioned the way in which Danish growers have continued to select only the very best strains of Cauliflowers, rejecting every one that was inferior.

There are large seed-farms near Copenhagen well worth visiting. Every grower feels an interest in seeing the newest machinery, irrigators, channels, &c., and all these things may be studied at the seed-farm of Immanuel Levy, Vangede, a village near Copenhagen. Traveller.

SCOTLAND.

TOMATOS AS A FARM CROP.

THIS is not an uncommon crop in the South of England. In Scotland, however, it is a very uncommon one, and I know of only two instances where it has been attempted. In both it proved that in Scotland a very large crop of Tomatos can be grown out-of-doors; but it also showed that our seasons are too short to allow of their ripening, and as a consequence the fruit must be gathered in a state of unripeness.

However, neither of the above instances proves the absolute impossibility of ripening a crop. It is indispensable, in order to secure any degree of success, that a light, warm soil, and a well-sheltered position be chosen. The variety of Tomato should be one that ripens its fruits early. Strong plants with a tendency to fruitfulness given them before planting out, must be employed. Planting above the level, or on ridges, would be advantageous. Manuring should consist in shallow or surface-dressing, and no nitrates or phosphates must be applied, except at the time of planting. When applied late in growth, as in Celery, these materials are apt to cause growth after it should have ceased. The plants need to be pinched at the earliest moment, the proper amount of fruit left on each, neither more nor less than will ripen, and the growths and foliage kept reduced to the proper quantity. A great help to ripening Tomatos in cold is to keep them perfectly dry; and a help to this in the open would be to loosen the roots of the plants, first on one side, and then in a few days on the other.

NEW DOUBLE SWEET PEA.

I have been favoured by a few sprays of a Sweet Pea named British Queen, a selection from Her Majesty, the colour of both being the same, but the former producing four wings instead of two. Those who are well acquainted with the Eckford Sweet Peas are aware that a few varieties, especially when highly cultivated, in addition to the ordinary number of wings, occasionally produce three. Mr. Angus, Norwood Hall, Aberdeen, has secured one of these abnormalities with four wings, and hopes to go on improving. In some instances there is a standard produced inside the normal one, and with the normal number of wings. At its present stage the double flower is brighter than the single flower, and nothing of the charm of the latter is lost. What may be the end of Mr. Angus's proceedings, when he has attained a really double flower, when standards and wings are both lost in petals in common, is a problem one does not much care to attempt solving. The Royal Caledonian Society awarded its raiser a First-class Certificate at its late show. R. P. Brotherston, Tynninghame Gardens. [In most cases in blooms, kindly sent us by Mr. Brotherston, it is the "standard" that is doubled. Judging from these flowers also, we think the single ones more charming. Ed.]

THE WEEK'S WORK.

PLANTS UNDER GLASS.

By W. MESSENGER, Gardener to H. C. BERNERS, Esq., Woolverstone Park, Ipswich.

Dipladenias.—As the plants cease to flower, plenty of air may be given them with full sunlight. Gradually reduce the supply of water to the roots, and very little will be needed during the winter months.

Primulas.—Encourage growth by giving frequent applications of weak manure-water, varying it occasionally with an artificial manure. Full light may be admitted, with an abundance of air, on every favourable occasion. Any plants not yet finally potted should be attended to at once. Keep them close to the glass.

Cinerarias.—Plants growing in cold-frames may be removed to houses or pits, where a little heat will be available in the event of cold or damp weather. Cool treatment, however, should be given as far as possible. An occasional dose of clear soot-water will be beneficial to them, and other stimulants may be freely given now that the plants are making plenty of foliage. Green-fly will be a source of trouble if not checked in time by fumigating the plants with tobacco.

Poinsettias.—As a few early plants are generally desirable for decorative work, it will be advisable to transfer a batch of the most forward plants to warmer quarters, giving them a position where the heads will be near to the glass. Do not crowd the plants, or they will quickly lose their lower leaves. They may be given weak liquid manure, or a little artificial manure may be put upon the surface of the soil. Later plants may be given a night temperature of 55°, not lower, and air may be freely given them on fine bright days, using the syringe freely to prevent insect pests.

Lachenalias are now making active growth, and should be transferred from cold pits or frames to the greenhouse, where they may be placed on a shelf or in a similar position. When the pots have become filled with roots, an occasional dose of manure-water will materially strengthen the plants.

Freesias.—The most forward plants may be given an intermediate temperature, and a moderate amount of air during fine days. Keep the plants near to the glass, and give them an occasional application of weak manure-water. Later plants will be best kept growing steadily in a temperature that does not fall below 50° at night. Give them plenty of air during the day when the weather will permit. Another batch of bulbs may be potted-up to continue the succession. Place them in a position where artificial heat may be used in the event of frost.

Gardenias.—Plants now producing flower-buds should be thoroughly examined and cleansed. If there be any mealy-bug upon them syringe the plants with paraffin emulsion, and two or three days afterwards go over the plants with a small brush and methylated spirits of wine to kill any insects that may have survived the syringing process. The use of stimulants should be considerably decreased when the plants commence to form their flower-buds. A moist atmosphere and a temperature of 66° to 70° at night will be best for them. Later plants may be given a temperature 5° lower. Re-pot cuttings that have rooted, and put them in brisk heat until established.

Ixoras.—Careful treatment of these plants is most necessary during the winter months. Water must be given with care—too much or too little will prove injurious. The syringe may be used freely, if the temperature at night can be maintained to 65°. Young plants intended to flower in small pots should be plunged where they have the advantage of a mild bottom-heat. When supplying the plants with water, let it be a few degrees warmer than the temperature of the house.

HARDY FRUIT GARDEN.

By W. H. DIVERS, Gardener to the Duke of Rutland, Belvoir Castle, Grantham.

Peaches and Nectarines.—The best season for planting fruit-trees is now at hand, and the gardener should decide what alterations are to be made, that the order for fruit trees may be despatched at once. It is convenient to remove a few of the oldest and weakest trees each season, and to plant a few young ones in their stead. By such a system young trees are continually coming into fruiting condition, and supply large fruit. New and valuable varieties may be thus introduced. If a large number of trees are required, it will be best to go to the nursery and

personally select them. Especially is this advisable in the case of Peaches and Nectarines, because so much of the future welfare of the tree depends upon the kind of stock they are worked upon, and the amount of frost they have had to contend with since they were budded. Select those with clean stocks, free from all knots and roughness, and that have a bright healthy-looking skin. Any that have been cut back several times should be avoided. Peaches and Nectarines, if grown in the open, require a warm position and a well-drained soil. If the situation be naturally cold and wet, a border should be made purposely for them, excavating the soil 2½ feet deep, with a fall of 1 in 25 from the wall to the edge of the border. Lay down a drain and connect with a suitable outlet, and in the bottom of the border put 6 inches of rough stones or broken bricks, and next a layer of turf-sods, with the grassy sides downwards, or failing this a layer of straw fresh from the stables, placed 4 inches thick. A moderately retentive loam is best for Peaches, but lime is also necessary, because their stones contain a large proportion of it. Lime may be added to the loam in the form of finely-broken chalk, or as lime-rubble that has been slaked. One-twelfth part of the whole will be sufficient. Burnt earth, or ashes from the garden-fire are also valuable, in the proportion of one-sixth to the whole in the case of retentive loams, or one-twelfth for light loams. These keep the border porous and sweet, and afford potash and other ingredients to the trees. If the weather be wet at the time of planting, the soil should not be trodden hard, but may be left to settle down naturally. In favourable positions, and in places where trees have previously grown well, it will not be necessary to fully carry out the above directions, but a quantity of fresh soil should always be placed around the roots of trees newly planted. Owing to their susceptibility to frost, these fruit-trees should be planted as early as possible after the leaves commence to fall, and the work should be finished off quickly.

Suitable Varieties.—The best varieties for outdoor culture in their order of ripening are: Peaches, Early Alexander, Early Louise, Hale's Early, River's Early York, Crimson Galand, Goshawk, Dymond, Stirling Castle, Alexandra Noblesse, Bellegarde, Barrington,* Sea Eagle,* Princess of Wales,* and Late Admirable.* In cold districts those marked * are too late to be of any use. Of Nectarines: Early Rivers, Lord Napier, Stanwick Elruge, Balgowan, Dryden, Pitmaston Orange,* Pine-Apple,* Spenser,* Humboldt,* and Victoria.* Those marked * are of no use in cold districts.

THE KITCHEN GARDEN.

By J. W. McHATTIE, Gardener to the Duke of Wellington, Strathfieldsaye, Hants.

Endive.—Blanching of this crop should not be commenced before the plants are fully grown. By whatever means it is proposed to blanch the plants, they should be perfectly dry before the process is begun. If a few plants be lifted at regular intervals and planted in pits or frames that can be darkened, it is a capital method. Some of the plants may be covered with pots in the open, where they have grown. These can now be obtained similar to those used for forcing Seakale, but only 1 foot in diameter, and 8 inches high, with a knob or handle at the top by which the pots can be conveniently lifted. Flower and Seakale pots may be used for the purpose, but they are less convenient. Some gardeners tie up the plants in the same manner as Cos Lettuce is done. Then cover them with dry Oak or Beech leaves, to prevent frost, damp, or light reaching the plants. If leaves cannot be procured, the plants may be moulded up with just enough dry soil to exclude light and frost.

Spring Cabbage.—The bulk of the Cabbage plants to produce early supplies in spring and summer may now be planted out. Select the strongest plants, and take care to avoid any that are blind, there being very many in such condition this autumn. A space of 18 inches each way will give ample room for early Cabbage that will be cut in a young state. The ground should be enriched with manure, and be carefully dug or trenched. If the soil is stiff, and the garden a cold one, lay up the soil in ridges in the usual way. Put the plants between the ridges and on the top of them. In spring, the best rows should be left, and the plants in the other ones may be used to fill up gaps that have occurred in the former. Care will be required this season not to use any green vegetables that would stand through the winter, whilst there are plenty of tender ones. Owing to the severe drought, winter vegetables will be very scarce in the south.

Asparagus Forcing.—When the stalks of the Asparagus in the outside beds show signs of ripeness, cut them down to the ground-level, and lift a few roots for early forcing in pits or hot-beds. At the same time clear the beds of weeds with the hoe and rake, and afford them a dressing with soot and salt. The large quantity of vegetable matter produced during the growing season by this plant renders the soil in which it grows very poor, and more support must be given Asparagus than other vegetables that are frequently renewed by sowing and transplanting.

Seakale for Forcing.—If early supplies of this vegetable are in request, and no frost has yet arrested growth, it will be well to lift the roots with a digging-fork, so as to crack or check them, after which the soil may be made firm again about the roots by treading. In the course of eight days the leaves will fall off, and the roots may then be lifted to place in the forcing quarters.

Early Rhubarb.—Lift a few stools carefully, not damaging the roots, and leave them fully exposed to the weather night and day. If there be dry, sunny days, however, a mat may be placed over them to prevent the roots unduly shrivelling. The roots will be ready for gentle forcing in the course of six days after being lifted.

Remarks.—All planting and sowing of vegetables and salads, of whatever nature, should be completed during the present month, that they may become rooted before the growing season has quite ceased.

THE ORCHID HOUSES.

By W. H. WHITE, Orchid Grower to Sir Trevor Lawrence, Bart., Burford, Dorking.

The Cool-house.—Plants of *Oncidium tigrinum*, *O. crispum*, *O. prætectum*, *O. varicosum*, and its variety *Rogersii*, are now producing their flower-spikes, and strong, well-rooted specimens may be allowed to bloom freely, but it will be best to remove the spikes as soon as the flowers have become fully expanded. If these be placed in water, they will remain fresh for a considerable period. In the case of small weakly plants, no flower-spikes should be allowed to develop. Many growers already know what splendid spikes are produced from the first season's growth after importation, but they quickly exhaust themselves if the plants be permitted to retain them until they fade. Such species as *O. macranthum*, *O. undulatum*, *O. loxense*, *O. serratum*, *O. superbium*, *O. Leopoldinum*, *O. zebrinum*, *O. monachicum*, and *O. lamelligerum* will now require a plentiful supply of water at the root, and shade from direct sunshine. *O. cheiroporum* is one of the prettiest of the small-growing *Oncidiums*; it is now growing and rooting freely, and if needful may be repotted at this time. Grow the plants in shallow pans, with a very thin layer of peat and sphagnum-moss, and suspend them from the roof at the warmest end of the house. The plant requires little water at any time, and great care is needed that no water reach the centre of the growth or the axils of the leaves. *O. concolor*, having completed its pseudo-bulbs, will require less water than formerly, but the bulbs should not be permitted to shrivel. The same treatment is necessary for *O. Marshallianum*, which is now rooting freely, and should be carefully protected from slugs, &c. The pretty *O. cucullatum* is strictly an alpine plant, inhabiting the cooler regions of the Andes. It requires the coolest and dampest position available in this house. Its varieties *Phalanopsis*, *olivaceum*, and *nubigenum* also require a similar position. *O. curtum* and *O. Forbesii* should be placed at the warmer end. *Cattleya citrina* is a cool-growing species that loves abundance of light and air, and thrives best when fastened to a teak raft, and suspended close to the roof, with the leaves and growths in a downward direction. Although the plant is now producing its new growths, it will need but little water until the flower scapes appear. Some cultivators succeed with the plant in an ordinary greenhouse, the principal reason being that it there receives plenty of sunbeats and light with a much drier condition of the atmosphere, consequent upon more air being admitted than in the case of an Orchid-house. The handsome *Odontoglossum coronarium* and its variety *miniaturum* are in full growth, and should be elevated close up to the roof-glass, but out of reach of actual sunshine. Abundance of water is necessary at all times. Plants of *O. Edwardi* that are sending up strong flower-spikes require to be kept thoroughly moist at the root, and care is necessary that the tall spikes do not get too close to the roof-glass, or the whole inflorescence may be lost,

O. Bictonense and its variety *alba* being now in bloom should be watered only very occasionally, as the roots are liable to decay if kept in a moist condition at this period. The three following species *O. grande*, *O. Insleyi*, and *O. Schlieperianum*, may be removed to the cooler and drier part of the intermediate-house, where they will rest; the humidity of the *Odontoglossum*-house during winter is unfavourable to them. *O. Cervantesii*, *O. Rossii*, and its numerous varieties should be suspended in a light position, and copious supplies of water may be given until the flowering season is past. The *Odontoglossums*, especially those of the *O. crispum*, *O. triumphans*, *O. cirrosum*, *O. Pescatorei*, and *O. Halli* sections will now be growing vigorously, and it will be necessary as the new leaves develop to closely examine them for small yellow thrips, which are often very troublesome. The best means to employ for killing these insects is Richards' XL All Vaporiser. Previous to the operation it is advisable to close the house, and damp it well down, so as to create a warm moist growing atmosphere; this will induce the insects to emerge from the axils of the leaves and disport themselves upon the surface, when they may be easily destroyed by the nicotine vapour. *Odontoglossums* will now stand a stronger fumigation than at any other period of the year. The operation may be done at night and the succeeding morning, or on two successive evenings, without any fear of injury to the plants.

FRUITS UNDER GLASS.

By G. NORMAN, Gardener to the Marquess of Salisbury, Hatfield House, Herts.

Peach and Nectarine Trees that are growing too strongly, may be brought into a fruitful condition by lifting them partly, or wholly, and root-pruning. The best time to do this is while there are still leaves on the trees. It is common for young trees to grow too vigorously in rich soil, and some varieties when they become good-sized trees are unfruitful indoors. When commencing to root-prune, begin at the part of the border furthest from the tree, and take out the soil without damaging the roots, in the same manner as if the tree was to be transplanted. Trace out strong roots that have grown in a downward direction, and shorten these, and cut off also the damaged part of other roots that were unavoidably injured in the operation by the digging-fork. Preserve all roots of a fibrous nature, and while the roots are bare look over them for suckers, and cut off all that can be seen. Relay the roots in the soil on the same levels and angles as they start from the base of the tree, treading it all firm throughout as the work proceeds. The work needs to be done as expeditiously as possible, so as not to allow the fibrous roots to suffer from long exposure to dry air, and afterwards give the soil a thorough watering. If the trees have been growing in the same soil for some years, a portion of it may be replaced with new material, mixing with it the old as the work proceeds. The new material should be the same as for making new borders, viz., loam, with an addition of mortar-rubble and charred soil. On the few bright days that may be expected afterwards, damp the foliage by syringing. Trees in late houses that are unsatisfactory because the soil has become exhausted, may be much improved by taking out the old soil and replacing it with new material, but this work should be done immediately, so as to allow time for young roots to be made in the new soil while the foliage is still on the trees. Continue to water Peach-trees as often as required, bearing in mind that the soil should not become quite dry, and continue to syringe them on the afternoon of every fine day. Houses that are to be planted with Peach and Nectarine-trees should be prepared beforehand. If the bottom be damp, the base should be concreted, and about 9 inches of brickbats placed thereon for drainage, laid on edge, with the smallest on the top, and from 1½ to 2 feet of soil. There will be necessary a trellis with wires running lengthwise of the house at about 9 inches apart, and about 1 foot from the glass. If the house requires to be painted, the work should be done before the trees are planted. The same remarks would apply to Cherry and Plum-trees.

THE FLOWER GARDEN.

By H. WALTERS, Gardener to Lord Gerard, Eastwell Park, Ashford.

Daffodils will succeed almost anywhere, but they appear to be most at home in a damp and somewhat shaded position, as by the sides of woodland walks or in grass, upon the margins of lakes and running

streams, &c. The bulbs should be planted during the present month. They like a good depth of soil, but are not very particular as to what kind it is. No manure is necessary for them, nor should they be planted at a greater depth than 4 inches. Daffodils are most effective if planted in large clumps. Straight lines should be avoided. The varieties that may be obtained are exceedingly numerous, and some amount of discretion will be necessary in selecting these, as some varieties flower much earlier than others. A good collection of *Narcissus* should afford flowers from February until May. The bulbs, when planted, need not be disturbed for years.

Narcissus.—The *Polyanthus Narcissus*, as distinguished from the *Daffodils*, are very useful for supplying flowers for cutting. Plant them in a good soil, and they also may then be left for years before replanting will be necessary.

Lilium candidum.—This beautiful white-flowering Lily should be planted during the autumn months. Any garden soil suits it, but a good rich loam is best, and the bulbs should be planted where they need not be disturbed. It is a plant which greatly resents frequent transplantation.

Dahlias.—In places where these have been cut down by the frost, the tubers should be lifted, and placed in shallow boxes, covering the tubers with light sandy soil or ashes. Afterwards store them in a position where frost will not reach them during winter.

Marguerites.—Take cuttings of *Marguerites* and insert them round the margins of 5-inch pots. Place them on the shelf of a house where the temperature does not fall below 55°.

THE APIARY.

By EXPERT.

Feeding-up and Packing for Winter.—This should now be completed. If it is not, the bee-keeper must bestir himself and feed as fast as the bees can take the syrup. Make good syrup, not thin and watery stuff, or the bees will have to evaporate or separate the excess of moisture at the cost of "wear and tear" to vitality. Feeding generally induces breeding, and thus, if done early, the brood hatches out early in October, and so strengthens the colony. Packing for winter must also be attended to shortly; if you have any queenless colonies on hand, unite them to those that have a queen.

Re-queening in Autumn.—Introducing queens to queenless colonies, unless the latter are very strong in bees (which is not often the case at this period of the year) is a waste of money, and usually brings disappointment to the purchaser, besides giving no satisfaction to the dealer or breeder. Pleased and satisfied customers furnish the best advertisement one can have. The matter of superseding an old queen by the introduction of a young one in its place at this period is a different matter altogether, and any stock which is known to be headed by a queen of 1896 that has done well during 1897 and 1898 should have its queen deposed in favour of a young one of 1898. There are exceptional queens which do good work in the third year, but it is not good policy to depend on the chance of this. It is best to keep young prolific queens at the head of colonies.

Planting for Bees; Painting Hives.—Now is the time to sow hardy annuals to stand the winter and bloom early next season. Hive roofs and covers should be painted where required, so that the interiors may be dry through the winter months. Chaff cushions are good top-wraps during the winter, such cushions being excellent heat retainers. They may be made of cheap unbleached calico, cut the size of the hive inside, and if about three-parts filled they will tuck in at the sides better than a cushion quite full, the calico should be washed before using it, or it will most likely get mildewed in damp and foggy weather.

Winter Passages.—It is a good plan to give passage to the bees from one comb to the other, so that they may not starve in long spells of very severe weather. Lay three little strips of wood side by side across the tops of the frames when packing up for the winter. The strips must be large enough to allow the bees to pass easily, and bevelled at the ends, so that the quilt may lie close on the frames at the outsides all round where the projections of brace combs are left on the top of frames. These, of course, allow passage-way over the tops of frames.

EDITORIAL NOTICES.

ADVERTISEMENTS should be sent to the PUBLISHER. Newspapers.—Correspondents sending newspapers should be careful to mark the paragraphs they wish the Editor to see.

APPOINTMENTS FOR THE ENSUING WEEK.

SALES.

MONDAY,	Oct. 17	Eight days' Unreserved Clearance Sale of Nursery Stock, at the Nurseries, Sunningdale, Berks, by Protheroe & Morris. Dutch Bulbs, at Protheroe & Morris' Rooms. Clearance Sale of Stove and Greenhouse Plants, at 131, Acre Lane, Brixton, S.W., by order of Mr. T. A. Dickson, by Protheroe & Morris.
TUESDAY,	Oct. 18	Annual Trade Sale of Shrubs, Conifers, and Climbers, at the Wood Lane Nursery, Isleworth, by order of Messrs. Chas. Lee & Son, by Protheroe & Morris. Dutch Bulbs, at Protheroe & Morris' Rooms.
WEDNESDAY,	Oct. 19	Great Sale of Liliun longiflorum, Palm Seeds, &c., at Protheroe & Morris' Rooms. Dutch Bulbs, at Protheroe & Morris' Rooms.
THURSDAY,	Oct. 20	Dutch Bulbs, at Protheroe & Morris' Rooms.
FRIDAY,	Oct. 21	Dutch Bulbs, at Protheroe & Morris' Rooms. Imported and Established Orchids, at Protheroe & Morris' Rooms.

AVERAGE TEMPERATURE for the ensuing week, deduced from Observations of Forty-three Years, at Chiswick.—49° 8'.

ACTUAL TEMPERATURES:—

LONDON.—October 12 (6 P.M.): Max., 59°; Min., 44°.
PROVINCES.—October 12 (6 P.M.): Max., 57°, W. Ireland; Min., 48°, Aberdeen.
Dull; general absence of rain; heavy dews.

The reciprocal action of Scion and Stock. It is a curious circumstance, that practical gardeners of the greatest experience of the generation now passing away, denied almost to a man that there is any action of the stock on the scion, or of the scion on the stock; and yet these men, and their predecessors, had been grafting and budding from time immemorial. They derived advantage from the process as a quick and convenient mode of propagation, but it is only comparatively quite lately that they have admitted that there are other benefits to be obtained. A pomologist grafts an Apple he wishes to propagate on the Paradise stock with the certainty that his Apple will be of more compact habit and of earlier and earlier fertility than if grown on the Crab or on its own roots. The vegetative system of the plant will be checked by the grafting, and by *balancement organique*, as the French say—by compensation, the development of flowers will be proportionately enhanced. Still, it is rare that a gardener will admit any further influence than what has been alluded to. He overlooks or ignores the many cases in which he grafts one Vine upon another with a view of curing some defect, such as cracking, or for some other cause, which renders his denial of reciprocal action somewhat inconsistent. It must be admitted that such effects are so rarely visible on the surface that they must be looked on as exceptional; but there is a great deal that we do not see, but which we may expect to see in the future.

The physiologist was also unwilling to admit that, as a rule, there was direct communication between stock and scion, but he recognised the exceptions, and found them, on investigation, more numerous than he had at first expected. These were the days when we were taught that the plant was made of little membranous bags or sacs, called cells, more or less filled with fluid when alive, but so perfectly closed and unbroken at the surface that no passage of fluid from one to the other was possible, except

by means of filtration by "osmosis." By virtue of this process a thinner fluid passes through an intervening membrane to mix with a thicker fluid on the other side.

No doubt, this process of osmosis is a powerful aid in ensuring the movement of fluid in plants. A discovery made some few years ago by a Cambridge botanist, Mr. WALTER GARDINER, and since abundantly confirmed, has, however, thrown a new light on the subject. In the living cell there is, as everyone knows, a thick, semi-liquid substance, which is known as "protoplasm." In former days each cell was supposed to have had its mass of protoplasm so long as it was alive and active, but any passage of protoplasm from one cell to another, or any admixture of the plasm of one cell with that of another was considered impossible. Mr. GARDINER'S discovery consisted in the proof that there were in that portion of the cell-wall between two cells, extremely minute tubes opening up communication from one cell to another, and permitting the passage of threads of protoplasm from one cell to another. Now-a-days a plant, instead of being looked on as an aggregate of independent cells, is considered rather as an independent whole, consisting of cells which are in communication, real or potential, throughout the whole plant. Of course, such a discovery revolutionises vegetable physiology, and we may certainly look to this "continuity of protoplasm" to explain much of what is still mysterious in the matter of bud-variation (sporting) and grafting.

We have been led to these remarks by the perusal, in the *Comptes Rendus* of the French Academy of Sciences, of the experiments of M. LUCIEN DANIEL. Cabbages, he says, can be improved by grafting appropriately-selected sorts one upon the other, and by sowing the seeds of the scion (*Création de Variétés Nouvelles*, par la greffe, April 30, 1898). Similarly variation in the common "Jack in the Hedge," *Alliaria officinalis*, may be obtained by grafting it on a Cabbage.

Pursuing his researches, M. DANIEL has grafted the wild Carrot on a cultivated form of stump Carrot. These two plants differ very materially, both in foliage and in the character of their roots. When grafted the wild Carrot grew well, utilising the reserves in the stock on which it was grafted, and ultimately produced seed larger than those of the check-plant grown for comparison. The seeds were sown side by side with some from the ordinary wild Carrot. The seedlings of the latter germinated in the usual manner, but those derived from the graft showed many differences which we have not room to cite here. Generally, we may say that the differences in the seedlings were manifested: 1, in the seed-leaves or cotyledons; 2, in the precocious development of seed; 3, a change in habit, colour, and hairiness; and 4, a swollen condition of the root, but without change of colour.

M. DANIEL'S experiments are recorded in the *Comptes Rendus*, July 11, 1898, and show the influence of the stock on the posterity of the graft. This influence determines not only variation in general, but a more or less complete admixture of the characteristics of the stock and of the scion, so that in the offspring of the scion a kind of disturbance (*affolement*) arises resembling that caused by crossing or hybridisation.

From a practical point of view the experiments reveal the possibility of "improving" wild plants by grafting, and subsequently sowing the seeds from the graft, and selecting

the seedlings in the ordinary way. M. DANIEL does not tell us how he grafted his wild Carrot. Of one thing we are certain: no gardener or farmer in this country will think it worth his while to make such experiments, whilst the paucity of research-stations does not augur well for the experiment being tried here at all. Thus, whatever comes of it, our neighbours will get the benefit, and we shall have to pay for what we might have raised ourselves.

NATIONAL DAHLIA SOCIETY.—The official catalogue, which has been issued this summer, contains on some fifty pages an account of the Dahlia, its bibliography, selected lists of the best varieties of each type, fancy, Pompon, Cactus, decorative, and single Dahlias, the latter grouped as self, fancy, Tom Thumb, and Cactus varieties, together with an alphabetical list, with name of raiser and date of introduction of Dahlias of all sections at present in general cultivation in Great Britain. Selections of varieties which make an especially effective display in the garden are given, as well as of those most suitable for exhibition. The catalogue can be obtained from the Hon. Secretary of the National Dahlia Society, Gunnersbury House, Acton, W. Price 1s. to non-members.

"KEW BULLETIN."—The number for the present month contains an exhaustive account of the Para rubber, *Hevea brasiliensis*, a native of the damp, shady forests of northern Brazil, where the temperature is very uniform, ranging from 75° at night to 87° at mid-day. The first half of the year is very wet, the other half relatively dry. Thanks to Kew, the trees have been sent to Ceylon, where they have borne seed, so that the number of trees on private estates is estimated at 200,000. The rubber collected in the Ceylon Botanic Garden has been valued at the highest market price ruling at the time, so that, on the whole, there is a prospect of a good return on the capital invested. Reports from Tenasserim and the Straits Settlements are also encouraging. In other colonies the experiments have not been continued sufficiently long to give commercial results. The samples from Trinidad are reported as excellent.

MADRAS.—The *Kew Bulletin* reports that Mr. C. A. BARBER, lately superintendent of the Agricultural Department of the Leeward Islands, has been appointed Government botanist for the Madras Presidency, in the room of the late Prof. LAWSON.

MEETING OF THE GHENT CHAMBRE SYNDICALE.—At the Meeting of the Chambre Syndicale des Horticulteurs Belges et Société Royale d'Agriculture and de Botanique of Ghent, held on October 2, the following awards were made:—Certificates "de floraison" to M. F. Van Driessche, for *Leucanthemum uliginosum*, and also for *Caryopteris mastacanthus*. A Cultural Certificate was awarded to the same exhibitor for *Acacia floribunda*; one to M. Aug. Van der Heede (*à l'unanimité*), for a collection of *Cyperus alternifolius*, eight months under cultivation; and to M. Alloncius for *Aralia Kerchoviana*. Honourable mention was allotted to M. Aug. Van der Heede, for a collection of foliage Begonias.

BACTERIA IN HAILSTONES.—If there is one place in which we should not have expected to find these organisms it would be the interior of a hailstone. Nevertheless, Mr. HARRISON in the *Botanical Gazette* for September, describes sundry forms met with by him. As many as 955 were found on the average in each hailstone. One of the bacteria was found to be poisonous to rats. These are facts for the Hailstorm Insurance Company to ponder over. It may well happen that the bacteria introduced by a hailstorm may be more destructive than the stones themselves.

"BOTANICAL MAGAZINE."—The plants figured in the issue for the present month are:—

Cyrtosperma senegalense, Engler, t. 7617. — A tropical African Aroid, with tufts of long-stalked,

hastate leaves, long-stalked spathes, like those of the common Arum, green, with broad stripes of purple, and short, blunt, purple spadices. Kew.

Cytisus purgans, Boissier, t. 7618.—A very handsome dwarf Broom, with a profusion of yellow flowers. It is a native of Central and Southern France and of Northern Spain. Kew.

Amelanchier canadensis var. *oblongifolia*, Torrey and Gray, t. 7619.

Peijoya Sellowiana, Berg., t. 7620.—A myrtaceous shrub, with large pendulous flowers; petals whitish on the outer, crimson on the inner surface. The fruit is an oblong-ovoid tubercled berry, about the size of a Walnut, and possessing an aromatic flavour and perfume. It was introduced into cultivation by M. Ed. ANDRÉ, and by him figured and described in the *Revue Horticole*, 1898, p. 264.

The varieties used are *acris*, *densus*, and of taller ones *G. Harris* (white), *Robert Parker*, and others. In spite of their beauty, such plants seem to us out of place in such a situation—but that is a matter of taste.

THE SHOW-HOUSE AT KEW.—Those who have to keep their conservatories gay at all seasons should make a point, if possible, of visiting this house at frequent intervals. Not only is it in general ornamented with the popular decorative plants of the season, but new plants, or plants not generally known, are made use of in order that their ornamental character may be tested. This is a matter of pre-eminent importance at Kew. We can see the ordinary flowering-stuff like the bedding-plants anywhere and everywhere. It is to Kew that we

are white. 3. Avoid fungi having a milky juice, unless the milk is reddish. 4. Avoid fungi in which the cap, or pileus, is thin in proportion to the gills, and in which the gills are nearly all of equal length, especially if the pileus is bright-coloured. 5. Avoid all tube-bearing fungi in which the flesh changes colour when cut or broken, or where the mouths or the tubes are reddish, and in the case of other tube-bearing forms experiment with caution. 6. Fungi which have a sort of spider-web or flocculent ring around the upper part of the stalk should in general be avoided.

FRUIT CROPS IN THE UNITED STATES.—As there seems to be some difference of opinion on this matter, we give the following brief note, received from the head of the State Department, just as we

[Photograph by G. Denny & Co., Teignmouth.]

FIG. 85.—WALL AT GLENDAVAGH, TEIGNMOUTH. (SEE P. 291.)

Rhododendron rubiginosum, Franchet, t. 7621.—A Western Chinese species, with lanceolate leaves, thickly beset on the lower surface with rust-coloured scales; flowers of moderate size, pink, in terminal clusters. It is nearly allied to the North American *R. punctatum*.

THE VICTORIA MEDAL.—The recipients of the Medal will, we learn, shortly receive a diploma on vellum, notifying to all and sundry that its possessor has, with the gracious assent of Her Majesty, been presented with the Victoria Medal by the Royal Horticultural Society.

ASTERS AT KEW.—Those who favour the introduction of herbaceous plants on terraces or in association with architectural features, have now an opportunity of seeing the effect of large masses of perennial Asters in front of the Wood Museum at Kew.

look for novelties and plants of unusual interest. Just now Asters in pots, such as *A. dumosus*, *acris*, *Amellus lævigatus*, and others, furnish excellent decorative subjects.

"LITERATURE" says that Dean HOLE is writing a book on *Our Gardens* for the Haddon Library.

THE DETECTION OF POISONOUS FUNGI.—The *Botanical Gazette* (Chicago) for September publishes some notes by Dr. W. G. FARLOW, prepared at the request of the U.S.A. Department of Agriculture, by the aid of which edible and poisonous fungi may be distinguished. The following rules are given for the beginner:—1. Avoid fungi when in the button or unexpanded stage, also those in which the flesh has begun to decay, even if only slightly. 2. Avoid all fungi which have stalks with a swollen base surrounded by a sac-like envelope, especially if the gills

are going to press:—Respecting Apples, there is, in general, a continued downward movement as to condition, only four States reporting the slightest improvement over the last unfavourable report. As to Peaches, taking the States in which these form a commercial crop, together with those in which the production is small, or not more than sufficient for the local demand, there is probably about two-thirds of a full crop. The conditions, however, vary greatly, ranging from 108 down to half a crop for some of the States ranking next to Georgia along the Atlantic slope. In the States from New York to Virginia inclusive, the condition ranges from 10 to 49 per cent. of a full crop. In the middle States the averages are somewhat higher; but in few cases do they indicate more than two-thirds of the normal. In Grapes the condition is in the main very satisfactory. On the other hand, there are no notably unfavourable conditions; and while no average for the entire

country can be established, owing to the want of a standard of comparison, the general outlook may be regarded as highly favourable.

VARIATION OF ALPINE PLANTS UNDER ALTERATIONS OF TEMPERATURE.—M. GASTON BONNIER contributes to the *Comptes Rendus* for August 8 the result of his experiments on the characteristics of alpine plants as modified by alternations in temperature. He thus sums up his paper:—Comparison was made between plants of the same species from the same root, some kept continually at a very low temperature (4° to 9° C.), others submitted to the usual variations of temperature in the environs of Paris, and yet others kept at a very low temperature during the night and in sunshine during the day. These last, subjected to extreme alternations of temperature, are more dwarf than those of the two former sets, the internodes are proportionally shorter, the leaves smaller, thicker, firmer, the flowering is more rapid. It is, therefore, possible to produce artificially the characteristics of alpine plants in specimens grown in the open by submitting them to a daily alternation of temperature equivalent to that which affects them in high mountainous regions.

A LIVING STATUE OF NAPOLEON I.—A gentleman, residing near Paris, named M. D'AGUILLÈRES, is the proud possessor of a unique statue of NAPOLEON I. His gardener has clipped a large shrub in such a way that it is a perfect model in evergreen of the "Little Corporal." Here he stands in his favourite attitude, wearing a cocked hat, sword, and with snuff-box in hand. Every detail of the face and figure is represented. Hundreds of visitors used to be attracted to see this curious achievement of the clever gardener, but when the present owner came into possession he closed the gates to all comers. The greatest care is necessary in order to preserve the likeness of the renowned warrior, and every day the gardener spends a considerable time in clipping off dead leaves, and cutting away an occasional branch that gets too thickly foliated. The signature of the great NAPOLEON is reproduced at the foot of the statue in Coleus plants.

HINTS TO INTENDING EMIGRANTS.—A circular has just been issued from the Emigrants' Information Office, 31, Broadway, Westminster, S.W., from which we make the following extracts: There is an excellent opening in the colonies for men with a little capital, who can take up land for fruit-growing, dairying, or general farming. In Ontario, and the north-west of Canada, free homesteads are given to settlers on simple conditions of residence and cultivation, the 160 acre grants in the north-west being open land, requiring no clearing. Western Australia is the only one of the Australasian Colonies which gives free homesteads: the Free Homestead Act there dates from 1893, and has lately been much used; 562 of such farms, of an average size of 151 acres, besides 54 homestead leases, representing nearly 72,000 acres, were taken up in 1897. In the other colonies, land (mostly uncleared) can be bought from 2s. 6d. per acre. But settlers must remember that the conditions of farming are necessarily very different from those they have been accustomed to here, so that they should not buy or rent a farm immediately on arrival, but should work for twelve or eighteen months with some colonial farmer, till they have acquired experience of soil, climate, and other local conditions. If a man has a working family he could cultivate a ten-acre block for fruit-growing, without the expense of hiring outside labour. There is a demand for experienced farm-hands on farms, orchards, and vineyards in parts of Queensland, Western Australia, and New Zealand; in Canada the demand is over for this year; in South Africa, farm labourers are nearly always natives or other coloured persons.

STOCK-TAKING: SEPTEMBER.—An analysis of the Board of Trade Returns for the past month gives a reassuring aspect to the prospects of trade generally. There is an increase in the value of both imports and exports. The imports for the past month are in excess of those for September, 1897, by £425,648. The figures for the nine months show an increase of

just £14,902,477. As to the month the sections showing a decrease are "animals, living and for food," "articles of food and drink duty free," "metals," "chemicals, &c.," and "manufactured articles." Among the items showing an increase are Wheat, as to quantity, 606,970 cwt.—there is a decrease of £156,875 in the value; this may serve to show the change in the market in the twelvemonths, though the price of bread is slow to follow the downward tendency of the raw material. Barley has gone up by £183,219; Wheat-meal and flour, £138,628; Currants give £149,218 as the increased value; wine shows £60,527. The following is our usual extract from the summary table:—

IMPORTS.	1897.	1898.	Difference.
Total value ...	£ 35,179,633	£ 35,605,281	+425,648
(A.) Articles of food and drink—duty free ...	12,576,367	12,195,318	—381,049
(B.) Articles of food and drink—dutiable	2,626,022	2,668,844	+42,822
Raw materials for textile manufactures ...	1,998,536	2,617,136	+618,600
Raw materials for sundry industries and manufactures	5,463,168	5,706,649	+234,481
(A.) Miscellaneous articles ...	1,023,637	1,261,991	+238,354
(B.) Parcel Post ..	76,502	84,573	+8,071

As usual, the table for the month of imported fruits, roots, and vegetables is a very interesting one, always repaying examination. It is as follows:—

IMPORTS.	1897.	1898.	Difference.
Fruits, raw:—			
Applesbush.	247,653	248,126	+473
Cherries"
Grapes"	217,790	274,835	+57,045
Pears"	311,575	169,064	—142,511
Plums"	289,014	257,492	—31,522
Unenumerated"	251,154	328,793	+77,639
Onions"	755,499	664,376	—9,123
Potatoescwt.	91,895	77,721	—14,174
Vegetables, raw, unenumeratedvalue	£112,747	£162,867	+£50,240

The returns of—

EXPORTS

are this month of a more satisfactory nature than have been noted of late. Coal-getters and engineers are now hard at work endeavouring to make up for the time lost in settling disputes by the cruelly cruel method of the strike. The increase in exports over those for the same period in 1897 is placed at £1,639,810—made up thus:—September, 1897, £18,305,275, as against £19,945,085 for the past month. The very recently noted heavy falling off is now reduced to £3,262,018 for the past nine months compared with the same period last year. Exported articles of food and drink increased in value by £159,085; raw materials went up by £573,616; chemicals and chemical preparations, &c., £35,860.

QUERCUS COCCINEA.—In the *American Botanical Gazette*, July, p. 56, mention is made of an Oak, the male flowers of which bore styles in place of stamens. Such changes are, of course, by no means uncommon in monœcious or dioecious flowers, but we do not remember to have met with any such change in the Oak, or to have seen any record of the fact.

THE "HOGG" MEDAL.—As stated in our last issue, there were two of these medals awarded on the morning of the first day at the Palace Fruit Show; subsequently, however, a third was awarded to Messrs. G. BUNYARD & Co., Maidstone. Three of the principal fruit-tree nurserymen were thus honoured on the first occasion of presenting this medal.

BUYERS OF FRUIT TREES MUST HAVE PATIENCE.—The lateness of the present season, and the extraordinary drought, is causing the fruit-tree nurserymen no small amount of trouble. Tree-planters occasionally favour the methods of the

ancient gardeners, and desire to plant their trees upon or before a certain date. The trouble such customers may cause nurserymen this season may be gathered from the following letter which we have received from one of the largest growers in the trade:—

'According to the Calendar, we should now be hard at work executing orders for Roses, Gooseberries, Currants trees, and Conifers, and even lifting some few Pear and Plum trees. But, alas! the land below the surface crumb is as dry as a brick, making all this work impossible; and meantime we are bombarded with letters such as—"I am told that now is the very best time for removing the things I ordered;" "If you are unable to supply what I ordered, you should have said so at the time;" "Unless my order is forthwith executed, please consider it cancelled, that I may be better served elsewhere." Well, what for a remedy? Why, patience. Practically, the season is three weeks late, and as no fibrous roots can be got out of the hard soil, my kind friends, trust to your nurseryman to do his very best. Apples are yet in full growth, and practically a week's heavy rain is wanted before lifting can be started. I send these few lines on behalf of myself and fellow nurserymen, as we, I feel sure, are only too anxious to do our best, and are not responsible when the clerk of the weather and the Calendar do not agree.'

THE SURVEYORS' INSTITUTION.—The first ordinary general meeting of the session 1898-99 will be held at the above premises on Monday, November 14, 1898, when the President, Mr. ROBERT VIGERS, will deliver an opening address. The chair will be taken at 8 o'clock.

THE CARDIFF GARDENERS' ASSOCIATION held a meeting on the 5th inst., when Mr. T. COOMBS, gardener to Lord LLANGATTOCK, The Hendre, Mon., read an instructive paper on the Hardy Fruit Garden; its Formation and Planting. No fewer than twenty members were enrolled during the evening.

THE NURSERY, FLORIST AND FRUIT-GROWERS' SYNDICATE, LTD.—From a circular to hand, it appears that this Syndicate is being formed for the purpose of acquiring the firm known as Edgwarebury Farm, which is upwards of 170 acres in extent, and is situate in Edgware Parish, Middlesex, about 1½ miles from Edgware station on the Great Northern Railway, and about the same distance from Mill Hill station, and is therefore within 9 miles of town, and comprises farmhouse, cottages, and most commodious farm buildings. The share capital is to be £12,000; and 4,500 preference-shares, and 7000 ordinary shares, are now offered for subscription.

HUNGARY.—We are requested by the Austro-Hungarian Minister of Agriculture to publish the following note:—"In consequence of the lamented death of our Queen ELIZABETH, the Minister of Agriculture of Hungary has desired that the fruit, vegetable, and flower-show in connection with the National Horticultural Society, as well as the fruit-fair of Budapest, be not held this autumn, but postponed until next year."

PUBLICATIONS RECEIVED.—*The Growth of Sugar-Beet and the Manufacture of Sugar in the United Kingdom.* By Sir John Bennet Lawes and Sir J. Henry Gilbert. (From the *Journal of the Royal Agricultural Society of England*.) Spottiswoode & Co., New Street Square, London. An unfavourable prognosis is given as to the commercial success of this crop in this country.—*Memoranda of Field and other Experiments on the Farm and in the Laboratory of Sir John Bennet Lawes, at Rothamsted, Herts.* by Sir J. Henry Gilbert.—*The Rothamsted Experiments, Plans and Summary Tables for Reference in the Fields, 1898.* A most serviceable summary of the results of these most important experiments.—*The Yorkshire College, Leeds, Victoria University. Prospectus of the Courses in Agriculture, Session 1898-99.*—*Practical Rose-growing*, by John Harkness. A second and up-to-date edition of a handbook for amateurs on an ever-popular theme. The first part deals with situation, soil, manure, selection of plants, planting, propagating, Roses under glass, and choosing, developing, and staging Exhibition Roses. The second portion deals with Exhibition Roses, Garden or Decorative Roses, and Roses for town gardens, ending with a monthly calendar of work. The whole is plainly written, and if reading would make a successful cultivator those

who look over this book would soon become skilful. —*The Culture of Flowers from Seeds and Bulbs*, and *The Buying and Home Testing of Seeds*. Two handbooks, by E. Kemp Toogood and William Toogood respectively (Southampton: Toogood & Sons). Eminent practical pamphlets; that devoted to bulbs and flowers contains cultural directions and many little pictures; the one on seed-testing will interest amateur growers, and suggest some experiments which they will like to try. —*Nature Notes*, October. —*Information Gazette, touching Divinity, Learning, and Physic*. Edited by the director of the Information Office, Oxford, Mr. C. C. Old, of Magdalen College. "The essence of the Gazette is to offer such suggestions and comments, based on reliable foundation, as shall prove of practical use in the given subject." An original, some will say refreshingly eccentric periodical.

large yellow self flower, of good substance, and a free bloomer. Cycle is a bright yellow, with slight purple shade; it has stout petals, with a deep purple margin. Edgar is also a large and showy bloom; whilst for a free-blooming scarlet and a most useful sort in borders, Cecil is one of the best. Besides the Carnations was a large number of choice Picotees. Some of the new Cactus Dahlias were in bloom, and the show and Pompon varieties were expected to make a fine display.

Passing into a greenhouse used as a flowering-house, the most noticeable feature was the display of Fuchsias on the roof; the stem of one of these was 6 inches round. The growth is carried up and trained on the roof, and a space of 20 feet on one side of this span-roof house is covered with two sorts, Elegans and President. This house contained varieties of Achimenes in baskets, also hanging from the roof.

14 feet high. The top of the wall inside the grounds is almost level with the borders, and so can easily be reached. The wall was originally built so that every other stone stood up some 8 or 10 inches above its fellows, with corresponding hollows between. These latter are utilised by having slate or tiles cemented to the sides, holes for drainage are left at the bottom of the slate; soil is put in these recesses, and everything of a free-flowering character planted from the inside. These have grown freely, and crept over the wall outside, so that the top of the wall presents a dense mass of colour, in which Ivy-leaf and zonal Pelargoniums, Godetias, Zinnias, Coreopsis, Petunias, Marigolds, Campanulas, Salvias, Marguerites, Lobelias, Nicotianas, &c., all contribute a part. A space on the wall the whole of its length immediately below these plants is covered with a dense-growing Sedum, so that the flowers had a green foil below. This picture cannot be seen from the inside of the grounds at all; the public have the pleasure of gazing upon this unique display, and all visitors to Teignmouth may enjoy the sight, since it is within five minutes' walk of the station. The proprietor, H. Hammond Spencer, Esq., is delighted to contribute to the pleasure and enjoyment of those who may favour this spot with a visit.

HOLLYHOCKS AT DULWICH.

It is pleasing to see that efforts are being made to revive the culture of Hollyhocks, which is undoubtedly one of the best hardy plants we are ever likely to possess in our English gardens. The photograph sent (see fig. 86) was taken three years ago, and we have here for many years, within 6½ miles of Charing Cross, had a display equal to it. If this hardy plant be treated rationally, we may (in spite of the disease) obtain it in as good condition as our grandfathers, whose mistaken notions of its requirements all but killed the plants.

The fungus found its opportunity in the unnatural and coddling processes to which the plants were subjected for the purpose of propagation. Several years ago, during a long frost, our plants were unprotected. The soil is London clay, and was frozen to a depth of nearly 2 feet. Many shrubs were killed to the ground. The hardy Cabbage and every bit of green in the kitchen garden perished, but the Hollyhock came through it uninjured, and the photo which was taken the following summer will show this.

There are several ways of propagating the plant without employing heat. The most natural and quickest is from seed, and fortunately it comes pretty true, if not to colour, to character, so that if seed from a good strain be sown, ninety per cent. may be depended on to produce double flowers just as beautiful for garden decoration as the choicest of named varieties.

The seed should be sown thinly in drills in the open ground about the last week in May, and early in autumn the plants may be put out into deeply-dug and well-manured ground. It is important that this work be done early, that the long whip-like roots may have time to get well down into the earth before the next summer. If the plants be moved in the spring these roots get broken, and are then not able to supply the necessary food to the plant during summer. By keeping the colours separate, a fair proportion of each may be planted. It will be found that the darker colours come thickest, and if the seed had been mixed there would be a greater proportion of them put out, and the whites and the yellows may be almost absent.

In addition to the cultivation already mentioned, the necessary staking, &c., during growth, is all the plants require. Artificial manure is useful in the spring, and the plants may be mulched with advantage.

Waterings are not absolutely necessary if the ground has been well prepared, but otherwise they will be required. I sow some seeds every year so as to maintain a supply of young vigorous plants, and they are planted in fresh quarters each season, being allowed to them only two years. Although we have the disease more or less, each season we have been able to laugh at it, as it does us little harm. *B. R. L., Dulwich.*

FIG. 86.—HOLLYHOCKS ADORNING A BORDER AT DULWICH.

SOME DEVONSHIRE GARDENS.

(By our Special Commissioner.)

GLENDAVAGH, TEIGNMOUTH.—So often has it been the case that Chrysanthemum blooms from these gardens have secured high honours at the exhibitions in the western counties, that finding an opportunity to visit Mr. G. Foster, I was glad to avail myself of it. By no means are the Chrysanthemums grown to the exclusion of other plants, for here the taste would seem to be a very broad one, and almost everything that can be grown has a place, and is well looked after.

The border Carnations were the chief feature at the time, for my visit was in August. Some are known named sorts, but by far the large portion are seedlings raised on the place, some of them having been in cultivation for four years. These seedlings include some of much merit, that have been distinguished by names. *Devonia* is a full and distinct flower, and, like almost all the varieties raised here, does not split its calyx; the colour is terra cotta ground, with scarlet and purple flakes. Mrs. G. Foster is distinct in habit and growth, producing a

A sunk pit is devoted to the culture of Muscat Grapes, in which were some bunches of fine size. Black Hamburgh, Buckland Sweetwater, Alicantes, Lady Downes, &c., in other divisions were in every respect satisfactory. A fine lot of Peaches and Nectarines were ripening inside, and in one division espaliers were seen along the centre of a span-roof house, and here were some excellent trees full of fruit. In the kitchen-garden were splendid Apples, chiefly on espaliers. The Pears were not quite so heavy a crop.

The Chrysanthemums were looking well, not too strong, but having clean hard growths. These plants were being afforded rich top-dressing, and over this new soil oyster-shells and pieces of tile or slate were laid. These keep the intense sun-heat from the top of the soil, and it is found that the roots run into the new soil right to the under-side of the shells, &c.

The pleasure-grounds, though not extensive, were in excellent keeping. I was much impressed by the boundary stone-wall. This portion at one part of the arden is just 120 feet in length, and about 12 or

HOME CORRESPONDENCE.

BIRDS IN THE GARDEN.—In your last week's issue, p. 277, "S., Abbey Wood" refers to some recent letters in the *Morning Post* on the above-named subject. The writer assumes that the writers of the letters in question are from a district where birds are not numerous. I beg to assure him that quite the opposite is the case. I have lived over a dozen years in Kent, but in this part of Berkshire there are as many birds to the acre as there are in a mile of the parts of Kent I am familiar with. Further, it is a well-kept garden, and has a proper provision of garden netting. Speaking from a gardener's point of view, the only bird I consider it necessary to destroy is the bullfinch. For the past eighteen years I have had charge of a large garden, practically in a wood, where birds are very numerous, and I have succeeded in keeping a large family well supplied with the usual produce of a gentleman's garden; but I think your correspondent "S." has not read his *Gardeners' Chronicle* carefully, or taken an interest in the above subject for any lengthened period. The subject has been frequently treated in the pages of the *Gardeners' Chronicle* by able writers like Mr. Harrison Weir. Upon the sparrow question I pass no opinion, only to remark, in passing, that although they are very numerous here, they never attack my Peas; but I have noticed them very busy in the corn fields making a nice fringe of threshed-out grain on the Oat-sheaves, and looking at you as much as to say, "We don't want your Peas; Farmer Giles provides us with plenty of grain, and allows us to eat it in peace and quietness." With respect to the Mountain Ash berries, I think the writer must be a young man to notice that fact, as in dry summers like the past, missel-thrushes and blackbirds always eat them, and quite right, too, as some compensation for destroying the insect pests during the previous nine months of the year, and Nature always has compensations to those with eyes to see and gratitude to be thankful. *R. M., Newbury* (writer of several letters to the "Morning Post").

—I note that "S., Abbey Wood," on p. 277, refers to the damage done by birds. We, too, have somewhat suffered by their frequent ravages upon the Pea-quarters, Strawberry-quarters, Plum-walls, and also Apples and Pears; but with the free use of fish-netting, these can be easily kept away. Not very long since we were seriously attacked by maggots upon the Cabbage and Cauliflower-quarters—in fact, all varieties and kinds of Brassica were attacked, and I immediately set boys to work to pick them off and destroy them. I have been visiting during the past fortnight, and have, during my rambles, seen Cauliflowers, &c., very much injured by these maggots. But in these gardens I saw one morning dozens of blackbirds and thrushes attacking them most voraciously, and in a few days were anxiously looking for more, and indeed were looking about as carefully as a boy who had lost his only sixpence, but they had cleared them all off, and before very much damage had been done. I have also seen our small friends, the sparrows, wrens and tits, picking off aphids from the Rose-trees, and in this way they have done an immense deal of good. This season has been a very trying one for the birds, as hereabouts there is very little water, and the birds have attacked the fruit, perhaps a little more than usual; but as I said at the commencement of this short note, we at once put netting on all the important fruit-crops. The wasps, flies, and bees, have done much more damage than the feathered tribe. We have just paid for 158 wasp-nests, destroyed within half-a-mile of these gardens. *W. A. Cook, Compton Bassett, Calne, Wilts.*

SPRUCES DROPPING THEIR LEAVES.—It is certain that the premature defoliation described by your Irish correspondent (p. 277), was due to the attack of insects. In two young mixed plantations on hill-side property here belonging to the University, about one-half of the Spruces were affected in a similar way in May. The cause was not apparent at first sight, the insects being minute, and of the same colour as the needles. A closer examination showed that the infested branches were crowded with aphides (visible by aid of hand-lens in photograph enclosed). The sticky substance, copiously secreted by the insects, gave a glistening appearance to badly-infested trees. Before long the leaves died, and when the trees were shaken, the foliage—almost the whole of it in some cases—fell in a shower. The obvious explanation of this was, that the stomata had become

thoroughly clogged with the secretion. Recent inspection of the trees shows that the growth has been greatly retarded by the infestation. Some of the foliage subsequently produced has died, and much remaining green is not nearly so strong as that of the trees which escaped the attack. *John H. Wilson, D.Sc., St. Andrews.*

BLUE FLOWERS.—Bright blue flowers are welcome at any time, but doubly so are the lovely flowers of *Salvia patens*, the ultramarine colour of which contrasts so finely with the *Crocasmia imperialis* and *Lobelia fulgens* growing by its side. *Ceanothus Gloire de Versailles* continues, like the *Salvia*, to give us its welcome, if pale, blue, flowers in these shortening autumn days; but in richness of colour and abundance of flower it is far surpassed by the *Caryopteris mastacanthus*, a small plant of which having stood out the last winter is now covered with its sapphire-blue flowers—it is a plant too seldom seen. *R. Milne-Redhead, Clitheroe.*

MICE EATING GRAPES.—A fortnight ago we were much troubled by mice eating the Grapes. The destruction they made even in a night was deplorable, not only by nibbling the berries, but by dropping the chewed skins into the middle of the bunches, from which it was impossible to remove them, save by cutting the bunches and holding them under a tap of running water. As a preventive had to be promptly applied, we got sheets of glazed paper cut into squares of about 12 inches. These squares were cut midway from one side to the centre, and brought carefully over the top of the bunches, the stem of the bunch passing along the cut. The two sides of this cut portion were passed one over the other and affixed with a pin, forming a funnel-shaped cowl, somewhat similar to an ordinary lampshade, with the bunch suspended inside, and resting only on two or three of the uppermost berries. Where a bunch did not hang clear of foliage and wires, the shoot was cut partly through and bent down, being secured from breaking off by a sling. So far this plan has been quite effectual; the only berries attacked since have been some on one side of a bunch near a string stretched horizontally, along which the delinquents must have walked. *B. J.*

BORDER CARNATIONS.—The present time is admitted to be the best for planting border Carnations. Having had a poor gravelly soil, I found the culture of Carnations to be most difficult, until I changed both soil and stock. Since doing this, Carnations have given me no trouble. Previous to planting, the beds are well dug, and a good dressing of farmyard manure is incorporated with the soil. A surfacing is always given of burnt clay and wood-ashes. The beds are made firm by treading, raked over, and the plants are planted with as good balls as can be procured, 15 inches apart. If the weather is dry, the plants are well watered with a rose-can to settle the soil. After severe frost they should be looked over, and any that are loose must be gently but firmly pressed into position. The strongest plants should be supported by a small stake, to prevent the wind from blowing them about. The best stakes I have found are made of galvanised wire cut in 3 feet lengths; they look smart, and are nearly the same shade of colour as the Carnation foliage. All Carnations are greatly benefited by disbudding, some good growers even thin the grass, and by doing so the remaining grass becomes stronger, and better layers are secured. The idea is sound and well worthy of practice. Heavy rains when the plants are in flower cause destruction not only to the expanded flowers, but to the bursting pods. Where protection can be given from sun and rain, the flowers are much cleaner, and present a brighter appearance when cut. Raisers should not lose sight of the value of the clove scent in Carnations when selecting new varieties of varied colours. Seedling Carnations are very useful; although there may be a percentage of singles, the bulk of them will be of much value for decorative purposes. *W. Angus, Aberdeen.*

GLOBE-SHAPED BEET.—Recently, at Chiswick and the Drill Hall, an Award of Merit was given to a capital stock of a deep, round-rooted, highly-coloured Beet, sent for trial to the former place, I think, by Messrs. Watkins & Simpson. Only a few days since the opportunity offered for me to pull and have cooked roots of a stock of exactly similar character obtained from Messrs. Sutton & Sons, under the name of Sutton's Globe, and grown in a Beet trial I have at Richmond. It is a first-class strain, the

roots deep, solid, rich in colour, and fine in flesh. During such a dry season as the past has been these round-rooted forms have done better than have the tapering-rooted ones, on a very dry porous soil. If it were the rule to sow seed of the former early in the spring, to give roots to last into October, and seed of the tap-rooted Beets at the end of May, very much more satisfactory results would often be obtained. *D.*

THE CHRYSANTHEMUM-RUST.—It is certainly odd that seeing, according to Mr. G. Massee's description of its life and operations, the spores of this fungus needs moisture on the leaves to excite germination, that the outbreak recently mentioned amongst Chrysanthemums should have occurred during one of the driest summers on record. The obvious inference is that dry air and hot aridity is more helpful to the fungus than is a moist season, yet we see in the somewhat analogous Potato-fungus that the heat and drought of the past summer have done so much to check its development, that breadths of Potato plants may be seen even in October green and vigorous, truly a *lusus naturæ*, in these days of *Peronospora* operations. We do know how important a part moisture plays in spore germination on the Potato leafage, and this season we see ample evidence, were it needed, of the counteracting effects of drought. Naturally, we might have expected that Chrysanthemum leafage in relation to an attack of an allied fungus would have equally benefited from dryness of atmosphere. But it may be, in the case of these plants, that their foliage has frequently been artificially moistened by moderate syringing, which sufficed to damp the leafage, and thus created favourable conditions for fungoid growth. On the other hand, frequent rains being more continuous, would perhaps have washed the rust-spores from off the leathery leaves of the Chrysanthemum plants, and thus rendered them harmless. The leafage of the Potato-plant is notoriously soft and hirsute, hence presents, when moisture prevails, much readier soil for fungoid germination. However, just now everybody interested wants to know of a preventative remedy, and that Mr. Massee has furnished. *A. D.* [It being customary to syringe Chrysanthemum plants in pots once or oftener on bright days, they cannot be compared to the Potato crop in the advantages possible from dry weather. Syringing may be necessary, but it is one of the surest means of spreading the "rust" fungus. *ED.*]

CALCEOLARIA AMPLEXICAULIS.—This species of *Calceolaria* was introduced from Peru in the year 1845, and soon became a popular plant. About twenty years since, however, the great rage for carpet-bedding began to elbow out of fashion such tall-growing subjects. The true merits of this *Calceolaria* are, however, again becoming appreciated. Given proper cultivation, no kind of weather, wet or dry, seems to affect them adversely. The terminal corymbs of pale yellow blossoms are most profusely displayed, and tend to give colour as well as variety to the garden. In a mass this *Calceolaria* is effective, and also when associated with *Lavatera trimestris*. This plant, however, should not be planted sufficiently thickly to interfere with the growth of the *Calceolaria*, which should be the base of colouring. Catalogues generally describe the height of growth as reaching 2 feet. Under ordinary cultivation this is a low estimate. At Aldenham Park, I lately saw a circular bed filled with plants fully 4 feet high, and it was a mass of colour, surrounded with bright-coloured *Begonias* and *Pelargoniums*. Cuttings should be inserted thickly in boxes or in cold frames during September or early October. Keep them from frost, and put out the plants into more boxes or a cold frame in March. Pinch out the point of each shoot to induce a bushy habit. *E. Molyneux.*

TRADE NOTICE.

S. S. MARSHALL, LTD.

The directors of this company have now taken over and amalgamated the two businesses of nurserymen, fruit-growers and market-gardeners, carried on by Mr. S. S. Marshall, and Messrs. Marshall & Pertwee, of Barnham, Sussex. Messrs. W. W. Pertwee and J. P. Goodacre will act as managing directors, and Mr. S. S. Marshall will remain as general managing director of the company.

SOCIETIES.

ROYAL HORTICULTURAL.

OCTOBER 11.—A meeting of the committees of this Society was held in the Drill Hall, James Street, Westminster, on Tuesday last. There was a fine display of exhibits, and this notwithstanding that the October exhibition of the National Chrysanthemum Society was held simultaneously at the Aquarium. In the afternoon, an interesting lecture was delivered by Professor HENSLOW upon some of the plants exhibited.

AWARDS.

The Orchid Committee recommended a First-class Certificate to *Lælio-Cattleya Dominiana* var. *Langleyensis* from Messrs. JAS. VEITCH & SONS; Awards of Merit to *Dendrobium Huttoni sanguinolentum*, also from Messrs. JAS. VEITCH & SONS; *Lælio-Cattleya Henry Greenwood*, from Messrs. B. S. WILLIAMS & SON, Upper Holloway; and *Sopbro-Cattleya* × *Cleopatra*, from Messrs. CHARLESWORTH & CO., Bradford. There was a very fine exhibit of plants in flower of *Dendrobium formosum giganteum* from Mr. J. Hudson, gr. to Messrs. DE ROTHSCHILD, Gunnersbury House, Acton.

By the Floral Committee, two First-class Certificates were awarded—one to a Palm, *Linospadix Petrickiana*, from Messrs. F. SANDER & CO., and the other to *Alocasia spectabilis*, from Messrs. JAS. VEITCH & SONS. Awards of Merit were recommended to *Chrysanthemum Jules Mary*, from Mr. WELLS; to *Cactus Dahlia Ebony*, from Mr. MORTIMER; and to *Cordylone Eckhautii*, from Messrs. JAS. VEITCH & SONS.

By the Fruit Committee, Awards of Merit were recommended to *Melon Gunton Scarlet*, from Mr. Allan, gr. to Lord SUFFIELD; to *Melon Wythes' Scarlet*, from Mr. Wythes, gr. to Earl PERCY; to a large red-fruited Plum, named *Primate*, from Messrs. T. RIVERS & SON; to *Apple Invincible*, from Mr. W. BODALY, Towcester; and to *Apple Mrs. Jno. Seden*, from Messrs. JAS. VEITCH & SONS.

Floral Committee.

Present: W. Marshall, Esq., chairman; and Messrs. Jno. Fraser, Chas. D. Drury, H. B. May, J. H. Fitt, Wm. Howe, Jno. Jennings, Jas. Hudson, J. F. McLeod, C. J. Salter, J. D. Pawle, Chas. E. Pearson, W. Bain, Geo. Gordon, Jas. Walker, J. T. Bennett-Poß, Henry Cannell, Ed. Mawley, Chas. Blick, Harry Turner, Geo. Paul, D. B. Crane, E. T. Cook, and Chas. Jeffries.

Mr. H. B. MAY, Dyson's Lane Nurseries, Upper Edmonton, had an uncommonly pretty exhibit that covered half of the length of one of the central tables. The exhibit was really one of exquisitely cultivated plants of the lovely winter-flowering *Begonia Gloire de Lorraine* in 5-inch pots. These were disposed on pedestals, and in various positions, and excellent examples of choice varieties of Ferns. The effect was very beautiful (Silver-gilt Flora Medal).

Messrs. WM. PAUL & SON, Waltham Cross Nurseries, Herts, had an exhibit of Roses in pots of Tea and Noisette varieties, and bunches of bloom from the open of many varieties. One of the newest of the plants in pots was *Tea Rose Queen Olga of Greece*, a warm salmon-pink bloom, very pretty in bud; *Empress Alexandra of Russia*, and other new ones were also remarked. A fine plant of *Yucca gloriosa variegata* in a pot from Messrs. Paul was shown with a flower-spike in course of development (Silver Flora Medal).

From THOS. S. WARE, Ltd., Hale Farm Nurseries, near Tottenham, came an exhibit of single-flowered Dahlias, perennial Asters, and a few varieties of Nerine.

A First-class Certificate was awarded Messrs. F. SANDER & CO., St. Albans, for *Linospadix Petrickiana*, a neat-habited and ornamental species of this genus of Palm with pinnate leaves.

Mr. W. WELLS, Earlswood Nurseries, Redhill, showed several varieties of *Chrysanthemum*, and an Award of Merit was recommended to the variety *Jules Mary*, a purple-crimson Japanese flower, of moderate size, and probably useful as an early-flowering decorative variety.

A First class Certificate was recommended to *Alocasia spectabilis*, shown by Messrs. JAS. VEITCH & SONS. The leaves are broad ovate hastate, metallic-green, the mid-rib and large veins very pale green, whilst the interspaces are beautifully veined with white.

A green-leaved *Cordylone* (*Dracæna*), named *Eckhautii*, was recommended an Award of Merit. It has narrow foliage (not more than an inch wide), much recurved, and will make a good decorative plant.

From Mr. R. GÜLZOW, Melbourne Nurseries, Bexley Heath, Kent, came fourteen plants of *Anthurium crystallinum* illustre. The plants were young, but being much variegated and mottled with creamy yellow, they are exceedingly decorative. It is said that the plants grow as large and vigorously as *A. crystallinum*, and it will undoubtedly be a much-coveted plant.

Messrs. PAUL & SON, Cheshunt, had a group of Rose-trees in pots, showing many varieties of Teas, &c., useful for winter-blooming. All of them were represented by finely-bloomed plants. There was also a collection of cut Roses in numerous varieties.

Messrs. PAUL & SON also showed sprays of *Ligustrum maculatum variegatum*, *L. japonicum aureum*, *Aucuba japonica rotundifolia*, a bold, but green-leaved variety, and of *Caryopteris Mastacanthus*, with its pretty, pale-blue flowers (Silver Flora Medal).

Messrs. JAS. VEITCH & SONS, Royal Exotic Nurseries, Chelsea, had some capital sprays of the new *Physalis Francheti*. The growing points of the shoots were yet quite green, and below upon each were eight or nine very brilliantly coloured calyces. Some sprays of an excellent strain of *Pentstemon*s, with large and beautifully-coloured flowers, were also from Messrs. JAS. VEITCH & SONS (Silver Banksian Medal).

A grand exhibit of Perennial Asters, or Michaelmas Daisies, was shown by Messrs. JAS. VEITCH & SONS, Royal Exotic Nursery, King's Road, Chelsea. These were plants lifted from the open ground and placed in pots, and accordingly the various habits of the varieties were illustrated, as well as the flowers of each. There were some excellent varieties of *A. Nova Angliæ*, one of them, *pulchellus*, being a large purple flower of grand effect. The varieties of the pretty *A. paniculatus*, too, were of great effect in the group; although the flowers are small, they are produced in great numbers. Then there were some of the dwarfier varieties that faced the group, many of these being bushy plants of a foot high, 2 feet, and so on. But we cannot enumerate a title of the desirable varieties. The Aster is an indispensable plant, and one is forcibly reminded of this fact every autumn (Silver Flora Medal).

A fine group of plants in flower of hybrid greenhouse *Rhododendrons* was also shown by Messrs. JAS. VEITCH & SONS (Silver Banksian Medal).

A beautiful exhibit of *Nepenthes* was made by Mr. Geo. Wythes, gr. to Earl PERCY, Syon House, Brentford. One of the most difficult plants to cultivate successfully, the *Nepenthes* are seldom exhibited from a private establishment, and such a large collection of healthy-looking plants, many of which carried large and well-coloured "pitchers," as was shown by Mr. Wythes is worthy all praise. We noted amongst the varieties shown *N. sanguinea*, *Amesiana*, *Mastersiana*, *Wrigleyana*, *Morganke*, *Wittei*, *Hookeriana*, *formosa*, *hirsuta*, &c., also a few *Sarracénias* (Silver-gilt Flora Medal).

Mr. GEO. PRINCE, of the Oxford Nurseries, had a few beautiful Roses, more particularly of the varieties *Marie Van Houtte* and *Maman Cochet*. By sprays, natural foliage, &c., a very fine effect was produced.

Sir T. LAWRENCE, Bt., Burford, Dorking (gr., Mr. Bain), showed sprays of some varieties of *Lobelia* and *Pentstemon*s. *Lobelia Queen Victoria*, *Crimson Gem*, *British Maid* (pink), *Caroline Gem*, and *Prince Arthur*, were all pretty; and the large flowered *Pentstemon*s also.

From Mr. S. MORTIMER, Rowledge Nurseries, Farnham, was shown a new dark coloured *Cactus Dahlia*, named *Ebony*. It is of large size and correct form, and is said to be deeper in colour than either *Matchless* or *Night* (Award of Merit).

Orchid Committee.

Present: Harry J. Veitch, Esq., in the chair; and Messrs. Jas. O'Brien (hon. sec.), De B. Crawshaw, J. Gurney Fowler, H. Pallantine, H. M. Pollet, E. Hill, J. Gabriel, F. J. Thorne, W. Cobb, W. H. Young, W. H. White, H. Little, T. W. Bond, S. Courtauld, T. B. Hayward, and H. J. Chapman.

Sir TREVOR LAWRENCE, Bart., Burford (gr., Mr. W. H. White), showed an interesting group of rare species and hybrids, among which were *Dendrobium Phalenopsis hololeucum*, a snow-white variety, the plant shown being a second introduction of the noble albino, the one now shown having probably rounder flowers with broader petals than the one previously certificated; *Lælia præstans purpurea* (grown at Burford since 1882), a richly-coloured form of the true type, displaying the peculiar features of lip which distinguishes it from *L. primula*, a pretty, nearly white form of which was also shown; *Cattleya* × *St. Benoit* (*Schrodæ* × *Acklandiæ*), a charming hybrid with light rose-purple sepals and petals, and magenta-purple lip, much resembling a variety previously shown as "*Duke of York*;" *Miltozia* × *Lamarcheana*; a fine specimen of *Cypripedium* × *Lawrebel* with ten flowers; *C. × regale* with several blooms; two fine spikes cut from a specimen with nine flowers of *Lælio-Cattleya* × *Exoniensis*; a portion of a plant of the original sent out by Messrs. VEITCH some thirty years ago, and which has been ever since in Sir Trevor Lawrence's collection; a fine pan of the scarlet *Habenaria militaris*, and the first plant exhibited of the elegant *Epidendrum porphyreum*, with reed-like stems, clad with dark green purple tinted leaves, and bearing at the top drooping panicles of orange-coloured flowers, with white lip, changing to yellow (Botanical Certificate).

Messrs. DE ROTHSCHILD, Gunnersbury House, Acton (gr., Mr. J. Hudson), staged a very effective and remarkable group of marvellously well-grown *Dendrobium formosum giganteum*, the thirty-four specimens bearing between them nearly 700 of their grand snow-white flowers, with orange centres. Staged with them were some good *Odontoglossum grande* and *Vanda Kimballiana*, and a Silver-gilt Flora Medal was awarded in recognition of the floral beauty of the group, and of Mr. Hudson's skill in developing it so well.

Messrs. J. VEITCH & SONS, Chelsea, staged a group of fine hybrid Orchids, in which the centre of interest was their reproduction of *Lælio-Cattleya* × *Dominiana* (*C. Dowiana* × *L. purpurata* ?), one of their earliest and best productions, and which was now called *L.-C. × Dominiana Langleyensis*, and deservedly awarded the only First-class Certificate given at the meeting. The large bold flowers had pale pink sepals and petals, the petals delicately veined with purple. The broad labellum was of a rich claret-purple, veined with yellow at the base, and with a narrow lavender-coloured margin. Another fine old favourite, now honoured with an Award of Merit, was *Dendrobium* × *rhodostoma* (*Huttoni* × *sanguinolentum*) which almost perpetually bears its French-white, waxy flowers tipped with claret colour; and very attractive

were specimens of *Lælio-Cattleya* × *callistoglossa* var. *ignescens*, and *L.-C. × Nysa*.

WALTER COBB, Esq., Dulcote, Tunbridge Wells (gr., Mr. J. Howes), sent a grand plant of a fine variety of *Vanda Sanderiana*, bearing five spikes, with an aggregate of fifty-one flowers and leads, and for which a Cultural Commendation was given. Also *Cypripedium Percival Cobb*, a dark-coloured hybrid, probably of *Cypripedium* × *Harrisianum* superbum.

Messrs. HUGH LOW & CO., Bush Hill Park, Enfield, were awarded a Bronze Medal for a group in which were *Cymbidium Traceyanum*, *Vanda cærulea*, *Lælio-Cattleya* × *Schilleriana*, *Cattleya superba splendens*, *Cycnoches chlorochilon*, *Odontoglossum cariniferum*, *O. grande*, *Dendrobium Lee-anum*, *D. Lowi*, *Cattleya Bowringiana*, *Oncidium ornithorhynchum album*, and *Cypripedium* × *Sallieri Heyanum*, &c.

Messrs. B. S. WILLIAMS & SON, Holloway, showed *Lælio-Cattleya* × *Henry Greenwood* (*L.-C. × Schilleriana* × *C. × Hardyana*), a plant from the same batch from which it was first exhibited at Ghent. The flowers were prettily formed, the sepals cream-coloured tinged with pink, the petals similarly coloured, but with fine rose-purple veining. Lip white at the base veined with rose, the middle portion chrome-yellow, and the front and tips of the recurved side lobes velvety-purple (Award of Merit). Messrs. Williams also showed the fine *Cypripedium Charlesworthi magnificum* and *Vanda concolor*.

Messrs. GEO. PAUL & SON, The Old Nurseries, Cheshunt, were awarded a Silver Banksian Medal for a group of very fine *Masdevallia tovarensis*, very densely set with their pure white flowers. The plants had been kept in a cold frame all the summer, shaded with wood-lath blinds. The pots were placed within an outer pot, the latter standing in water; at this season they are placed in a north house from which the lights are removed at night. Also with them were some good *Cypripedium Spicerianum*.

B. B. BAKER, Esq., Palace Road, Roupell Park, Streatham, showed a fine plant of *Odontoglossum grande*, with twenty-five flowers (Cultural Commendation).

W. A. BILNEY, Esq., Fir Grange, Weybridge (gr., Mr. Whitlock), showed two very finely flowered specimens of *Lælia pumila* (Cultural Commendation).

Messrs. CHARLESWORTH & CO., Heaton, Bradford, sent a three-flowered inflorescence of *Sopbro-Cattleya* × *Cleopatra* (*S. grandiflora* × *C. Leopoldi*). The flowers in size were similar to other *Sopbro-Cattleyas*, the sepals and petals of a peculiar red colour; the trilobed lip resembled the *Cattleya* parent in form, but on a small scale; yellow at the base; the tips of the side-lobes and the middle-lobe bright cherry-red (Award of Merit).

Messrs. F. SANDER & CO., St. Albans, showed an interesting group, in which were the singular *Angræcum ichneumoneum*, with pendent racemes of flowers, after the manner of *A. pellucidum* (Botanical Certificate and Cultural Commendation); the new *Dendrobium puniceum*, Rolfe; the pretty *Maxillaria striata*; a fine pan of *Stenoglottis longifolia*; the singular *Saccolabium curvifolium penangianum*; the fine *Miltozia vexillaria Leopoldi*, *Habenaria carnea*, *Lælia pumila*, *Cattleya Mantini inversa*, &c.

F. W. MOORE, Esq., Royal Botanic Gardens, Glasnevin, Dublin, sent the singular *Maxillaria longissima*, with long narrow yellow sepals and still narrower whitish petals, the lip being cream-white, delicately veined inside with dark rose (Botanical Certificate); and *Zygopetalum Gibizæ*, a variety of the *Warszewiczella* class, near to *Z. marginatum*.

Fruit Committee.

Present: Philip Crowley, Esq., chairman, and Messrs. J. Willard, Jos. Cheal, P. C. M. Veitch, A. F. Barron, W. Pope, T. J. Saltmarsh, J. Wright, Alex. Dean, G. T. Miles, Jas. H. Veitch, J. W. Bates, Geo. Wythes, W. G. Empson, J. Smith, F. Q. Lane, Geo. Reynolds, and Robt. Fife.

Messrs. GEO. BUNYARD & CO., Maidstone, exhibited a collection of 100 dishes of cooking Apples in remarkably good condition, it being one of the finest exhibits this firm has shown at the Drill Hall. Were it not so soon after the Crystal Palace show we might be tempted to particularise the varieties, but it will be sufficient to say that the 100 varieties were all good ones, and scarcely one of them was represented in other than first-class specimens (Silver-gilt Knightian Medal).

An Award of Merit was recommended to a large kitchen Apple, named *Invincible*, from Mr. D. BODALY, Green's Norton, Towcester, Northampton. The fruits are angular, red on one side, and green on the other, more or less covered with small spots. The eye is almost closed in the deep socket, and the stem is also deeply set.

A curious small-fruited Tomato, with the name of Walker's Green Gage, was shown by Mr. JNO. WHITE, Blythwood Gardens, Maidenhead. The fruits appear to ripen whilst green, eventually becoming coloured to a small degree.

A pretty little Apple was shown by Messrs. J. VEITCH & SON, Royal Exotic Nursery, Chelsea. It is from a cross between King of the Pippins Apple and the Transcendent Crab. The fruits are fairly intermediate, and it will be a very ornamental Crab, and probably a useful Apple also. It is known as Mrs. J. Seden.

A pretty fruit of *Melon*, Empson's Seedling, was shown by Mr. Empson, gr. to Mrs. WINGFIELD, Amptill House, Amptill.

Messrs. R. VEITCH & SON, Exeter, showed a very fine sample of Potato, Walter Raleigh (Vote of Thanks).

Some poorly-coloured Peaches were shown by C. J. SHEPHERD, Esq., Maidstone. They were described as seedlings from *Nectarine Victoria*, and were raised in 1894. This variety known as *Princess May* was passed over.

Messrs. T. RIVERS & SON, Sawbridgeworth, showed fruits of an excellent large-fruited red Plum, known as Primate, to which an Award of Merit was recommended.

A twin-fruit of Melon Frogmore Scarlet, which weighed 7 lb. 10 oz., was shown by an exhibitor whose name did not appear. We have already figured a twin Cucumber in these columns, and the Melon like it is the result of the union of two flowers at a very early stage of growth.

A collection of thirty-six dishes of Pears from M. R. SMITH Esq., The Warren, Hayes, Kent (gr., Mr. C. Blick), was very commendable. Bearing in mind the fact that the present season Pear crop has been a very indifferent one, the samples shown were first class. A few of the varieties, such as Doyenné Boussoch, Madame Treyve, Beurré Hardy, Souvenir du Congrès, were in a ripe condition (Silver-gilt Knightian Medal).

Another collection of Pears and of Apples was shown by Mr. A. H. Rickwood, gr. to Dowager Lady FREAK, Fulwell Park, Twickenham. There were nearly thirty dishes of Pears, and about forty of Apples (Silver Knightian Medal).

Mr. Allan, gr. to Lord SUFFIELD, Gunton Park, Norwich, showed half-a-dozen fruits of a new Melon, named Gunton Scarlet, a scarlet-fleshed variety of moderate size and good flavour. The exterior is yellow, sparsely but prominently netted (Award of Merit).

Several other seedling Melons were exhibited, including one from Mr. Geo. Wythes, gr. to Earl PERCY, Syon House, Brentford. It is a scarlet-fleshed fruit, with yellow exterior, and the flavour is good (Award of Merit).

A collection of Potato-tubers, in twenty six varieties, from Mr. R. W. GREEN, Wisbech, served to show how cleanly the tubers lift this season. The crop generally has been exceptionally free from disease, and the tubers should keep well. Some of the best varieties were represented (Silver Banksian Medal).

From Messrs. H. CANNELL & SONS, Swanley, Kent, came an exhibit of fine Onions of large size and good weight. Amongst the varieties were Improved Wroxton, Ringleader, Masterpiece, Reading Improved, Cannell's Selected White, Spanish, Cranston's Excelsior, Rousham Park Hero, Ailsa Craig, Anglo-Spanish, The Lord Keeper, Cocoa-nut, Sandy Prize, Cannell's Al; also Garlic, &c. The types were good, and well selected. There were twenty-six varieties (Silver Knightian Medal).

SCOTTISH HORTICULTURAL.

OCTOBER 4.—An ordinary monthly meeting of the Scottish Horticultural Association was held on the above date.

A paper on "The Influence of the Press on Horticulture," by Mr. A. S. GALT, was read by Mr. R. LAIRD. Before the advent of the Press to its present place of honour and of power, the theory and practice of horticulture consisted largely in the making and keeping of secrets; the eager questionings of youth were met with the answer, "Ah! my laddie, that's a secret." With the higher light and safer leading of our horticultural and general literature, the idols of secrecy have been smashed, and the practical man vies with the Press in clearly revealing the secrets of Nature and art as revealed in horticulture. Nor is there any antagonism between the highest and best literature and the most solid practice. Rightly understood these are not two, but one. The Press voices clearly and gives fuller expression to our best practice, and pictures more vividly our great object-lesson of beauty and utility in field and garden. Nor can any passive policy of ignoring the Press, nor any conspiracy of silence, arrest the progress of our horticultural literature.

After a few remarks on the scope and object of the Press, Mr. GALT proceeded to divide the Press into two—the lay or general, and the special or horticultural. Horticulture is essentially the industry by which mankind is fed and clothed. Horticulture is also an important science, claiming relation to other sciences, and has thus close relation to mind as well as matter. And yet, as a rule, the general Press has little to say about horticulture, and when it does speak, not seldom makes mistakes, more amusing than instructive, through probably being buttonholed by some crank.

It may be convenient to divide the horticultural Press under the three heads of—The periodical Press, mostly weekly; books dealing with special subjects, as trade, literature, nurserymen's catalogues, pamphlets, &c. These are educational agencies among gardeners of the highest potency and value. They keep them up to date in their information.

No trade or profession is better served with manuals than horticulture, encyclopedias abound, and some of these are now and again being pulled up to date through new editions. Nicholson's Dictionary of Gardening, The Treasury of Botany, Thompson's Gardeners' Assistant, are merely samples of useful books that abound, and that have proved companions, friends, mentors, to thousands of gardeners. Special books, manuals, crowd the highways and byeways of horticulture on fruit, vegetable, and flower culture, Ferns, Roses, herbaceous plants, hardy and exotic plants. Principles are being expounded as well as facts circulated through the Press. Unless this is done, the gardener becomes the mere slovenly imitator of his predecessors. Subsequently, the Press quickens dull brains, fosters dullards into students, and presents each with a set of keys, that virtually open most of the closed doors he meets with in his everyday life, enabling him to find that what he reads bears directly upon the trivial round, the common task of his daily gardening.

The highly educational and other advantages of our highly improved trade literature must be obvious to all. The descriptions of these are true to fact, the illustrations *fac*

similes of Nature, and the cultural instructions the best available. Contrasted with some of their survivors of the olden times, we see how fast and how far we have travelled in higher and better directions.

The duty of gardeners towards the Press.—Make your wants known through it by advertising and describing them. Perhaps this is best done in the words of an American journalist to his readers: "Let us know what you are doing."

The effect of the Press on the individual appears when we remember that nothing develops the thoughtful man like reading; neither is it true that only fools engage in Press controversies; discussions often flash out new light, and all who take part in discussion, may, and often do, come out gainers. To be sure of our facts is the first qualification for Press-work. The influence of the Press on gardening as a profession has raised its quality, and done a good deal towards raising its market value in higher wage, &c. The battle is not yet over because it is not yet won.

Partly through the educational standard of England being raised up to, or beyond the level of Scotland, Scotchman and Scotland have lost the monopoly of first-class situations in both countries. We must take what comfort we can from Mr. GALT's explanation, that the Northern has not fallen away, but the Southern has gone up.

Mr. GALT concluded his interesting paper with a long paragraph on Press advertisements, and a hearty commendation of the Gardeners' Charities.

The lecture gave rise to a very animated discussion, in which several speakers condemned the Press as worthless, while others spoke of its services to horticulture in the highest terms.

THE EXHIBITS INCLUDED.—

a fine collection of small flowers. Early Chrysanthemums from Messrs. THOMAS METHVEN & SONS, Mr. CHAPLIN, St. Leonard's Park, and Messrs. R. B. LAIRD & SONS. Messrs. JAMES GRIEVE & SONS showed some fine strains of Pansies. The president (Mr. TODD), also showed a very choice vaseful of paper-white Pyrethrums, so much more chaste and elegant than white Asters at their best; likewise a vase of Gaillardias, and a bouquet of General Jacqueminot Roses, with the soft pinky Mrs. John Laing in the centre, and a few very dark Roses near it. Mr. ALEX. MACKENZIE, of the Warriston Nurseries, Edinburgh, gave some interesting notes on Mr. Methven's exhibit of early Chrysanthemums.

LOUGHBOROUGH AND DISTRICT GARDENERS' MUTUAL IMPROVEMENT.

OCTOBER 7.—An exhibition of hardy fruits was held in the Corn Exchange on the above date. The display of fruits, numbering 400 dishes, was one of the best exhibitions of Apples and Pears ever got together in the neighbourhood.

There are no prizes offered, the object of the association being to compare notes of merit, and to correct the nomenclature of doubtful varieties of fruits, and at the same time to afford a good object-lesson to would-be planters by placing before them the best and most reliable varieties to select from. During the evening the exhibition was well attended. At 7 P.M. Mr. C. C. HURST, F.L.S., gave an instructive and scientific lecture upon the "Origin and Improvement of Our Hardy Garden Fruits." In the absence of the president of the association who, owing to business engagements, was unable to be present, the chair was taken by the Mayor, Ald. W. TIDD, J.P. D. R.

UNITED HORTICULTURAL BENEFIT AND PROVIDENT.

OCTOBER 5.—The annual dinner was held on the above date, at the Holborn Restaurant, when Geo. Bunyard, Esq., V.M.H., presided.

There were about 110 persons present, many of whom being either honorary or benefit members. The chairman, in proposing the toast of the evening, stated that the increase of members continued in a most satisfactory manner, the present number of benefit members being 728. He urged all of those present to do their utmost to make the unique advantages which this Society offers to its members better known, and expressed a hope that ere another annual dinner was held that 1000 members would be on the roll. Mr. Bunyard explained in a concise manner the working of the Society, and the peculiar advantages that were within the reach of all who joined its ranks. The treasurer, Mr. HUDSON, who responded, thanked the chairman for his advocacy of the Society's claims, and expressed a hope that more young gardeners would join in the future than had done in the past. The Voluntary Convalescent Fund, established by the instigation and liberality of Mr. N. N. Sherwood, and the munificent donations of Mr. and Mrs. H. J. Veitch, renders it possible to assist young men who may after an illness need a change of air during convalescence. Several other gentlemen spoke in support of other toasts, and numerous donations were announced during the evening. For full particulars as regards this Society of, and for the benefit of gardeners, we refer enquirers to Mr. W. COLLINS (the secretary), 9, Martindale Road, Balham, S.W.

OCTOBER 10.—The truth of the remarks made by Mr. Bunyard at the annual dinner, was evident in a most emphatic manner on Monday last, when, at the monthly meeting, the secretary announced that one of the oldest members of the Society, one who took an active part in its formation, and since then on its committee, had reached the

age of seventy years, having during the thirty-three years of its existence made no claim for sick pay. The balance standing to the credit of this member was about £76, which sum, or any part of it, he can now draw as he may need it. As he was in failing health, and had strictly complied with all the requirements of the Society, by its rules he was voted the sum of 8s. per week, which sum amounts to £20 8s. per year, or a few shillings more than the yearly pension of the Gardeners' Royal Benevolent Society to its male pensioners. This fact illustrates in a striking way the advantages which accrue to aged members. This case is one which could not possibly occur in the Society until it had been in existence twenty-five years, as the age limit of admittance is forty-five. It is the first instance in which this distinct benefit has been applied for and granted, but in the future such claims no doubt will be more frequent, and each will be decided upon according to its particular merits.

READING AND DISTRICT GARDENERS' MUTUAL IMPROVEMENT ASSOCIATION.

THE first meeting of the 1898—1899 session was held on Monday evening last in the club-room at the Old Abbey Restaurant, Mr. Turton presiding over a good attendance of members.

The subject for the evening was "A few Orchids that can be grown with other plants," by Mr. W. P. BOUND, of Bill Hill Gardens, Wokingham. The lecturer took up the various varieties suitable for different kinds of treatment, much stress being laid on the purchase of imported plants. A discussion ensued which turned chiefly on the topics—whether a drawing-room was a suitable place for Orchids, and if it is desirable to afford manure to Orchids. A hearty vote of thanks to Mr. Bound for his lecture, brought the meeting to a close.

A fully-flowered specimen of *Miltonia Clowesii* was shown by Mr. LAY, gr., to LEONARD SUTTON, Esq., Hillside, Reading.

NATIONAL CHRYSANTHEMUM.

OCTOBER 11, 12, 13.—The second show of the season was held in the Royal Aquarium on the above dates, and was an exceedingly satisfactory one. Many of the Chrysanthemum blooms shown were already very fine, and indicated a grand season of exhibition blooms later. The fine display of vegetables presented for Messrs. DEVERILL & Co.'s prizes also were exceedingly attractive, the Giant Onions fairly beating the record.

Plants in Competition.—Only two groups of Chrysanthemums arranged with foliage-plants were staged, the 1st prize being awarded to Mr. J. SPINK, Walthamstow. His arrangement was somewhat formal, and the plants were thin, but had fine blooms, which seemed to have condoned for defective grouping. Mr. W. HOWE, gr. to Sir HENRY TATE, Streatham Hill, was 2nd, having a taller and more highly-dressed group, also much better finished. His flowers, like his competitor's, were all Japanese, and very good. In both cases whites and yellows largely predominated. There were no entries in the class for bush plants.

Cut Blooms.—A very fine stand of twenty-four Japanese, placed 1st, came from Mr. J. BROOKS, gr. to W. J. NEWMAN, Esq., Totteridge, Herts. It included Madame Gustave Henry, Mutual Friend, and E. Tilsbury, whites; Sunstone, Oceana, John Seward, Phœbus, and Miss E. Curtis, yellows; Australia, W. Seward, Mrs. G. W. Palmer, and Elthorne Beauty, diverse. Mr. H. SHOESMITH, Woking, was 2nd, having in his stand good blooms of Madame Bruant, E. Molyneux, Pride of Madford, Bertha, F. C. Schwabe, Master W. Tricker, and International, good. Mr. R. JONES, gr. to C. A. SMITH RYLAND, Esq., Warwick was 3rd.

With twelve Japanese, Mr. J. FULFORD, gr. to D. LAMBERT, Esq., Cookham, Berks, was 1st. His stand included excellent flowers of Mr. J. Shrimpton, Oceana, Elthorne Beauty, bronze; Mons. Pankoucke, Mons. C. Biron, and others. Mr. JONES was 2nd, having fair blooms; and Mr. BROOKS was 3rd. The latter, however, was 1st, with six Japanese, having Miss E. Curtis, Mrs. H. Payne, Madame A. Molin, Elthorne Beauty, Oceana, and Madame Gustave Henry. Mr. F. POSTER, Havant, was 2nd; and Mr. B. NASH, gr. to F. A. WELLESLEY, Esq., Woking, 3rd.

With six blooms of one variety, Mr. R. GLADWELL, gr. to J. SMITH, Esq., South Norwood, was 1st, having very broad specimens of Madame G. Bruant. Mr. BROOKS was 2nd, with Madame Gustave Henry; and Mr. NASH followed with medium blooms of Edith Tabor.

Incurved blooms were restricted to one class only, for six flowers, Mr. R. BAILL, gr. to D. H. EVANS, Esq., Pangbourne, being 1st, with four blooms of M. R. Bahuant, and one each of D. B. Crane and Baron Hirsch. Mr. ROBINSON had Madame Ferlat and Duchess of Fife, with two other varieties.

The best twelve bunches of Pompons, a poor lot, came from Mr. S. J. COOK, gr. to A. N. STEPHENS, Esq., Hendon, a 2nd prize only being awarded.

Far better flowers came in the class for six bunches from Mr. T. TURK, gr. to J. BENEY, Esq., Highgate, having good Veuve Clicquot, Osiris, Vesuve, Nellie Rainford, Madame E. Dordan, and La Vierge. Miss R. DEBENHAM, St. Albans, was 2nd. In a further class for twelve bunches of Pompons, this lady was 2nd, no 1st being awarded.

In the amateur's class for twelve Japanese, Mr. W. C. CLARK, Hitchin, was 1st, with fair flowers, but little variety; Mr. H. LOVE, Sandown, Isle of Wight, was 2nd.

With six Japanese, Mr. W. AMES, South a ford, came 1st; and Mr. CLARK 2nd. There were one or two other classes in this section, but they do not call for comment.

Vases.—There were several very attractive pairs of these set up, the best coming from Mr. Mease, gr. to A. TATE, Esq., Downside, Leatherhead. The vases were rather too tall, but the flowers in them were very fine, and were admirably draped and dressed with handsome-coloured foliage and grasses.

With a single vase of Pompons, Mr. W. GREEN, Haroldswood, Essex, was 1st, with a charming bunch, pleasingly arranged.

The class for three dressed stands or epergnes filled a large table, and formed a most attractive feature. Very beautifully dressed were those from Mr. D. B. CRANE, Archway Road, Highgate, the flowers being moderate, and the dressing of Croton foliage, Sumach, Asparagus, &c., was singularly beautiful. Mr. W. GREEN, Haroldswood, was 2nd, with rather broad wire stands, not sufficiently dressed. Mr. J. R. CHARD, Stoke Newington, coming 3rd.

Floral decorations of a more extensive nature, arranged on tables, came from Mrs. NELLIE ERLBACH, with Mr. J. R. CHARD, and Mr. J. EMBERS, Walthamstow.

Miscellaneous.—Under this heading were many very fine exhibits, including a very large and superbly arranged group of Chrysanthemums and foliage plants, from Mr. H. J. JONES, of Hither Green Nursery, Lewisham; also one having a dense base of cut bunches of autumn-blooming varieties, from Mr. W. WELLS, Earlswood, the variety and colouring being remarkable and beautiful; with this was set numerous tall plants of Japanese varieties, amongst which was the new yellow Le Grand Dragon, that was very fine. Messrs. H. CANNELL & SONS, Swanley, had a charming group of Cannas interspersed with cut blooms of a Polygonium, and a table of cut Chrysanthemum blooms also set in the same inflorescence.

MESSRS. H. DEVERILL & Co., Banbury, had a large group of hardy herbaceous flowers, early blooming Chrysanthemums, and other things. Mr. NORMAN DAVIS, Framfield Nurseries, Sussex, had in the gallery where few visitors went, a remarkably attractive collection of perennial Asters in fine bunches, one of the best groups ever set up. A very attractive one only a little less imposing, came from Mr. E. Beckett, gr. to Lord ALDENHAM, Elstree. There was also a huge arrangement in cones or pyramids of Cactus, Decorative and Pompon Dahlias in wonderful variety from Mr. T. S. WARE, Ltd., Tottenham; and a very fine display in the usual way of Show and Cactus Dahlias from Mr. S. MORTIMER, Farnham, Surrey, showing that frosts have spared these tender flowers in some districts.

Mr. GODFREY, Exmouth, set up a fine lot of Japanese Chrysanthemum blooms, and an even more attractive collection of winter-blooming Carnations in low vases dressed with Fern, that was greatly admired. Messrs. J. LAING & SONS, Forest Hill, had a splendid collection of Apples and Pears, with some small fruits. The table was handsomely dressed with plants, flowers, and foliage.

Messrs. W. CUTHBUSH & SONS, Highgate, sent very fine Apples and Pears, in splendid form, and dressed their table admirably with plants and foliage, but somewhat incongruously included several small heaps of large Onions. A grand table of hardy fruit came from Mr. H. BERWICK, Sidmouth, that was also handsomely dressed with flowers and foliage; and there was also an excellent show of fruit from Messrs. SPOONER & SONS, Hounslow.

Messrs. R. CUTHBERT & Co., Southgate, showed plants of their pretty, soft, rose-shaded, dwarf Chrysanthemum, Miss Wingfield; and Mr. G. R. BOX, Croydon, exhibited numerous Begonia flowers.

MESSRS. H. DEVERILL & Co.'s VEGETABLE PRIZES.

The class for a collection of eight kinds of vegetables brought very fine produce, the 1st place being taken by Mr. BECKETT, whose lot comprised grand Cauliflowers, Leeks, Onions, Beets, Tomatos, Carrots, Satisfaction Potatos, and fine red Celery; Mr. R. Lye, gr. to Mrs. KINGSMILL, Sydmon-ton Court, Newbury, was 2nd with very similar kinds, of great excellence; and Mr. W. Pope, gr. to the Earl of CAR-NARVON, Highclere Castle, was a wonderfully close 3rd; Mr. T. Wilkins, gr. to Lady THEODORA GUEST, Henstridge, being 4th with twelve Ailsa Crag, or Cocoa-nut Onions.

Mr. W. Fyfe, gr. to Lord WANTAGE, Lockinge Park, was 1st with huge samples, that whilst of fine form, wanted rather more finish; Mr. J. MASTERSON, Shipston-on-Stour, was 2nd with very large bulbs also, but rather rough in appearance. Mr. T. WILKINS, who had the best finished large bulbs, coming 3rd. The decisions seem, however, to be determined by the scales and not by judgment. With six bulbs of the same varieties Mr. FYFE was again 1st. In both classes only Ailsa Craig was staged.

In the class for twelve bulbs of other varieties, Mr. FYFE was again 1st, with huge Lord Keeper; Mr. WILKINS coming 2nd, with Anglo-Spanish. The bulbs of these were exactly alike, differing only in name. Flat bulbs of Ailsa Craig exactly resemble both. Mr. WILKINS was 1st, with twelve bulbs of the globular Wroxtan. Mr. D. Gibson, gr. to T. B. JOHNSON, Esq., Kingston Hill, had the best six Leeks.

Mr. BECKETT had the best twelve Beets, but had necks and tails too long; Mr. BOWERMAN, Hackwood Park, Basing-stoke, having prettier roots, was placed 2nd.

Mr. BECKETT was again 1st with Celery. Mr. BECKETT also had the best Parsnips, very handsome, clean roots, and the handsomest Tomatos.

The Chrysanthemum Rust.

Stirred by the numerous complaints of damage wrought by the fungus figured and described in our last issue, the executive of the National Chrysanthemum Society on a

a conference upon the subject. This was held in St. Stephen's Hall, at the Royal Aquarium, on Tuesday evening last, and proved to be a very popular event, there being, we should estimate, upwards of 200 persons present. Mr. T. W. Sander, Chairman of the General Committee, was chairman.

After a few introductory remarks from the chairman, a paper was read upon the practical aspect of this rather serious question, by Mr. P. WATERER.

In opening the subject, Mr. WATERER described the appearance of the pest upon the leaves, and exhibited a painting of an affected leaf. Curiously enough, Mr. Waterer's experience is that the fungus has not occurred upon leaves below the first "break." He first found the disease in his collection on September 10 last. The plant was at once isolated, and a healthy plant was placed on either side of it. Though the disease spread rapidly through the collection, it is a coincidence the plants placed near the one first attacked remained perfectly free from the disease. The weaker-habited varieties had fallen a prey to the rust, but the disease is less destructive to those having strong leathery foliage; whilst the Davis and Carnot types have altogether escaped. Since the plants have been housed, the pest has greatly decreased, due probably to the altered conditions under which the plants are cultivated. Mr. Waterer looked about his garden to see if the fungus was upon other species of plants, and as it is common to most plants of the Compositæ order it is not surprising that he found it upon the Hawkweed and various other species. Mr. Waterer was most interesting when he came to explain what success has attended his efforts to cure the disease, that is, kill the spores, &c., but his words offered little encouragement. He had tried sulphide of potassium, neat paraffin, and an insecticide obtained from a chemist, who declared that the same was capable of "killing the d—— at 100 yards." However, neither the one nor the other, according to Mr. Waterer, was sufficient to kill the spores of this fungus. Mr. Waterer suggested: 1, That it was possible spores of the fungus were present in the material used for potting the plants; 2, that the ground around the plants should be kept as clean as possible; 3, That the rubbish-heap be given a very wide berth. He was glad that the Society had shown its earnestness in this matter.

Next was delivered a lecture by Mr. GEO. MASSEE, of the Herbarium, Royal Gardens, Kew. This lecture fully explained the "rust" from the scientific point of view, but as there appeared in these columns last week an illustrated article by the same gentleman upon the subject, it will not be necessary to refer at much length to his remarks on the present occasion. Mr. Massee knew that he addressed an audience composed largely of Chrysanthemum growers, and he did not let slip the opportunity of telling them, that to a very large extent, he believed that they had themselves to blame for the epidemic character the disease had assumed. Overcrowding was the sin Mr. Massee charged the growers with. They would insist upon growing their plants huddled up one against another. They had progressed, said the lecturer, in many ways as gardeners, but they had neglected to acquire a general idea of the habits and life history of fungi, and accordingly they were ignorant of the simplest precautions against its spreading, and had none but the most superficial knowledge of its character.

Mr. Massee reiterated that when the rust appeared it was only the fruit of the fungus, the mycelium of which was in the tissues of the leaves, and could not be killed by spraying or other means. Spraying is useful and certain as a preventive, but as a cure of no value whatever. It was explained that this particular "rust" was called Puccinia Hieracii, because it was first discovered upon the Hieracium, or Hawkweed. The difference between and separate functions of the summer spores and resting spores was fully described last week. It may be repeated here, that unless the spores fall upon a leaf with a damp surface they fail to germinate, and hence the syringe becomes the most effective agent in spreading the disease. If the leaf be damp, the spore will germinate in a couple of hours. The disease is entirely absent from a plant when leafless, as it fails to enter the stem at all. The winter or resting spores cannot germinate until spring, but where plants in houses carry green leaves during the winter the summer process of reproduction may be continued. When the plants are not present, the house may be syringed with sulphate of iron in solution. This will not hurt Vines, nor most other plants when leafless.

A discussion which was remarkable for a variety of extraordinary statements, that provoked many signs of incredulity, was then commenced.

Mr. W. WELLS read a paper dealing at some length with the subject, and he was apparently unable to make up his mind to call the "rust" a fungus at all, probably in his desire to distinguish it from the fungus that attacks the variety Golden Wedding and other weak-habited ones. But Mr. Wells had something of importance to communicate, and after the declaration of Mr. Waterer it came as a relief to hear that at Earlswood the fungus had threatened the plants greatly, but a weak mixture of paraffin and water—one tablespoonful to two gallons of water—had been found to be all that was needed to keep the pest at bay, and to render the plants entirely safe from destruction. Mr. Wells declared that he had completely cured his plants by its use, and without damage to the foliage. The meeting breathed easier. Here was a large grower who could afford to speak of the "rust" with a fearlessness bordering upon contempt. But Mr. Wells, before sitting down, exclaimed that he had the disease, and every other grower had it too. Now, it is well known that Mr. H. J. Jones had publicly declared that the disease was not to be found upon his plants, consequently, upon Mr. Wells resuming his seat, Mr. Jones rose to say that 'he was obliged now to admit that the fungus was in t
By or t collection, that Mr. Wells had been the only gentl

man able to discover it there, and it was upon a plant purchased from Mr. Wells himself." After this little passage of arms Mr. Norman Davis suggested that the rain-water used for syringing and watering the plants, be regarded as a very probable means of distributing the pest, a suggestion that Mr. Massee afterwards described as a particularly likely one. Mr. Massee therefore proposed that a little fungicide be mixed with this water before it is used. Mr. Davis also advanced the theory that the Chrysanthemum had become so weakly through too frequent crossing and inter-crossing; that this fact explained the reason why a pest, hitherto unknown on the plant, should suddenly become so destructive. He thought that it first attacked the weaker-habited plants, and upon them the fungus became stronger, and able to attack other varieties.

Next came a suggestion from Mr. BEVAN, of Finchley Cemetery, that the disease had been imported in cuttings and plants from France, where it raged last year. This may be so, but as the fungus abounds upon otherspecies of plants in almost all gardens and on the roadsides, it matters little whether a portion of the fungus came from France or not.

Mr. H. CANNELL, of Swanley, was the next speaker, and he, like a few others, was disposed to take an optimistic view of the whole matter. The pest need be feared little. He believed that it would run its course, and afterwards Chrysanthemums would be cultivated just as formerly. They would soon understand all about it, just as they did now understand the Potato-disease. Drought evidently favoured the development of the Chrysanthemum-fungus, and there had been three hot seasons. If 1899 was an ordinary British summer, the disease would not be an epidemic. Mr. Cannell then startled a few of the company by declaring that, knowing exactly what conditions were necessary for the development of the Potato disease, he could tell to a day when it would attack the crop generally. He has done so, and acres upon acres have become infested during one single night.

Both the lecturers were called upon for a last word, and Mr. Massee took the opportunity to explain that it was more than probable that the disease had become epidemic, owing to its having found a well-fed, exceedingly satisfying host-plant.

Mr. Waterer, in referring to Mr. Cannell's statement respecting the Potato-fungus, said, that he himself could always foretell mildew, and when certain conditions of weather prevailed, he was wont to say to his gardeners, "Get the sulphur out; there will be mildew in three days." Rarely had he been wrong in such prophecy.

Votes of thanks to the lecturers, to the Royal Aquarium Company, and Chairman of the meeting, brought to close a very interesting and instructive Conference.

Obituary.

CHARLES SMITH.—There are many who will regret to hear of the death of Mr. Charles Smith, on the 4th inst., in his eightieth year. He was one of the few remaining "old-school" gardeners. Away back in the fifties he was one of the leading exhibitors at most of the London shows. During his long career there was scarcely a single branch of his profession in which he failed to excel, thoroughness and force of purpose contributing to this result. Years back he was a most successful cultivator of New Holland plants. The British flora he was well versed in, and pomology was one of his hobbies. As a landscape-gardener he has left his mark in many gardens that bear proof of his ability. He took a great delight in the education of the many men he had under him, and was always ready to help them. He was buried in Hawley churchyard, followed by many friends. The whole village showed its last respect to an old parishioner, who was ever willing with his helpful counsel and sympathy. Mr. Smith was twenty-one years gardener to Mr. Anderson, at The Grove, Norwood, and it was whilst there that he gained his reputation as an exhibitor. He afterwards laid out the gardens at Ossemsley Manor, near Christchurch. From there he laid out Harefield House Gardens, Romsey, and a garden at Sunningdale. He retired from his profession about sixteen years ago.

CONTINENTAL NOVELTIES.

MESSRS. PLATZ & SON of Erfurt offer:—

Myosotis alpestris, "Star of Love,"—compact in growth, deep in colour.

Matricaria eximia corymbosa, fl. pl., "Snowball," pure white flowers.

Marrow-fat Pea, "Nero," six feet high, very productive, pods dark violet.

Frame Cucumber, "Alabaster," very productive, well-shaped fruits, white in colour.

Messrs SLUIS & GROOT, of Eekhuizen, Holland, are sending out:—

Radish, "Triumph," roots globular, horizontal scarlet stripes on a white ground; especially suited for forcing.

Mr. FREDERICK ROEMER, Quedlinburg, Germany, is offering:—

Bidens atrosanguinea superba (*Dahlia Zimapani superba*), like a miniature Dahlia; height 1 foot, flowers $1\frac{1}{2}$ inch across, dark red, nearly black; petals loose, sometimes cut and curled.

Coleus macrophyllus nanus.—A dwarf variety, not exceeding 6 inches in height; leaves dark red, flaked with a paler shade.

Godetia Duke of York compacta.—Dwarf, stout, and regularly branching; flowers bright scarlet-carmine.

Godetia carminea aurea compacta.—Of similar habit, but the blooms are rosy-crimson, edged with bright pale yellow.

Helianthus cucumerifolius "Orion."—With twisted or fluted petals, similar to those of a Cactus Dahlia.

Tagetes patula, fl.-pl., *Sulphur Liliput*.—Dwarf Marigold, with bright and double flowers.

Trifolium suaveolens foliis aureis.—A sweet-scented Clover, with golden-yellow leaves, and small lilac-red flowers.

ENQUIRY.

"He that questioneth much shall learn much."—BACON.

How is polishing of all kinds of wood effected, without staining it? *N. C. L.*

NOTICES TO CORRESPONDENTS.

ABIES NOBILIS: *Inverness*. The gouty swellings are the work of a scale insect like that which is known as American blight. Burn the affected shoots; and if possible, spray with petroleum emulsion. See figure and description in *Gardeners' Chronicle*, July 22, 1882.

BOOKS: *X*. You may obtain *Die Bindekunst* from J. Olbertz, Erfurt, Germany.—*J. H. M.* *The Propagation and Improvement of Cultivated Plants*, by F. W. Burbidge (published by W. Blackwood & Sons), has much on the subject, but we do not know any separate book.

BOWLING-GREEN: *P. J. P.* and *Heath*. So far as we can tell from the small plants, it is *Prunella vulgaris*. Fork it out, and sow Clover or fine grasses now or in the spring. A dressing of nitrate of soda or sulphate of ammonia would be advisable, to encourage the growth of the grasses. The mossiness is a sign of wetness of the soil, which nothing but drainage will prevent. To rid the lawn of worms apply lime-water, and afterwards collect the worms.

CHRYSANTHEMUM-RUST: *A. E.* See our issue for last week, and also the present issue.

COLD GREENHOUSE: *Beginner*. 1, Let it be constructed with glazed sides and ends, unless it be used for growing small market plants, when the roof may rest upon the wall plate, but the ends should be glazed; 2, Being a span-roofed house light would be abundant in either case, and the inmates would grow of symmetrical form, with an occasional turn round; 3, Purchase home-made, 21 oz. glass, free from flaws and air-bubbles. We do not know what is meant by the trade terms, "Thirds and Fourths."

CUCUMBER-HOUSES FOR MARKET-WORK: *J. W. R.* Where the erection of two or more Cucumber-houses is contemplated, a great saving of bricks and labour will be effected by substituting 9-inch brick piers for the continuous division walls. This method of construction has the additional advantage of a more uniform degree of heat and moisture being maintained during the whole period of forcing. In the construction of a block of houses on this system, outside and end walls only will be necessary; the former consisting of $4\frac{1}{2}$ -inch work, with 9-inch piers built flush with the wall inside at intervals of about 7 feet, the end walls being 9-inch work. The piers for supporting the valley-gutter should have a space of $12\frac{1}{2}$ feet from centre to centre crosswise, and at the distance mentioned above longways. This will give a width of 12 feet inside each house. The brickwork should

be about $2\frac{1}{2}$ feet high from the floor-line or door-sill. Planks of pitch Pine, 11 inches wide and $1\frac{1}{2}$ inch to 2 inches thick, should be used for supporting the rafters when fixed in position on piers, wall-plates being secured on either side of these for fastening the rafters to, and at the same time forming the valley-gutter for conducting roof-water into rain-water tanks. If rafters 8 feet long are used, a capital roof-angle will be secured. Well-seasoned yellow deal should be employed, and the houses should run north and south. Twenty-one-ounce glass, 18 inches wide and about 20 inches long, should be used in roof, bedding this in good putty, and securing on the top with brass sprigs, six to two panes, which should be allowed a lap of half an inch. The advantage attached to placing houses in the ground-line, that is, with the roof starting from the ground-line, is a small saving of bricks and less exposure to external conditions, a sunken central pathway being necessary in this case. The disadvantage, and a serious one, too, consists in not being able to use such class of house profitably for late crops of Tomatos, to be planted after the Cucumber plants are exhausted.

CYCLAMEN: *R. M.* We cannot find the grubs. They are probably those of a weevil, which are very destructive. Trap them at night with slices of Potato or Carrot.

EARLY-FLOWERING GLADIOLUS: *Walter S.* As soon after the beginning of March as the weather will permit.

FERNS, SEAWEEDS: *X.* Mr. James Crombie, of Barrow, has a collection of dried specimens for disposal.

GARDENERS' LIBRARY: *R. McF.* See *Gardeners' Chronicle*, January 4, 1890, p. 14.

GRUB: *Kentish*. The larvæ of a moth. Encourage starlings, rooks, or sea-gulls. Another time, please write each query on a separate piece of paper.

HORTICULTURAL LECTURERS: *R. A.* We know of no other means than advertising.

INSECTS: *G. Donald*. Not *Tipula oleracea*, but the larva of *Agrostis exclamantis* (the "Heart and Dart Moth"), very destructive, feeds at night, and retires underground during the day-time. The name of the Celery-fly is *Tephritis* (*Trypeta*) *onopordinis*. *R. McL.*

NAMES OF FRUITS.—Applications to name fruits are so numerous at this season, as seriously to hamper us in the exercise of our editorial duties. They entail an expenditure of time, labour, and money, of which our readers can have little idea. We are most desirous to oblige our correspondents as far as we can, but we must request that they will observe the rule that not more than six varieties be sent at any one time. The specimens must be good ones, just approaching ripeness, and they should be properly numbered, and carefully packed. We do not undertake to send answers through the post, or to return fruits. Fruits and plants must not be sent in the same box. Delay in any case is unavoidable.

—*S. E. A.*, *Yorks*. 1, Peasgood's Nonsuch; 2, not known; 3, Warner's King; 4, Yorkshire Greening; 5, Tower of Glamis; 6, Golden Noble.—*General Berkeley*. 1, Mère de Ménage; 2, Worcester Pearmain.—*J. A.*, *Antrim*. 1, not known; 2, King of the Pippins; 3, Pear, Gloût Moreau.—*J. P.* 1, Hawthornden; 3, Beauty of Kent; 4, Cox's Orange Pippin; 5, Cox's Pomona; 6, Cox's Pomona.—*G. S.* 1, Queen Caroline; 2, Winter Nelis; 3, Doyenné Boussoch; 4, Thompson's; 5, New Hawthornden.—*Ferns*. 1, Braddick's Nonpareil; 2, not known; 3, Cox's Orange; 4, Braddick's Nonpareil; 5, Worcester Pearmain; 6, Beurre Rance.—*D. C.* 1, Stirling Castle; 2, New Hawthornden.—*J. B.* 1, not known, some local sort; 2, Golden Noble.—*X. Y.* 1, Cox's Orange Pippin; 2, Ditto; 3, Beauty of Kent; 4, Norfolk Beefing; 5, Winter Peach; 6, Ecklinville Seedling.—*A. Hope*. This Apple, named Dumpling, is evidently a local sort, somewhat resembling New Hawthornden.—*Heath & Son*. Pear, Beurre Hardy; Apple, not known, probably Old Nonsuch.—*T. W. Swinburne*. Apple, Beauty of Kent.—*S. D.* 1, Lord Derby; 2, St. Alban's Pippin.—*Cydonia*. 1, Reine du Canada; 2, Dumelow's Seedling; 3, Striped Beefing.—*J. T. T.* 1, New Hawthornden; 2, Gravenstein; 3, Washington; 5, not known; Pear, Josephine de Malines.—*G. W. P.* Apple, Waltham Abbey Seedling.

NAMES OF PLANTS: Correspondents not answered in this issue are requested to be so good as to consult the following number.—*E. G. H.* Not a *Clerodendron*, but *Euonymus latifolius*.—*E. M. W.* The flower sent is of *Lælio-Cattleya* \times *exoniensis*. There is some variation in it, and yours is one of the lighter-coloured forms.—*J. G. W.*, *Oban*. The

Orchid is *Oncidium flexuosum*; the climber an *Aristolochia*, but which species it is impossible to say without seeing a flower, which we failed to find. The packing was excellent. We wish our correspondents generally were as careful as you.—*J. S.* *Pinus insignis*.—*Kentish*. 1, *Cupressus* (*Retinospora*) *pisifera*; 2, *Thuja dolabrata variegata*; 3, *Thuja Lobbi* of gardens, true name being *T. plicata*; 4, *Osmanthus aquifolium*; 5, *Thuja dolabrata*; 6, *Pseudo-tsuga Douglasi*—the Douglas Fir.—*W. B.* 1, *Pinus Laricio*; 2, *Thuja orientalis* var.; 3, *Picea orientalis*; 4, *Cupressus Goveniana*; 5 and 6, next week.—*G. D.* 1, *Rochea falcata*; 2, *Begonia Fischeri*; 3, *Myrtus communis*; 4, *Rubia pseudacacia*; 5, *Sedum Ewersii*; 6, *Ruscus aculeatus*; 7, *Oenothera macrocarpa*.—*J. R.* 1, *Quercus Phellos*; 2, *Punica granatum*; 3, *Myrica Gale*; 4, *Gaultheria Shallon*; 5, *Bambusa Fortunei variegata*.—*J. C.* 1, *Gaura Linheimeri*; 2, *Achillea Ptarmica*.—*D. M. F.* *Helianthus multiflorus*, double flower.—*J. E. K.* *Cineraria maritima*.—*T. W. C.* 1, *Chrysanthemum serotinum*; 2, *Rudbeckia speciosa*; 3, *Helenium autumnale*; 4, *Stachys lanata*.—*J. P.* No numbers. *Cornus mas variegata*; *Magnolia tripetala*; *Phytolacca dioica*; *Stachys lanata*, downy.—*D. C.* *Physianthus albens*.—*W. L.* 1, *Polygonum*; 2, *Polygonum orientale*; 3, *Solidago Purshi*; 4, *Aster divaricatus* (?); 5, *Poterium canadense*; 6, *Geranium pratense* var.; 7, *Linaria purpurea*.—*J. S.* *Solanum dulcamara*.—*H.* The Lucombe Oak.—*D. F.* The varieties of *Aster* are so numerous that we are unable to assist you. You should apply to some trade-grower.—*R. R.* 1, *Gaultheria Shallon*; 2, *Ilex crenata*; 3, *Aster amellus*; 4, *Potentilla fruticosa*; 5, *Berberis Wallichiana*, so far as we can tell from a flowerless scrap; 6, one of the dwarf Spruces, perhaps *Picea Clanbrassiliana*. Why send such miserable specimens?—*J. M. G.* We cannot undertake to name varieties of *Roses*.

PEARS: *W. H. S.* To understand the peculiarity of your Pears, you must first call to mind that the edible portion of a Pear or an Apple is not really a fruit at all, but merely a swelling of the flower-stalk enclosing the core, which is the true fruit. In your case the flower-stalk or branch has started into growth again, but no true fruits or "core" has been formed. The condition is by no means uncommon, and you will find in our back volumes numerous illustrations of it.

PEAR CRACKING: *Kentish*. The cracks are due to the attacks of a fungus, *Fusicladium dendriticum*. It kills the skin so that it cannot expand as the tissue within grow, hence the cracking. Spraying with Bordeaux Mixture in spring will check the disease.

PELARGONIUM: *C. S.* Very pretty deep rose, with a white centre. The flowers are small, semi-double, and rather rough, but quite good enough to induce us to recommend you to persevere.

POTATOS: *J. V. & Sons*. The Potatos are attacked with a fungus (*Peronospora*), which has arrested the proper development of the tubers.

WATERPROOF PAPER: *J. G.*, *S. W. D.*, *H. M.*, &c.—Our correspondent who wrote upon this subject, may be found at Norwood Green, London, N. Presumably, it would be to the advantage of the manufacturers to advise the specialty.

CONTINUED LARGE INCREASE in the CIRCULATION of the "GARDENERS' CHRONICLE."

Important to Advertisers.—The Publisher has the satisfaction of announcing that the circulation of the "Gardeners' Chronicle" has, since the reduction in the price of the paper,

MORE THAN DOUBLED, and that it continues to increase weekly.

Advertisers are reminded that the "Chronicle" circulates among COUNTRY GENTLEMEN, and ALL CLASSES of GARDENERS and GARDEN-LOVERS at home, that it has a specially large FOREIGN and COLONIAL CIRCULATION, and that it is preserved for reference in all the principal Libraries.

(For Markets and Weather, see p. xii.)

THE

Gardeners' Chronicle.

SATURDAY, OCTOBER 22, 1898.

ALPINE PLANTS.*

THE practical gardener and amateur rarely meet with so valuable a treatise upon any subject as is this book on the cultivation of alpine plants. The material, and the way in which it is put together, will cause it to rank as one of our first-class cultural guides. The author himself, who is and has been engaged with the cultivation of alpine plants for nearly twenty years [and whose rockery at Zurich is one of the best we have seen. Ed.], has in his long experience made no small amount of observations, and noted many facts concerning the treatment of these beautiful plants in our gardens. Many alpine plants are as obstinate in accommodating themselves to our cultivation as some Orchids are. In placing his conclusions and valuable hints before the public, Mr. Woeke renders good service to growers, as will be generally acknowledged on reading about various species that are well known as most difficult to keep in our gardens.

The book is devoted to true alpine plants only. Plants generally used for decorating rockeries, and not natives of alpine regions, have not been taken into consideration. The matter is not only pleasant reading for those employed in plant culture and who read German, but the chapters about the natural homes of these little gems, and the transplantation of them from those regions into our gardens, will certainly interest many of those who visit the Alps yearly.

The contents are arranged in five sections. The first is devoted to alpine plants in their natural state, including notes on the climatal condition, and the nature of the soil, besides physiognomical and biological matters; and the distribution of alpine plants over the world. After showing in these chapters which factors in Nature exercise the greatest influence over the prosperity of the plants, and which of them have particularly to be studied to ensure success in cultivation, the writer proceeds to the second part. This is the most important one to the cultivator, as it treats exclusively of alpine plants in gardens, and mentions the principal points essential to cultivation. Here we find great stress laid on shortening the period of growth, keeping the soil moist, admitting air, and regulating the amount of light necessary for the various plants.

The author then proceeds to divide the alpine plants into groups, according to the physical character of their natural surroundings, and regards the following

points as specially important:—I. Shortening the period of growth; II. A thorough moistening of the soil, particularly in spring time, and the maintenance of a moist atmosphere around the plants; III. Classification of the cultivated plants according to the physical conditions of their natural homes, into, 1, rock and boulder plants; 2, half-rock or half-humus plants; 3, humus plants. IV. Exposure to full light (erection of the rockery in the most open place at command); V. Protection against unbidden guests, and destruction of weeds; VI. Covering and protecting the plants in winter.

A good many alpine plants have, on account of their delicacy, rarity, and for the purpose of propagation, to be cultivated in pots, and here again the writer displays great capability as a cultivator. The chapter on this subject is even more agreeable reading than is the rest of the book, and most instructive. He explains the reasons of critical cultivation of some plants, as *Phyteuma comosum*, *Campanula Zoysii*, *C. Morettiana*, *C. Raineri*, *C. Elatine*, *C. excisa*, *C. elatinoidea*, *Plantago nivalis*, *Melandryum* (*Silene*) *Elisabethæ*, and *Androsace*.

After devoting six pages to the treatment of alpine plants out on rockeries, the author goes on to show the necessity and importance of propagation, and describes various modes valuable to every grower. In connection with this chapter a list is given of alpine plants that are well suited for propagation by cuttings. Short percentage notes of the number of cuttings grown, and of special treatment where such is necessary, are also appended. For instance:—

<i>Achillea Clusiana</i> , Tsch., grew ...	60 per cent.
(Requires careful treatment).	
<i>Alpine verna</i> (L.), Bartl., grew ...	50 per cent.
(Rot easily).	
<i>Androsace carnea</i> , L., grew ...	80 per cent.
(Remains a long time unrooted).	
<i>Androsace Lageri</i> , Huot, grew ...	80 per cent.
(Roots very slowly).	
<i>Arabis bryoides</i> , Boiss., grew ...	75 per cent.
(Careful watering necessary).	
<i>Artemisia Baumgarteni</i> , Bess., grew ...	70 per cent.
(Requires to be kept rather dry, or it rots easily).	
<i>Dryas octopetala</i> , L., grew ...	35 per cent.
(Grows best in spring-time). &c.	

We are then led on to the chapter on soils, and to another dealing with the enemies of alpine plants under cultivation. Of all creatures none seem to have annoyed this lover of plants more than the thrush. We then come to the third section of the book. In it we find the erection and planting of rockeries described in detail. The author, who himself carried out the erection of the "alpinum" in the Royal Botanic Garden, Berlin, evidently possesses the ability to advise others, who are about or intending to carry out such structures. Various illustrations in this part show well the *modus operandi*, and should help others to avoid mistakes, which are so very easily made in this work.

A chapter very interesting, even to those having a good knowledge of alpine plants, is that in the fourth section, devoted to the habits of alpine plants in our gardens. Their changeability of character when grown in the lowlands is well known. An unsuitable soil or position is usually the cause of alteration in their habit. The majority, however, are the smaller-growing kinds, short in growth, with small leaves arranged for the greatest part in rosettes; these are true rock plants, and do not show any change of character in their foliage at any time.

A list of the best alpine and sub-alpine plants for cultivation forms the principal part of the fifth section. It is a valuable list for the cultivator, as letters prefixed tell him whether the plant is a rock, humus, or half-humus plant; shade or sun-loving, moisture-needing, or preferring a dry situation. Each plant-name is authenticated by the name of its author, and the native country is also indicated. To alpine plants with erroneous names, and those easily mistaken for others, a few pages of elucidation are devoted. An omission, which will be felt by many readers, is the want of an index, which the author has not thought necessary to append. It will be an addition of great value to every gardener's book-shelf, especially to those who are able to read German. It is composed of 257 pages, well and clearly written. E. B. B.

KEW NOTES.

HIPPOPHAE RHAMNOIDES.—There is nothing, perhaps, among hardy trees and shrubs that produces so bright an effect during the last quarter of the year as bushes of the Sea-buckthorn well set with fruit. A good example of its beauty may be seen on the banks of the pond near the Palm-house at Kew, where there is a group of plants now thickly set with the brilliant orange-coloured berries. These berries are almost globose, about the size of small peas, and clustered close to the branches almost as thickly as they could be packed. Considering its great beauty and the length of time this is retained, it is surprising to see how little the Sea-buckthorn is planted. It will ultimately grow into a small tree, but can by means of an annual pruning be kept as a shrub. Even without the fruit it is handsome in its foliage, the long narrow leaves having a grey-green, metallic hue, and the plant itself being of free and graceful habit. As male and female flowers are borne on separate plants, it is necessary that both sexes should be planted in the same group. It is best to keep them in the nursery till the sex can be determined, so that as many fruiting plants as possible may be selected. If set out in groups, one male to half-a-dozen or so female plants is a sufficient proportion. The Sea-buckthorn is a native of the coasts of Britain and other European countries, and loves abundant moisture.

HAMAMELIS VIRGINICA.

Whilst it has no pretensions to great beauty of flower, this, the old Witch-hazel of North America, is always interesting at this season of the year. For more than a century and a half it has been in cultivation in this country, yet, curiously enough, it is still uncommon. In some respects it is quite a unique plant. It comes into bloom at a time when the few flowers to be seen on hardy shrubs are, almost all of them, merely belated survivals of an earlier season, and when it is itself carrying the ripened seed of the previous year's flowers. Old specimens in the United States may occasionally be met with over 25 feet high, but I have seen none in this country anything like so high. It is a slow-growing shrub, of quaint and crooked growth, and more inclined to grow in diameter than in height. Its hazel-like leaves often turn a clear yellow before they fall. The calyx is brown and the petals pale yellow, the latter thin, narrow and wavy. The plant commences to flower in September, and continues till the new year. Whilst the petals and stamens fall as soon as the flower to which they belong is fertilised, the calyx persists. The ovaries of the flowers, fertilised in autumn, do not commence to swell till spring, and during the winter the calyx-lobes close over and protect them. The species has a wide distribution in Eastern North America, stretching from Nova Scotia and New Brunswick to Florida and Texas. It was introduced by Peter Collinson in 1736. W. J. B.

LEONOTIS DUBIA.

This is a beautiful addition to our greenhouse shrubs. It has been attractively in flower in the Mexican-house at Kew since August, having formed a loose shrub 8 feet high, and nearly as much through in about as many months. It differs from *L. leonurus*, the Lion's-tail Plant, in having their nettle-like leaves and axillary whorls of orange-brown velvety flowers, which form a cluster 3 inches through at intervals of about 1 foot on the upper part of the quadrangular stems, some of the clusters containing about a hundred flowers. There is something both pleasing and unusual in the colour and pose of the flowers, whilst the plant has grown like a veritable weed in the loamy soil of a border in a sunny greenhouse. We owe its introduction to Mr. John Mahon, of the Scientific Department of Zomba, British Central Africa, who sent seeds of it to Kew in January last, with the following note:—"A. leonotis, widely spread in British Central Africa at all elevations. It is interesting and really ornamental, the flowers being abundant, and of a deep orange colour."

* *Die Alpenpflanzen unter Gartenkultur der Tiefländer*, von Erich Woeke, Curator des Bot. Gartens, Zurich. (Verlag von Gustav Schmidt, Berlin, S.W., 46.)

ISOTOMA AXILLARIS.

Although a native of New South Wales, and recommended as a greenhouse plant, this Lobelia-like herb has grown and flowered freely in a sunny border in the open air at Kew, where it has been in flower for nearly three months, and is attractive still. I should say it would prove an excellent plant for the open border and flower-bed if raised from spring-sown seeds under glass, and planted out for the summer in the same way as Lobelias. Each plant has formed a tuft 9 inches high and 2 feet across; the numerous stems are clothed with bright-green pinnatifid leaves, from the axils of which spring erect slender one-flowered peduncles, the flowers consisting of a whitish slightly curved tube an inch long, and five radiating segments forming a star $1\frac{1}{2}$ inch across, and coloured purple-blue. It ripens seeds freely. It was first discovered by Allan Cunningham, who sent it to Kew. A figure of it was published in the *Botanical Magazine*, t. 5073 (1858), under the name of *I. senecioides* var. *sub-pinnatifida*.

NICOTIANA SYLVESTRIS.

This is a handsome Tobacco in the way of *N. Tabacum*, from which it differs chiefly in having its flowers elevated well above the foliage, and in their longer tube. It has been a conspicuous border-plant this year at Kew, where it has formed a mass nearly 6 feet high, with stems 2 inches in diameter, leaves from 18 to 24 inches long and 12 to 18 inches wide, smaller towards the top, bright green, covered with a soft pubescence. The flowers, which are pure white, consist of a long, slender, slightly inflated tube, and a limb an inch across; they are arranged in a terminal fascicle, and are semi-drooping. Unlike many of the Tobaccos with showy flowers, this has its flowers wide open all day, even in the brightest, hottest weather. It is a first-rate annual for the herbaceous border, and would be effective if planted in a mass on a lawn. Kew is indebted to Messrs. Dammann & Co., Naples, for seeds of it. A figure and description of it are given in their catalogue for 1898, where it is stated to be a native of the Argentine Republic.

HEMIZONIA PUNGENS.

This is a quick-growing, woody-shrub, with some resemblance to Gorse in its branched, straggling habit and fasciculate, spinous leaves. The upper branches and branchlets are terminated by yellow, composite flowers, with green disc, not unlike a small *Helianthus*. It has grown to a bush a yard wide and high, in a sunny position in the open air, where it was planted as a tiny seedling in June last. The bark of the main branches is almost milk-white; the leaves are bright-green, and as the flowers are both numerous and continuous, the plant makes an effective display all through the autumn. It appears to revel in a light soil and a sunny position. For its introduction Kew is indebted to Mr. Burt Davy, who sent seeds of it from California. It has ripened seeds freely at Kew, and judging from its behaviour here it is worth a place among annuals for a sunny border. Under favourable conditions it would probably prove perennial. W. W.

PLANT NOTES.

CRINUM GIGANTEUM.

This is a very useful *Crinum* of a size suitable for cultivation in small houses, it is also of comparatively easy culture. The leaves are lanceolate, 4 inches in width by 3 feet in length, somewhat flaccid in texture, inclining to glaucous-green in colour, with undulating margins. The flowers are sessile, six to eight in number, measure 6 inches across, with a light green, stem-like tube 6 inches long. The colour is white, with a light green band outside each segment; they are horizontally disposed in the form of an umbel on a scape 2 feet long. The flowers half close on bright days, expanding fully at night, and remain so on dull days. They are very fragrant, but last only for a few days. A temperature of 60° as a minimum suits the plant whilst growing; afford

slight shade, and keep them moderately damp when at rest. *C. giganteum* flowers best when the roots are somewhat confined, and a pot about twice the diameter of the bulb is large enough, as the bulbs need not be buried. It will be benefited by being placed outside during the summer, choosing a shady place for it. Thrips can be more easily kept in check outside. The flowering season extends over the greater portion of the year.

CYRTANTHUS SANGUINEUS

is now flowering with me. It usually produces four narrowly lanceolate leaves a foot long, and a solitary scapigerous flower resembling that of a *Vallota*. The flower measures $3\frac{1}{2}$ inches across and 3 inches in length, is cerise in colour, with six rich crimson lines inside the somewhat distended tube, and a white base. A temperature of 55° during growth, a dry resting period, and very careful watering, are its chief requirements. It may be propagated by offsets. A small quantity of coarse basic slag mixed with the soil suits this and many other bulbous plants from dry regions.

AMARYLLIS BELLADONNA VAR. KEWENSIS.

This grand bulbous plant is said to be a hybrid between *Amaryllis belladonna* and *Brunsvigia Josephinae*. It produces upwards of twenty flowers of a very deep rose colour, half of which are open at the same time. The long stout peduncles, pedicels, number and coloration of the flowers resemble the *Brunsvigia*, whilst the form of the flowers and leaves resemble those of *A. belladonna*. It ranks among the best flowering bulbs we have; four or five bulbs have recently flowered in front of the T range at Kew. In cold, retentive soils, *Amaryllis* should be planted at the base of a heated wall, placing a sheet of glass over the bulbs whilst resting, to throw off rains. A dry, warm resting period is essential to successful flowering. *Geo. B. Mallett*.

LINOSPADIX PETRICKIANA,
HORT., SANDER.

A VERY elegant, pinnately-leaved Palm was shown at the last meeting of the Royal Horticultural Society by Messrs. Sander & Co., St. Albans, under the above name. We have no means of verifying this appellation, and so we must provisionally adopt the name above given. *Linospadix* is a small genus of New Guinea Palms, comprising only two or three species. (See Beccari, *Malesia* i. (1877), p. 62.) Our illustration (fig. 87, p. 299), though of necessity inadequate, botanically suffices to show what a graceful addition to our stove Palms has been secured.

SOME DEVONSHIRE GARDENS.

(By our Special Commissioner.)

POWDERHAM CASTLE.—Among the ancient mansions of the county of Devon, this noble seat doubtless holds the premier position. Nearly six centuries have passed since the Courtenays first installed themselves by the Exe at Powderham, and there, in spite of many vicissitudes, they have remained.

Entering the Park at the Starcross gate, and proceeding up the drive towards the castle, the extent and variety of this grand estate are seen to be remarkable. Noble trees are met with in abundance, whilst nearer the edge of the carriage-way are grand pieces of *Berberis Darwini*, 10 to 12 feet high, covered with clusters of its purple berries. The climate here is most salubrious; a rich soil, resting on the red sandstone, has produced crops of a most satisfactory character, and are, as a consequence, unusually early. Mr. D. Powell kindly acted as guide on the occasion of my visit.

Looking across the river towards Exeter, and far beyond, the eye at one sweep takes in Topsham, with its historic landing-stages; Lympstone, with Nutwell Court, the home of Sir Francis Drake; Woodbury Castle, whose clump of Firs, enclosing the old Roman encampment, is a landmark for miles around; Exmouth, also, with its docks; and away beyond, Littleham, and the West Down Beacon of Budleigh

Salterton, the whole presenting a scene that can scarcely be matched.

Passing into the castle, I was shown a good-sized engraving, dated 1753, in which the castle is well represented. The chief interest, however, of this picture consists in the fact that at high tide the sea would appear to have come up almost to the very wall of the castle, since small pleasure-boats are depicted, as well as one of the larger ships of the period about to unload on the quay. This must have been on what is now part of the park.

That the deer in the park have been numerous and of large size we had evidence, since hat-stands, &c., were made entirely from the horns, many of which were unusually fine. The river Kenn passes through the grounds, and very sluggishly it moves along, attesting to the fact that the land at this particular spot is nearly on a level with the water in the estuary; from which, however, it is now kept out by a wide and solid embankment, built by the Great Western Railway, on which their trains are constantly passing to Torquay, Plymouth, and beyond.

The Castle is of historic interest, the north tower is generally admitted to have been built at least some 600 years ago; other portions, however, have been rebuilt once or twice, but each time on the earlier foundations.

Leaving the Castle, and passing round by the flower-garden, a scene of surpassing loveliness now arises before us. This portion, as another old print shows, was originally encompassed with stone walls, with a large square building at the far end, through which visitors must have passed. At different times the walls have been taken away, and the keep removed, following which this portion has been raised some 3 feet. Here the flower-garden is laid out, and in its best days was admitted to be one of the finest in the whole of the country. Many circular beds, with a double row of closely-trimmed Box-edging, were filled with choice bedding plants, and close-shaven Conifers at regular intervals add to the variety of the scene; this, with the grand surroundings and the river just beyond, is a rare sight. Round the castle were immense specimens of *Magnolia grandiflora*, 30 to 40 feet high! Oleanders, just passing out of flower; Myrtles, *Wisteria sinensis*, covering a large space; Jasmine, with a stem 9 inches round; *Chimonanthus fragrans*, very vigorous, deliciously fragrant when flowering in late autumn; whilst the same can be said now of *Lonicera fragrans*, which here is almost a continuous bloomer, scenting the air for a long distance around.

Passing into the park were groves of Beech of large size and perfect in shape; Oak, Ash, and Spanish Chestnuts were large, and of fine form. During the gale of March, 1897, when so much damage was done in South Devon, some 1500 trees were brought down on this estate, and even yet many of the giants are lying prostrate waiting removal. Beside the deciduous trees, there were fine examples of *Cupressus Lawsoniana*; and, as is often the case with this species, considerable variety was observed. *Thuia borealis*, reaching a height of 40 feet, perfect in form; *Thuia plicata gigantea*, stout, and in fine character; *Tauca Mertensiana*, 50 feet high, graceful and distinct; *Abies Nordmanniana*, of similar dimensions, even yet one of the most beautiful in open spaces; *Abies grandis* was also finely represented by specimens 50 feet in height. Among such fine trees it was curious to notice a singular *Thuia dolabrata*, that at some time must have had some injury inflicted on the leading shoot (perhaps by squirrels); this now had formed a dense wide-spreading shrub, some scores of short shoots having risen from the base, and so far, not many have attempted to attain a greater height than 3 or 4 feet. Now we pass through a fine sweep of Bracken, and come to the Wellingtonias; these and others in various parts are noble specimens, many reaching a height of 70 feet, and full of vigour. They doubtless were among the earliest introductions, and well they have done. Just one specimen of *Abies Pinsapo* now came in sight; singular to say, in the hard winter of 1881, all the trees of this species were killed. The Cedar-avenue now comes in view, and truly this is a magnificent sight.

Coming nearer again to the castle, and entering the pleasure-grounds, may be noticed *Cupressus macrocarpa*, a splendid tree, dense, and fully 50 feet high. Here, too, was *Picea Morinda*, or *Smithiana*; this is one of the most distinct and beautiful trees on the estate. Standing well away from other specimens, reaching a height of some 60 feet, its characteristics impress themselves most forcibly. Its wide-spreading branches have a somewhat pendulous habit, and from the lower side of these, feathery branchlets hang down in a perpendicular manner, 4, 5, and 6 feet in length, gracefully swinging to the slightest movement of the breeze. Fine trees of the Spanish Cork, always interesting. A grand *Pinus excelsa*, has now upon it old cones of last year, also numerous younger ones hanging in clusters at the ends of the shoots. *Taxodium distichum*, with its

There are grand *Magnolias* with their large cup-shaped flowers, *Liriodendron tulipifera* full of flower, and Portugal Laurels densely covered with bloom. Here, too, is the unique *Eucalyptus coccifera*, an immense tree, now passing out of flower (see *Gardener's Chronicle*, vol. ix., 1891, fig. 42, p. 169). I send portions of shoots, in which you will observe the singular capsules now left by this season's flowers, the buds already formed for next year, and the incipient stages of the same for the year following. This tree is now 70 feet high, and covers a space 40 feet from the stem each way; the trunk is 13 feet in circumference 3 feet from the ground, and is covered with a singularly rough bark; the branches, however, stretching out as described, are now shedding their bark, and as it falls in lengthy pieces the exposed parts of the branches are of a bright tawny colour,

Here, too, is a grand *Cedrus Libani*, with a stem 18 feet in circumference at 3 feet from the ground, whose lower, wide-spreading branches sweep the grass; this tree is fully 80 feet high. *Abies nobilis*, *grandis*, and *Nordmanniana* are here, too, in fine condition. *A. cephalonica*, 90 feet high, dense and compact, but slightly overhanging; the gale of March, 1897, has moved it out of the perpendicular. *Pseudo-Tsuga Douglasii* is well represented. One magnificent specimen, some 120 feet high, had as its neighbour a large Tulip-tree, with two leading stems. This latter fell during the storm mentioned, and as each stem passed down the sides of the *Abies* every limb was stripped off; so now a very tall tree, with a good head, a stem some 70 feet of its length with numerous shoots all over, appears more like an immense decorated post than a growing tree.

FIG. 87.—*LINOSPADIX(?) PETRICKIANA*; HORT. SANDER. (SEE P. 298.)

pale-green foliage; *Cryptomeria japonica*, 60 feet high; *Sequoia sempervirens*, a noble specimen; *Pinus insignis*, 70 feet high; *Thuiopsis dolabrata*, a perfectly-shaped tree, with branches down to the ground, and covering a space 30 feet through. *Cupressus* again in variety, and close by the castle is a grand piece of *C. macrocarpa*, 60 feet high, perfect in shape, and robust in health.

In the American-garden were fine clumps of hardy Azaleas, 20 feet through; specimen Camellias and clumps of the same. One Camellia was shown me the stem of which is 4 feet in circumference, the plant 30 feet high, and as much through. The late Mr. Pince, fifty or sixty years ago, sent regularly, and had cuttings from this plant; these were rooted and used for stocks, on which better sorts were grafted. These Camellias are healthy and clean, flower freely, and stand all weathers as freely as an *Aucuba* or Laurel.

and wonderfully smooth. In the winter of 1881 this tree was checked in a singular manner. Up till then the growth at the extremity of the branches was continuous and regular. Every season, from the spring of 1882, this has been much less so, and instead new shoots have pushed out on the bare stems, so that now the centre of the tree is more filled than had been the case heretofore. To see branches of some 18 inches in diameter, with numerous shoots of small dimensions, many only 3 inches through, these latter being almost upright while the lower branches are almost horizontal, adds considerably to its singular and special interest. This tree is said to have been grown first in a pot, then roughly treated as of little consequence, then at last discarded; ultimately it was planted in its present position by one of the garden labourers just to get it out of the way. Truly a strange experience for such a rare species.

Passing into the kitchen-garden, Mr. Powell, who now rents this portion and the glasshouses, lamented the absence of rain. In the vineries were fine crops of Black Hamburg and Foster's Seedling Grapes. Tomatos, Cucumbers, and Peaches are also largely grown. Ferns and table plants occupy other glasshouses, all houses being devoted to plants that will sell, rather than those that might be used for the adornment of the castle, as in former days. It is fervently to be hoped that ere long the castle may be again occupied by its owner. W. S.

THE PUBLIC GARDENS, DORCHESTER.

If it be borne in mind that this plot, gay with colour during the spring and summer months, was but a few years ago the fair-ground and cattle-market, a large part being also used as a nursery, the change in

its appearance seems almost magical. Those arriving at the station of the Great Western Railway may reach the gardens in a few minutes. The space enclosed measures about 5 acres, and the most is certainly made of it.

The configuration of the ground does not lend itself to picturesque treatment, but Mr. W. Goldring who laid it out, and personally superintended the planting, has given it a pleasing, natural appearance, and it only requires a few years to bring out its finer effects. The grass slopes form a pleasing feature, and help to keep the walks out of sight from whatever point the garden is surveyed. There are many large flower-beds in the upper parts of the garden, as well as on the lawn adjacent to the band-stand, and the only dead-level part is to be found where tennis and croquet courts are placed.

Stretching along one side of the grounds, are two rows of large trees, Elms, Sycamores, and Limes, which add greatly to the appearance of the grounds. Many such avenues are met with in various parts of Dorchester, forming delightful shady walks for long distances out of the town.

The boundaries of the garden are marked by ornamental trees and shrubs, which need only a few years to shut out the view from the public roads. That Mr. Harris, the head gardener, makes good use of the space at his command will be readily admitted, the beds being well filled with masses of gay colours. Ivy-leaf Pelargoniums are much employed; also bronze tricolor, zonal, and varieties, Lobelias, &c. Perhaps, however, the beds that make the finest effect in August were those of the "American Mammoth" Verbena, the plants having been raised from seed. The trusses of flowers are large, the tips of good size, the eye clear, and the colours vivid. Some beds of the American Giant Petunia are also a feature; the plants strong, with large, many-hued flowers. Ageratums are also used with good effect. Cannas and Lobelia cardinalis in variety are very noticeable plants. Among yellow flowers, mention ought to be made of the large beds of *Calceolaria aurea floribunda*, which have a purplish-brown flowered variety planted in the centres; it is similar to the old favourite, Princess Helena. These beds are capital, the plants having stood the drought remarkably well, and doubtless they will continue to flower for some time to come if rain should fall. Shrubby Phloxes, *Tritoma Uvaria*, *Helianthus*, and other herbaceous plants, were flowering profusely; *Helenium pumilum* was planted in several large masses. Among species of *Spiraea* in flower were *S. callosa alba*, and a quantity of *S. bumalda*, Anthony Waterer, the latter now covered with its deep rose-coloured corymbs of blooms.

The Roses had been gay, and many of the plants still carried blooms. Masses of *Rhododendron*, *Conifers*, ornamental evergreen and deciduous shrubs, afford diversity of form and aspect. The turf was observed to be in excellent condition. *W.S., September.*

EXPERIMENTAL SPRAYING OF FRUIT TREES.

DURING 1897 the experimental spraying of Apple-trees, carried on by the Department of Agriculture of the Province of Ontario, was conducted in twenty-five orchards, situated in twenty-three counties, covering the Province from Sarnia to Lancaster. The original plan was for six sprayings at each point. This would have finished the work early in July. About this time, however, scab was making such headway that it was decided to make another application. Accordingly, the men were sent out again, and the work was completed by July 18.

Only one solution was used—Bordeaux Mixture—according to the following formula:—Copper sulphate, 4 lb.; fresh lime, 4 lb.; water, 40 gallons. To this, in every case, was added 4 oz. of Paris Green.

On account of the law, which forbids the spraying of fruit-trees while in full bloom, and on account of rain, many applications were omitted, and numbers of applications were discounted or lost by being closely preceded or followed by rain. However, the results were highly satisfactory, in some

cases the full 100 per cent. of clean fruit being obtained. These trees and their fruit were absolutely perfect.

A great deal of interest was taken in the work, and the gentlemen in whose orchards we sprayed did all in their power to assist us. The people are gradually waking to the fact that spraying is indispensable to the up-to-date orchardist, and every year the experimental (or more properly now, the instructional) spraying of fruit trees is attracting more and more attention. The attendance this year was 60 per cent. greater than last year, and inquiry by mail was ten times as great.

In a recent report by the entomologist of the State of New York, 356 species of insects which commit depredations on the Apple are catalogued, and each is known at times to feed upon the Apple from choice. Many others will feed upon it when other plant food is lacking, and he adds:—"The least harmful among them may at any time, through such sudden and inexplicable multiplication as is often witnessed in the insect-world, become a serious pest." Add to these the injurious fungi, and you will have some idea of the phalanx of enemies the Apple-grower has to face. I believe the most effective artillery we have is the spray-pump, but to be effective the proper ammunition must be used at the right moment. With every insect there is a time when it is most vulnerable with some treatment, which can only be successfully applied for a few days in the season.

I want to give you a few of the actual results obtained in our work this year. In calculating the percentage of perfect fruit, the following plan was adopted:—A part of the tree was stripped of every Apple; these were carefully examined, and any specimen which had a worm or a spot, no matter how small, was rejected.

IN MR. WARNER'S ORCHARD AT TRENTON.

Apples.	Experimental Spraying.	Unsprayed.
Spy	76 per cent. clean	8 per cent. clean.
Snow	75 " " "	No clean fruit.
Wealthy	90 " " "	20 per cent. clean.
Summer Pearmain	75 " " "	5 " " "
Baldwin	90 " " "	10 " " "
Bottle Greening...	76 " " "	5 " " "

The packers said it was the best fruit they had packed this year; and Mr. Warner says the increased value of the crop on the twenty-five sprayed trees was 100.00 dols.

IN MR. J. P. THORN'S ORCHARD, PICTON.

Apples.	Experimental Spraying.	Unsprayed.
Spy	90 per cent. clean	10 per cent. clean.
Colvert	90 " " "	" " " "
St. Lawrence ...	75 " " "	10 " " "

Swaar	75 " " "	10 " " "
Red Astrachan ...	80 " " "	15 " " "

Mr. Thorn says that the spraying of the twenty-nine trees we worked on was worth 75.00 dols. to him. He further says that while unsprayed Spys were worth 2.00 dols. per barrel, he was getting 3.50 dols. per barrel for sprayed fruit. *W. M. Orr, Fruitland, condensed from the Report of the Fruit-Growers' Association of Ontario.*

ORCHID NOTES AND GLEANINGS.

TRING PARK.

THERE is a good show of Orchids in Lord Rothschild's garden at the present time, the showier sections contributing largely to the display. The best displays are found in the intermediate and Cattleya-houses, and in the largest of the former a

group of varieties of *Dendrobium Phalaenopsis Schroderianum* arranged with varieties of *Cattleya labiata autumnalis*, with plants of *Oncidium varicosum* in bloom overhead.

The Cattleya-houses showed a number of *Cattleya labiata Schroderae*, well furnished with flower-sheaths, and some good examples of the favourite, fragrant *Cattleya aurea*; a remarkable form of *Laelia flava* with reddish-tinged flowers; a splendid example of *Laelio-Cattleya* × *Nysa*, *Cattleya bicolor*, *C. Loddigesii*, *Laelia pumila*, and some few other pretty species.

The houseful of white and coloured varieties of *Laelia anceps*, which thrive so well at this place, are well furnished with flower-spikes. The large plants of *Phalaenopsis* still maintain their vigour, though not without showing indications of the effects of the protracted hot weather. In bloom are some varieties of *P. Esmeralda*, which, though not so showy as some of the species, is attractive. Plants of the pretty dwarf *Phalaenopsis Lowii*, *P. violacea*, &c., were remarked.

In the cool-houses some good forms of *Odontoglossum crispum*, *O. Pescatorei*, *O. nebulosum*, and other species are in bloom, as well as *Cochlidia vulcanica*, *Masdevallia Chimera Rozei*, *M. bella*, the singular mossy-stemmed *M. muscosa*, the beetle-like *M. triaristella*, and *M. trichate*, *M. torta*, and others, and some *Restrepia* and *Pleurothallis*.

Other noteworthy Orchids in bloom are *Dendrobium formosum giganteum*, *Miltonia Warscewiczii*, and others; *Vanda Kimballiana*, *Cirrhopetalum ornatissimum*, and *Ansellia confusa*.

The Carnation-houses are well furnished with blooms, especially the one filled with plants of *C. Mrs. Leopold Rothschild*. Among the flowering bulbous plants are some excellent scarlet-flowered *Nerines*, and blue *Griffinia hyacinthina*.

CATTELEYA SUPERBA SPLENDENS.

As with many other Orchids having a wide range of distribution, the quality of the flowers of *C. superba* depends entirely on the locality from which they are derived. From some localities a plant of the variety known as "splendens" could not be obtained; whilst from the locality where "splendens" is found, the ordinary run of the flowers is far superior to that of flowers from other districts, and as is luckily the case, the plants seem to grow and bloom with greater freedom. Such an importation was the one recently secured by Messrs. Hugh Low & Co., by the evidence of the flowers sent by various correspondents. That taken from a plant with seven blooms, sent by Joseph Broome, Esq., Sunny Hill, Llandudno (gr., Mr. A. Axtell) is the best. Its broad sepals and petals, which expand flatly, and measure more than 5 inches in width, are of a glowing dark purplish-rose, the sepals being slightly margined and tipped with white. The side-lobes of the lip (through the opening in which the fleshy white column shows) and the front lobe are ruby-coloured, the base of the lip and insides of the side-lobes of blush-white, and the small disc of chrome-yellow. The plant requires to be grown rather warmer than the varieties of *Cattleya labiata*, and experience has proved that it succeeds better when grown in baskets or suspended Orchid-pans than in pots placed on the stage.

DENDROBIUM AQUEUM.

This would be a favourite species, if grown up to its best, as was shown by the high price realised at a sale some time ago by Messrs. Protheroe & Morris for a few fine specimens in flower. It is not a difficult plant to cultivate if its wants be understood; and growth is rapid, if abundance of water be afforded during the growth period. It requires a rest more than usually long in a cool dry house, enough water being applied to prevent shrivelling. Thus cultivated, the foliage is retained on the pseudo-bulbs that are bearing flowers, which is an added attraction. The flowers measured about 1½ inch in width, and are produced singly or in pairs on the upper portion of the pseudo-bulbs. They are white, with a peculiar yellowish-silver veining, and a primrose-yellow tinge on the lip. It was first introduced from

the Nilgiris in 1842, and has since then been found in other parts of southern India. It is also known in gardens as *D. album*, and was figured under that name in *Wight's Icon. Pl. Ind., Or.*, t. 1645, but Lindley's name having the priority, is the correct one. The name *aqueum* was given, according to the author, on account of "its pale green watery flowers," an appearance which may still be seen in badly-cultivated specimens, though when well-grown its flowers, which are fragrant, are almost white. A portion of a leafy pseudo-bulb with flowers attached is sent by Mr. John S. Treseder, manager to Messrs. Heath & Son, Cheltenham, who received the plant from India as "white *Dendrobium Cambridgeanum*."

CATASETUM MACROCARPUM.

This fine species is imported from various localities, but the best forms appear to come together with *C. Bungeoethi*, the importations from that quarter also including some of the beautiful, variable hybrids between the two species named, called *C. × splendens* by their original importers, Messrs. Linden & Co., of Brussels.

A showy form of *C. macrocarpum*, with bright-yellow fleshy lip, and French-white sepals and petals, spotted with rose-colour, has been sent us by Mr. De la Salle, Enbridge Lodge, Newbury (gr., Mr. Geo. Ellwood), who obtained it for *Cynoches chlorochilon*. The plant is described as carrying a fine spike of fifteen flowers, and another spike in course of formation. *J. O'B.*

Hypericum galioides was originally described by Lamarck in the fourth volume of his *Encyclopædia*, which was published in Paris during the French Revolution. It is dated "L'an IV de la République"—i.e., 1796-97—which proves the plant to have been known for more than 100 years. The type-specimens had been sent to Lamarck by John Fraser, one of the most noted of the earlier American plant-collectors. But even before it had been named and described, it was already in cultivation in the National Garden in Paris, having been raised there from seed sent home by Michaux. Notwithstanding its early introduction to Europe, it has been almost entirely lost sight of till quite recently, when through the agency of Professor Sargent and the Arnold Arboretum it has been re-introduced, and has flowered at Kew and several other places. The figure now published was made from a specimen grown in Mr. Gumbleton's garden at Belgrove near Cork, and is the first illustration of this species that has been published in Great Britain. The plant is not one that can claim a place among the best hardy shrubs, or even among the best *Hypericums*. Still, it is interesting and pretty, and may be welcomed as an addition to the few hardy shrubs that flower in autumn. *W. J. Bean, Arboretum, Kew.*

FORESTRY.

OUR WOODS AND FORESTS.

(Continued from p. 213.)

It is the sylvicultural side of our woods and forests which appeals most strongly to the practical foresters of this country, or at least to those of them who feel that something ought to be done by the State to put their particular industry on a more satisfactory footing. No doubt some allowance must be made for professional zeal and enthusiasm when listening to the opinions of the advocates of advanced forestry practice in this country, and the fact may sometimes be lost sight of that proprietors, and not foresters, must settle the question of British forestry reform. But for all that, a good case may still be made out for more serious recognition of economic forestry by the Government of a country which possesses a considerable proportion of semi-waste land, and a surplus population more or less in need of employment. Technical education is beginning to receive the attention it deserves at the hands of the State; but unless it can be turned to practical account, it will not be a complete success.

Whether the Government be justified in granting money for the teaching of scientific forestry in Edinburgh and other centres by the actual circumstances under which British forestry is carried on, is not an easy question to answer in an impartial spirit; but I have little hesitation in stating that the proper management of our Crown woodlands would have as much (if not more) educational influence upon the forestry practice of the country than lectures and classes, which only reach a few working foresters, or prospective land-agents. That these classes are not in themselves sufficient to attain the object in view, is evident from the strong appeal recently made to the Board of Agriculture for funds to start an experimental forest area in Scotland. So far, the only response to this appeal has been a verbal one, characteristic of Governments in general, but whatever the final verdict may be, England and Wales have as much right to some consideration in this question of forestry education as Scotland.

Putting all local prejudice aside, if a properly-equipped British Forest School is to be established, Edinburgh (or its vicinity) is undoubtedly the place for it, and we have nothing to say against the scheme suggested by our friends beyond the Tweed. But it seems absurd to grant a comparatively large sum of money for establishing a forest area in Scotland, and at the same time allow the splendid opportunities presented by our Crown woodlands for educational purposes to remain neglected. If any good reason existed for preserving the obsolete methods of management more or less in vogue, we should have little to say against them. *A. C. Forbes.*

(To be continued.)

FIG. 88.—*HYPERICUM GALIOIDES* (LAMARCK): FLOWERS YELLOW.

DENDROBIUM FORMOSUM VARIETIES.

While some importations of this grand white-flowered Orchid exhibit tolerable constancy in the similarity of the yellow colour on the lip, others show great variation; but we have not previously noticed such a wide difference as that shown in the case of two flowers sent by Reginald Young, Esq., Fringilla, Linnet Lane, Sefton Park, Liverpool (gr., Mr. Poyntz). The colour on the lip of the one is of a pale chrome; on the other a fine, glowing, dark tint of reddish-orange, even finer than that seen in the labellum of the best form of *Dendrobium Jamesianum*. The varieties showing these peculiarities should be marked, in order to see whether they are maintained in their present intensity. Fine forms of *Cattleya maxima* and *C. Bowringiana* were also sent for inspection.

HYPERICUM GALIOIDES

(LAMARCK).

UNDER cultivation in this country the American species of *Hypericum* are by no means so beautiful as the Asiatic and European ones are, but *H. galioides* is one of the most attractive of them. It is a native of the Eastern United States, and is a compact bush, growing 2 feet to 3 feet in height, whose slender stems are well furnished with narrow, linear-lanceolate leaves, varying from half-an-inch to 2½ inches in length, by about one-eighth of an inch in width, and dark green. The flowers are yellow, half to three-quarters of an inch in diameter, and they are borne in small axillary and terminal cymes. The plants commence to bloom in July, and continue till the present time,

FLORISTS' FLOWERS.

NEW CACTUS DAHLIAS AT SLOUGH.

I HAVE known the Dahlia to be cut down by frost during the second week in September, but this year the corresponding week of the month was characterised by tropical heat, and the Dahlias at Mr. Turner's nursery, at Slough, though well cared for in the matter of moisture, hung their heads under the effects of the burning sunshine. At Slough, success is not so much the result of the rich soil in which the roots are planted, as of the liberal mulching on the surface, and copious supplies of water when required, with close attention to freedom from vermin.

I was more particularly interested in the Cactus varieties. The Cactus varieties have enormously increased during the past three years, and they are nearly as numerous as the show varieties. Without exactly giving the varieties in the order of alphabetical arrangement, the following may be taken as representing the best of the new varieties of the present year:—Capstan, soft brick-red, with a tinge of apricot at the base, 3 feet in height, good habit, throwing its flowers well above the foliage on long stems; it is early to flower, and produces its blooms much more abundantly than others. Laverstock Beauty, soft red or vermilion—a very good type of Cactus indeed; good habit of growth, the flowers produced on stiff, stout stems. Mary Service, a lovely variety, of a pleasing tint of pinkish-apricot, with a pleasing yellowish-brown base; it is taller in growth than the foregoing, and quite a free bloomer, but does not throw its flowers well above the foliage; it is a refined type of flower, of decided value for exhibition purposes. Britannia is a deservedly popular variety for exhibition purposes; it is of a delicate shade of soft salmon-pink, with a base of brownish-apricot—in the younger blossoms especially there is a lovely tinge of colour; early to flower, and free for one of this type of Dahlia; it produces its blooms on long, stiff stems. It does not require much thinning-out to get perfect flowers; in height, it is about 3 feet. Keynes' White is an improvement upon the white Cactus varieties, and can be caught of highly refined character, but it is of tall and coarse growth, and except for exhibition purposes, of little use in the garden; it requires a lot of thinning to obtain well-developed blooms—height 5 feet. In the variety Arachne, we get a remarkable break, for it is distinct both in form and marking; the centre of each petal is white, with a broad band of bright crimson on either side; it has an indifferent pendent habit of growth, forming a spreading bush, and the flowers are inclined to come then—height 3½ feet. Alfred Vasey has a colour difficult to describe: the raisers say that it “reminds one of a reddish-sunset, enlivened with aurora-like reflections of amber and pink.” The flowers are produced on short stems, and the blossoms were somewhat irregular; it is, however, likely that a moister season will produce its better character; it is a variety requiring to be well thinned out—3½ feet. Regulus is a very bright deep crimson self, with a good stem and habit, one of the brightest-coloured varieties grown, and perhaps, owing to the drought, showed a tendency to go back to the decorative type. Island Queen is of a soft lilac-mauve colour, very distinct and pleasing, its flowers produced on good long stems, and inclined to be somewhat pendent; it is a variety that should not be grown too strong; perhaps owing to the season it showed a tendency to come cross-eyed. Casilda is a variety with a yellow centre, and pinkish-salmon basal florets, but has a bad habit of growth, hiding its flowers among the foliage. Falka is another variety, with good stems to the blossoms, but hides its flowers, and the habit is by no means good. Daffodil, a delightful Cactus of a pale canary-yellow colour, has proved very disappointing, coming green-eyed, and quite coarse. Night is an improved Matchless, and remarkably good dark Cactus, being of an intense dark maroon, nearly black; excellent habit, a free grower, producing its flowers on long stems. Amber, pale orange-red or amber colour, is

disappointing, as it shows a tendency to revert to the decorative type. Tillie, salmon, suffused with pale rose and mauve, has also proved disappointing; it is of dwarf habit, but hides its flowers. Ruby, rich ruby-red and bright carmine, also proved disappointing, though it is fine in colour, and has a good stiff stem. Mrs. John Goddard is of a very fine rich crimson-scarlet colour; the brilliant blossoms, borne on long stems, are thrown well above the foliage; height 3½ feet, with an excellent habit of growth.

The foregoing may be taken as the best of the new varieties of the present season. Of those of 1897 the best are Starfish, pure orange-scarlet or coral-red, very free and constant, every bloom good, the habit excellent, and the flowers borne well above the foliage. Cycle, rich ruby-red, somewhat tall-growing, but good habit; requires disbudding freely, but decidedly good. Mrs. Kingsley Foster, very distinct, old gold coloured; strong growing, and good habit. Cinderella, very good when at its best, is bright-purple colour, and a very good Cactus type. Charles Woodbridge is probably the very finest and most constant Cactus variety in cultivation, and if one variety only were grown this should be it. Fantasy is not so good as last year; it has small flowers, and they are hidden in the foliage, requiring a great deal of disbudding to induce them to throw their stems above it.

The best six Cactus Dahlias of 1896, judging by the present season's results, are Beatrice, Fusilier, J. E. Frewer, Mrs. Beck, Mrs. Gordon Sloane, and Miss A. Nightingale. R. D.

STORING DAHLIAS.

After taking up the roots, and turning their stalk downwards to drain the moisture from the latter, and partially dry the tubers, which is best done under glass or in an airy shed, I fasten a label with the name of the variety to each in a secure manner, and place the tubers neatly together in a dry, frost-proof potting-shed, beneath the bench, and cover with fine soil or fine coal-ashes. I have wintered the roots with equally good results in dry cellars, without any covering, merely shaking some straw over them, and in this manner the tubers keep plump till the spring; of course, the very special and more costly varieties get a little more care, being put into Pelargonium-boxes, and covered with moderately-dry leaf-mould. Dahlia-roots should be stored in an even, rather low temperature, and on no account should they be allowed to get much shrivelled. H. Markham.

THE WEEK'S WORK.

THE ORCHID HOUSES.

By W. H. WHITE, Orchid Grower to Sir Trevor Lawrence, Bart., Burford, Dorset.

Orchids in Flower.—Amongst the more beautiful are *Dendrobium Phalaenopsis Schroderianum*, which has few equals in the way of producing graceful sprays of blossoms that are very suitable for cutting, if this be desired; and these keep a long time in a fresh condition in water. The plant does not vary in habit, but the flowers do so in their tints considerably, some being white, and others of crimson-purple. The plants which are in flower should be placed in a part of a warm-house where the ventilation is good; they would, however, last just as long in the Cattleya-house, the drier air of which suiting them even better than that of the warm-house. When the spikes are removed place the plants altogether in one part of the house, where the fullest amount of sunshine will reach them, which will have the effect of maturing the new pseudo-bulbs. While at rest the plants must not be excited, or premature growth will be started. And to this end the air must be dry; still, enough water must be afforded as will prevent shrivelling, or the roots perishing.

D. bigibbum, *D. Statterianum*, *D. superbiens*, and *D. Goldii*, being species that are about to flower, should be afforded the same kind of treatment as *D. Phalaenopsis Schroderianum*. *Spathoglottis aurea*, *S. Fortunei*, *S. Lobbi*, *S. plicata*, and *S. Kimballiana* now completing their growth should be hung close up to the roof, so that the pseudo-bulbs may mature. When the leaves of these plants change colour, water must be gradually reduced in frequency and quantity, and when these have all fallen off, water should be withheld, and the plants allowed to rest.

Mormodes, *Cynoches*, &c.—Notwithstanding the past hot summer, many *Catasetums*, *Mormodes*, and *Cynoches* still retain their foliage, and these plants should for the present be kept warm and fairly moist at

the root, and near to the roof-glass. When the leaves change colour remove the plants to a house somewhat cooler and drier. If matured they will need no water in the resting season, but pseudo-bulbs ill-matured may require water, such being liable to shrivelling.

Thunias are retaining their foliage, and being usually in a dry atmosphere and in full sunlight, red-spider is apt to infest the leaves. When this is found to be the case, examine and cleanse them frequently, as these acari will spread to more valuable plants. In order to clear off red-spider, lay the plants on their sides and syringe the under-sides of the leaves with warm rain-water, in which soft-soap is dissolved; or if badly infested, use Richard's XL All nsecticide.

Miltonia Phalaenopsis that have been growing in the cool-house may now be placed near to the roof at the warmest part of the intermediate-house, and afforded water abundantly at the root, and aired freely whenever the weather is mild. The *Chimæra* section of *Masdevallias*, as *M. Chimæra*, *M. bella*, *M. nycterina*, *M. Winniana*, *M. Backhouseiana*, *M. stupenda*, *M. Roezli*, *M. gongora*, and *M. Wallisii*, may likewise be removed to the same house immediately fire-heat has to be employed in the cool-house. These plants, as a rule, are much infested by insects, requiring a good deal of time to be spent in keeping them clean.

Lælia harpophylla is now finishing up its growths and flower-spikes, and calling for copious applications of water till such time as the flowers open, when the quantity should be much reduced. This species thrives in a slightly warmer temperature than that in which *Odontoglossums* are grown, as does *Epiphrontites Veitchii*. This last-named plant suffers during the winter months if much water be afforded, the tips of the leaves becoming spotted. Instead of affording water in the usual manner, I merely sprinkle the surface of the compost with a fine rose water-can, and should spots appear on the tips of the leaves, the plant is kept on the dry side for about eight days.

Odontoglossum Insleayi, *I. leopardinum*, and *I. splendens*.—The flower-spikes will now be pushing up, and the plants will do better if they are placed with those of *O. grande* in the coolest and driest part of the intermediate-house. When the flowers fade, afford the plants a period of rest. Owing to the partiality of slugs for the flower-spikes of this *Odontoglossum*, the plants should be isolated as much as possible on pots, &c., and a ring of wadding placed around the base of the spikes.

Grammatophyllum Ellisii.—Any plant which has made up its growth may be removed to the cooler part of the East Indian-house, and afford just enough water to prevent the pseudo-bulbs from shrivelling.

Vanda tricolor, and others of that section, requiring attention in the matter of re-potting, should be kept somewhat on the dry side for one week following the re-potting.

THE FLOWER GARDEN.

By H. WALTERS, Gardener to Lord Gerard, Eastwell Park, Ashford.

Spring Bedding Plants.—October affords the best time for planting out in the beds the various plants which are to make the flower-garden gay in the spring. The beds and borders so planted should have a liberal dressing of decayed manure, and be deeply dug. The planting should be carried on when the soil is somewhat dry. In regard to mixed beds, one that is planted with *Myosotis dissitiflora*, or other variety, intermixed with a yellow-flowering Tulip, affords a pleasing effect; and if *Silene pendula* is used with an edging of *Pyrethrum aureum*, which is always better coloured in the spring months than later, it makes a desirable mixture. If the yellow Wallflower is employed in a bed, the dwarf *Myosotis* or *Aubrietia* in variety go well together. The dark-coloured Wallflowers look well with an edging of some light foliage-plant, such as *Antennaria tomentosa*, or *Arabis alba*. Other plants which can be used judiciously, mixed with various bulbs, are *Alyssum saxatile*, *Polyanthus*, *Primroses*, both double and single-flowered; *Pansies*, *Violas*, *Hepaticas*, *Phlox divaricata*, *P. nepalensis*, *P. Nelsoni*, and *Gentianas*. A certain amount of care must be exercised in the planting of these subjects, to see that no soil remains in the crown of the plants after planting, as in wet weather this very frequently causes the crown of the plants to decay. In places where spring-bedding is not carried out, the following dwarf shrubs are very suitable for filling the beds during the winter. Among the best are *Aucubas*, either male or female, with green or variegated leaves; *Hollies*, with variegated leaves; *Box*,

Euonymus in variety, Golden Yew, *Retinosporas* (*Thuya*), *Arborvitæ*, Junipers, Pontic *Rhododendrons*, Sweet Bays, and dwarf bushy plants of the common Laurel. A due admixture of the pyramidal Conifers with the flat or round-headed shrubs, with self or variegated foliage, has a pleasing effect when carried out in a tasteful manner. Where shrubs are not to be had, evergreen twigs may be used instead.

Herbaceous and Shrubby Phloxes.—The present is a suitable month for lifting and replanting Phloxes, if it be desired to increase the stock; or, if owing to exhaustion of the soil, the blooms have got small. Only the portions at the circumference of the clumps should be replanted, the central parts being thrown away. If very fine heads of bloom are looked for, plants raised from cuttings only should be planted. The stations for these plants should be heavily manured and trenched. Arrange the plants with due regard to their colours, the intervals apart between the plants being determined by the strength of the variety. In planting, set them a little lower in the soil than they were previously, and make the soil firm about the root.

Calceolaria Cuttings.—These should now be made and inserted in the cutting-bed without delay, a cold frame affording the best kind of protection for them. The bed should consist of leaf-mould and sharp sand, the cuttings being put in about 4 inches apart. Be careful not to afford the bed much water, or damping-off will soon occur. Let air be afforded on all favourable occasions, and protect the cuttings from frost. For general purposes, Golden Gem, Prince of Orange, and *Amplexicaulis* (a fine lemon-coloured variety) are best for beds, the last-named being, however, not suitable for early work.

FRUITS UNDER GLASS.

By G. NORMAN, Gardener to the Marquess of SALISBURY, Hatfield House, Herts.

Peaches and Nectarines (continued from last week).—This being the purchasing season, I would advise the following being obtained from the nurseryman. The best variety of Peaches to bear early fruit, when forced or naturally grown, are Early Alexander, Hale's Early, and Rivers' Early York. Of Nectarines choose Early Rivers, and Lord Napier. For later forcing there are not any better than Royal George, Bellegarde, Noblesse, Violette Hative, Dymond, Grosse Mignonne Peaches; and of Nectarines Elruge, Pitmaston Orange, and Pine-apple. The latest Peaches for houses or walls are Barrington, Sea Eagle, and Princess of Wales, the last-named being an abundant bearer, the fruit of large size, good flavour, and of a yellow colour with red streaks; the flesh is not melting. Those who prefer to grow only the best Peaches in season from May to September, should possess Royal George, Bellegarde, and Noblesse; and Nectarines, Lord Napier, Elruge, and Pine-apple. The sort of tree to plant should be that which is most suitable for the shape of the house and trellis, choosing a dwarf-trained tree for a low lean-to at the front, where the glass and trellis are near the surface of the border. In some houses the trellis is erected equidistant from the roof and the border; or it is curvilinear, and may reach two-thirds of the breadth of the house, the back part being about one-third of the height of the house above the border, so as to admit of sufficient light reaching any trees, which may be either dwarfs or half-standards, planted against the back wall. In forcing-houses where the front wall supports the roof some considerable height above the surface of the border, and there are no front lights, standard trees are the more suitable, dwarf-trained trees being planted against the ends of houses. The fan-shaped tree is that generally liked, and is, moreover, the most natural to the Peach. In buying fan-trained trees it is more economical to buy "maidens," or such as have been once cut back. Some gardeners do not mind if the Peach has a central stem after the first year's pruning, but I do not like them, and prefer a tree without a stem above the first pair of branches. A young tree should be strong and healthy, with no gouty appearance about the point of budding. The trees should be planted at such a distance apart that they have space to develop to a good size, and the roots have plenty of feeding space. It is better to have fewer trees than to crowd them together, and a distance of 15 feet from stem to stem is the least that can be recommended. This year growth out of doors is late, hence nurserymen will be late sending out the orders; when the trees do arrive, plant them forthwith.

Cherries.—The following free-bearing varieties are

recommended for the Cherry-house, viz., Early Rivers, Elton, Black Tartarian, and Bigarreau.

Plums.—The following will give satisfaction under glass, viz., Jefferson, Transparent Gage, Kirke's, Dennison's Superb, and Cox's Golden Drop.

THE KITCHEN GARDEN.

By J. W. McHATTIE, Gardener to the Duke of WELLINGTON, Strathfieldsaye, Hants.

Lifting Beet, Parsnips, and Carrots.—In removing these roots from the soil, do not cut or break them with the tool used in the work, as in the case of the Beet, the damaged root bleeds on being cooked, and is spoiled. The leaves should be cut at least 2 inches from the crown for the same reason. Some gardeners lift the whole of the crop of Beets, storing the roots away in damp sand before sharp frosts occur to damage; others, on the contrary, lay in the roots close together on a sheltered border, covering them in the event of hard frost with leaves or litter, and in this way the roots keep fresh and juicy till late in the spring. Parsnips, when lifted, may be stored in cold sheds, like Beet and Carrots, or they may be left in the soil, and lifted at any convenient time, enough roots being dug when hard frosts appear imminent to cover a few weeks' consumption.

Carrots, not being a crop that can be exposed to much frost, should be lifted during this month, or as soon as winter weather actually begins; and, as in most kinds of soil crooked and split roots are found among Carrots, the best roots should be selected and kept by themselves, whilst those that are inferior should be put aside for immediate use, or as flavouring materials. If the Carrots are placed horizontally in the root-house or cellar in banks of moist sand or mould, with their tops protruding 2 inches, they will keep in good condition for four months, whereas if the tops are buried under the soil, rotting of the roots is soon set up.

Mushrooms.—Let a steady temperature of about 58° be maintained in the house or cellar, which may be done at this date, with the warmth afforded by beds recently made. If fire-heat is required, the air must be rendered moist by damping the paths, walls, &c., several times a day, or as often as it may appear to be necessary. Prepare materials for fresh beds under cover, and sift loamy soil in readiness for soiling-beds. Field-Mushrooms will have become more plentiful since the much-wanted rain has come, and these should be collected.

General Work.—Exhausted crops of all kinds should be cleared off the ground, and all kinds of work that can be performed at this season should be expedited, such as earthing-up Celery, &c. Chicory may be taken up, and the tops, cut off to within 1 inch of the root, and the latter laid in half sand and leaf-soil, with the tops above the soil, the boxes or pots containing the roots being placed in a warm, dark cellar or Mushroom-house.

HARDY FRUIT GARDEN.

By W. H. DIVERS, Gardener to the Duke of Rutland, Belvoir Castle, Grantham.

Apricots.—Complaints are sometimes made by gardeners of the difficulty they experience in the cultivation of this fruit-tree, the trees in some instances dying by degrees as soon as they have attained full size, and even sooner. This mishap is more to be feared in southern than in midland counties, and is especially prevalent on soils which consist of light loam resting on sand or gravel, the Moorpark being more liable than any other variety. I am of the opinion that the inclination of the Apricot to make early growth has much to do with this loss of whole limbs, the young and tender shoots getting injured by night frosts. In warm districts, where dying-back is of common occurrence, I would likewise recommend the planting of the Apricot on a western instead of a south aspect, and if the soil consists of light loam, to make it heavier by the addition of strong loam taken from off the chalk or limestone rock, putting the whole firmly together, with mortar-rubble added, but no manure. Trees planted not too deeply in such a soil make short-jointed firm wood, which ripens thoroughly in most years. In the gardens at Belvoir there exists a Roman Apricot-tree which is planted against a west wall at a point where a pavement comes up close to the stem, and it is in perfect health. The tree was planted in 1857, and measures 30 feet in height by 24 feet in width, and it bears good crops of fruit. The subsoil at Belvoir consists of clay of great depth, and is, therefore, cold. I mention this because it shows under what apparently adverse conditions it is

possible to fruit the Apricot. It is always prudent in the case of wall-trees exhibiting great vigour when young to check this by lifting the roots either wholly or in part as soon as the leaves begin to fall. The consequences of neglecting to lift are unripened shoots, followed by gumming, and lastly by the dying-off of some of the branches. Apricot-trees of almost any size may be safely removed in the autumn if care be taken to preserve the greater proportion of the fibrous roots, and trees so treated frequently set an excellent crop of fruit the following spring. Having lifted and replanted a tree, it should be loosely fastened to the wall for about three weeks, so as to allow the tree to follow the settling of the border. In any case, water should be heavily applied during the act of filling in the soil, and immediately the job is completed.

Varieties.—Moorpark is the best flavoured variety, but it is also the most liable to disease; Hemskirk, Kaisha, Peach, and Shipley, are hardier, and may be recommended where the Moorpark is a failure. Breda and Roman are small-fruited varieties of good constitution, and useful for preserving and culinary purposes.

PLANTS UNDER GLASS.

By W. MESSENGER, Gardener to H. C. BERNERS, Esq., Woolverstone Park, Ipswich.

Anthurium Scherzerianum.—Those plants which have completed their growth for the year may now be removed from the stove to an intermediate-house for resting for six or seven weeks, but little water being afforded them. If scale infests them, let the foliage be thoroughly cleaned with a piece of sponge and Paraffin Emulsion or Richards' XL-All liquor. Do not leave this operation till growth commences, the young leaves being readily injured.

Anthurium Andreanum.—This variety is one of the most useful in the winter in affording spathes for cutting. The plants should be placed in a warm part of the stove, and liberally supplied with moisture at the root. If the plants are grown in 7-inch pots, they will be found effective when dotted about amongst other stove plants.

Petunias.—Cuttings, when well established in small pots before the winter, make useful flowering plants for conservatory decoration early next season. If cuttings are inserted forthwith, and left after rooting in the pots they were struck in, they will afford a supply of cuttings early in the spring. It is desirable to keep a few old plants to supplement these, as a reserve against loss of cuttings. Place them near the glass in a greenhouse, and afford water sparingly at the roots, damping off quickly if there is much moisture in the soil.

Fuchsias.—Plants that have been standing out-of-doors may be removed to a dry, cool shed, protecting them against frost. Fuchsias struck from cuttings some time ago in small pots should be placed in the same position as that advised for Petunias, where they will continue to grow steadily during the winter. Later-rooted plants may be placed in thumbs, and offered the same kind of treatment as the earlier-struck ones.

Cyclamens.—If early flowers are required let the most forward be selected from the stock of plants, and place them on a shelf close to the glass in a house with a temperature of 56° to 60°, admitting air in moderation day and night on every favourable occasion. The main batch of plants may be removed from the cold-frames in which they have been standing, to a light, airy house, and be afforded no artificial heat for some time to come, unless the air in the house becomes stagnant, when a little heat may be employed to restore it to wholesome conditions. Let water be carefully afforded, but do not cause suffering by an insufficient supply. Any plants which have filled their pots with roots may be supplied with a weak liquid-manure.

Small Decorative Trailing Plants.—A good batch of cuttings of *Opismenus* (*Panicum*) *Burmanni* variegata, *Tradescantia zebrina* and others, and *Selaginellas* in variety, should be inserted to the number of six in 3½ inch pots; the *Opismenus* and *Tradescantias* being placed under a handlight, or in a close case in a warm house; and the *Selaginellas* in a shady part of a moist intermediate-house, affording water and shade when necessary.

Shading.—All shading materials may now be put away for the season when in a thoroughly dry state, each being marked for the purpose of identification. The roofs, sides, and ends of all glasshouses should be thoroughly cleansed of dirt and conserve, so that the maximum of light may be admitted to the inmates.

EDITORIAL NOTICES.

ADVERTISEMENTS should be sent to the PUBLISHER.

Newspapers.—Correspondents sending newspapers should be careful to mark the paragraphs they wish the Editor to see.

APPOINTMENTS FOR THE ENSUING WEEK.

MONDAY,	Oct. 24	National Chrysanthemum Society's Floral and General Committees, Meeting.
TUESDAY,	Oct. 25	Royal Horticultural Society's Committees.

SALES.

MONDAY,	Oct. 24	Great Unreserved Clearance Sale of Nursery Stock, at Noble's Nurseries, Sunningdale, by Protheroe & Morris. Dutch Bulbs, at Protheroe & Morris' Rooms.
TUESDAY,	Oct. 25	Dutch Bulbs at Protheroe & Morris' Rooms. Orchids at Protheroe & Morris' Rooms. Last day of eight days' Sale of Nursery stock at Noble's Nurseries, Sunningdale, by Protheroe & Morris.
WEDNESDAY,	Oct. 26	Dutch Bulbs at Protheroe & Morris' Rooms. Orchids at Protheroe & Morris' Rooms. Unreserved Clearance Sale of Nursery Stock and Stove and Greenhouse Plants, at the Avenue Nursery, Brondesbury Park, Willesden Lane, by order of Mrs. E. I. Goubert, by Protheroe & Morris.
THURSDAY,	Oct. 27	Dutch Bulbs, at Protheroe & Morris' Rooms. Unreserved Sale of the Established Orchids, at Earlham Hall, Norwich, by order of the Rev. Canon Ripley, by Protheroe & Morris. Twenty-fourth Great Annual Sale, at Hollamby's Nurseries, Groombridge, Tunbridge Wells, by Protheroe & Morris (2 days).
FRIDAY,	Oct. 28	Dutch Bulbs, at Protheroe & Morris' Rooms. Orchids, at Protheroe & Morris' Rooms.

AVERAGE TEMPERATURE for the ensuing week, deduced from Observations of Forty-three Years, at Chiswick.—47° 3°.

ACTUAL TEMPERATURES:—

LONDON.—October 19 (6 P.M.): Max., 57°; Min., 51°.
PROVINCES.—October 19 (6 P.M.): Max., 56°, Scilly;
Min., 29°, central Ireland.

To the *Comptes Rendus* of the Académie des Sciences for June 20, MM. ALEXANDRE HÉBERT and G. TRUFFAUT contribute a paper on the Uses of Manures in Horticulture, in continuation of others already mentioned by us. They there record that:—Among the plants recently experimented upon, *Dracena Bruanti* is one of the species which yielded the most definite results. It was cultivated in pots four inches high, containing three hundred and thirty grammes of leaf-mould.

The trial began with cuttings ten to twelve inches long. Only a fraction of the subjects received the manures; the rest were reserved as check plants.

Preliminary analyses of these plants decided the experimenters to distribute to them, during the course of the trials, twenty-five grammes of a mixture of nitrate of potash, of chloride of ammonium, phosphate of ammonia, sulphate of magnesia and sulphate of iron.

The experiment lasted nine months (from March to November) during which time the plants were kept under glass and not repotted. The effect of the manure was distinctly visible very shortly after the commencement of the trials, and gradually increased. The plants treated were much stronger than the others, their stems more turgid, harder, more woody, their roots more developed. The market value of the test plants, which amounted to about the sum of 2 francs each, was estimated to be doubled for the plants which had received an

addition of manure. Statistics prepared by MM. HÉBERT and TRUFFAUT show further the percentage chemical composition of the check plants and of the *Dracenas* under treatment. With the latter, assimilation was doubled. All the substances contained in the manure were beneficial to the plant, except the sulphuric acid, which seems of least importance. It is also seen that plants having their food provided can assimilate a larger quantity of silica, alumina, lime, and soda, elements which are not furnished them in the form of manure, but which are contained in excess in garden soils and in water.

This experiment proves the increased production obtainable by a rational use of fertilising matters. Identical experiments made with numerous plants: *Adiantum*, *Begonia*, *Cocos*, *Ficus*, *Hortensia*, *Phoenix*, *Roses*, &c., yielded analogous results. Thus, according to MM. HÉBERT and TRUFFAUT, by employing manures judiciously, the horticultural trade may receive a fresh impetus, the sale of ornamental foliage plants and of flowers may become of increasing importance. In this way, at a trifling expense for manures, the prosperity of a national industry may be largely augmented. An abstract of this paper was given in the *Journal de la Société Nationale d'Horticulture de France* for August last.

THE PURPLE BEECH.—“Have you ever seen a finer Purple Beech than this?” said Miss SULLIVAN to the writer, on the occasion of a visit he paid to her delightful garden at Fulham one hot day in August last. Of course, it is not easy to remember statistical details relating to trees seen it may be years ago, and not inspected since, but there can be little doubt that this is one of the finest trees of the kind that we have ever seen. LOUDON, in his *Arboretum*, iv., p. 1979, mentions one at Enville, in Staffordshire, 70 feet high, with a head 85 feet in diameter; and one at Syon, Middlesex, 71 feet high; another at Muswell Hill, 62 feet; one at Claremont, 50 feet, and many more. But it is not the size that gives the charm to these trees—that is only one element. Their dense habit, feathering gracefully to the ground, the richness of their colouring, and the agreeable shade they give, all impress the spectator. Let him place himself beneath the tree, and look up at the frame-work (fig. 89, p. 305), the interlacing branches, and the dense canopy over all, and he will, if he have eyes to see, leave well nigh awe-struck at the thought that all this mighty mass is the product of water and air in conjunction with light and heat—the soil goes for so little except as a water-furnisher. Here, for instance, is a noble Beech, growing on alluvial soil and valley-gravel, as different a soil condition as can well be imagined from the dry, chalky downs whereon the Beech flourishes generally. Miss SULLIVAN'S garden, by the Thames side, comprises not only points of great beauty, and still greater interest, but a degree of variety most charming to experience, and the more remarkable as the garden is now unfortunately well within the zone of London smoke and fogs. We may have an opportunity of speaking later on of this wonderful garden in more detail.

ROYAL HORTICULTURAL SOCIETY.—The next Fruit and Floral meeting of the Royal Horticultural Society will be held on Tuesday, October 25, from 1 to 4 P.M., in the Drill Hall, James Street, Westminster. A lecture on “Experimental Horticulture” will be given by Mr. GEO. GORDON, V.M.H., at 3 o'clock.

ST. PETERSBURG.—The great International Horticultural Exhibition to celebrate the fortieth anniversary of the foundation of the Imperial Horticultural Society, will be held in the Taurida Palace, St. Petersburg, from the 5/17 to 15/27 May next. Professor FISCHER DE WALDHEIM is the President of the foreign section, and Mr. W. ENDER the Secretary.

HORTICULTURAL CLUB.—The first dinner and *conversazione* for the session 1898-99 took place at the Windsor Hotel, Victoria Street, Westminster, on Tuesday, the 11th inst., the chair being taken by Mr. PHILIP CROWLEY, and there were also present Messrs. G. Munro, J. H. Veitch, Peter Kay, W. Bassett, J. Walker, P. Veitch, J. Asbee, C. Mason, and the Secretary. A paper was read of Mr. George Bunyard's, who, owing to indisposition, was himself unable to attend. The subject of it was the Fruit-crop of 1898 and its lessons. It was very ably treated, and led to a very interesting discussion, in which most of those present took a part.

DIOON EDULE.—The Curator of the Botanic Gardens, Cambridge, is desirous of offering fresh pollen of this plant to any one who may chance to possess a female cone.

THE NORTH PECKHAM AMATEUR CHRYSANTHEMUM SOCIETY.—We are pleased to find, from a communication we have received from Mr. W. NICHOLS, the prize-fund secretary, that this energetic suburban Society is moving ahead, and making every effort to keep in the front rank. We note that one hundred pounds' worth of prizes, consisting of watches, clocks, vases, cruets, medals, &c., are on view this week at Messrs. SEALE & SON'S, Rye Lane, Peckham. Many of the members of the Society are found in the ranks of the printing and publishing trades residing in Peckham. The Society does not, however, content itself with the local exhibitors and cultivators, but by means of open classes endeavours to secure others living within a ten-miles radius. The President of the Society is GEO. PEABODY GOOCH, Esq., 8, Porchester Gate.

RAINFALL RECORD IN INDIA.—The British farmer principally, and almost everywhere in these islands, as well as those persons who are dependent on wells for their water-supply, including our dwellers in the East End, who draw what they can from the water-main, must have read, with a recurrence of thirst, the statistics published the other day connected with the rainfall for the past year in one of our Indian possessions. The rainfall at home, as recorded in our weekly weather table, has been the lowest for years—the sun the brightest and warmest, whilst another part of our empire has had more than its usual large allowance of rain. The southern slopes of the Himalayas receive the largest measured rainfall in the world, and pour it down to the Indian rivers. Cherrapunje, where the monsoon first strikes the hills in Assam, gets no less than 489 inches of rain. According to returns for the past twenty-five years, the year is keeping up its reputation. Letters of September 4 report that 76 inches had fallen in five days, and that the total fall up to date was nearly 400 inches. Even this amount was greatly exceeded in one memorable year, viz., 1861—the record was actually 805 inches, of which 366 inches fell in the month of July.

THE CURRANT CROP OF GREECE.—Atmospheric conditions interfered this year before and after placing the Currants on the market; on the average, the quality would appear to be very good. It would have been an exceptional crop, but the rains during drying time interfered deleteriously. From the point of view of profit to the grower and exporter, the crop is a failure. The estimated yield being about 5 to 10 per cent. in excess of the ordinary output—120,000 tons—depressed the average price of 22s. duty paid last year to 17s. this season, or a fall of 5s. To this have to be added adverse rates of exchange, cost of travelling, and depressed markets, bringing out the return at 25 per cent. less than in 1897. Besides the increased product this year, earlier shipments (by fifteen days) have contributed to reduce the price, because the consignments commenced to arrive in England sooner than the buyers were ready for them.

FLOWERS IN SEASON.—We have lately received from Mr. T. S. WARE, numerous flowers of the newer varieties of single and double tuberous-rooted *Begonias*

FIG. 89.—PURPLE BEECH IN MISS SULLIVAN'S GARDEN, BROOM HOUSE, FULHAM.

(SEE P. 304.)

in bewildering shades of colour and form. As substitutes for zonal and other Pelargoniums in vases, pots, and beds, nothing finer can be conceived at this late part of the year, for whereas in most inland gardens the Pelargonium is either entirely, or partly, out of flower, Begonias are almost as good and floriferous as ever, and yet we are exceeding loth to part with our zonals.

PLANTS REQUIRE A CHANGE.—Professor BEAL, who has had the management of the Botanic Garden, Michigan, for many years, tells us that he finds that there is no such thing as planting once for all time. There is no such thing as stability, for plants need a change sooner or later, and will have it or perish. The longer a plant remains in one place in quantity, the more likely is it to be disturbed by enemies—animal or vegetable, big or little.

BOTRYCHIUM LUNARIA.—We should not have expected to find this plant on a dry hot sand-bank, nevertheless we did meet with it on the slopes of the lateral moraine bounding the Findelen glacier, and where scarcely anything else was growing, and where the soil was so comminuted as to be reduced to sand, and so hot as to induce us to remove our hands quickly.

COMING CHRYSANTHEMUM EXHIBITION AND CONFERENCE AT LILLE.—The Chrysanthemum is making rapid strides as an exhibition flower in France. We have received an enormous but artistically coloured poster, advertising the coming International Exhibition and Conference at Lille, under the auspices of several of the most important French horticultural societies. The poster includes representations of several types of Chrysanthemum blooms, and of the Palais Rameau, in which the exhibition will be held. The Chrysanthemum's connection with the East is indicated by a Japanese lady, surrounded by specimens of the flower. It is a very effective poster, and free from any vulgarity. The exhibition will extend from November 10 to 15, and the conference will take place on November 10. A prize of 500 francs and a Gold Medal has been offered for competition by the Minister of Agriculture, on behalf of the French Government.

THE CHRYSANTHEMUM SOCIETY AND THE ROYAL AQUARIUM.—The sub-committee appointed by the National Chrysanthemum Society to consider what suitable place could be found in which to hold the annual exhibitions presented its report, as we are informed, to a special meeting of the executive on Monday evening last. Excepting the secretary to the society, Mr. BALLANTINE was the only member of the sub-committee that voted in favour of remaining at the Aquarium; Messrs. BEVAN, CRANE, MOORMAN, SIMPSON, TAYLOR, and WATERER, favouring the Crystal Palace. It is said that the Crystal Palace authorities were prepared to make a financial grant to the society equal to that which it has enjoyed from the Royal Aquarium Company. The next to unanimous recommendation of the sub-committee was, we learn, rejected.

PUBLICATIONS RECEIVED.—*Report on Flax Culture for Seed and Fibre in Europe and America.* By Charles R. Dodge (Washington). — *Botanical Gazette* (Chicago), September, 1898, contains articles on Origin of Gymnosperms and the Seed Habit, John M. Coulter; Regeneration as exhibited by Mosses, Fred. de Forest Heald; Southern Maidenhair Fern in South Dakota; Bacterial Content of Hailstones; and other subjects.

PLANT PORTRAITS.

ACALYPHA HISPIDA (Burman) = *Sanderi* hort., *Revue Horticole*, October 1, tab. col.

CALICOMA SERRATIFOLIA, *Revue de l'Horticulture Belge*, September. Saxifragaceae, greenhouse shrub, with lanceolate dentate leaves and globular flower-heads in clusters; flowers, yellowish.

CAMELIA DONKELAARII and **C. SASANQUA**, *Garden*, September 24.

CATALPA HYBRIDA.—A hybrid between *C. ovata* and *C. bignonioides*, *Garten Flora*, t. 1454.

PEAR "ANVERSOISE."—A seedling from Marie Louise; fruit medium-sized, turbinate, oblique at the base; skin, brown; flesh, white, juicy and of agreeable flavour. *Bulletin d'Arloriculture*, &c., August.

VIENNA.

THE PUBLIC GARDENS AT VIENNA.—The Gardens of the Town Council at Vienna are a credit to the city, and contain a great collection of new and rare spring-flowering shrubs, many of the latest introduction. Their display in May or June is unique. I have visited these gardens on various occasions during many years, but they have improved remarkably during the capable management of Mr. W. Hybler, head-gardener to the Town Council of Vienna. I will confine my attention to the largest of the public gardens—the Stadtpark. It is situated just outside the old city, is of no very considerable extent, but contains the largest collection of ornamental and flowering shrubs in Vienna. It was laid out in 1868 by the late Stadtgärtner, Dr. F. Siebeck. To go into full details of every feature would require much space; it is only possible to notice a few of them. Immediately on entering the park from the Park Ring, a fine avenue of Planes, Ailanthus, Elms, &c., the first thing to attract attention is the Kursalon, a refreshment-pavilion, a large and very handsome building. It is situated on slightly rising ground, surrounded on either side by fine groups of trees, with a flower-garden in front. The building has a very imposing appearance. The view from the terrace across the wide and open lawn to the lake and its surroundings is very picturesque.

I should, however, especially like to draw attention to the bedding in front of the pavilion. The flower-garden is in two divisions, the beds representing two spirals, which spread as a fanciful border of varying width, with clipped Box-edgings, over the space covered by the garden, and are filled with plants of neat habit: Pelargoniums, Silver Star Begonia, Chilean Beet Königin, Torenia Fournieri, Begonia splendens, Acalypha, Ageratum, and other showy and effective species.

Cannas are used freely in this parterre: they are planted out in the border; each plant has plenty of room to develop and display its beauties. For excellence, the following varieties may be mentioned:—Königin Charlotte, Stadtgärtner Sennholz, Col. Boiesau, and Franz Buchner. In addition, there is a large circular bed; in the centre, on each side, it is planted with Cannas, rather old, small-flowering varieties, with large foliage; in the middle is a fine plant of *Chamaeris excelsa*, surrounded with *Phalaris arundinacea variegata* and *Perilla nankinensis*, which produce a striking effect. A good use was made of *Canna Kaiser Wilhelm*, edged with *Centaurea candidissima*. In front of the parterre we noticed a well-kept carpet-bed, representing the arms of Austria, with the monogram of the Emperor, F. J. I., and on either side the dates 1848–1898.

In the pleasure-grounds may be seen some good specimens of flowering shrubs and trees—*Kolreuteria paniculata*, *Eleagnus rhamnoides*, with, on either side, fine trees of *Acer dasycarpum*, *Laburnum*, *Amorpha*, and *Deutzia*, *Prunus*, *Berberis*, and *Spiræas* in variety.

Leaving the parterre, and entering the principal walks, the flower-beds on each side are most pleasing. On the right we find a large group of tropical plants, *Caladiums* mixed with *Hedychium*, Cannas with large foliage, and fine plants of *Musa*.

In the pleasure-grounds may be noticed some good specimens of spring-flowering shrubs—*Deutzia*, *Desmodium*, *Cornus*, *Calycanthus*, *Fontanesia*, *Prunus* and *Staphylea*. A circular carpet-bed, planted with *Alternanthera amona*, *A. aurea*, *Echeveria secunda*, *Lobelia*, and *Pachyphytum* made a good contrast to the others. There are also noticeable free, fine specimens of *Catalpa bignonioides* and *Magnolia cuspidata*, which bloom in great beauty every spring; *Crataegus Crus-galli*, with double pink flowers, *Sophora japonica*, Planes, and many others. Let us extend our walk through the fine Horse-chestnut walk to the lake. The ground is pleasantly undulating; the turf in excellent condition, being regularly mown and swept. Many trees and shrubs are labelled, and students spend much time in this garden studying botany. Still passing on, we come to a bush of *Corylus Avellana asplenifolia*, reminding us very much of *Asplenium furcatum*; single and

double-flowered *Prunus cerasus*, *Eleagnus argentea*, *Spiræas* in variety, and other well-known ornamental shrubs. They do not thrive so well as in England. Exotic conifers especially are in a very poor state, and all suffer more or less from the severe Austrian winters. Many of our soft-wooded and evergreen shrubs are grown in pots only.

The lake is fringed with varieties of Willows, *Poplars*, *Lonicera Alberti*, Beech, and Birch-trees; *Amygdalus*, *Caragana*, *Phormium tenax*, *Gynierium*, *Arundo*, *Iris*, and Bamboos; they all add to the beauty of the whole. The lake is also interesting for its various water-fowl. Leaving the lake behind us, and following the path, after a short walk we reach the Selenko monument to the late Lord Mayor of Vienna. From here we get a glorious view across wide and open lawns to the pavilion, and the flower-beds on each side.

We return to the pavilion, passing a fine tree of *Pterocarya fraxinifolia* 50 feet high. On the lawns are planted clumps of from ten to twenty of our best-known hardy evergreen shrubs and trees; also other hardy plants are planted out singly, each plant having room to display its own peculiar beauty: the effect is very artistic and satisfactory. The many flowering shrubs and trees make a grand display during the summer-time; the gardens, in fact, are exceedingly picturesque, and well worthy of a visit. *Ch. Schneider, Swanley.*

BOUQUETS.

THESE creations are almost as much regulated by fashion as are the bonnets of the ladies. It is repellent to the mind of men of science and intelligence to admit the existence of such a thing as chance or caprice. These words are simply expressions denoting our ignorance. And we are in ignorance of the laws that dictate the presence of ribbons, sashes, or stuffed birds in a bouquet. We simply note them for the guidance of those unfortunate beings who are obliged to follow the dictates of fashion, and shall heartily sympathise with them when the taste changes.

At one time we looked to France to furnish illustrations of taste, elegance, and appropriateness in bouquet work, but in our opinion the French have gone behind the Germans in this matter of late years. The French have the colour sense best developed, and although they now deck their bouquets and flower-pieces with monstrosities in the way of ribbons, the colour is usually well adjusted to that of the flowers. Anyone who has tried to group *Cattleyas* will acknowledge the difficulty of getting suitable tints of ribbon, or indeed, of getting other flowers which "will go with them."

For our illustrations of some fashionable bouquets of the day (figs. 90, 91), we are indebted to Messrs B. S. Williams & Sons, Court florists, of Piccadilly, and of the Victoria Nurseries, Upper Holloway. The large resources at their disposal, and the taste of their artists, place them in the first rank as decorative florists.

NOTICES OF BOOKS.

ELIZABETH AND HER GERMAN GARDEN.
(Macmillan & Co., London.)

That "Elizabeth" is very fond of her garden there is no doubt; it is also to be noted how freely her pen runs on when speaking of its charms. She gives us no set picture of her "paradise," but rather a series of "snap shots" of it which we may piece together to glean an idea of it as a whole. She writes:—"I love the Dandelions and Daisies even more passionately now. . . . The Dandelions carpeted the three lawns—they used to be lawns, but have long since blossomed out into meadows filled with every sort of pretty weed—and under and among the groups of leafless Oaks and Beeches were blue Hepaticas, white Anemones, Violets, and Celandines in sheets. The Celandines in particular delighted me with their clean happy brightness, so beautifully trim and newly varnished, as though they

too had had the painters at work on them. Then, when the Anemones went, came a few stray Periwinkles and Solomon's Seal, and all the bird Cherries blossomed in a burst. And then, before I had a little got used to the joy of their flowers against the sky, came the Lilacs, masses and masses of them, in clumps on the grass, with other shrubs and trees by the side of walks, and one great continuous bank of them half a mile long, right past the west front of the house, away down as far as one could see, shining glorious against a background of Firs. When that

amuse *dilettante* readers for half an hour now and then. There are no illustrations.

THE MAKING OF A DAISY: *Wheat out of Lilies, and other Studies in Plant Life and Evolution. A popular Introduction to Botany.* By Eleanor Hughes-Gibbs. With illustrations. (Charles Griffin & Co., Exeter Street, Strand.)

There is assuredly no lack now-a-days of elementary books on botany; the only doubt is whether

illustrations to this book are not very numerous, nor especially remarkable. But it is a difficult task to deal with subjects so often treated of, and on the whole the author of *The Making of a Daisy* may be congratulated on having written in a style which is sure to find some admirers, and on having put together facts, true in themselves, and correctly chronicled.

HOME CORRESPONDENCE.

CROCOSMIA.—How many of us have tried *Crococsmia aurea* and its varieties *C. imperialis* and *C. maculata* in a bog-bed? I find that in wet peat, in company with *Parnassia palustris*, *Saxifraga hirculus*, and *Epipactis palustris*, they flower well, and the leaves do not go prematurely brown. I have been told by those who have seen them in their home in South Africa, that they flower admirably under the shelter of dripping rocks. *C. Wolley Dod, Edge Hall, Malpas.*

CHRYSANTHEMUM DISEASE.—My information points to the spread of the rust disease in the Isle of Thanet and East Kent. Every gardener should be careful whence he obtains cuttings and plants, otherwise he may quite unwittingly introduce the rust into his collection. I am told that, to a great extent, Chrysanthemum growers are themselves to blame for the epidemic character the disease has assumed, and I believe it is so; but we must go further afield in combating this malady than in taking care of our own plants. By taking timely measures against its spread, each in his own garden, much may be done, if not to extirpate it, yet to keep it within moderate bounds. *H. Markham, Northdown, Margate.*

BLUE FLOWERS.—In my note on autumnal blue flowers in last week's *Gardeners' Chronicle*, I omitted to name *Lobelia syphilitica*, which for the last fortnight has been very charming in the bog-bed, with its spikes of porcelain-blue flowers. *R. Milne-Redhead.*

SHRUBS WITH BEAUTIFUL LEAF-TINTS.—Amongst shrubs, what can excel, or even rival, *Parrotia persica*, which has now in its leaves every shade of green, from a pale, almost yellowish tint, to dark olive; and of reds, from yellow to scarlet and crimson; and frequently all these shades in the same leaf! *Prunus Pissardi* has been very handsome this autumn, compensating by its present vivid colouring for the unobtrusive character of its summer growths. *R. Milne-Redhead.*

MULTIPLE PARENTAGE.—The fact that a considerable number of abnormal forms have been added to our already extensive list of Ferns by crossing diverse varieties, and that some of the plants so produced have shown the characters of several varieties conjoined, has led to the idea that such combinations are due to the simultaneous fertilisation of one archegonium by several antherozoids derived from different prothalli, the various potencies then evidencing themselves by their several characteristics in the one plant resulting from the presumed multiple conjunction. There are, however, grave reasons for believing this theory to be untenable. That combined variations may be obtained by cross-fertilisation has now been amply demonstrated, so far as two distinct varieties are concerned. The first and most striking instance was in Mr. E. J. Lowe's hybrid between a cruciate form of *Polystichum angulare* and a dense form of *P. aculeatum*, a cruciate *aculeatum* resulting. Since then equally conclusive crosses have been obtained; *A. f.-f. Victoriae*, for instance, crossed with the bristly variety known as *A. f.-f. setigerum* has yielded a perfectly typical percruciate *Victoriae*, with the bristly character of the other. These, however, only demonstrate dual parentage, which falls entirely within the recognised lines of reproductive biology. In the cases, however, which we have in view, principally forms of *Scolopendrium vulgare*, we have, for instance, allied in one plant *S. v. crispum*, *S. v. cristatum*, and *S. v. muricatum*, or *rugosum*, that is, frilled, crested; and roughly-surfaced forms, the result being a muricate or rugose crested *crispum*. The three characters, or it may be more, are undoubtedly there. The question, therefore, is, whether the triple or quadruple combination is the result of one cross or more. In the first place, as evidence for plurality of crosses, it cannot be ignored that the plants have been raised amid a multitude of already crossed, and, therefore, variable plants, and no one who has raised

FIG. 90.—A FEATHERWEIGHT SHOWER-BOUQUET. (SEE P. 306.)

ine came, and when, before it was over, the Acacias all blossomed too, and four great clumps of pale silvery-pink Peonies flowered under the south windows, I felt so absolutely happy, and blest, and thankful, and grateful, that I really cannot describe it. My days seem to melt away in a dream of pink and purple peace." This is a fair specimen of the style of the book in such parts of it as deal with the delights of flowers; other portions, wherein such characters as the Man of Wrath, the babies, Trais and Minora are introduced, have still less to do with the garden or with horticulture, and are rather annoying than otherwise, having a tiresome assumption of wittiness and smartness. The book may

such "popular" works are capable of imparting any information, or of interesting readers in the subjects with which they deal. As regards the volume before us, there is no doubting the excellent intentions of the writer, nor her sincerity, but her rhapsodies about "dear Mother Nature" blend oddly with an attempt to explain evolution and the "making" of plants; subjects on which she owns herself that she has "little that is really new to offer." With the desire to become familiar with Nature, every appreciative person must sympathise, and every intelligent one now knows that evolution is not contrary to or "really opposed to creation," so that fresh assurance on the point seems somewhat unnecessary. The

Ferns from spores can exclude from his mind the ever-present possibility of stray spores intervening to mar the integrity of a sowing. Given the most careful collection and subsequent protection by glass, spores, when ripe, fly broadcast in all directions, and hence a gathered frond is almost sure to bear upon its surface not merely its own spores, but alien ones shed by its neighbours. Given, then, the spores of two combinations, there is, of course, the possibility of another cross, combining the special characters of four plants, and crossing these multiple combinations again, either purposely, by selection, or accidentally by means of strays, we arrive at such a composite state of matters as may yield almost anything. Even with the utmost care, a continuous course of crossing the same species within the same area would have such results as are in question, i.e., a number of plants presenting all sorts of characters in combination in various degrees. This diversity would furthermore be increased by the chance of original sports occurring again and again from spores derived from already varied and crossed parents. We, therefore, see that the difficulty of establishing multiple parentage as indubitably the cause of multiform progeny is extremely great in any case, the determination of the actual parents being almost impossible. The main and fundamental objection to the acceptance of the theory is, however, outside this particular cultural difficulty, and is purely a biological one. The act of fertilisation, although effected upon a microscopic scale, is thoroughly systematic and orderly, and not due to a haphazard admixture of diverse elements. In the first place, prior to fertilisation, the egg or mother-cell prepares for it by throwing off one half of its nucleus, a highly complex body in which are seated all the potencies of the mother plant. This rejected half is the province of the sperm or fertilising-cell to replace, and this it does to a nicety, its own nucleus being already a half one, containing in itself all the potencies of the paternal plants. These two halves then join together and form a complete and perfect nucleus, completing and perfecting the previously imperfect mother cell, and rendering it capable of proceeding with its destined work of dividing and redividing, and building up the future plants. It will be seen that this orderly method of procedure and especially the previous throwing off of half of the nucleus to make room for the coming moiety, pre-supposes the impracticability of accommodating anything more than it has made room for, and in fact when the phenomenon is carefully watched, as it has been, it is seen that the nature of the subsequent combination and development of the two is such that a third intrusive nucleus, or even a fourth, as the theory of multiple parentage demands, would be absolutely *de trop*, and in vulgar parlance "wouldn't work." The cell, indeed, may be compared to a pill box with its lid; we may bring a dozen lids to the box, but if one is on, the box is complete and there is an end of the matter. Viewed, therefore, in the light of the above facts, we are driven to regard multiple parentage as impossible, and to impute the multiform results obtained by the sowing of mixed spores to successive crosses or independent variation, due to the instability of previously varied forms. *Chas. T. Druery, F.L.S., V.M.H.*

PASSIFLORA EDULIS.—There has been a good deal said and written about *Passiflora edulis* lately, which induced me, about two years ago, to try what I could do with a plant of it planted on the back wall of a young viney. During 1897 the plant did nothing but grow, produced a few flowers, but set no fruit. During the spring of this year, some heat was applied for the benefit of the young Vines, and also for the benefit of some Peach-trees, which I also have planted so as to economise the space and light of the viney until the young Vines covered the roof. The *Passiflora* shoots were trained over the path, from which long, pendent shoots were allowed to drop; these flowered profusely, and set liberally: there are now 650 fruits hanging on those shoots, which is certainly a picture, representing both beauty and abundance. I may mention that whilst the house was kept warm and close for the sake of the young Vines and Peach-trees, the *Passiflora*, although it flowered freely, only set one or two fruits. When, however, the house was kept at a cooler temperature, with the top-light let down about a couple of feet, the fruit set freely. As probably my variety may not be the true one [it is], I am sending a couple of green-fruit for your inspection. Later on I will send some of the ripe. The back wall of this same house has been since 1866 densely covered with *Monstera deliciosa*, producing every year its curious fruit in great abundance. Although the

fruit is of excellent flavour, it is worthless for dessert, for no sooner is a small mouthful swallowed, than an irritation is produced in the throat, which compels one to leave off, and say rather nasty things of the *Monstera*. [The proper way to eat it, is to thrust a quill through the rind where are the crystals which produce the irritation into the pulp, which is free from the "needles" and suck the juice. *Ed.*] A good space of the wall we cleared of the *Monstera* to make room for the *Passiflora*, and also for a variety of Sweet-Orange. As I have noticed the introduction of some Peach-trees into this house, I may mention that they produced satisfactory results in 1897. It was during the early spring of that year they were planted, and again most satisfactory this season. I should like to try them even another year, provided the young Vines do not monopolise the whole of the roof of the house to their hurt. Altogether, this has been a most interesting house. *W. M.*

LOBELIA RIVOIREI.—I have seen with much pleasure the note and illustration in the *Gardeners' Chronicle* for September 24, 1898, p. 233, of *Lobelia Rivoirei*—to be more exact, *Lobelia Gerardi Rivoirei*. The entire series of *Gerardi Lobelias* was obtained by myself by hybridising, in the Lyons Botanic Garden, at the Tête d'Or Park; and in addition to *L. G. Rivoirei* there are others also very interesting—*L. G. corallina* and *L. G. lugdunensis*, among others. Since the acquisition of *L. G. Rivoirei*, which marked a starting point for a new race, the latter yielded last year *L. G. Rivoirei roseo-ardens*, with bright rose flowers, and this year the most beautiful of all. This new variety, which we call *Lobelia Gerardi triumphans*, is a cross from *Lobelia G. Rivoirei* the type \times *L. G. corallina*. The habit and foliage of it are entirely those of the type, but it is distinguished from it in having larger flowers, and of a brilliant red, not inferior to that of *L. cardinalis* Queen Victoria. This acquisition will prove a very successful one. The whole series has been dedicated to Professor R. Gérard, Director of the Botanical and Horticultural Collections at the Tête d'Or Park, Lyons. *G. Chabanne, Secretary of the Société d'Horticulture du Rhone at the Tête d'Or Park, Lyon.*

FRUITS: RETROGRESSION.—In Pears we seem rather going backward; and it is time also we had plain speaking or writing on the decline of Pineapple culture. What would James Barnes of Bicton have said to the beggarly spread of Pineapples at the great fruit show at the Palace? Fine Melons, mostly novel, do not constitute a great advance. One might safely assume, without seeing or tasting one of these new Melons, that not one of them surpassed the Hero of Lockinge. Our great fruit-growers should either give up showing hardy berries or other fruits, such as Cherries, or stage them of such quality and in such quantities as were common enough forty years ago. Then, on most north walls pecks of Morellos or other late Cherries could be found through September or October; and autumn-bearing Raspberries and Strawberries were plentiful as Blackberries should be. Now we have at this great show one dish of Blackberries, two of Cherries, two of Gooseberries, two of Currants, two of Raspberries, and two of Strawberries (one of Royal Sovereign and one of St. Joseph); while our factories are loudly calling out for Blackberries for jam and port-wine [!] and the cry is heard in various directions for Strawberries all the year round—and they will come before long. *North Briton.*

AMERICAN AND BRITISH APPLES.—Sometime since, passing one of our Kingston market stalls, I was interested in the appearance of the fruits in a partially used barrel of Apples, a fine even well-coloured sample, evidently King of Tomkins County. These were undoubtedly early in the market, and their presence serves to show that American growers are alive as to the condition of our Apple supply. Some home-growers perhaps may complain that these foreigners should come in as they do free of duty to compete with their stocks, as it hinders them from obtaining fancy prices, but that is not the opinion of the consuming million, or even of the dealers. As it is, good home-grown Apples are selling at from 2½d. to 3d. per lb. retail, which means from 10s. to 12s. per bushel; there seems little room for complaint as to home returns, provided the grower gets a relative price wholesale. But what chiefly attracted my attention in relation to these American Apples was their soundness, for whilst there were from two to three bushels in the barrel when full, yet every fruit seemed after travelling several thousand miles to be as sound as well could be. Could we possibly pack home-grown Apples of good size and well matured in

the same way and in the end after long journeys show the same minimum of injury? Are not the Americans so dry-fleshed that they bear hard equal compression such as they get in the barrels, because so equally sized and so firmly packed, without any packing material. Our Apples do not attain to that dry-fleshed condition, they are more juicy, and having such comparative moist flesh, not only endure compression badly, but very soon begin to decay in the form of a wet rot which soon spreads all over the fruit. In the American varieties any decay caused by improper packing, or undue compression seem to be limited for some time at least, to the portion originally injured, hence there is with them less of waste. If ever a season approached to the condition of an average American summer, surely it has been the past one, yet our Apples seem to be of the same juicy texture as is usually found. Thus it would seem as if seasons with us did not change the fruit's nature. Probably it is the same throughout Europe. On the very same day that I saw these American Apples, I also saw set upon a board a quantity of large green Lord Derby Apples. It was, however, most distressing to see that they were covered with bruises, very recently given, but too evidently the product of that utter "don't careness," the great curse of our home fruit-growers in handling and sending to market. These had in appearance alone lost fully fifty per cent of value by the rough treatment given them. *A. D.*

THREE GOOD ANNUALS.—Among the numerous varieties of new annuals that have come under my notice, there are three excellent ones. *Godetia gloriosa* is a charming variety, and one of the best yet introduced to the public, being most brilliant in colour. It is very free-flowering, has a compact habit, and attains the height of 12 to 14 inches. The flowers are rich magenta-crimson in colour. If sown during April in masses on the borders of shrubberies, or walks in the pleasure grounds, it will present a very bright and attractive display of flowers during the summer months. Marigold: "Legion of Honour."—Unlike most other varieties of Marigolds, this has a neat and dwarf habit of growth. It flowers abundantly, and the blooms are bright golden yellow in colour with a dark crimson centre. Its height rarely exceeds 9 inches. Candytuft: "White Spiral," produces spikes of pure white flowers, quite 6 inches in length. If sown towards the end of March, it will give a display of snowy-white flowers from June to September. *E. Beckett, Aldenham House Gardens, Elstree.*

BRITISH WOODS.—We are so apt to think of Scotland as much wilder and more wooded than England, that it will surprise many to hear that out of 2,594,273 acres, 1,602,507 acres of woodland are in South Britain, and in Scotland only 823,809 acres. In Wales 167,957 acres are woodland. The most wooded county of England is Sussex, then comes Hampshire, but as Hampshire contains the famous New Forest, the Sussex area is extremely remarkable. It is noteworthy that both these counties have been great forest areas from prehistoric times. We know that when the Normans invaded Britain, great woods stretched from Pevensy in the south-east of Sussex to near Bath, and that these woods were existing in great part as recently as the reign of Charles II., when charcoal-burners in Sussex woods were very numerous. *Percy Collins, Netherby, Longtown.*

THE STRAWBERRY-RASPBERRY.—I have now seen and tasted the fruit of *Rubus palmatus*, the so-called Strawberry-Raspberry. It is in form like a small Strawberry, with pointed extremity. In taste it resembles a poor flavourless Raspberry. It is, therefore, I think, quite worthless save as an ornamental plant, as its flowers are comparatively large, and of a pure white. It might, I think, be called the Strawberry-Bramble. *W. E. Gumbleton.*

CHAMÆROPS EXCELSA FLOWERING OUTDOORS.—Passing along the principal garden-portion of Hyde Park, the flower-beds by Park Lane, the other day, I noticed the large Palms and foliage plants that are annually plunged to impart a tropical effect, were being taken up for the purpose of housing them. Among them I remarked that a very fine tall specimen of the above-named Palm was in flower, the plant being 9 to 10 feet in height, with plenty of healthy foliage, and nearly at the top, between the leaf-stem, two flower-spikes were showing opposite each other, each spike carried several heads of bloom, something in shape and size to a head of bloom of *Hydrangea paniculata*. The flower-spikes measured about 18 inches in length, the branches about 6 inches long, the colour was pale yellow. This is the first occasion that I have noticed this species of Palm in flower outdoors. *C. A. B. Bromfield. [Not uncommon. Ed.]*

SOME NEW APPLES.—It was certainly an odd circumstance that the Fruit Committee should at a recent Drill Hall meeting have granted Awards of Merit to one of the largest, as well as to one of the smallest, Apples yet placed before them. The large one—Invincible—a broad, conical-shaped fruit, something after Alfriston, but more ribbed and coloured, and devoid of the russet which always characterises that variety, if it turns out to be really a distinct one, and quite new, as it apparently is, should make one of our finest kitchen varieties. It is especially the solid build which market-men so much like, and devoid of those depressions which characterise some other fruits so undesirably. The smaller one should in time become very popular on the dessert-table. It is flattish-round in shape, quite handsome, of small size, and has flesh of a solid brisk juicy nature, and of yellow colour. This it inherits from its transcendent Crab-parent, which was the seed-producer, and with

by doubling, is a matter of opinion; it is certainly more showy, and will be very useful for many purposes. From the description given of Mr. Angus' flowers, mine appear to be the same in form, but I expect further advancement another season. *W. H. Divers, Belvoir Castle Gardens, Grantham.*

THE FATE OF WIMBLEDON - HOUSE AND GROUNDS.—I note the comments on the above place in the *Gardeners' Chronicle*, p. 224, September 17, 1898, and am sorry to say those remarks are too true, as I leave here on October 20, after twenty-four years' service, to make room for the builders who will cut up the property, so that the gardens which were extolled by Loudon in his *Suburban Gardener*, and which have been the pride of the neighbourhood for years, will be things of the past. The late Sir Henry W. Peek, Bart., expended over £30,000 in rebuilding the glasshouses and offices, and in improving the

A "COTTAGE-LOAF" TOMATO.

EVERY cultivator of Tomatoes has had occasion to observe at one time or another what curious shapes the fruits sometimes assume. This was especially the case when the large-fruited varieties of the Trophy type were more commonly grown. The "Perfection" type, that produces smaller, smooth-skinned fruits usually "sets" more freely, and less frequently produces monstrous fruits. Monstrosities are generally the result of imperfect fertilisation of the flowers; the union of two flowers at a very early stage; or of abnormal flowers that occur owing to the unnatural and over-fed conditions the plants are grown under. It is only when these irregular fruits assume grotesque shapes, or mimic the form of everyday articles, that they call for special remark. The photograph from which fig. 92 has been prepared, was submitted to us by Mr. J. D. Mason, of Streatham, who aptly described it as a cottage-loaf Tomato. The plant which produced the fruit was grown in the open air.

The particular form of the fruit in this case is due to the formation of a second or supernumerary row of carpels above the first.

A NEW PROFITABLE CANADIAN INDUSTRY.

THE GINSENG.—There is a plant that grows in many parts of Ontario and Quebec which for some time has been an article of export, but now has become very scarce, and is nigh to extermination, because the natural increase is not able to maintain a supply equal to the demand, especially as no effort was made to leave under-sized plants to produce seed. In 1891 the Ontario Legislature prohibited the digging of it from January to September, with the object of preventing its destruction; but so long as greedy hunters would dig up the plants regardless of size, the open season is sufficient to accomplish sooner or later its extermination. The export from Ontario and Quebec ten years ago was estimated to be worth 100,000 dollars; it is now so small that it cannot be found in the exports of the last fiscal year, but occurs among names of other roots imported. The plant referred to is the Ginseng (*Panax quinquefolium*, L.).

It has been successfully cultivated in the United States, and inasmuch as it is also at home in our forests, and can be just as easily grown here, therefore this article is written, both to call attention to the subject and to give the latest information in the possession of the writer concerning the method of cultivation and preparation for market, as well as its market value and the probable profitable demand. The writer is indebted for much of the information and for the illustrations which elucidate it, to a paper on the cultivation of the American Ginseng by Prof. George C. Butz, published by the Department of Agriculture of Pennsylvania.

There is also a special incentive that appeals to the enterprising Canadian to induce him to give some consideration to this matter, in the fact that Ginseng grown in our climate is of better quality, and therefore commands a higher price than that grown to the south of us. J. L. Cilley, a New York exporter, issued a circular last August in which he offered to pay for Canadian, Vermont, New York and Northern Pennsylvania Ginseng \$3 to \$3 20 per pound; for that of Southern Penna, Northern Ohio, Northern Indiana, Michigan and Western Illinois, \$2.90 to \$3.00: a difference in our favour of twenty cents per pound.

The cultivation of Ginseng begins with the gathering and planting of the seeds which are contained in the berry-like fruit, which is scarlet when perfectly ripe; two, sometimes three in a berry. These will be found ripe in the latter part of August. They do not germinate in the next spring, but remain dormant during all the following summer as well as both of the winters, and come up in the second spring. During all this time they must be kept moist to ensure germination. They can be safely kept over the first winter and succeeding summer in a wooden

FIG. 91.—A BASKET OF ORCHIDS. (SEE P. 306.)

King of the Pippins as pollen-parent; so it had very interesting progenitors. But it is very evident that the chief impression made by the pollen-parent is in enlarging the leafage somewhat, and of slightly increasing the fruits in size, and materially improving the texture of the flesh. Few Apples in commerce are more worthy of growth for the supply of fruit for children than is this one, which has been shown by Messrs. Jas. Veitch & Co., and appropriately named after Mrs. John Seden, the wife of the raiser. The precocity of the variety in producing fruit was evidenced in the fact that the seedling was heavily laden with fruit in the fourth year. May we not hope to find those beautiful Crabs, John Downie and Dartmouth, also utilised for the production of more of the new race of Apples as commenced in Mrs. John Seden. *A. D.*

DOUBLE SWEET PEA (p. 286).—I have also a double form of this flower, which I have raised from the variety called Venus. The colour remains the same as the parent. Whether the flower is improved

grounds thirty-one years ago, the work being entrusted to the late Robert Marnock. The end of the gardens of Wimbledon House will also mark the termination of my career as a gardener, as for some years past I have been developing a brick-making business, which has now an out-put of two millions and a half per year, so I therefore intend devoting my full attention to this occupation for my amusement and profit. *J. Ollerhead, formerly gardener and bailiff to the late Sir Henry Peek, Bart.*

FLOWERING OF LILIUM GIGANTEUM.—A bulb of this fine Himalayan Lily produced a fine flower-spike this season in the hotel gardens at Whitefield, Garelockhead, N.B. Mr. Monro, the proprietor of the hotel, informed me that this bulb has been in the garden, in various situations, for about a dozen years, but this is the first time it has flowered. The spike measured 7½ feet in height, and 9 inches in circumference at the base, and carried nineteen flowers. It has at present eighteen fully-developed seed-capsules. *J. Brown.*

box by covering the bottom with an inch thickness of moist leaf-mould, strewing upon this a thin layer of seed to be covered with half an inch of leaf-mould, thus alternating with layers of seed and soil, and finishing with an inch or two of leaf-mould. The box should be kept in a shady place, mice and ground-squirrels excluded, and the soil always moist, not soaking wet.

If preferred, the seeds may be sown at once in the seed-bed. It may be made under the shade of tall trees where there is no under-growth, or, if proper shade is provided, in the open garden. In either case the soil must be light, loose, and rich. If necessary to enrich it, let it be done with well-rotted, never with fresh, manure; and that thoroughly worked in so as to be evenly distributed in the soil. The ground should be dug a foot deep, and everything that would interfere with the direct downward growth of the young plants, as sticks, stones, tree-roots, &c., carefully thrown out. When the bed is made in the woods, it will usually be convenient to work in sufficient leaf-mould to make the soil light and porous, but if made in the garden it will be necessary to procure a quantity and work in a liberal supply. Narrow beds, say 3 feet wide, are preferable for convenience in weeding and stirring the soil between the rows of plants. For planting the seeds, drills are made 3 inches apart and 1 inch deep, into which the seeds are dropped 1 inch apart, and covered. If there is danger that the soil may crack or a crust be formed, the bed is covered up with some leaf-mould and brush spread over the surface to remain until the young plants are expected to appear. After the seeds have been in the moist soil for a year and a half, whether they passed the first twelve months packed in a box or the entire eighteen in the seed-bed, the young seedlings are expected to appear with the advent of warm weather in the second spring. During the first season they attain only an inch or two in height, bearing three simple leaves in a whorl at the top. If the soil has been favourable and the plants well cared for by weeding and cultivation, the seedlings will at the end of the second season's growth be large enough to be transplanted into the permanent beds. They are prepared much the same as the seed-beds, the soil thoroughly pulverised a foot deep, everything taken out that would interfere with free root development, yet having less of leaf-mould than the seed-beds, more like a garden loam that is light, friable, porous, and rich.

Transplanting can be done in early spring, but it is said that September or October is preferable. The plants are set out in rows six inches apart each way, putting the new bud of the root-stalk 2 or 3 inches below the surface. Care must be taken to preserve all the little rootlets, and all breaking or trimming of the roots in any way must be sedulously avoided. During the growing season the soil between the plants should be frequently stirred, and kept free from weeds; and before the ground freezes the beds covered well with forest leaves, upon which brush is laid to prevent the leaves from being blown away. Cattle are to be fenced out from access to all beds of Ginseng, for they not only do great damage by trampling on the beds, but also have a great fondness for the foliage.

When circumstances are favourable, these beds, as also the seed-beds, are made in the forest where the trees afford necessary shade and there is a free circulation of air. When they are made in the open ground artificial shade must be provided, such that while the plants have all the needed shade, they have also an unhindered flow of an abundance of air. Mr. George Stanton, who is probably the most successful grower of Ginseng, secures all of these essentials by the following means: he sets rows of posts 8 feet apart and 6 feet apart in the row, 2 feet deep in the ground and 6 feet high, and braces them with strips an inch thick and 3 inches wide, nailed upon the top of the posts, and running in both directions. Upon these are fastened screens made of lath, having a space of $\frac{1}{2}$ of an inch between the strips of lath. Screens made in the same way are fastened to the sides, enclosing the whole from the ground upwards for 3 ft., the remaining 3 feet being left open. In these beds

the plants are grown for five or six years, until they attain the size requisite for profitable marketing. Before that time they will have reached the fruiting age, when above a simple stem about a foot high, bearing a whorl of three to five palmate leaves composed usually of five obovate pointed leaflets, appears a simple umbel supported by a slender peduncle, and containing in July from ten to fifty yellowish-green flowers, which will be succeeded by green berries that in August turn at first purple, then red, and at last, when perfectly ripe, scarlet. These will be carefully gathered and the seeds cared for, from which enlarged plantations and successive crops can be secured. In the fall this part of the plant dies; that which survives, and which alone is of commercial value is the root.

The underground part is not wholly root, that which lies just below the surface, called root-stock (rhizome), is not fleshy and is marked with scars, which indicate the annual above-ground growth of previous years, thus telling the age of the plant. It is believed that the root does not increase materially in size after the eighth year, though it lives to a considerable age, for some have been found having

the export from the United States, showing the number of pounds exported and the average price per pound—

Ten years, 1868-1877—3,881,539 lbs. at \$1.09 per lb.
1878-1887—3,690,360 lbs. at \$1.75 „
Nine years, 1888-1896—2,193,063 lbs. at \$3.04 „

Consul Johnson in his report dated Amoy, July 29, 1897, states that it sells in Amoy at from \$12.50 to \$17.50 per pound, that at these figures Amoy handled in 1896, \$88,517.34 worth of it which came from America in addition to the value of \$44,222.80 from Korea. He adds also the following significant statement, "I do not exaggerate when I state that it is possible to market annually in China twenty million dollars worth of these roots." The italics are the writer's, not Consul Johnson's.

Given a suitable soil, good cultivation with proper attention to shading, ventilation, and preparation for market, the growing of Ginseng in Ontario should be a profitable industry. Mr. Geo. Stanton is quoted by Prof. Butz as stating that the cash product in less than five years from less than two square rods (7'15" of the land had been in Ginseng only four years) was \$387.96. For twenty-eight pounds of his last season's

FIG. 92.—A "COTTAGE-LOAF" TOMATO. (SEE P. 309.)

sixty-five of these scars. When roots are eight years old, two years in the seed-bed and six in the permanent-bed, they will be considerably larger than the average of those growing wild, of the same or even greater age. Sometimes roots are found having the human form; these are highly valued by the Chinese, and it is said are worth their weight in gold. Grosier says that Ginseng signifies resemblance to a man. When the cultivated plants are seven or eight years old they will be of the size in which they undergo preparation for market.

In taking the roots out of the ground it is important that they should not be cut or broken, for all cut or mutilated roots are classed in a lower grade. They are then to be washed perfectly clean, without any trimming of the rhizome or rootlets, and dried by spreading them out on hurdles in the sun, or in an evaporator; if in the latter the heat must be regulated so that the roots do not become scorched or partially cooked. If dried quickly without injury they will look better and sell better.

When thoroughly dried the wild roots lose about one-third of their weight, but the cultivated, according to Prof. Butz, do not shrink so much. They have then only to be neatly and securely packed in boxes to be ready for market. That there is a constantly increasing demand will be seen from the statistics of

crop he received \$5.50 per pound, which is a good illustration of the superior quality of cultivated over wild roots. Taking Mr. Stanton's figures as a basis, with time of cultivation in permanent-bed six years, and quantity of ground two square rods, we have at the end of six years a return of \$64.66 a year for two square rods which when increased to a quarter of an acre, which is forty square rods, would make the revenue at the end of the six years \$7,759.20, which would be a dividend of \$1,293.20 for each year, from which is to be deducted all the expense of cultivation, rental value of land, interest on outlay, and reduction in value of tools and plant.

At present it is evident, from the figures given by Consul Johnson, that the exporter has more than a fair share of the profit; for when he gets \$17.50 per pound for best quality and pays only \$5.50, there is a margin of \$12 per pound. Surely the exporter's expenses are not twice those of the grower.

One word of advice to such readers as may feel disposed to embark in the cultivation of Ginseng. Go slow. Begin with a small bed. Experience will teach. If failure be the result, then the loss will not be severe. If success crown the undertaking, which is more probable to him who proceeds cautiously, this article will not have been written in vain. D. W. Beadle, in *The Canadian Horticulturist*.

SOCIETIES.

NEWCASTLE AND DISTRICT HORTICULTURAL MUTUAL IMPROVEMENT.

OCTOBER 11.—The monthly meeting of this Society was held at 25, Westgate Road, Newcastle-on-Tyne, on the above date. Mr. Bullock presided over a large attendance of members.

The exhibits consisted of Chrysanthemums and Cactus Dahlias, shown by Mr. ROME, Oakwood, and of Asters shown by Mr. RENWICK, Oakwood.

Mr. Bidgood, B.Sc., F.L.S., gave an interesting account of Vine cultivation in France, treating of grafting, propagation, &c. He also gave an account of the ravages wrought by the Vine-disease, and how it had been partially overcome by the selection and engrafting of varieties which had proved to be better able to withstand it. The lecture proved very instructive, and was followed by an open discussion, many questions being asked Mr. Bidgood, to which he readily replied. Votes of thanks concluded the meeting.

MANCHESTER AND NORTH OF ENGLAND ORCHID.

OCTOBER 14.—On the occasion of the meeting of this Society at the Coal Exchange, Manchester, on the above date, there were present W. Thompson, Esq., in the chair; and Messrs. G. W. Law Schofield, A. Warburton, J. Leeman, J. Cypher, W. Holmes, R. Johnson, W. Stevens, and T. Mills (Hon. Sec.).

W. THOMPSON, Esq., Stone, Staffs., was awarded a Silver Medal for a group of plants; A. WARBURTON, Esq., Haslingden, an Award of Merit for a plant of *Laelia prestans alba*; and a First-class Certificate for *Cypripedium Nandif*. SAM. GRATRICK, Esq., of Whalley Range, received Awards of Merit for *Vanda Sanderiana*, *Cypripedium Juno*, *C. Memoria Moensii*, and *C. Orphanum*. THOS. STATTER, Esq., Whitefield, received an Award of Merit for *Cattleya aurea magnifica* and *C. Asltoniana*. MRS. BRIGGS-BURY, of Accrington, had an Award of Merit, for *Cypripedium Lilian Greenwood*, and for *C. Charlesworthii rubescens*.

DR. HORTON SMITH, of Northwich, showed *Laelia elegans Turneri*, receiving an Award of Merit; RICHD. ASHWORTH, Esq., Newchurch, showed *Cattleya Mantini* (Award of Merit); and *Odontoglossum vexillaria Leopoldi* (First-class Certificate); JOHN RICHARDSON, Esq., Hale, showed *Vanda cœrulea*, and received an Award of Merit and a Cultural Certificate; A. J. KEELING, of Bingley, showed *Cattleya Hermione* (Award of Merit); HUGH LOW & CO., Enfield, showed *Cymbidium Tracyanum*, receiving a First-class Certificate.

SHIRLEY AND SURROUNDING DISTRICTS GARDENERS' AND AMATEURS' MUTUAL IMPROVEMENT ASSOCIATION.

OCTOBER 17.—The monthly meeting of this body of gardeners took place on the above date at the Parish Room, Shirley, Southampton. Mr. B. LADHAMS, F.R.H.S., presiding over a fair attendance of the members.

Mr. J. MILES, gr., Portwood Park, opened a discussion on "The best Apples for the District," the soil of which is chiefly a shallow loam, resting on a gravelly subsoil. Mr. Miles gave a list of the varieties of kitchen and dessert Apples most suitable to the soil, which really excluded some good varieties which are found to do badly here.

The discussion which ensued brought out the members' personal experiences with some of those mentioned, showing both failures and successes. Mr. Miles afterwards gave reduced lists of varieties suitable for amateurs and cottagers desiring to plant a limited number only. At the close of the discussion a hearty vote of thanks was accorded to Mr. Miles.

Mr. H. CURTIS showed twenty-six dishes of Apples and Pears, and was awarded 1st prize for six Pears, 2nd prize for six dessert Apples, and 2nd for kitchen Apples.

Mr. H. WRIGHT was 1st for dessert Apples, and Mr. WILCOX 3rd. Mr. SNELGROVE was 1st for kitchen Apples, and Mr. BIGGS 3rd. Mr. OTHEN was 2nd for Pears, and Mr. BIGGS 3rd.

GARDENING APPOINTMENTS.

Mr. J. JONES, for the past six years Gardener to the late S. STILL, Esq., J.P., The Grange, Cloughton, Birkenhead, as Gardener to SINCLAIR PORTER, Esq., at the same place.

Mr. ALEXANDER MORTON, for the last three years Foreman at Taymouth Castle, Perthshire, and Foreman at Harewood, Leeds, as Head Gardener to Colonel DRUMMOND, Blair Drummond, Stirlingshire, Scotland.

Mr. DRESSER, as Head Gardener to Miss LODGE, Bishopdale, Aysgarth, R.S.O., Yorkshire.

Mr. WM. IVEY, as Head Gardener to A. PEARSON WALLIS, Esq., Church House, Awkley, Doncaster.

Mr. HENRY ALLEN, as Head Gardener to Mrs. DUFFIS, Sessan Hall, Thirsk. The last three were filled by Messrs. Kent & Brydon, of Darlington.

Mr. J. MAJOR, as Bailiff and Gardener to F. W. B. GUBBINS, Esq., Park Hall, Evesham, Warwickshire.

Mr. ALEX. HOYLE, formerly Head Gardener at Blaston Hall, Leicestershire, as Gardener to THOS. HILL, Esq., Beech House, Heywood, Manchester.

Mr. F. J. CROOK, formerly Gardener to B. B. COLSON, Esq., Winchester, Vice-Chairman of the Winchester Gardeners' Association, as Head Gardener to F. HUGHES-GIBBS, Esq., The Manor House, Gunville, near Blandford, Dorsetshire.

Mr. A. W. OLIVER, formerly Head Gardener at Aspenden Hall, Buntingford, Herts, as Head Gardener to Lady GRANT DUFF, Lexden Park, Colchester.

Mr. RICHARD NISBIT, Jun., for the last three years Gardener at Needwood, as Head Gardener to the Hon. Mrs. BASS, Byrkley Lodge, Burton-on-Trent.

MARKETS.

COVENT GARDEN, OCTOBER 20.

We cannot accept any responsibility for the subjoined reports. They are furnished to us regularly every Thursday, by the kindness of several of the principal salesmen, who revise the list, and who are responsible for the quotations. It must be remembered that these quotations do not represent the prices on any particular day, but only the general averages for the week preceding the date of our report. The prices depend upon the quality of the samples, the supply in the market, and the demand; and they may fluctuate, not only from day to day, but often several times in one day. Ed.]

CUT FLOWERS.—AVERAGE WHOLESALE PRICES.

FRUIT AND VEGETABLES.

GLASGOW: October 19.—The following are the averages of the prices recorded since our last report:— Apples, Canadian Spy, 25s. per barrel; do., Western States Russets, 30s. do.; Plums, 4d. to 8d. per lb.; Pears, 12s. to 18s. per cwt.; Grapes, home, 3s. 6d. to 4s. 6d. per lb.; foreign, 6d. to 1s. do.; Vegetable-Marrows, 3s. to 6s. per dozen; Tomatoes, Guernsey, 6d. to 8d. per lb.; do., Scotch, 8d. to 10d. do.; Cabbages, 1s. to 1s. 9d. per dozen; Cauliflowers, English, 1s. to 1s. 6d. do.; do., Dublin, 2s. to 2s. 6d. do.; Parsnips, 4s. to 4s. 6d. per cwt.; Potatoes, 5d. to 6d. per stone; Carrots, 3s. to 4s. per cwt.; Artichokes, 3s. per stone; Cucumbers, 3d. to 5d. each; Lettuce, Cabbage, 6d. to 9d. per dozen; do., Cos, 6d. to 9d. do.; Radishes, 1s. 6d. per dozen bunches; Horseradish, 2s. per bundle; Mushrooms, 1s. to 1s. 6d. per lb.; Beetroot, 4d. to 5d. per dozen; Mustard and Cress, 3d. per punnet; Brussels Sprouts, 2s. per stone; Turnips, 3d. to 4d. per bunch; Celery, English, 1s. to 2s. per bundle; red Cabbage, 2s. per dozen.

LIVERPOOL: October 19. — Wholesale Vegetable Market: Potatoes, per cwt., Giants, 2s. 2d. to 2s. 6d.; Main Crop, 2s. 9d. to 3s. 4d.; Bruce, 2s. 4d. to 2s. 10d.; Turnips, 6d. to 8d. per dozen bunches; Swedes, 1s. 3d. to 1s. 5d. per cwt.; Carrots, 6d. to 8d. per dozen bunches, and 2s. 9d. to 3s. per cwt.; Parsley, 4d. to 6d. per dozen bunches; Onions, English, 5s. to 5s. 6d. per cwt.; do., foreign, 3s. 6d. to 4s. 6d. do.; Cucumbers, 1s. to 1s. 6d. per dozen; Cauliflowers, 1s. to 2s. do.; Cabbages, 1s. to 1s. 9d. do.; Celery, 1s. to 2s. do. St. John's: Grapes, home, 1s. 6d. to 3s. per lb.; do., foreign, 4d. to 8d. do.; Pine-Apples, 4s. to 6s. each; Damsons, 4d. per lb.; Cob-nuts, 10d. per lb.; Cucumbers, 4d. to 6d. each; Mushrooms, 10d. per lb. and basket; Potatoes, 10d. to 1s. per peck. Birkenhead: Potatoes, 8d. to 10d. per peck; Cucumbers, 2d. to 6d. each; Damsons, 4d. per lb.; Grapes, home, 1s. 6d. to 3s. do.; foreign, 4d. to 8d. do.; Mushrooms, 8d. to 1s. per lb.

SEEDS.

LONDON: October 19.—Messrs. John Shaw & Sons, Seed Merchants, of Great Maze Pond, Borough, London, S.E., write that to-day's American cablegrams quote much higher prices for Clover seeds. New English Winter Tares, showing good quality, are now attractively cheap. Rye, however, is scarce, and wanted. The market for Mustard and Rapeseed keeps steady. As regards Canary seed, there is a decidedly improved tone, whilst Hemp seed, on the spot, is now almost unobtainable. Blue Peas and Haricot Beans continue in active request at advancing rates. For Wisconsin green boilers there is an increasing inquiry. Scarlet Runner Beans are considerably dearer.

CORN.

AVERAGE PRICES of British Corn (per imperial qr.), for the week ending October 15, and for the corresponding period of 1897, together with the difference in the quotations. These figures are based on the Official Weekly Return:—

Description.	1897.	1898.	Difference.
	s. d.	s. d.	s. d.
Wheat	31 10	26 6	— 5 4
Barley	28 3	27 11	— 0 4
Oats	16 1	16 6	+ 0 5

THE WEATHER.

[The term "accumulated temperature" indicates the aggregate amount, as well as the duration, of degrees of temperature above or below 42° Fahr. for the period named; and this combined result is expressed in Day-degrees—a "Day-degree" signifying 1° continued for twenty-four hours, or any other number of degrees for an inversely proportional number of hours.]

The districts indicated by number in the first column are the following:—

0, Scotland, N. Principal Wheat-producing Districts—1, Scotland, E.; 2, England, N.E.; 3, England, E.; 4, Midland Counties; 5, England, including London, S. Principal Grazing, &c., Districts—6, Scotland, W.; 7, England, N.W.; 8, England, S.W.; 9, Ireland, N.; 10, Ireland, S.; * Channel Islands.

THE PAST WEEK.

The following summary record of the weather throughout the British Islands for the week ending October 15, is furnished from the Meteorological Office:—

"The weather was unsettled and rainy at the commencement of the week, but subsequently became fair for a time in most districts, although a good deal of mist prevailed. Towards the end of the period very rainy conditions again set in, in the south-west (especially in 'Ireland, S.'). and spread gradually to all parts of the Kingdom. In the west of Scotland, and at most of our south-eastern stations, however, the fall was slight.

"The temperature differed very little from the mean over the Kingdom as a whole, but was 3° above in 'Scotland, N.' The highest of the maxima occurred, as a rule, on the 9th, and ranged from 66° in 'England, S.W.' and 65° in 'England, E.' to 60° in 'England, N.E.' and 'Ireland, N.' The lowest of the minima were generally recorded about the middle of the week, and ranged from 29° in 'Scotland, E.' 'Ireland, N.' and 'England, S.W.' to 37° in 'England, S.' and to 42° in the 'Channel Islands.'

"The rainfall greatly exceeded the mean in 'Ireland, S.' and just equalled it in 'England, N.E.' in all other districts there was a deficit, that in 'Scotland, N. and W.' 'England, S.' and 'Ireland, N.' being large.

"The bright sunshine was deficient in nearly all parts of Great Britain, but exceeded the mean over Ireland, as well as in 'England, N.W.' and 'Scotland, N.' The percentage of possible duration ranged from 41 in 'Ireland, S.' and 36 in the 'Channel Islands,' to 18 in the 'Midland Counties,' and to 10 in 'Scotland, E.'"

NOTICES TO CORRESPONDENTS.

AGRICULTURAL COLLEGES AND SCHOOLS: A. B. W. Cirencester, Downton, near Salisbury; Aspatria, near Carlisle; South-eastern College, Wye, Kent; and Minto House, Edinburgh.

APPLE SCALE (LECANIUM MALI AND MYTHIASPIS POMORUM): G. R. Dress the trees twice or thrice just before they come into bloom with kerosene emulsion. When trees are small, and easily dressed, clay, soft-soap, cow-dung, and lime, formed with sour milk into a thick paint, may be laid on with a stiff (half-worn-out) paint-brush. This may be done at the winter season.

ARTICLES ON ROSES: W. A. J. Time is valuable; can you not indicate the year when the articles appeared in these columns?

BOILER: *Anxious*. Provided the circulation of the water be not stopped by valves in the flow and return pipes, no occurrence of the kind mentioned is probable, whatever be the sort of fuel used. It is assumed that a vent for the escape of steam, should it ever form from excessive firing, exists at the highest point of the pipe-system. The supply cistern should be in connection with the return pipe, at a point near the boiler, and if possible, it should be self-feeding.

BOOKS—FORESTRY: D. P. Anson. We are not aware that the writer in question has written a work on forestry.—A. S. The *Kew Bulletin* is published by Eyre & Spottiswoode, East Harding Street, Fetter Lane, Fleet Street, London, E.C.—G. R. The best work of moderate price on fruits is the *Fruit Manual*, by the late Dr. R. Hogg, fifth edition, published at the office of the *Journal of Horticulture*, 12, Mitre Court Chambers, Fleet Street, E.C. Smaller, but still excellent manuals, are published by Mr. George Bunyard of Maidstone; Messrs. Cheal of Lowfield, Crawley; and Messrs. Smith, of Worcester.

CHRYSANTHEMUM SEROTINUM: G. W. M. Fasciation is not at all uncommon in this and other fast-growing plants.

CLEARING LAND OF LARCH AND FIR-TREE STUMPS: *Stumps*. With strong iron clips, such as builders employ in raising large masses of stone, and a powerful wooden lever, shod with iron on its upper side, and 20 feet in length, resting on a portable fulcrum, having a strong plank as a support, the work could be readily done. In using the lever, the chains to which the clips are attached, should be shortened as much as possible, and the free end of the lever consequently elevated considerably, and with a stout piece of rope fixed to an iron ring at the end, it can be readily pulled down to a height at which it can be seized by four or more men and lowered sufficiently as to extract the stump.

CULINARY APPLES: E. B. C. Manx and Keswick Codlins, Lord Suffield, Lord Grosvenor, New Hawthornden, Peasgood's Nonsuch, Alexander, Wellington, Dumelow's Seedling, Lord Derby, Golden Noble, Tower of Glamis, Alfriston, Prince Bismarck, Northern Greening, Annie Elizabeth, Bramley's Seedling, Lane's Prince Albert, Blenheim Orange Pippin, Small's Admirable, and Queen Caroline. These are varieties which in most soils grow well, and crop abundantly if the weather is propitious at the flowering period. The following are occasionally very good, viz.—Northern Dumpling, Norfolk Beaufin, Lady Heniker, Domino, Jolly Beggar, Cox's Pomona, Mère de Ménage, and Sundringham.

GUMMING IN CHERRY-TREE: W. M. W. The causes of gumming are various. In the first place, there is some injury or wound, inflicted on the bark by the puncture of an insect, by frost, pruning, or other cause. In this wound alight fungus-spores and bacteria. These feed on the starch and other components stored in the bark, and change the sugar, starch, &c., into gum. Irritation of the living tissues of the bark beneath the outer rind, is also set up causing swelling, and as the outermost rind is dead and cannot expand, it cracks and allows the gum to exude. Cold, damp, dark, undrained situations, and bad soil, do not as we believe, actually cause the disease, but they predispose the tree to attack whenever opportunity offers. We cannot recommend any remedy beyond cutting away the affected branches and burning them. If the drainage is wrong, that can be remedied.

INSECT ON TWIGGS OF GOOSEBERRY: T. R. Caterpillar of the "Pepper"-moth (*Amphidasis betularia*). R. McL.

INSECTS: *Thos. L. Green*. *Zeuzera æsculi*.

NAMES OF FRUITS.—Applications to name fruits are so numerous at this season, as seriously to hamper us in the exercise of our editorial duties. They entail an expenditure of time, labour, and money, of which our readers can have little idea. We are most desirous to oblige our correspondents as far as we can, but we must request that they will observe the rule that not more than six varieties be sent at any one time. The specimens must be good ones, just approaching ripeness, and they should be properly numbered, and carefully packed. We do not undertake to send answers through the post, or to return fruits. Fruits and plants must not be sent in the same box. Delay in any case is unavoidable.—J. J. 1, Tower of Glamis; 2, New Hawthornden; 3, Cox's Pomona; 4, Warner's King; 5, Round Winter Nonsuch; 6, Blenheim Orange.—W. D. 2, Monsallard; 3, Beurré Diel; 4, Maréchal de la Cour; 5, Duchesse d'Angoulême; 6, Doyenné d'Alençon; 7, Comte de Lamy.—W. D. Lynn. 5, Cox's Orange

Pippin; 51, Beurré Rance; 54, Bergamotte d'Espéren.—G. Brown. 1, Maréchal de la Cour; 2, Hampden's Bergamotte; 3, Vicar of Winkfield; 4, Louise Bonne; 6, Catillac.—Geo. Jones. 1, Beurré Hardy; 2, Beurré de Capiaumont; 3, Beurré Diel.—W. C. Large Apple, Reinette du Canada; 2, small, Beauty of Kent.—Bolam & Sons. 1, Bedfordshire Foundling; 2, Worcester Pearmain.—C. W. S. Next week.

NAMES OF PLANTS: Correspondents not answered in this issue are requested to be so good as to consult the following number.—Quintin Read. *Desmodium penduliflorum*.—E. S. R. We only undertake to name species of plants. Florists' varieties frequently resemble each other so closely, that it is necessary to cultivate them, observe their habits, &c., before names of varieties can be satisfactorily determined.—A. C. H. 1, *Dendrobium chrysanthum*; 2, *Oncidium incurvum*; 3, *Cattleya Leopoldi*. The two *Cypripedium Charlesworthi* are ordinary varieties.—W. T. B. 1, *Rondeletia speciosa*; 2, *Davallia dissecta*; 3, *Ageratum mexicanum*; 4, *Davallia Tyermani*; 5, *Doodia caudata*; 6, *Begonia argyrostigma*.—Garaway. *Boussingaultia baseloides*.—A. H. 1, The fragments of leaves appear to be those of *Robinia pseudacacia*; 2, a *Cissus*, probably.—W. F. S. *Rhus Cotinus*, the wig plant.—M. N. R. *Phytolacca dioica*.—G. P. *Caryopteris Mastacanthus*. The under-ground stems from the clay are those of some *Equisetum*.—J. G. W. 1, *Berberis vulgaris*; 2, *Cornus mas albo-variegata*; 3, *Coccoloba platyclada*; 4, *Ginkgo biloba*; 5, *Ligustrum sinense*, probably; 6, *Rhus glabra laciniata*.—G. T. 1 and 2, *Anthericum lineare variegatum*.—W. H. 1, *Abies Webbiana*; 2 and 3, both varieties of the common Spruce, *Picea excelsa*.—W. B. 1, *Pinus Laricio* var. *Pallasiana*; 5, *Juniperus excelsa* var.; 6, *Juniperus communis* var. *hibernica*; 7, *Thuja orientalis*, Japan variety.—R. T. Your *Cymbidium Tracyanum* is of the usual quality of the later introductions, though perhaps scarcely equal to the original.—J. B. The flowers sent are of a pretty and brightly-coloured form of *Cattleya Warszewiczii*, often called in gardens *C. gigas*.—A. B. C. 1, *Adiantum capillus veneris*; 2, *Asparagus plumosus nanus*; 3, *Pteris serrulata*; 4, *Cyperus alternifolius*; 5, *Dracena pulcherrima*; 6, *Begonia incarnata* (metallica); 7, *Abelia triflora*; 8, *Euphorbia splendens*.—A. Hills. The *Poplars* are probably as you describe them, we cannot definitely determine from the specimens. Send No. 3 plant when in flower.—J. K. Perhaps *Crataegus nigra*, so far as we can tell from leaf only.—F. *Salvia Horminum*.

PEAR CRACKING: G. G. See our answer to "Kentish," in our last number (p. 296).

PRONUNCIATION OF LA MOUCHEROTTE: F. C. V. Pronounced Lah Moocherotte. We should be glad to know the opinion of our readers on the pronunciation of foreign names, now so frequently given to varieties of *Chrysanthemums* and other florists' flowers.

RASPBERRIES ON NORTH BORDERS: G. R. Canes planted in such borders are common in southern counties, the fruits forming a succession to those planted in full sunshine. Partial shade is not inimical to the Raspberry. Any but very late or very acid varieties, as *Semper fidelis*, may be planted in such positions.

WATERPROOF PAPER: H. Scott and De P. Anson. See our last issue p. 296, third column.

WORM WITH TWO TAILS: A. B. C. Certainly uncommon but not unparalleled. It arises from the forking or subdivision of the original tail, a circumstance not very rare in the lower animals.

COMMUNICATIONS RECEIVED.—H. T. (*Polygonum*, next week).—A. C. F.—H. T. M.—J. J. W.—E. S.—G. B. M.—Daniells Bros.—*Anxious Inquirer*.—H. C. W.—W. R. F.—B. W. S.—H. G. C.—Dr. Plowright.—N. F. B.—R. S. M.—G. W. S.—W. B.—A. H.—X. (three Pears in a gas-lamp box without any name).—H. M. S.—Albert Maume, Paris.—M. Marshall.—F. C. Heinemann, Erfurt.—H. Chinkaberry, New Jersey.—S. S.—W. N. B.—E. Sieveking.—J. Clayton.—Mrs. R.—Canon E.—A. P. Florence.—A. W. G.—C. de B.—J. O'B.—W. E.—T. B. H.—M. C. O.—W. M. W.—J. R.—Nursery, Florist and Fruit Growers' Syndicate.—Fern Bulletin.—E. Benary (shortly).—W. S.—C. O.—J. R.—H. W. W.—Geo. Fry, Lewisham.—A. H.—W. H. D.

PHOTOGRAPHS, SPECIMENS, &c., RECEIVED WITH THANKS.—F. P., Leamington.—H. C., New Jersey.

MARRIAGE.—The marriage of Miss MARTHA DE KERCHOVE DE DENTERGHEM, daughter of the Count de Kerchove de Denterghem, with M. GUSTAV BOËL, Senator, is announced to have taken place at Ghent on the 18th inst. *Félicitations empressees!*

THE Gardeners' Chronicle.

SATURDAY, OCTOBER 29, 1898.

SOME WELSH GARDENS.

I HAVE recently been spending a two months' holiday in North Wales, and have seen a good deal of Denbighshire and Carnarvonshire. I was prepared to find that the Welsh are not a gardening people such as the English are, but I did not expect to find good gardening so rare as it is. I have not seen one really good cottage garden, and the farmers' gardens are not much better. Some, indeed, are as bad as the worst. Usually, the gardens are devoted almost exclusively to growing Potatoes—and weeds, and such weeds, too! vigorous in growth and numberless in quantity, so that I have been almost wild with vexation to see such a reckless waste of fertility.

The truth is, that "the purest of human pleasures" has not yet, to any extent, commended itself to the good graces of the interesting and amiable people of this beautiful country, so that the County and District Councils would do their constituents a great service if they would take some pains to instruct them how to make their gardens pleasanter to look at and more productive of a greater variety of wholesome vegetables and fruits than they are at present. But they will first have to awaken interest in the subject, and this, I confess, will probably be a very up-hill task.

If I might mention a way to get at the masses of the population, I would recommend that the "preachers" of the dominant Nonconformist communities of Wales should be approached, and if they could be led to recognise the value of well-kept gardens to rural people, they might in time be induced to exert some of their undoubted influence to make the people who listen so attentively to their preaching aware of the fact that they could add to their comforts and pleasures by properly cultivating their gardens instead of letting them run wild, as they often do at present. And this might easily be done if at some of the frequent week-evening gatherings in their chapels they would occasionally bring the subject of gardening before the people in a pleasant and convincing manner. At some of these meetings secular subjects are already discussed, as a matter of course, from time to time, for the chapel in many parts of the Principality is the reading-room and institute as well as the place of worship of the people who frequent them. In the parish where I am writing I have been much interested to notice how well these week-evening gatherings are attended. Quarrymen, farm-labourers, farmers, women, and young folks of both sexes are all present, though some of them have to walk long distances to and from their homes among

the mountains, and this after, in many cases, a long day's hard work.

In this salubrious neighbourhood—the west coast of Carnarvonshire—I am living in a mountainous district where slate and granite quarrying and farming are the only occupations. The farms range from small holdings of a few acres up to one hundred or so, only a very small number exceeding that acreage. The land is mostly pasture or meadow, a very small part being arable. The agriculture of the district cannot be called "advanced," neither is it bad; and this season there is such an array of hayricks and stacks of Oats and Barley everywhere, that, taken in conjunction with the large flocks of sheep and the numbers of Welsh black cattle seen in all directions, one is able to realise that the farmers are industrious and energetic, and, to all appearances, thriving. The climate is extremely good, and, though there are very high winds at times, the temperature is fairly equable, and frost is much less prevalent during the winter than it is in the inland towns of England in the same latitude—the Staffordshire Potteries, Buxton, Lincoln, Horncastle, &c. Evidence of this is given by Fuchsias, Hydrangeas, and other plants which here stand the winter with impunity year after year.

Close to where I am just now, there are bushes of Hydrangea 4 to 5 feet through smothered with bloom, and Fuchsias in great beauty, 7 to 8 feet high, grown in hedges and on the centre of lawns without any wall or other protection. Nor are these isolated instances. *Choisya ternata* grows here to a good sized bush, and the Japanese Honeysuckle (*Lonicera aureo-reticulata*) blooms freely; so does the *Arbutus*. These are sufficient proofs of a climate which many residents in the Midland counties would gladly possess. So that it is not a bad climate for out-door gardening that prevails in this part of North Wales; on the contrary, it may be described as one most favourable for the growth of many plants which do not thrive nearly so well in the climate of London and its vicinity, and it is clear that all that is wanted here is the spirit of the true gardener more commonly diffused.

To show that this is so, I will give some account of a few of the well-cultivated gardens I have seen in Wales, two in Denbighshire, and one in the adjoining county of Carnarvon. Both counties have a diversified sea-coast, and each has its mountains, but Carnarvonshire is a mountainous county, while Denbighshire is an upland one. In both, however, many of the physical features are similar, and of these a large number of valleys, with accompanying hills or rising ground near them, are common to both; so, too, is the presence of rivers and streams, though those in Carnarvonshire are the more picturesque, just as its mountains are the more grand and magnificent.

The first garden I shall describe is in the lovely Vale of Clwyd, situated in one of its most beautiful parts. The little river Ystrad runs near it, and the neighbouring country is charmingly diversified with hill and valley, well-cultivated fields, and fine timber trees. The owner of this garden is a lady "to the manner born." She is a devoted gardener, and one who will have nothing but the best of its kind about her. She not only loves her garden, but "loves a greenhouse too." Her taste is eclectic, and she does not attempt to grow too many different kinds of plants. In one of her houses, besides a few good trailers and climbing-plants, the leading features are

such Ferns as are useful for cutting, and a particularly good selection of the finest-named Pelargoniums, of which she grows a considerable number. Whatever plants are grown by her are of the best kinds obtainable, and are cultivated in the best manner. One of her houses, when I paid my visit, was filled entirely with a large and excellent collection of the very best named varieties of tuberous Begonias. All were well grown. There was a preponderance of double varieties, and the colours were white, yellow, pink, scarlet, and crimson, deftly intermingled. As there was not a plant which was not well in bloom, the beauty of the display may be conceived. It was a source of great pleasure to visit this house in the early morning, and I did so on several occasions, and could not but notice how richly and distinctly the varied tints displayed their several charms to the utmost advantage at that delightful period of the day.

The large out-door flower-garden was also very bright and attractive. A fine feature in it was the extremely well-kept lawns, which are of considerable extent, lawn-tennis and croquet being much in vogue in the neighbourhood, which is a favourite residential one. Large beds of Tea Roses, Ivy-leaved Pelargoniums, and the best of the named Carnations were all very beautiful, while a number of other flowers useful for room and table-decoration were to be seen in quantity. At suitable spots isolated Conifers, some of great size, all well-furnished down to the grass, and trained to good shapes showed up superbly.

Adjoining the flower-garden, but separated from it by a hedge, is a large kitchen-garden, bordered on the south side by a treble line of the best herbaceous perennials, showy annuals in isolated patches, Dahlias, &c. This mixed border has for its edging *Erica mediterranea*. Next to this is a grass walk 4 feet wide, which is practically an extension of the lowermost lawn on the same level. A continuous, closely-mown grass-walk over 200 yards in length is thus provided, and forms a charming feature of this pretty and attractive garden. A fine orchard of nearly 200 pyramidal Apples, Pears, Plums, Nut-bushes, &c., occupies a large plot of land beyond the kitchen-garden. The trees which are about a dozen years old, include none but the best varieties, are in good health, and usually yield very large crops of fruit. This year, however, is an exception to the rule, for the crop is small, but those trees which were not affected by the late spring frosts have some fine fruits upon them, which were "swelling" visibly when I saw them at the middle of August.

The next garden I visited was in the same neighbourhood as the foregoing, its owners being two ladies who are among the most devoted and enthusiastic gardeners of my acquaintance. The feature of this garden to which I shall allude is the extremely fine collection of alpine plants it contains. I will not occupy space by enumerating all the plants I saw, most of them in full bloom, but will merely say that they included an immense variety of the most distinctive kinds, many of them not usually seen except in the gardens of specialists. The point I want to emphasise is this: here I found alpine plants of marked beauty grown so well by two ladies who, so far as these plants are concerned, are their own gardeners, that had I not been aware who were the owners, I might easily have supposed the garden belonged to some wealthy man, who had secured the services of a first-class professional

gardener who makes alpine plants his specialty. I saw very few plants that were not grown as well as they are at Kew, and I am glad to say they are grown in good sized patches too, so that even the casual observer cannot see them without being impressed by the show they make. The position of this alpine garden is an exposed one so far as sunshine is concerned. It is, however, protected from bleak winds. On the other hand, the soil is not naturally good, it is too heavy; and it is obvious that nothing but great skill, and the daily attention which a true fondness for gardening alone ensures, must be called into regular exercise in the cultivation of these interesting and beautiful plants, for without such skill and attention, results like those I saw in this garden, would be utterly unattainable.

The third attractive garden I visited was a much larger one than the two above described, and deserves an article to itself. This with the editors's consent, shall appear another week. *E. W. B., Clynnog, October 10, 1898.*

ORCHID NOTES AND GLEANINGS.

ORCHIDS AT THE BEECHES, ST. JOHN'S WOOD.

IN the rather confined space devoted to garden and plant-houses around the residence of Herbert Druce, Esq., in the Circus Road, as in other districts on the borders of London, the influence of the great city makes it more difficult to carry on gardening as time goes on. Here, as in other places affected by fogs, soft-wooded plants, and what are generally called greenhouse plants, are very difficult to keep in anything like presentable condition, though Orchids, with care and attention, seem to thrive as well in the neighbourhood of London as they do in the country. It is true that those blooming in the foggy season often lose their flowers, but the plants themselves do not seem to suffer. Not only do the Orchids at The Beeches thrive well under the care of Mr. Walker, the gardener, but a number of hybrids of considerable interest have been raised there. Among those now approaching maturity, and which are watched with considerable interest, are various crosses of *Cypripedium Charlesworthi*, which should prove novel and beautiful. Here also are many reputedly difficult plants, which have grown successfully and bloomed regularly for a long period; among them Mr. Walker called attention to some *Cattleya citrina* in fine condition, which had not failed to bloom every year for ten years.

In bloom were several good specimens of *Cattleya labiata autumnalis*, *C. Bowringiana*, *Oncidium Lanceanum*, *Cynoches chlorochilon*, several plants of *Cypripedium Charlesworthi*, one with a very fine rosy-lilac upper sepal, 3 inches across; *C. Chamberlainianum*, which has been in flower for many months; *C. tonsum*, and other *Cypripediums*; *Lycaste Deppei*, a nice show of *Dendrobium Phalenopsis* *Schroderianum*, *D. bigibbum*, *D. formosum giganteum*, &c. In the cool-house, in which Begonias and other greenhouse plants are also grown, the specimens of *Cymbidium* are very vigorous, *C. giganteum* sending up three very stout spikes, and *Odontoglossum crispum*, *O. Pescatorei*, *O. grande*, *Cochlidia vulcanica*, *Maxillaria grandiflora*, *Masdevallia bella*, and others are in bloom.

"SAINT LÉGERIANA."

Under this title the Vicomte de Saint Léger proposes to establish a monthly journal devoted to the illustration of Orchids. Each number is to contain five coloured plates, of the same size as the *Reichenbachia*. The text is to be in French, Portuguese, German and English.

CATASETUM LONGIFOLIUM.

This is a very distinct species from British Guiana, which was first imported about 1838. The specific name is characteristic of its leaves, which are

from 18 to 20 or more inches in length, and very narrow, the sheathing base remaining on the bulbs for some time. A plant flowering here bears two pendent scapes, each carrying thirteen flowers. The sepals and petals are reflexed, and purplish-green in colour; but the most attractive part of the flower is its inflated lip, the edges along each side being lined with a fringe of reddish-coloured hairs, whilst the pouch inside is yellow, with a purple blotch at the front. A moist stove temperature suits it well whilst growing, with but little compost about its roots.

The *Botanical Magazine* contains a figure, t. 3819, under the name of *Monachanthus longifolius*. *R. L. H., Edinburgh*

CEOLOGYNE LAGENARIA.

A number of pretty plants of this showy *Cœlogyne* of the *Pleione* section, and covered with their bright crimson and white flowers, forms year by year an attractive feature in the Orchid-house of T. F. Blackwell, Esq., The Cedars, Harrow Weald. Introduced from the hills of Khasia about 1848, it was for many years regarded by gardeners as a very difficult plant to cultivate; but in more recent times, while some still continue to get small returns for their labours, others not only grow and flower it and some of the allied species easily, but rapidly increase their stocks of the plants. These at The Cedars form a case in point, for originally Mr. J. Dinsmore, the gardener there, had but a few pseudo-bulbs of it; but these he has steadily increased every year until there are now a sufficient number to make a fine display in the autumn. The plants are principally grown in small 48's, and many of them carry from twelve to fifteen flowers. Some of the plants are suspended, and others are arranged round the front of the staging, to which they form an effective border for the Orchids and Anthuriums staged thereon.

CYMBIDIUM TRACEYANUM.

A flower of this fine *Cymbidium*, taken from a plant which was carrying sixty-seven flowers on four spikes, has been sent to us by Mr. R. Thomson, gr. to W. S. Steel, Esq., Philiphaugh, Selkirk. For some time the type plant in Baron Schroder's collection, illustrated in the *Gardeners' Chronicle* in 1890, p. 718, together with a smaller one, represented the plant as observed in cultivation. Occasionally plants have been imported since that time, and the one at Philiphaugh is one of the best type of them. Its large flowers, with greenish-gold sepals and petals, striped with a reddish-chocolate tint, and ornate cream-coloured lip, streaked with red on the side-lobes, and spotted on the front one, approaches very closely the original illustrated in the *Gardeners' Chronicle*.

AMARYLLIS BELLADONNA.

ON more than one occasion lately we have alluded to the splendid form of *Amaryllis Belladonna* in cultivation at Kew. Not only does it differ in size from the ordinary form, but also in the deeper and richer tint of its rose-coloured flowers. Our illustration (fig. 93, p. 315), though greatly reduced, serves to show the proportionate size of the two forms. The larger plant has a scape 3 feet in height, and bears a truss of twenty-six flowers. For the photograph we are indebted to Mr. Watson.

CHRYSANTHEMUMS.

WE are once again entering upon the season when Chrysanthemums almost wholly take the attention of gardeners, and excite the admiration of the public. There are no signs that the flower has lost any of the hold it has had upon our affection, and its supremacy in the foggy, dreary days of November is undoubtedly at present unchallenged by any other flowering plant. It will be interesting to see what effect upon Chrysanthemums the exceptional season of 1898 has had, and whether the displays during next month will be as good as usual. It is a fact that in some collections there has been much injury wrought by the "rust" fungus; but the alarm that was indulged by some growers a week or two since was hardly justifiable. It amounted almost to a

scare, but, like many other scares, it has fortunately been short-lived. It is recognised now, that the pest, like every other plant pest, is subject to certain conditions, and may be prevented by the exercise of ordinary care when once the cultivator has obtained sufficient knowledge of its character and life history. That it has appeared so suddenly to an epidemic degree, has not been definitely explained even by the mycologists, but the suggestion that, having found such a favourable and well fed host-plant as the Chrysanthemum, the fungus would naturally make the most of it, and spread very rapidly, appears to be a common sense view of the matter. Mr. Massee in these pages has told the grower what the fungus is, and how it lives, and multiplies itself, and also that it is a fungus that exists in almost every district upon one or other species of composite plant. But the Chrysanthemum in its native home, it is said, is not attacked by this fungus. The Chrysanthemum has been grown in this country for years, yet until now the fungus has never attacked it seriously. The one point that remains unexplained is this: What circumstances have led to the general attack this season? So far as record has been kept, Chrysanthemum leaves affected by the "rust" fungus were first submitted to the *Gardeners' Chronicle* three years ago.

We had recently the pleasure to inspect Mr. Haywood's Chrysanthemums at Woodhatch Lodge, Reigate, and there Mr. Salter assured us that he had kept the "rust" in check, and indeed killed it, by the use of paraffin, applied directly to the "rust" by means of a small brush. In many instances there were obvious signs upon the leaves that this had been the case, many of them being disfigured on the underside, but at present exhibiting no live fungus. Mr. Wells, of Earlswood Nurseries, has also had the disease to contend with, but has mastered it by a method slightly different to Mr. Salter's. Mr. Wells has syringed or dipped his plants with a liquid prepared as follows: 1 lb. of lime, and 2 lb. of sulphur, boiled for one hour. The liquid from this was poured off, then $\frac{1}{2}$ lb. of common soda, 1 lb. of soft-soap, and $\frac{1}{2}$ pint of paraffin, were mixed together in hot water, and afterwards added to the lime and sulphur wash, making about a gallon altogether. For syringing the plants, one wine-glassful of this mixture was added to a gallon of clear water, and the effect was perfectly satisfactory. In neither collection has the fungus done any serious injury, though it has occasioned some amount of trouble.

Chrysanthemums at present are a trifle late, but the character of the weather may make good this before November is well in. We shall not be surprised if in the London district the blooms are a little less good in quality than usual.

On p. 320 is given a list of Chrysanthemum shows arranged for November. Though this includes only the larger exhibitions, and possibly not all of these, it will be sufficient to indicate the density of the Chrysanthemum season. The week commencing Monday, November 7, will be the busiest; and, unfortunately, on Tuesday, November 8, there will be the National Chrysanthemum Society's Exhibition at the Aquarium; a meeting of the committees of the Royal Horticultural Society at the Drill Hall, and large exhibitions at Birmingham and other places. Steps should have been taken by the executives of both Societies, in the interests of each, to prevent the clashing of the Aquarium Show with the Royal Horticultural Society's meeting. *P.*

SEASONABLE HINTS.

From the present time the gardener will have an anxious period of about three weeks' duration, especially if he be a raiser of large blossoms. Those who devote their energies to the supplying of cut blooms only, or for home decoration, have no conception of the amount of care required by plants which are intended to compete for valuable prizes in the best company. Concurrently with the development of the blooms, earwigs and woodlice increase; it would surprise the novice to find what damage the first-named can wreak upon three-parts of, say, a fully-developed incurved bloom in a night. In Japanese varieties the florets are more

numerous, and so formed that the loss of one is easily covered by its neighbour; but in the incurved or Chinese section, where the recurve of the floret is an important point, a damaged floret cannot be spared so easily. Where the Chrysanthemum-plants are brought into flower in such available places as vineries and Peach-houses, where the borders are wholly or partly inside, and often thickly covered with a mulch of manure, this dry manure affords a safe retreat during the daytime for earwigs and woodlice. A close watch must be kept and search made by candle-light, and various methods of trapping adopted, as for example, Broad Bean stalks, cut in lengths of 1 foot, and pieces of rolled black cloth thrust amongst the leaves as a harbour by day. It is surprising how many earwigs may

Where plants have to be given extra heat to hasten their development, cockroaches are more liable to attack the plants than in a cold house.

Green caterpillars are at times a source of annoyance, and except by chance the night is the only time when they may be discovered. It will readily be seen that growers of Chrysanthemums for exhibition have sundry enemies to contend with, all of which must be kept within bounds if perfect blooms are to be obtained.

The ventilation of the house by night, too, is of importance. Afford more or less air as the weather may suggest, and in such a manner that no rain falls upon the flowers. All dead leaves should be sedulously removed from the plants. Plants having blooms upon them three parts developed should not

fulness on the part of the workmen, much damage may be done to the tender florets. The best way to carry a tall plant when in bloom is this:—One person should take the pot, and another the branches, and the flowers, which should be carried in a horizontal position, the blooms dependent, yet held securely, a gentle swinging doing them no harm. If any variety is likely to be too much advanced at the required time, remove the plants to a cool, dry shed or cellar where air can reach them but no moisture, as soon as the petals are developed. If the blooms of any variety are backward, instead of leaving them in their present position until a few days before the show, when much heat would be necessary to hasten their development, thereby rendering a loss of colour, remove the plants to slightly warmer quarters, and push them on very gradually, which will bring no loss of colour. If two or three doses of sulphate of ammonia be afforded backward plants, the blooms will develop more quickly. In obstinate cases a pinch of nitrate of soda in the water at one application, and supplied when the soil is moist, will greatly assist the growth of the petals.

Chrysanthemums being hardy plants, it is more natural for the flowers to expand in a cool place than in strong heat. The colour then under proper conditions will be more in its true character than when subjected to long heat, which tends to produce washy tints. Japanese varieties will stand more heat than the incurveds, the latter being liable to reflex their florets when hastened very rapidly. It is the compactness of the exterior florets that makes a perfect incurved bloom. Perhaps the reverse is more applicable to the Japanese.

Reverting briefly to the subject of retaining blooms in a fresh condition after they are fully developed without removing them from the plants, it may be stated that they may be removed from the plant, and kept in a satisfactory condition for, say, eight days; in some instances longer. When cut, the flowers should be perfectly developed just at the time they are quite at their best, and before they lose their freshness.

The commencement of decay is best shown by the lower florets becoming soft and flabby. An experienced cultivator is able to tell in the dark the condition of the blooms, a certain softness of touch being a sure sign of decay. When this occurs the white varieties soon assume a pink tinge. When cutting a blossom, let at the least 10 or 12 inches of the stem and leaves be retained, so that a small portion may be cut off each day, and place the stalk in a bottle filled with water, to which a pinch of table-salt has been added. It matters not whether the water be hard or soft. Place the blooms in a cool, slightly-darkened room having a dry atmosphere.

Large-flowered varieties of the incurved section, notably those of the Queen of England type, may be considerably improved and assisted while developing, especially if the plants are being subjected to heat to hasten them, by hanging the blooms downwards. This can only safely be done by releasing the plants from the upright support, tying them to wires similar to a Vine-trellis running up the roof, thus allowing the blooms to hang loosely down. This position induces the florets to grow in a natural manner, viz., incurving toward the centre. *E. Molyneux.*

CHRYSANTHEMUMS AT THE CEDARS, HARROW WEALD.

In the long ranges of vineries in the gardens of T. F. Blackwell, Esq. (Mr. Dinsmore, gr.), contain at the present time a fine show of Chrysanthemums, the flowers throughout being splendid examples. More than the ordinary amount of attention was bestowed upon them during the summer in the matter of affording water to the roots, or the results would have been anything but satisfactory. Specially noteworthy among the varieties were T. B. Haywood, Mrs. H. Weeks, Simplicity, Lady Ellen Clark, fine whites; Madame J. Bernard, a noble white, with yellow-tinted centre petals; Master Jas. Epps, Edith Tabor, Joseph Brooks, and Oceana, very fine yellows; Eva Knowles, buff, with red-brown reverse to the petals; Joseph Chamberlain, an attractive bronze Japanese;

FIG. 93.—AMARYLLIS BELLADONNA.

(To show the difference between the ordinary form and the Kew variety. Much reduced. See p. 314.)

be caught every morning by strict attention to the examination of these traps. Woodlice can only be exterminated by hand-picking at night, and where they are very numerous, the work must be incessantly carried out. A woodlouse has a habit of ensconcing itself in the centre of a bloom in the daytime, and of eating its way out, as it were, by night. Slugs, too, often disfigure the flowers by crawling over them, and in some cases gnawing the florets. Where any trace of these creatures is noticed during the day, they are almost sure to revisit that particular spot the following night; and knowing this habit, slugs can usually be caught by searching for them after dark. Some bran laid on the top of the pot will also serve as a bait for them. Cockroaches, where numerous, are sure to molest the blooms, and these insects are rather more difficult to entrap when feeding, as the moment a light is turned on them off they go.

receive more water than is absolutely necessary to keep the soil just moist; and any stagnation of moisture at the roots at this stage is highly dangerous.

Timing the blooms is an important detail, and one which should not be neglected. Timing them means having the bloom or head of blooms in perfection at a certain date. An experienced exhibitor will know it is of no use whatever to have some varieties past their best and others not expanded. What is required is that all the varieties, or nearly so, of those to be exhibited, should be in perfection at the appointed time. It will be found necessary two or three weeks before a show to hasten some of the plants and retard others.

The moving of tall plants when in bloom from one house to another for the purpose of retarding those which are found to be too forward, requires doing in a systematic manner, as without the utmost care-

Australia, Elthorne Beauty, Pride of Madford, Viviani Morel, and other favourites, all in splendid condition, and as a whole, making a grand display. Here, as in many other gardens, the beauty of the Chrysanthemum affords the amplest reason for their high cultivation, as without these plants the gardens, in most places, would just now be somewhat bare of flowers.

THE ROSARY.

OCTOBER IN THE ROSE GARDEN.

DURING the early part of October our Tea Roses were so parched that the flower-buds could not expand, and many of them perished. In spite of this, the ripened wood below was making shoots, and now that rain has fallen, and the air is dew-laden at night, there is quite a number of Rose blossoms at the time of writing (October 24), and one of the best is G. Nabonnand. This variety is always good late in the season, and it stands well after the extra warm time we have passed through. Of free-flowering Roses, G. Nabonnand is the most certain, and it is very seldom that one finds any blind or flowerless growths. It has handsome foliage, a long and well-formed bud, and blooms are so freely produced that they may be gathered without stint. It is such Roses as this one which should be extensively grown where Roses for cutting are much required. Another strong grower with flowers boldly carried is Souvenir de Catherine Guillot. This also has very deep bronzy-red foliage and wood, an immense number of buds, all of which expand much better after cutting than the majority of Roses. The tints of this Rose are difficult to describe. Copper salmon, nasturtium-red, orange and apricot, are all found in it at varying stages of the flower. These last two Roses are simply perfection late in the season. Although not possessed of many petals, they do not expand so quickly as most, and they are always showy. The blossoms of Madame Abel Chatenay are exceedingly pretty at the present time, and attract notice at once from their deep salmon-carmine centre. This variety is also a free grower and productive bloomer, but not so much so as the two first-named. Papa Gontier is a Rose with a deep crimson-tinted bud, which opens as a large few-petalled flower. With this one we have four grand decorative Roses still in full blossom outside.

Undoubtedly the Rose of the year has been Mrs. W. J. Grant, and plants of this variety are in flower at this date. All who require a good late deep cherry-red Rose must grow Tom Wood, for scarcely a shoot of this fails to have blossoms, and I find it to be as nearly free from mildew and red-rust as any of the Hybrid Perpetuals, not excepting Ulrich Brunner. One of the prettiest features in the Rose-garden now are the various forms of *R. rugosa*. Even through the heat and drought of the summer, these did not appear in the least distressed, and when others were sadly disfigured by mildew and orange-rust, the *rugosas* were looking quite healthy. The new *rugosa* from Bath, named *Delicata*, is exceptionally free, and has the sweetest perfume of any Rose. It is a pity the birds play such havoc among the hedges of *R. rugosa*. I do not know of any flowering shrub so good for town gardens as these Roses. One of the prettiest beds I have seen was formed of a half-standard white *rugosa*, surrounded by dwarf plants of the darker colours.

Victor Hugo and Marquis of Salisbury are still very bright. The first is a grand late Rose, and keeps its intense deep scarlet shade long after the flower has expanded. Some I have noted were fresh and brilliant for more than a week.

Meteor is a Rose that is never seen at its best out-of-doors till late in the season, and then it is really a fine flower of deep crimson and maroon colours. Earlier it gets burnt with crumpled outer petals, but at the present time some fine trusses may be gathered from the bushes.

Owing to the drought, most of our plants were considerably more than half-ripened when the rain came, especially the hybrid perpetuals; and unless cooler weather ensues forthwith, new growths will

be made, which cannot possibly mature, and much of what would be valuable wood will be crippled. It is different with Teas and Noisettes of ordinary vigour, which never seem at a standstill until several sharp frosts, and a very short spell of genial weather causes them to break into blossom again.

It will be well to take advantage of the present open weather, and get the planting of Roses performed early, so as to check the formation of new growths, and assist the ripening of the wood. A. Piper.

AMERICAN NOTES.

THE DATE PALM IN ARIZONA.

WHILE we who live in the Northern States think most about fruits which will resist the greatest possible degree of cold, other American horticulturists are facing quite different problems. It is a very interesting illustration of the breadth and variety of the work done in the agricultural experiment stations of the United States to note the recent *Bulletin* published by the Arizona Experiment Station, and written by Professor J. W. Toumey. The *Bulletin* contains many details of no interest to the public, but the general conclusion is reached that Date-growing on a commercial scale is possible in certain favoured sections of the desert region of Southern California and Arizona. The Date Palm tree itself will grow in many localities where it does not fruit, or where it seldom fruits. Some few trees now growing in the State, and varying in age from 15 to 25 years, form the chief basis of these conclusions, though some faith is also placed in the similarity of the Arizona climate to that of the Old World regions where Date Palms are grown. The United States Department of Agriculture, through the Division of Pomology, has taken an interest in the culture of the Date Palm, and at different times has made importations of Old World varieties from Cairo, Arabia, Algeria, &c. Real material results in convincing quantity are still awaited, however.

SAN JOSÉ SCALE IN MARYLAND.

One of the most extensive publications among the many recently issued, dealing with the San José scale in various parts of America, is a recent bulletin by Professor W. G. Johnson, of Maryland. The San José scale has been comparatively destructive in that neighbourhood, and Professor Johnson has had exceptional facilities, as well as an exceptional willingness, to study it. The present volume might almost be called a treatise on the subject, covering 116 pages, and including an index and many illustrations, with a good portrait of the late lamented Dr. C. V. Riley as a frontispiece. It gives the history of the scale, its introduction, its present distribution, and the status of the work for its suppression. Professor Johnson evidently regards the San José scale as a very serious factor in fruit culture in Maryland, but thinks that the system of state inspection, fumigations, and renovations now in practice will control the pest to such an extent as to prevent the sorrowful necessity of abandoning the thousands of acres of Peaches, Plums, and other fruits now growing in that State.

"PRINCIPLES OF FRUIT-GROWING."

This is one of the most popular of Professor Bailey's many works on horticultural subjects. It has gone to a second edition in a trifle over a year. I am told that it has found a considerable market in Australia, New Zealand, Tasmania, and in other remote spots, that it sells in fact everywhere that people speak English and cultivate fruit-trees. The second edition has some slight changes, the principal one being a chapter in the appendix relating to methods of describing and classifying fruits. The new preface is a very interesting essay, setting forth the contrast between European and American methods of fruit-culture. Professor Bailey thinks that the American excels in large commercial operations, in growing and selling large quantities of uniform fruit in distant

markets; but that the European fruit-grower understands much better how to grow fancy fruit in small quantities for the home demand.

NEW YORK STATE COLLEGE OF FORESTRY.

This institution was founded by an Act of the New York State Legislature in the spring of 1898, and has already begun its work. The State Legislature appropriated 10,000 dols. to establish and maintain the school for the present, and also arranged for the establishment of a college forest of not more than 30,000 acres. A considerable portion of this land, I am told, has already been located. It lies in the mountainous region of the Adirondacks, and is covered with more or less first and second growth Spruce, Pine, American Larch, Hemlock, and broad-leaved species. It seems altogether probable that the practical demonstrations to be made in this college forest will have a very great value for the whole United States. The College of Forestry has been made a department of Cornell University, located at Ithaca. Dr. B. E. Fernow has given up his work as chief of the Division of Forestry in the United States Department of Agriculture, to become director of the new college of forestry and professor of forestry therein. His former assistant in Washington, Mr. Filibert Roth, makes the same transfer, and becomes assistant-professor of forestry, forest manager, and instructor in timber physics and technology. Courses have already been begun at Cornell University, and, though the registration of students in the College of Forestry proper is yet small, the lecture courses are well attended by students from other departments of the University. The regular course of instruction now outlined occupies four years, and leads to the degree of Bachelor of the Science of Forestry; but several shorter courses have likewise been provided. F. A. Waugh.

HYBRIDISATION OF SPREKELIA AND HIPPEASTRUM.

In your issue of June 14, 1898, p. 272, "Delta" writes: "I was told that Dr. Bonavia succeeded after many years in getting a cross between these two (*Sprekelia formosissima* and *Hippeastrum*)." I beg to state, that although I have often tried to cross these two, I never have succeeded in producing any result, and I am not aware that anybody else has ever succeeded. It is impossible to say what may happen in similar attempts in different climates, in different soils, and under different conditions. The *Vallota* seems as refractory with *Hippeastrums* as the *Sprekelia*. "Nothing can be known without trying," and trying persistently under different conditions.

Who would have thought that among Orchids *Sophranitis* and *Lælia* could intermarry—two distinct genera, according to botanists. *Epidendrum* and *Cattleya* or *Lælia* have also been successfully crossed. Anatomical distinctness does not necessarily mean physiological distinctness. Two plants may be anatomically distinct, while physiologically they may be one.

When in India, I imported a *Hippeastrum* bulb from Holland. It flowered, but would not cross either way with plants I got from Lucknow. The next season it flowered again, and I tried it in both ways, but again without any success. The third season I repeated the operations, and obtained a number of seeds, both by its pollen on my *Hippeastrums*, and their pollen on its pistil. Now these were both *Hippeastrums*. Thinking over the matter, I thought that possibly either the Dutch bulb was too young to produce crossable pollen and pistil, or it was not sufficiently acclimatised to effect a successful cross.

I have noticed this refractoriness in other cases of *Hippeastrum*; although anatomically one, they may have been physiologically distinct. Who would have thought that the lion and the tiger would cross? Yet this has been done. The form and coloration of the *Sprekelia* are so lovely, that attempts at crossing them under different conditions should continue.

Lilies amongst themselves are very difficult to cross. *Lilium Parkmanni* is said to have been a cross between *L. auratum* and *L. speciosum rubrum*. But

no one has been able to repeat this cross—if it was one, for some disbelieve that it was evolved through such a cross. The curious thing is, that this magnificent Lily does not seed; that is, it will not take its own pollen. The Sprekelia and the Vallota also do not take their own pollen, so far as my experience goes.

I have no doubt that the regular form of the Hippeastrum can, by selection and crossing, be transformed into the Sprekelia type, but it would require patience, perseverance and time. All irregular forms of flowers have been evolved from regular forms, and there is no reason why, by manipulation, this result should not be again produced. *E. Bonavia, M.D., London, August 15, 1898, in "Indian Gardening."*

nevertheless a month when the success attending the work of the past six months is apparent. I found many of the houses were undergoing alteration for more modern methods of ventilation, and a new system of hot-water was being carried out.

Several vineries I found in this transition, stags and in cases where a house had been planted years ago with several varieties in it, this was being replanted with one only. One new house was planted in January last, and good canes had run up this season. Capital crops were hanging on those Vines not yet interfered with, the Muscats being especially good. The secret in regard to two canes of Muscat was doubtless owing to the fact that young canes of this variety had been inarched on a well-rooted cane

with standards and pyramids, that it is intended to plunge out on the lawns or in the flower-beds. Next spring the plants will be of good size, and, it is hoped, will make a distinct feature in the pleasure-grounds. Perhaps even better than standing them singly, would be the placing of ten or a dozen in a clump, not too closely together, with some loose-growing Lobelia or Verbena as an undergrowth; these are free and rapid-growing, and would soon hide any appearance of bareness, that sometimes is observable in the Fuchsias. Free-blooming varieties, with flowers of but medium size, as are the sorts here, are far to be preferred to the larger flowering varieties.

Palms and Ferns are indispensable for the decora-

FIG. 94.—SOUVENIR DE LA MALMAISON CARNATIONS AT IWERNE MINSTER.

IWERNE MINSTER HOUSE.

(By our Special Commissioner.)

THIS noble establishment is six miles from Blandford, but having called at Shillingstone, I had but three miles to traverse before reaching it.

Iwerne Minster House, though built some eighteen years ago, has still a new look about it; to take this off, the lower walls are all wired, and the Ivy planted has made good growth, so that many parts are already covered with it. The pleasure-grounds are in excellent keeping, grand trees rearing their heads to a great height, and, as many stand singly on the lawns and park their grand proportions may be observed in a notable manner. Much new landscape work has been undertaken during the past few years, and as the seasons pass, these portions blend with the older, and add a richness and completeness to the scenery, such as it did not formerly possess. Perhaps August is not the most desirable month to visit gardens, at least we are sometimes told that is the case; but it is

of [Black] Hamburg. The canes of Muscat now three years old, were very strong, and bearing a good crop. The bunches were better shaped, that is, had broader shoulders, and were not quite so attenuated as other Muscats close by. The setting quality of the flowers was decidedly more free and certain, the berries were of large size, and the flavour excellent. Mr. Th. Foakes, the gardener, expressed himself as highly pleased with this method, and purposed inarching several others. I have observed this plan carried out at several other places in the south. The variety Mrs. Pince was likewise in very good form; and the flavour of Mrs. Pearson (white) was excellent. In one house, a number of young Peach and Nectarine-trees was planted last January, and had made good growth; other Peach-houses had excellent crops, whilst a number grown in pots were now stood outside, that the wood may become hard by exposure.

I found the cultivation of specimen Fuchsias practised here. A house was occupied exclusively

tion of the mansion, and these also have divisions entirely devoted to them. They look well, and, as is the case with all plants used for this purpose, moisture and heat are now given to cause growth, so that any blemishes may as quickly as is possible be covered over with healthy and vigorous fronds. Chrysanthemums are well grown, and some 900 plants, as bush specimens, or others for the production of blooms, were looking well.

Here, too, Carnations are grown in great numbers. The Malmaison varieties had flowered, and layering was being effected. In fig. 94 is illustrated a house of these when in bloom. Of the tree-variety Mrs. L. de Rothschild some 1500 plants are grown, and these, with Miss Joliffe and others make it possible for Mr. Foakes to cut Carnation-blooms any day during the year. The method adopted with these is simple enough. Cuttings are inserted in pots in January, and struck in a little heat. As soon as they are rooted, they are potted into 3-inch pots, and then later in the

spring into 7-inch pots. Carnations in different stages of growth are met with in almost all places. The Begonia, Gloire de Sceaux, filled one house entirely, and was in capital condition; whilst the pretty Gloire de Lorraine was represented by a large number of plants in pots and frames.

In one of the stoves I noticed a large portion of the roof covered with Allamanda cathartica, the flowers of this are somewhat smaller than A. Hendersoni, and are most useful for vases and table decoration. Another variety even less in size than A. cathartica is A. Williamsii, which is well deserving a place where this class of flowers can be used. To say that Violets are not forgotten is a negative way of stating the fact that borders were filled with young plants. Spring-flowering bulbs are also grown in large numbers, Lily of the Valley crowns being utilised to a great extent, since the desire is to have this lovely gem in flower as early as possible, and to lengthen its blooming period as long as can be done. Some thousand Strawberry-plants in pots are forced each season, and preference is given to Royal Sovereign.

Passing through the pleasure-grounds and flower-gardens, I noticed some pretty flower-beds. In many nooks herbaceous plants were gay, and a pond was utilised for Rushes, Iris, and Water Lilies; whilst strong-growing Ferns had a capital rockery quite set apart for them. The kitchen-garden is some distance from the pleasure-grounds, and with that near the glasshouses is well cropped. Cabbages are grown in large numbers; Melons, Cucumbers, Tomatoes, and Figs are perfectly satisfactory.

THE WEEK'S WORK.

PLANTS UNDER GLASS.

By W. MESSENGER, Gardener to H. C. BERNERS, Esq., Woolverstone Park, Ipswich.

Hard-wooded Plants.—So long as the weather keeps open and mild, all the air possible should be afforded these plants. Those for example, as Indian Azaleas, Rhododendrons, &c., which are liable to be overrun by thrips, should be syringed once a day as a precaution, and should the pests be present on the plants fumigate the house twice, on alternate evenings, for, if the pests are not annihilated quickly, yellow leaves will soon be apparent. If the present mild weather continues no fire will be needed. Take great care that no plants become dry at the roots, and no crowding of the plants occurs. When plants have been standing out-of-doors it is not advisable to keep the greenhouse very dry, as doing so leads to the dropping-off of the leaves, Camellias being great sufferers in this way.

Myrsiphyllum asparagoides.—Do not allow growing shoots to become entangled, but go over them at intervals, and tie them in neatly without bruising or breaking. This species is useful where much indoor decoration has to be carried out; and a good number of plants should be grown. Those which are grown are improved if weak guano-water be often applied. Let plenty of air be afforded when the weather permits.

Adiantums.—Those plants which were closely cut-over and have been rested somewhat, may now be started into growth by putting them in an intermediate temperature, affording them some weak stimulus when growth has become active. Such Adiantums as have developed fronds may be placed in a cool position in full light, and afforded a fair amount of fresh air. Thus treated, the fronds last longer when removed from the plants than those that are grown in a close, moist house.

Herbaceous Calceolarias.—Only cold-frame or greenhouse treatment is suited to the needs of the Calceolaria in mild, open weather; and in the event of autumn frosts, coverings are better than fire-heat, and these are readily applied when the plants are placed in cold-frames or pits. Greenfly must be diligently kept under by fumigation, and air must be admitted to the plants in mild weather, so as to obtain compact, stocky growth, and healthy leaves.

Celosias.—The later-sown batches of plants available for decoration at this season having been afforded cool-house treatment, will have well developed plumes. Those, on the contrary, which have pushed on in heat will be more delicate, and will need careful hardening off before they are placed in a cold green-

house. If any plant should be in a backward condition, let it be grown close to the glass, in an airy intermediate-house, which will have the effect of checking or preventing spindling of the plants.

HARDY FRUIT GARDEN.

By W. H. DIVERS, Gardener to the Duke of Rutland, Belvoir Castle, Grantham.

The Apple.—Where trees are being purchased from the nursery, whether for forming bushes or espaliers, they should always be obtained on the English Paradise stock, upon which the Apple gives much finer fruit than on the free stock, as the former has more abundant fibrous roots running near the surface, therefore within reach of rain, and readily affected by manurial top-dressings during growth; besides, the trees do not make so much wood as is the case on the Crab, nor are they so large-headed as to overshadow other crops; they continue in bearing without root-pruning longer than those, and they come into bearing much sooner. I have found, as doubtless have other gardeners, that the French Paradise stock does not enable the Apple worked upon it to make enough growth for ordinary purposes, although no fault can be found with the fruitfulness of any variety worked upon stocks of this species; and it may be considered a useful stock for small gardens. Bushes on the French Paradise will bear a lot of fruit when from 2 to 4 feet high, and they may be planted at 4 feet apart. Apples on Paradise stocks may be transplanted without being much checked in fruit-bearing for even one season if the work be performed at about this date. For orchard culture the wilding Crab or free stock, as it is called, is best, and trees worked on it afford the greater weight of fruit per acre; owing, however, to the length of time required for a standard tree to form a head and come into bearing, it is desirable to cover the ground between the standards with Apples in bush form or worked on the English Paradise, or else with Currants and Gooseberries. By this means the cultivator obtains remunerative crops whilst waiting for the Apple-trees to come in bearing. This is a much better system than sowing down an orchard with grass-seeds, the trees making better progress, because the soil must necessarily be well tilled. In planting an orchard, varieties (if more than one tree be planted) should be kept together, either as an entire row or part of one, as the gathering of the fruit is then more quickly done. If possible, an orchard should be placed upon rising ground, with a gradual slope to the south or south-west, and the north-east winds are less destructive to the flowers and young foliage in the spring. Shelter there should be from the west and south-west winds, which blow most severely at a time of the year when the fruit is attaining to full size. This may be provided against by planting a belt of Canadian Poplar, Balsam Poplar, Larch, and Spruce trees at a distance of 30 yards or thereabouts from the boundary of the orchard, and these growing up quickly will screen the trees from the wind without forming a harbour for insects destructive to fruit trees.

Select Lists for Garden Culture: Dessert Varieties.—Mr. Gladstone, Beauty of Bath, Duchess' Favourite, Duchess of Oldenburgh, St. Edmund's Pippin, Worcester Pearmain, Summer Golden Pippin, Margil, Ribston Pippin, King of Pippins, Cox's Orange Pippin, Wyken Pippin, Cockle Pippin, Claygate Pearmain, Duke of Devonshire, Allington Pippin, Allen's Everlasting, Lord Burghley, Rosemary Russet, Sturmer Pippin.

Kitchen Varieties.—Lord Suffield (only fit for warm soils and aspects), Lord Grosvenor (if the first cannot be employed), Grenadier, Ecklinville Seedling, Warner's King, Frogmore Prolific, Peasgood's Nonsuch, Sirling Castle, Golden Noble, Blenheim Orange, New or Winter Hawthornden, Bismarck, Lane's Prince Albert, Annie Elizabeth, Dumelow's Seedling, Newton Wonder, Bramley's Seedling, Barnack Beauty, Northern Greening, Easter Pippin. The above are good bearing varieties in their order of ripening, and will give a succession of fruit throughout the season.

For orchard planting, if for private use, the above selection, with the exception of Lane's Prince Albert, will be suitable. If for market purposes:—

Dessert Varieties.—Duchess of Oldenburgh, Worcester Pearmain, Summer Golden Pippin, King of Pippins, Cox's Orange Pippin, Rosemary Russet.

Kitchen Varieties.—Grenadier, Lord Grosvenor, Warner's King, Peasgood's Nonsuch, Cox's Pomona, Golden Noble, Blenheim Orange, New Hawthornden,

Waltham Abbey Seedling, Bismarck, Annie Elizabeth, Newton Wonder, Dumelow's Seedling, Bramley's Seedling, Barnack Beauty.

THE KITCHEN GARDEN.

By J. W. McHATTIE, Gardener to the Duke of Wellington, Strathfieldsaye, Hants.

French Beans.—Plants in frames and pits bearing a crop should be given air during mild weather, but on no account must frost be allowed to reach the plants. Throw a few mats over the structures during frosty nights. Maintain a constant supply of Beans by making frequent sowings. It is of no use to rush the plants with excessive heat, nor to crowd them together in the forcing-houses. Keep them in a steady temperature by day of 65° to 70°, with a night temperature of 60° to 65°.

Globe Artichokes.—Prepare a heap of litter, consisting of dry rough stable-manure, straw, Bracken, and Oak or Beech-tree leaves, and on a dry day wheel this on to the ground, putting it between the rows. Cut off all the leaves and stems from the Artichokes to within 1 foot of the soil; then place the litter loosely around the plants in such a manner as will not prevent air reaching the plants. Do not cover the hearts, or they will decay.

Trenching and Digging Land.—As every kind of culinary vegetable derives more or less benefit from a timely and suitable tilling of the soil by digging one, two, or more spits deep, the sooner in the winter this work is performed, in the case of heavy and medium soils, the better. The last three dry summers have brought the matter of deep-digging of the land home to most gardeners—the deepest and best-tilled land has always carried the best vegetables, of course, with the addition of more or less manure. At this season a plan should be sketched of the intended cropping of the garden, and the soil prepared accordingly. The main divisions will be those which will carry the Pea, Onion, Carrot, Parsnip, Beetroot, and Potato crops, remembering not to have two crops of an exhaustive nature, or belonging to the same genus, following each other, and changing as much as possible the positions of the different kinds of vegetables.

Brussels Sprouts.—On a day when the plants are not wet with rain, let those with the forwarder sprouts be cleared of decaying leaves and any which will come away with a slight touch, and thus admit the sunlight amongst the plants, in order to avert to some extent the loss of leaves during the winter. Let the later-planted rows be moulded up for the last time. These last, in the event of our getting a few more weeks of mild weather, will carry a moderate crop of sprouts of a useful size.

Seeds which may be Sown.—Some early round-seeded Peas may be sown this month on a south border. Kentish Invicta and Ringleader are good hardy varieties. If these are selected for sowing, the rows should be 2½ feet apart, and the drills 3 inches deep, made flat at the bottom, so that the seeds may lie at the least an inch or two apart. The land, if in fair heart, should not be manured, but potash and manure-water may be applied in the spring. Broad Beans may be similarly treated, but manure is not inimical to this vegetable. The early Mazagan is a trustworthy variety to sow. Let the rows be 2 feet apart, and the drills as deep as for Peas.

Salsify and Scorzonera.—These roots may be lifted and stored in sand in a light cellar, with the tops shortened to 2 inches, protruding so that growth may go on.

Potatoes.—The tubers in the Potato cellars, &c., should be looked over, and all small and diseased ones removed. Examine likewise the seed Potatoes, and if the least sign of dampness be noticed, let them be removed to a drier place. Potatoes pitted out-of-doors must be well protected against the ingress of rain and snow, otherwise great loss of tubers will occur.

THE ORCHID HOUSES.

By W. H. WHITE, Orchid Grower to Sir Trevor Lawrence, Bart., Burford, Dorking.

Vandas (continued).—It may be well to mention a few of the varieties which are best known and more generally cultivated, as V. tricolor, V. t. planilabris, V. t. Dalkeith var., V. t. Bassetti, V. t. formosa, V. t. Dr. Paterson's var., V. t. Chatsworth var., V. suavis, and V. s. Veitchi. It is generally remarked by Orchid growers that these handsome plants are not nearly so well grown as formerly, and from my own observation when visiting other collections, I believe

the principal reason to be that the plants are grown much too warm, and they are given an insufficiency of fresh air and moisture. Give the plants generous treatment, and no difficulty need be experienced in cultivating and blooming them. A group of Vandas, furnished with strong healthy leaves down to the rim of the pot, whether in or out of bloom, is an imposing feature in the Orchid-house. Any of these plants that require to be repotted may be so treated at once. Less foliage will be likely to suffer now than were the work deferred until spring. Some growers fear to interfere with Vandas even when they become "leggy," and consider the cutting of them down to be erroneous practice, but if the plants are attended to at the proper season, and care used in the operation, as well as in the treatment afforded the plants immediately afterwards, no fear need be entertained. If a plant must be repotted because of a loss of leaves at its base, the old material and drainage should be removed, and if any roots are clinging to the sides of the pot, gently detach them with a thin-bladed knife. In most cases there will be found live roots some distance up the stem, which will allow of a portion of the stem to be cut off, and so much should be removed that when the plant is placed in the new pot the lowest pair of leaves will be almost down to the rim. Place the plant in the centre of the pot, and put a few large crocks at the bottom, which may be covered with a thin layer of sphagnum-moss. Replace the lowermost roots over the surface, and carefully work in amongst them some clean crocks, and a moderate quantity of unchopped sphagnum-moss, pressing it firmly down. Then distribute more roots in a like manner, bringing them well up to the surface, and filling up to within half an inch of the top. Finish off with clean healthy sphagnum-moss, well mixed with finely broken crocks. Afterwards secure each stem in an upright position to neat wooden stakes, it being essential that the plant should not move about. Any of the large fleshy aerial roots that are long enough may be pegged down on the surface of the moss, and in time these will root into it. The more roots enticed down in this way the better. The repotted plants must be shaded from all sunshine, and no water need be afforded them for several days, after which give them a thorough soaking. The moss on the surface will soon become dry again, when it should be lightly sprinkled over, and kept growing in this way until each plant has re-established itself, when the quantity of water may be gradually increased. The potting material, however, must never be kept in a saturated condition, it being more advisable to keep the surroundings moist by damping between the pots and under the stages several times daily. Large healthy specimens that need no root disturbance, will only require to be resurfaced with living sphagnum-moss, but if there be any suspicion of the old moss low down in the pot having become decomposed, it should be carefully picked out from between the roots, and fresh material substituted. Vandas require a cool intermediate-house temperature, and a cool moist stage for them to stand upon. Some cultivators stand the plants on open wood-work stages immediately over or near to the hot water-pipes. No worse place could be found for them. If they must be placed over the pipes, the stage should be covered with thin slates or tiles, over which a layer of finely broken coal or coke should be laid to a depth of 3 or 4 inches, which will hold moisture. All newly-imported Vandas should be potted in crocks only. Keep the stems and lower leaves well syringed to prevent undue shrivelling. As soon as roots appear, the plants may be potted in the ordinary manner.

THE FLOWER GARDEN.

By H. WALTERS, Gardener to Lord GERARD, Eastwell Park, Ashford, Kent.

Alterations and Improvements.—The season has arrived when ground work, turf-laying, the formation of beds, borders, shrubberies, rockeries, &c., may be undertaken with less chance of the work being impeded by bad weather. When turf has to be laid or relaid, the ground should be dug over half a spit deep, obliterating every inequality in doing this, and finishing-off the job by a good even trampling and raking with an iron rake. Turf should be very carefully laid, the joints being as close as it is possible to make them. When the whole is turfed over, a sprinkling of finely-sifted loam should be brushed into the spaces, and on the first dry day a heavy roller should be passed over it.

Shrubs.—The removal of most of the evergreen shrubs may be carried out at this season, care being taken to secure good balls of soil with them, and to plant in a hole considerably larger than the ball or the stretch of the roots. Having placed the plant in position,

only a little deeper than it was before, fill in around the ball and among the roots with fine soil, a little at a time, and if it be dry, wash it amongst them with water from a can having no rose on the spout, then place more soil over the roots, make the whole firm by treading it evenly; and finish off neatly. If the staple is clayey, some leaf-soil may be well incorporated with it, or failing this, charred soil, wood-ashes, or some not-much-decayed manure. Where new shrubberies are to be made, the ground should be dug two or three spits, manure or leaf-mould being incorporated with it during the operation. Do not plant before the land has settled after being trenched, or in wet weather, or before the ground has become dry enough not to stick to the boots or the tools. These precautions are of great importance if the soil be heavy.

General Remarks.—Much work will be found by the gardener from now onwards to the close of the year, for the flower-garden and pleasure-grounds must be kept with neatness; tree-leaves collected almost daily, and the lawns swept and rolled once or twice a week. The rains will have caused the grass to grow anew, and the mowing-machines and scythes cannot be put away just yet. Grass verges and the edges of the lawns must be neatly trimmed and well defined. Walks of binding gravel will need frequent rolling to keep them firm. Creepers on walks and fences may need some attention by removing or securing long shoots, and affording a mulch of rotten manure to the borders. The borders of herbaceous perennials must be tidied up, and the stems, &c., removed. When the walks are hard, as after frost, manure may be wheeled on to the beds in readiness for being dug in. Gladiolus corms may now be lifted and put just as they are in a cool place to dry, previous to being stored away in sand for the winter. Hardy herbaceous plants that admit of increase by division, may be taken up and divided; and if manure can be spared, the border may be dressed with it. *Helleborus niger* (Christmas Rose), should have bell-glasses or handlights placed over them to preserve the purity of the flowers. Keep a sharp look-out for wireworms amongst recently planted Carnation layers, and if the appearance of a plant indicates their presence on the roots, scrape the soil carefully away from the plants, and find the creatures. Layers of the Carnation should be potted forthwith, and stood out-of-doors until hard weather compels their removal to cold pits or frames.

FRUITS UNDER GLASS.

By G. NORMAN, Gardener to the Marquess of SALISBURY, Hatfield House, Herts.

Figs.—Any plants which require more root-space may be repotted, using turfy loam, with about one-eighth in bulk of lime-rubble or slaked lime, and the same of burned soil, added in greater or lesser quantity according to the nature of the loam and its constituents. A quart of bone-meal to a wheelbarrow-load of the soil affords desirable nutriment to the Fig. Before replanting, shorten the strongest roots. The potting should be firmly performed as the pot is filled up, the ball being sunk about 1 inch deeper than before. Large trees that have not been potted for a year, must be repotted into the same size pots or tubs, or re-surfaced with the soil, making it firm by ramming it. When a plant is repotted, &c., sufficient water should be afforded to moisten the ball throughout, and then stood in a cold-house.

The Earliest Pot-Vines.—We are now at the commencement of the forcing season for Grapes, and first among the varieties in favour comes the Black Hamburgh, than which none is easier to force and obtain of good quality in the latter half of the month of April. A good companion variety to grow along with it is Foster's Seedling, although there are others which force as readily, as Chasselas Vibert, a round white Sweetwater, ripening early naturally—one of the best; Duke of Buccleuch, a handsome round berry, and fine bunch, becoming of a fine amber colour when ripe; Ascot Citronelle, an oval Muscat Grape, ripening three weeks in advance of the Black Hamburgh, well worthy of being grown in moderate quantity, but, as Mr. Barron remarks in his treatise on the Vine, "too small for extended cultivation;" and Ascot Frontignan, a round white Muscat of first-class quality. Cultivators might add some or all of these varieties to their collection, with the certainty of giving interest to the dessert. The best pot Vines for early work are those which have made two seasons' growth, and have been once cut back, and the growth of such was completed and ripened much earlier than usual this year.

The early vinery should have a full south aspect; and before anything else is done, it should be well cleansed in every part, and the walls lime-washed, taking the precaution to put a handful of flowers-of-sulphur into the white-wash bucket. Everything of a nature to harbour mildew, red-spider, thrips, or mealy-bug, should be cleared out of the vinery, together with a few inches of the top soil if there be any borders. If means of affording bottom-heat exist, a mass of Beech and Oak leaves should be placed therein, and be well trampled down as the filling of the pit goes on. If the house is not provided with a bed for bottom-heat, let the Vines be placed on a shelf along the front of the house, but at some distance from the hot-water pipes. I have grown Vines for many years by both methods, but I prefer to plunge the pots to the rim in a bed. Before putting the Vines into the house let them be dressed with one of the usual Vine dressings. In a former Calendar I advised the shortening of the pot Vines to the required length, and if this has been omitted, and the Vines are found to be too long for the rafters, do not shorten the canes now, but disbud instead when they have broken, as any pruning carried out immediately before beginning to force might set up bleeding when the sap becomes active. Let the Vines be placed 2 feet apart, and in order to encourage a regular break, tie them along the lower part of the trellis, causing the canes to form a slight bow. The canes may remain thus till after they have broken, which is usually in about a period of six weeks. They may then be tied along the rafters, at about 1 foot distant from the glass. Let the forcing go on very gradually, with a temperature of not more than 50° at night, a few degrees higher if mild, and a few lower in time of frost; and 55° in the day with or without fire-heat, allowing it to rise 10° to 15° higher if the sun-heat is powerful enough, and maintain a moist but not a stagnant atmosphere, damping the Vines and all bare surfaces once, twice, or thrice a day, as may be necessary, and affording ventilation in accordance with the state of the weather. This kind of treatment must be persevered in till the canes break, at which stage the temperature may be raised 2° or 3°. When approaching dryness, afford applications of tepid water to the soil in the pots, examining the pots twice a week if plunged, and every day if standing on shelves.

Borders of Vineries to be started later may also have a thin covering of leaves, which may be added to at a later date. This early covering of the borders prevents the escape of heat latent in the soil.

THE APIARY.

By EXPERT.

Extracting and Cleaning-up Combs.—Boxes of combs, after the honey is extracted, must be given to the bees to clean-up before being stored away till next year. Some care is needed in getting this job completed without disturbance, and a little trouble will be well repaid. The combs should be given to a few stocks only; allow two or three colonies to do all the cleaning-up for the whole apiary, and give the wet combs after nightfall, taking special care that no strange bees get at the combs from the outside. The latest form of super-cleaver—which provides for the re-admission of the bees to boxes of wet combs which have been replaced on hives for cleaning-up, preparatory for storing away for winter—affords great assistance in preventing excitement, and consequent "robbing." With a couple of these clearers in use, all combs may, after extracting, be got into the necessary clean condition with a minimum of risk or trouble.

Clearing away Summer Appliances.—Clear everything in the shape of appliances away after they are done with, and do not forget to parcel and label each lot when they have been cleaned and prepared for use next year. Surplus brood-combs should always be marked and numbered before packing away, in order that they may occupy the same positions in the same hives next season. In contracting hives for winter, remove all combs not covered with bees, and after noting the hive from which they are taken, stow them away by themselves, and use them again when required for the same stock—this is a possible preventive of infection. As the weather becomes colder, bees will occupy a very much smaller portion of the hive, and it will soon be seen how many combs will be needed to winter on. About eight standard-sized frames will be the number required for a fair stock, but only leave as many as the bees can cover, and be certain that each has not less than 20 lb. of food at the end of October.

APPOINTMENTS FOR NOVEMBER.

		Scottish Horticultural Association meet.
TUESDAY,	Nov. 1	Chrysanthemum Exhibitions at Torquay (2 days); Southampton (2 days); Stratford-on-Avon (2 days); Croydon (2 days); Watford (2 days); Kingston-on-Thames (2 days); Eastbourne (2 days).
WEDNESDAY,	Nov. 2	Chrysanthemum Exhibitions at Isle of Thanet (2 days); Wolverhampton (2 days); Dorchester (2 days); Jersey (2 days); Ascot (2 days); Blackheath (2 days); North Peckham (3 days); Lowestoft (2 days); Woking (2 days).
THURSDAY,	Nov. 3	Chrysanthemum Shows at Exeter (2 days); Plymouth (2 days); Wandsworth (2 days); Maidenhead (2 days).
FRIDAY,	Nov. 4	Battersea Chrysanthemum Show (2 days).
SATURDAY,	Nov. 5	North Scotland Root, Vegetable, and Fruit Show.
		Royal Horticultural Society's Committees.
TUESDAY,	Nov. 8	National Chrysanthemum Society's Exhibition at the Royal Aquarium (3 days). Chrysanthemum Shows at Birmingham (3 days); Highgate (3 days); Yeovil; Coventry (2 days).
WEDNESDAY,	Nov. 9	Chrysanthemum Shows at Bourne-mouth (2 days); Jersey (2 days); Wisbech (2 days); Hanley, Staffs. (2 days); Cardiff (two days); Liverpool (2 days).
		Harrogate Chrysanthemum Show (2 days).
THURSDAY,	Nov. 10	Cambridgeshire Horticultural Society's Chrysanthemum Show at Cambridge; Windsor, Eton and District Chrysanthemum Show; Sidcup (Kent) Horticultural Society's Chrysanthemum Show (two days).
FRIDAY,	Nov. 11	Chrysanthemum Shows at Nottingham (2 days); Leicester (2 days); Sheffield (2 days); Dalkey, Wiltshire, Cheshire (2 days); Bradford (2 days); Huddersfield (2 days); Altrincham, Bowdon, Sale and District Chrysanthemum Society's Show (2 days); Eccles (2 days).
MONDAY,	Nov. 14	National Chrysanthemum Society's Floral Committee meet.
		Ulster Horticultural Society's Chrysanthemum Show at Belfast (2 days).
		Brighton and Sussex Horticultural Society's Chrysanthemum Show (2 days).
TUESDAY,	Nov. 15	Folkestone and District Chrysanthemum Society's Show (2 days). Leeds Paxton Society's Chrysanthemum Show (2 days). Winchester Chrysanthemum Show (2 days). Great Yarmouth Chrysanthemum Society's Show (2 days).
		Ancient Society of York Florists Chrysanthemum Show (3 days).
		Buxton Chrysanthemum Show.
WEDNESDAY,	Nov. 16	Bristol Chrysanthemum Show (2 days). Hull Chrysanthemum Show (2 days). Ayrshire Horticultural and Agricultural Society's Winter Show at Ayr.
THURSDAY,	Nov. 17	Scottish Horticultural Society's Chrysanthemum Show, in Waverley Market, Edinburgh (3 days).
		Royal Botanical and Horticultural Society of Manchester Chrysanthemum Show, in St. James' Hall (3 days).
FRIDAY,	Nov. 18	Stockport Chrysanthemum Show (2 days).
MONDAY,	Nov. 21	National Chrysanthemum Society Floral Committee Meet.
TUESDAY,	Nov. 22	Royal Horticultural Society: Committees Meet.
THURSDAY,	Nov. 24	Dundee Chrysanthemum Society's Exhibition (3 days).
MONDAY,	Nov. 28	National Chrysanthemum Society General Committee Meet.

AVERAGE TEMPERATURE for the ensuing week, deduced from Observations of Forty-three Years, at Chiswick.—45° 4'.

ACTUAL TEMPERATURES:—

LONDON.—October 26 (6 P.M.): Max., 62°; Min., 56°.

PROVINCES.—October 26 (6 P.M.): Max., 59°, Dungeness; Min., 49°, Shetland.

Mild, fine, little rain.

SALES FOR THE ENSUING WEEK.

MONDAY,	Oct. 31	Dutch Bulbs, at Protheroe & Morris' Rooms.
TUESDAY,	Nov. 1	Dutch Bulbs, at Protheroe & Morris' Rooms. Great Annual Sale of thousands of Herbaceous and other Plants, at Ware's Nurseries, Tottenham, by Protheroe & Morris (2 days). Clearance Sale of Orchids, Stove and Greenhouse Plants, Greenhouses, &c., at Swanswell, Coventry, by order of John Powers Esq., by Protheroe & Morris.

National Chrysanthemum Society.

THAT there is nothing that succeeds like success, is an aphorism which might be applied to the National Chrysanthemum Society. Its progress of late years has been remarkable. The tide of popular favour has set in, to the advantage of the Chrysanthemum and its growers, and the Society has been wise enough "to take it at the flood." Success by the populace is estimated mostly in terms of £ s. d.—a sordid way of

FIG. 95.—TAXODIUM DISTICHUM IN SUMMER AND WINTER, IN THE GARDENS AT STONELEIGH ABBEY. (SEE P. 323.)

WEDNESDAY,	Nov. 2	Dutch Bulbs, &c., at Protheroe & Morris' Rooms. Imported and Established Orchids, at Protheroe & Morris' Rooms.
THURSDAY,	Nov. 3	Dutch Bulbs, at Protheroe & Morris' Rooms. Clearance Sale of Nursery Stock, at Muller's Nursery, Ivy Lane, Brockley, S.E., by order of Messrs. B. Muller & Sons, by Protheroe & Morris (2 days).
FRIDAY,	Nov. 4	Dutch Bulbs, at Protheroe & Morris' Rooms. Imported and Established Orchids, at Protheroe & Morris' Rooms.

looking at things, doubtless, but we fear the only way in which the majority can be made to appreciate the work of a society such as that to which we are now alluding. The larger the amount of prize-money that can be offered, the better the shows, and the greater the satisfaction of the exhibitors. A large amount of prize-money cannot be obtained without a large body of subscribers, and a large body of subscribers cannot be held together without large shows

and big prizes. The factors governing success are interchangeable and inseparable.

Other circumstances that go a very long way to explain the success of the Society are the small amount charged for membership, and the central position in which the shows are held. But the success of a Society should not be looked at exclusively from the financial point of view. The work that a Society does, apart from mere prize-giving, and the way in which it does it, are of greater importance than mere monetary possessions. A good reputation—a good character as it would be called when speaking of an individual—is at least as important as a big balance at

may, even its very existence, may depend upon the action taken by the members.

We suppose that those who really feel that the Aquarium at Westminster is a fit and proper place for the exhibitions of a body with the pretensions of the Chrysanthemum Society are very few. Nevertheless, the majority seem swayed exclusively by financial considerations, and herein lies the *crux*.

A statement of recent proceedings will make this clear. Some doubts had evidently arisen as to the wisdom of continuing to hold the shows at the Aquarium, and consequently a sub-committee was appointed to consider the subject, and to ascertain what, if any, more

rightly informed, the company is prepared to give as large a monetary subvention as do the directors of the Aquarium. The distance from the centre of London, or rather the time occupied in the journey to and fro militate powerfully against the Palace, and it will be for the members of the Society to decide whether this objection is sufficient to outweigh the manifest advantages which the site at Sydenham offers.

Does not this all show the great need there is of an independent Horticultural Institute in London, where all the societies could be accommodated, where the library could be properly housed, and which

FIG. 96.—VIEW OF RIVER AND STONE BRIDGE AT STONELEIGH ABBEY. (SEE P. 323.)

the bankers, and should be jealously maintained by the governing body. The fulfilment of the objects for which it was established—increase of knowledge, progress and adaptation to circumstances as they arise—these are matters upon which in the long run success depends, quite as much as upon financial well-doing.

Societies rise and fall, but when they fall, it is generally because they have run away from first principles, and gone off to worship strange gods. If they elect to worship Mammon rather than to pursue the primary aim of their existence, their success is sure to be fleeting. We allude to these matters now, not with any idea of insinuating ought against the Society, but rather because it seems to have arrived at a parting of the ways, and its future success,

suitable place could be found. The sub-committee, as we learn in their report, almost unanimously recommended that in future the shows be held at the Crystal Palace. In spite of this recommendation, however, the executive committee, by a large majority, set aside the recommendations of the sub-committee, and determined to recommend to the members at large the continuance of the Society at Westminster. So the matter stands for the present. It will, we suppose, shortly come up for the consideration of the members at large, and their decision will, of course, be final.

The Aquarium is about as bad and inconvenient a place wherein to hold a show as could be named, but it has the merit of accessibility. The Crystal Palace, in many respects, is an ideal place for a flower show, and, if we are

might be the head-quarters of the gardening charities? The Chrysanthemum Society in its search for a home has had precisely the same experience as that which befell the Royal Horticultural Society when it was compelled to migrate from South Kensington. The engagement of the Drill Hall for the fortnightly meeting of the committees was from the first only considered as a temporary arrangement in default of others more appropriate. Some years have elapsed, and still no more suitable place has been found. Let us hope that the experience of the Societies may speedily induce conjoint action, and that before the coming century is out of its infancy horticulture may be endowed with its much-needed institute, and be independent of everybody and every locality.

ROYAL HORTICULTURAL SOCIETY.—The October part of the *Journal of the Royal Horticultural Society* has recently been issued. It contains the text of Mr. ENOCH's informing lecture on "Insect Blights and Blessings," concerning which we can only say it is far too short. Mr. BURBIDGE's lecture on "Fragrant Leaves" is also given, as well as Mr. O'BRIEN's lecture on "Hybrid Orchids." Mr. MANSON BAILEY describes various North Australian species of *Nepenthes*, among them being *N. Rowanae* and *N. Jardinei*, new species of which, it is to be hoped, botanical journals will take note, as it is very long since any species were described in the publications of the Society, and they may therefore be overlooked. Pitcher-plants usually grow "in unhealthy, hot, humid parts of the globe, conditions not to be met with in any part of Australia. In fact, it would be difficult to find a more healthy locality than that in which our Australian Pitcher-plants grow." The other species alluded to by Mr. BAILEY are *N. Kennedyi* and *N. Bernaysii*.

"THE FLORA OF TROPICAL AFRICA."—The concluding part of the seventh volume has now been issued (LOVELL, REEVE & Co.). It contains the remainder of the *Amaryllidaceae* and the whole of the *Liliaceae*, from the pen of the indefatigable J. G. BAKER, so that its value as a work of reference for cultivators may readily be assessed. As many of our readers are aware, the three first volumes of this publication were issued under the editorship and largely under the authorship of Professor OLIVER. When he relinquished his task, the publication came to a standstill. In spite of official and other protests, it was allowed to remain incomplete till comparatively lately, when a vigorous effort has been made to continue it, and the result is the publication of the present volume, which contains the petaloid monocotyledons. We believe that the manuscript for numerous other orders to fill up the gap between the third and the seventh volumes is in a forward state of preparation, though there is an ominous paragraph in the preface—to the following effect: "The printing of the volume commenced in July of last year [1897], and has been attended with very considerable difficulties. Whether it is followed by any other volumes will largely depend on the extent to which these difficulties are removed." A strange pronouncement to be made in the case of a publication issued by the Government, with the resources of civilisation at their disposal.

CHRYSANTHEMUM SHOW AT LILLE.—In November an exhibition will be held in the Palais Rameau, Lille, by the Société des Chrysanthémistes du Nord de la France, in collaboration with two local societies. A congress will be held, and certain entertainments and excursions are planned. It is proposed, on November 11, to visit the nurseries of Roubaix, Tourcoing, established at Watreloos, where warming apparatus by low-pressure steam was first adopted on a large scale. One apparatus heats nearly two-and-a-half acres of glass. Excursions will also be made to other houses at Roubaix; then the grounds of Dutrie Frères, at Steenwerck, and the vineries at Bailleul. Here an iron house is in course of construction, 260 feet long, and 56 feet wide; the ground was prepared on August 1, and on the date of the intended visit the building is to be not merely completed, but stocked with 150,000 Chrysanthemums, and, probably, lighted by electricity. Another erection to be completed by that day is a house 65 feet long, to contain a gas-motor to work a pump to raise 170 cubic feet of water an hour. The water is to feed a pond of 211,000 cubic feet capacity. In these establishments are five vineries, each over 500 feet long by 26 feet wide, and each containing 150,000 bunches of Grapes.

SIR HENRY BARKLY.—The death of this eminent statesman is announced. He was successively Governor of British Guiana, Jamaica, Mauritius, Victoria, and the Cape of Good Hope. In all these capacities Sir HENRY elicited the commendation and gratitude alike of the colonists and of the home Government. Horticulturists and botanists also held

him in high esteem for the manner in which he promoted the interests of science and practical agriculture wherever he went. He was a frequent correspondent with the authorities at Kew, which establishment is indebted to him for numerous introductions.

ANTWERP ARTISANS AS GARDENERS.—At Lierre, near Antwerp, a "Dodona" Society has been started, with the object of encouraging horticulture among working-men, and based on similar institutions in England. At the first meeting more than 300 artisan members were present. It is hoped that the pursuit of gardening may brighten many dull homes, and prove beneficial in various ways. The horticultural press would be doing good service in calling attention to the new society.

DECORATIONS.—We learn from the *Semaine Horticole* that among other members of the fraternity less known in this country, the French Minister of Agriculture has appointed M. CHARLES BALTET, HENRI MARTINET, and CROZY, as officers of the "Merite Agricole," and MM. BOUCHARLAT, RIVOIRE and DAUTHENAY as Chevaliers of the Order.

LINNEAN SOCIETY.—The first meeting of the Society for the forthcoming session will be held here on Thursday, November 3, at 8.0 P.M., when the following papers will be read:—Prof. H. MARSHALL WARD, D.Sc., F.R.S., F.L.S., and Miss DALE, "On *Craterostigma pumilum*, Hochst." Rev. T. R. STEBBING, M.A., F.R.S., "Amphipoda from the Copenhagen Museum and other Sources. Part II." Exhibitions:—Prof. HOWES, LL.D., F.R.S., "Embryos of Hatteria." Mr. ALAN F. CROSSMAN, F.L.S., "Photographs of chicken with foster-parent a common buzzard." Messrs. H. & J. GROVES, F.L.S., *Nitella hyalina*, Ag., a new British plant.

MESSRS. JOHN LAING & SONS, nurserymen, Forest Hill, S.E., have been awarded, by the International Jury of the Earl's Court Exhibition, a Diploma, together with a Gold Medal for the meritorious display they have made with flowering plants, &c., in the gardens during the past season.

CHRYSANTHEMUMS ABROAD.—There seems to be no flagging in the interest excited by the Chrysanthemum in foreign countries, judging both by the literary activity displayed, and the notices of forthcoming shows, some of the latter being events of more than ordinary importance. American shows will no doubt be quite as numerous as ever, and on the Continent there will be several attempts to surpass even the most successful of previous efforts. Italy, France, Belgium, Germany, and probably Portugal, have all entered the list; while we learn that there will be two Chrysanthemum shows in Egypt, and one in Algeria.

THIRD CENTENARY OF THE BIRTH OF VANDYKE.—We have already mentioned that in connection with the fêtes commemorating the third centenary of the birth of Vandyke, there will be held a horticultural show at Antwerp, from the 9th to the 13th of next April. The programme of the exhibition is just published, and includes mention of nearly 200 sections, and of certain prizes to be awarded. The King and Queen offer gold Medals for competition. That from the King is to be allotted for the best collection of fifteen plants with ornamental foliage, such as Palms, Cycads, Aroids, Pandanus, and Cyclanthes; the Medal given by the Queen is to be awarded for the best five-and-twenty plants in flower. The president of the Horticultural Society, Baron Oey de Z-gwaart, Governor of the province, offers an award for the finest and best-arranged group of Orchids; the vice-president, M. Jean Everaerts, a prize for the best forty miscellaneous greenhouse-plants. The exhibition is to be held in the Palais des Fêtes, in the Zoological Garden. *Ch. De B.*

"LE DICTIONNAIRE PRATIQUE D'HORTICULTURE," in other words, the French translation of NICHOLSON'S *Dictionary of Gardening*, has now reached

the last letter of the alphabet. We advise those who read French to add it to their libraries, as several additions to the original work have been made by the translator, M. MOTTET. The work is published by M. OCTAVE DOIN, Place de l'Odéon, Paris, and may be procured through any foreign bookseller.

THE NARCISSUS FLOWER.—Prof. CELAKOVSKY, in the *Bulletin* of the Bohemian Academy of Science (1898), has a paper in which he shows that the tube of the flower is not axile, but a portion of the perianth-tube with which the bases of the stamens are incorporated. The cup or corona is an out-growth (excrecence) from the perianth, as it is also in *Pancratium* and *Eucharis*, but the stamens are in these cases still more consolidated with the perianth-tube from the beginning.

EUCALYPTUS GLOBULUS IN CORNWALL.—According to the *West Briton*, there is now growing in the garden of Mr. CHARLES H. HEXT, at Polgwin, a specimen of *Eucalyptus globulus*, commonly known as the "Blue Gum-tree," showing quite a large number of seeds. For a tree of this kind to bloom and seed in the district is exceedingly rare, the gardener, Mr. FRANK POLKINGHORNE, never having come across a specimen, either in the neighbourhood or elsewhere. *Extracted from the "Pharmaceutical Journal."*

ADDITION TO EPPING FOREST.—A valuable addition has been recently made to Epping Forest in the presentation by Mr. E. N. BUXTON, Chief Verderer, of the picturesque vantage-ground known as Yardley Hill. "This (writes the donor) is a timbered ridge which projects into the Lea-valley basin, from which river its highest point is distant about 400 yards. It connects the outlying portion of the forest called Gillwall Lane with the main block near Hawkwood." The new piece of land is, in extent, about 28 acres.

CASHING CROSSED CHEQUES.—The *Pharmaceutical Journal* reports a case in which a trader cashed four crossed cheques for a customer. The endorsements were made out in some other name than that of the person desiring to change the cheque, and proved to be fraudulent. Before this was discovered the cheques had been paid into the bank and honoured. An action was entered against the defendant who cashed the cheques, on the ground of negligence. The Judge remarked that it was a very different thing to cash a man's own cheque and that drawn in favour of another person, especially when, as in this case, that person was the employer of the man seeking to cash the cheque. The Jury returned a verdict for the plaintiff.

PRESENTATION.—An interesting presentation took place at Upleatham recently, the recipients being Mr. and Mrs. NICHOLAS, the former having been for the last twenty-one years head gardener to the Earl of ZETLAND, at Upleatham Hall. The chair was taken by Mr. G. FROST, Mr. Nicholas' successor, who presented Mr. Nicholas with a black marble chiming clock, bearing the inscription, "Presented to Mr. Nicholas on his leaving Upleatham, by the inhabitants, October 7, 1898," and also bronze figures; and to Mrs. Nicholas a silver-plated tea and coffee service.

METROPOLITAN OPEN SPACES.—It is worthy of note, that as this great London expands its circumference, so the number of so-called "open spaces" increases. The latest of these to be placed on the record is that at Wandsworth—a piece of ground having been secured in that district, to be transformed into what will be known as Riverside Park, near the mouth of the Wandle. A second "space" is to be found in Kipling Street, in the rear of Guy's Hospital. This is much needed, the nearest playground being 2 miles distant, in Kennington Park. Going on to Lee, in Kent, we find that a proposition has been made to take land there, and also to purchase the Manor-house, with its lake and grounds. There are very many charming features in the grounds, and this would make a grand addition to our metropolitan health-resort.

A VIEW IN MISS SULLIVAN'S GARDEN, BROOM HOUSE, FULHAM.

VARIETIES OF MELONS: THEIR DURABILITY.—

There is no kind of fruit, varieties of which are more freely raised from seeds than the Melon. During half the year at least, fruits from seedling plants are exhibited at the Drill Hall for certificates. Occasionally this honour is won, but whether or not, a number of the varieties are known for a season or two, and little is heard of them afterwards. It is worthy of remark, however, that the variety William Tillery, shown by Mr. J. W. MILLER, of Ruxley Lodge Gardens, Esher, at the Drill Hall on Tuesday last, were certificated by the Royal Horticultural Society in 1879. Mr. MILLER raised it a year or two previously when at Clumber, and has cultivated it uninterruptedly since that date. Looking at the Royal Horticultural Society's list of certificated fruits, we think that there are few Melons now in cultivation that were certificated previous to 1879, though Victory of Bath and one or two others might be named. As is well known, William Tillery is a green-fleshed Melon of considerable size, and generally less round in shape than the fruits shown on Tuesday last. But considering it has been grown for so long a time, Mr. MILLER has kept it wonderfully true.

PUBLICATIONS RECEIVED.—*Flower and Fruit Farming in England*, II., by William E. Bear (from the *Journal of the Royal Agricultural Society*, vol. ix., part iii.)—*Work* (Cassell & Co., London), October 15.—*The British Bee Journal*, September 29 and October 6.—Royal Botanic Gardens, Ceylon: *Classified List of Seeds available for Exchange*, August 20.—*Annual Administration Report of the Forest Department, Madras Presidency*, for the twelve months ending June 30, 1897. This contains chapters devoted to:—1, Extension and Constitution of State Forests; 2, Management of State Forests; 3, Gross Yield and Out-turn of Forest Produce; 4, Financial Results; and 5, Forest Administration.—*Lecture and Articles on Irrigation in India, America, Egypt, and Australia*, by Robert Wallace (Edinburgh: Oliver & Boyd, Tweeddale Court).—*The American Florist*, September 17.—*Calendrier Egyptien du Jardinier et du Cultivateur*, par G. Delchevalerie.

STONELEIGH ABBEY.

WHEN in Warwickshire in August last, we welcomed an opportunity that presented itself to visit the fine old residential seat of Lord Leigh. This estate is near to Kenilworth, and not far distant from the towns of Leamington, Coventry, and Warwick. Stoneleigh has been in the possession of the Leigh family for very many years, and its history has been traced far earlier than this even. To those who would like to become acquainted with its remote history, we may mention that the Hon. Miss Mary Leigh, in the *Pall Mall Magazine* for November, 1896, contributed a most interesting article upon the subject, which clearly showed that the historical associations of Stoneleigh are unusually rich. It appears that King Henry II. gave Stoneleigh to the Cistercian monks. It was first possessed by the Leigh family in the reign of Bluff King Hal, when it was purchased by a Sir Thos. Leigh. Miss Leigh records the story, though without vouching for its truth, that the possessor of the estate during the reign of Charles I. was a giant, who finding a man upon a donkey trespassing within the park, lifted both man and beast and threw them over the gate. Whether as a reward for his superior stature or not we cannot say, but this extraordinary man was made a baron by his monarch.

Miss Leigh's account does not appear to agree exactly with that of the historian Camden, who says that during the Saxon and Norman days, Stoneleigh or Stoneley Holme, was Royal property, and that Henry II. founded there an Abbey for the monks. But Henry VIII. routed them, and gave the estates to the Duke of Suffolk, whose family ceased to exist in the reign of Queen Elizabeth. Then Sir Thos. Leigh, one of the Lord Mayors of London, acquired them.

The present Abbey was built by Edward, Lord Leigh, in 1720, and certain parts of it I believe are open to the inspection of visitors. Lord Leigh is particularly generous in this respect, freely giving permission for anyone to wander in either of the

large parks and in the garden. The charming grounds have in times past owed much of their beauty to the "Sweet and gentle river Avon," that lazily wanders through them, and very close to the south front of the Abbey. But time has wrought a change, and the beautiful feature of those days may now be almost attributed a nuisance. Its waters have been polluted by sewage, and in other ways, and it sometimes presents a black and pestilential appearance, though efforts are made to clean that portion of it, that included in the area of the estate.

Immediately prior to my visit some kind of poison had been permitted to reach the river, presumably from Coventry, and this had killed so many of the fish that men were engaged in taking them from the surface of the water. So bad was the smell from these, that for a time his lordship deemed it prudent to remove his household to Leamington. But after all, if one does not examine the state of the water too closely, the views of the river and its banks are most gratifying. In fig. 96 is reproduced a photograph that will convey to the reader some idea of this.

The parks cover some hundreds of acres, and in one of them there is a vast herd of deer. There is abundance of timber, and the Beeches and Oaks are predominant, though there are also many fine specimens of Sweet Chestnuts, Sycamores, Planes, and Birches. The parterre flower-garden is immediately to the west front of the abbey. It is formal, and there was no mixed planting, but the beds were well designed, and had a very gay effect. Particularly good were the Calceolarias, to the virtues of which Mr. Molyneux has lately drawn attention in these columns. On three sides the flower-garden is surrounded by an old stone wall. Turning round to the left, a very different view is brought to notice on the south side. There is a Grecian garden there, with beds and scrolls of Box-edging. There are Irish Yews, and the ground, slanting steeply down to the river, rises again beyond to wooded elevations. It is this view that convinces one of the antiquity of Stoneleigh. Everything appears to have stood still for a century, and the method of gardening, at any rate in the precincts of the Abbey, are such as to accentuate the antique appearance the more permanent features possess.

The conservatory has a span-roof and glass front, the other side resting on a wall some 15 feet high. Begonia fuchsoides was here growing most vigorously, and to a considerable height, flowering profusely. Tuberous-rooted Begonias, Ivy-leaved Pelargoniums, and other plants made the structure gay.

Walking now to the east of the Abbey we meet with a good specimen of *Sequoia sempervirens*; but the most wonderful object then within view, and, indeed, one of the most remarkable features of Stoneleigh, is the Ivy-bower. Three or four persons may walk abreast in this, and the old thick Ivy stems are as interesting as the bower is uncommon.

The herbaceous garden contains a fine lot of flower-producing plants, and is valued highly. The Montbretias were making a beautiful display of flowers. There is a Rose-garden, and in the centre of this is a fountain, of curious interest, from the fact that the stones that form the confines of the basin are each carved to represent some animal. From a fishing-house near to the Rose-garden, another pretty view across the river may be obtained, which at this point is the more attractive by reason of a pretty islet. Then, turning, there is an exceeding old Beech; it has been wired and nailed, so as to keep the bark upon it, but it is quite dead, and the woodpecker has commenced his work. Apparently it has been used for years and years as a family register. The names of Lord Leigh's family for a long time past may be found cut upon it. In this wilder or less formal part of the grounds was noticed another fountain; and near to this there have been planted several plants to Crimson Rambler Rose that will make a special feature.

Before leaving the out-of-door part of Stoneleigh, remark is merited by a fine tree of the deciduous Cypress (*Taxodium distichum*) (fig. 95, p. 320). It

stands near to an archway that connects the stable-yard to the Abbey. The tree is about 70 feet high, of slender build, much branched, but it has been a little damaged by high winds. If the reader turns to the illustration, he may see this tree as it appears in summer and in winter. A very old Cork-tree (*Quercus suber*), and an Oak planted by Her Majesty the Queen, 1858, also a pair of Wellingtonias planted at same time by the Prince Consort, are among the trees of interest.

THE KITCHEN GARDENS.

The ground utilised for the cultivation of vegetables and fruits is curiously divided, and it might be correctly described as forming three gardens. There is a fine quantity of wall-space, and it is profitably utilised for the growth of most kinds of fruits, including Peaches and Nectarines. Tomatos abound everywhere where plants can be put, and a large yield of this fruit from out-of-door positions is obtained each season. The vegetable crops were capital, but I was particularly struck by the appearance of the Seakale. There are cultivated 2000 crowns of this delicious vegetable, and apparently it is a peculiar variety. Mr. Martin, who succeeded Mr. Beddard a few years since as gardener at Stoneleigh, was once foreman to Mr. Beckett, of Aldenham House Gardens, Elstree, whose success in vegetable-culture is well known. It is not surprising, then, that at Stoneleigh, in addition to the main crop of Onions, there was a crop of the varieties Ailsa Craig and Lord Keeper, the bulbs of which were of exhibition size and quality. They were grown in soil from an old Vine-border, and were planted out from each other at distances of 1 foot.

I must not forget to mention the cordon Gooseberry-trees. They are a feature of Stoneleigh. The reader will begin to think the place has many features. It has. These cordon Gooseberries are exceedingly prolific, and old-fashioned as the method may be, it is one that might be imitated to advantage.

THE GLASS STRUCTURES.

The fruits cultivated indoors comprise Grapes, Peaches, Nectarines, Melons, Figs, Tomatos, and Cucumbers. There were good crops of Grapes and Peaches, and Nectarines were ripening abundantly. The Fig-house contained the varieties White Ischia and Brown Turkey. The crop of Tomatos in one of the houses was an excellent one, and the fruits were solid, of saleable size, and best "Perfection" type.

In the greenhouse, it was gratifying to observe a nice batch of plants in flower of *Asclepias curassavica*. This interesting but rarely-seen flowering plant is grown well by Mr. Martin. The other plants were ordinary ones, such as *Francoa ramosa*, *Achimenes*, *Agapanthus*, *Begonias*, &c.

In one of the plant-houses there is grown a fine lot of *Myrsiphyllum asparagoides*. Mr. Martin said he had recently cut 50 yards of the decorative growths of this plant. *Cyperus natalensis* and *Carex marginalis* are both useful decorative plants prized at Stoneleigh. There is a small collection of serviceable Orchids, and some specimen plants of *Epiphyllum* grafted upon *Pereskia* in 10-inch pots. Altogether the plant-houses are interesting and well maintained.

THE OLD GATEHOUSE.

This ancient structure, part of which is now utilised as the gardener's residence, is on the north side of the Abbey, and well within view. This gateway is said to have been built by Robert de Hockele, who died in 1349. Over the gateway is a large stone escutcheon bearing the arms of Henry II., placed there by Robert in memory of the founder of Stoneleigh Abbey. The building was originally used as a chapel, and the small arched confessional is in a good state of preservation. It is just one of the many features of Stoneleigh that impress the visitors with a sense of the antiquity and historical interest of the estate. A capital illustration of the gatehouse, and one representing part of the garden, with the fountain, was given in a supplement to the *Gardeners' Chronicle*, Sept. 20, 1890.

Lord Leigh recently celebrated his golden wedding. He is deservedly popular, and it is hoped he may yet live long to enjoy the place in which he has already spent so many years. R. H. P.

CONTINENTAL NOVELTIES.

MR. ERNST BENARY, of Erfurt, among many other novelties, offers the following:—

Candytuft, Little Prince (*Iberis coronaria princeps*).—A new dwarf variety from the beautiful Empress Candytuft. Though only half the height of the parent, say 4 to 6 inches, it forms massive spikes of large pure white flowers, which stand erect from the Wallflower-like foliage, and are grouped candelabra-wise round the main stem.

Aster Dwarf Mignon (Crimson-white).—Just as the leading classes of Asters, such as the Victoria, Chrysanthemum, and Pæony-flowered, have in the past given rise to dwarf-growing sections, so now the beautiful and extremely popular Mignon class has also produced a form with a low habit of growth. About 10 inches high, the plant branches just above the soil, and the elegant stalks bear a profusion of the same lovely and refined semi-globular flowers which are so highly prized in the tall Mignon Aster.

Dianthus Heddewigii, Queen of Holland.—A dwarf variety with white flowers.

Lobelia cardinalis atro-sanguinea, with deep blood-red flowers.

LAW NOTES.

STREDWICK v. THE NATIONAL CHRYSANTHEMUM SOCIETY.

THE plaintiff sought, at the County Court of Hastings, on the 24th inst., to obtain from the Society certain sums awarded to him as prize-money at the November show, and withheld by the Arbitration Committee on the ground that though plaintiff exhibited as an amateur, he was not entitled to do so, as he was a dealer in plants, and issued a printed priced catalogue. The Judge upheld this decision, and non-suited the plaintiff.

HOME CORRESPONDENCE.

RED NECTARINE-PEACH.—We have grown trees of this Peach for many years under glass, and also on a south wall, and they have invariably produced good crops of excellent fruits. In general characteristics it resembles Bellegarde more than any other Peach I know of, though it is quite distinct therefrom. I have not hitherto tried it for very early forcing, but I am about to put into our early Peach-house a good-sized tree growing on a south wall. When looking through the gardens at Nutfield Priory, Redhill, Surrey, in the early part of last summer, I noticed a splendid tree of this Peach in a second-early house; it was certainly one of the best trained Peach-trees I ever saw. The whole surface of the semi-circular trellis in a house, about 40 feet long by 16 feet wide, was covered with fruit-bearing wood. The fruits were regularly dispersed all over the tree, and promised to be fine in size and colour. Mr. Moffat, the gardener at Nutfield, told me that it had never failed to produce good crops of fine fruit from being first planted. *H. J. C., Grimston Park, Tadcaster.*

SOME UNCOMMON NERINES.—In the autumn of 1893 I purchased from a leading firm at Haarlem single bulbs of four varieties of uncommon if not new varieties, of the beautiful, autumnal-blooming family of Nerine, known to the unlearned as Guernsey Lilies. These were named respectively, Nerine Novelty, *N. coruscans pallida*, *N. sarniensis insignis*, and *N. sarniensis carnea*. Some account of their development during the five years I have grown them may, I hope, be of some interest to those of your readers who grow and admire these most brilliant-flowered of autumn-flowering bulbous plants. The first to bloom of the above-named four varieties was Novelty, which is now flowering for the third time with me, and has increased so rapidly that the single bulb has developed into a good potful of more than a dozen bulbs, which are now producing a dozen fine spikes just coming into flower in my cool greenhouse. The heads of bloom are comparatively small, bearing from six to eight flowers, each of a pleasing shade of light rose colour. This is by far the freest blooming variety known to me, and should be in

every collection. *N. coruscans pallida* bloomed for the first time last year, producing a single spike, and is now again in flower with two spikes, and is considerably better and brighter than it was last year. The heads are large, bearing fourteen flowers, which are of a brilliant shade of orange-scarlet. It is a most beautiful variety, but is, I think, somewhat inaptly named *pallida*, as it has nothing whatever pale about it, though it may be paler in shade than its type form, which I have not in flower to compare with it. *N. sarniensis insignis* is blooming now for the first time with me, and has one good spike, bearing eight large flowers of a most beautiful shade of deep rose colour, with a clear white centre. This is most correctly named, as it is a marked improvement in every way on the type form, the best known of all as the common Guernsey Lily. The fourth variety, *N. sarniensis carnea*, has not yet bloomed with me, and I fear I shall have to wait another year before I can see what the bloom may be. Another fine hybrid form, and the latest of all to bloom is *N. Manselli*; it is only now showing its flower-spikes, but when in full bloom it is very handsome, and also free-blooming, as my potful of bulbs is now showing seven flower-spikes, which will not expand for another fortnight. *W. E. Gumbleton.*

CROCOSMIA IMPERIALIS.—Mr. Wolley Dod's experience with this plant in wet peat is of much interest (see p. 307), but I would like to know if he finds this species hardy under the conditions he affords it. It is, as I know, a splendid thing when grown in a pot in the greenhouse. It has hitherto been too scarce with me to try it outside. A fine batch of seedlings which I have raised this year look likely to flower next year, but it is, as yet, too good a plant for me to risk any of them out of doors just yet. *W. H. Divers.*

GAURA LINDHEIMERI.—Allow me to recommend this to all gardeners who do not already grow it. It is of the Willow-herb tribe, with large pure white flowers, and slender spreading branches. A native of Texas, it cannot stand the stormy cold of winter at Edge, but is treated here as an annual from cuttings, which strike readily in September and October, and may be kept through winter, several in a pot. Planted out in April, it begins to flower in July, and continues to grow and flower till stopped by hard frost in November. At this date (Oct. 24) plants of it are 5 feet high and as much across, and are covered with flowers and buds. It is not exacting as to soil or situation, and only wants room to spread. As an annual from seed, it begins to flower later, but does well so treated. *C. Wolley Dod, Edge Hall, Malpas.*

CACTUS DAHLIAS.—I am reminded by the interesting and seasonable notes on Cactus Dahlias, in your issue of the 22nd inst., of the claims some of the good bedding varieties have on our notice. I am aware the present season has been favourable for the production of good flowers in quantity, and I do not know a plant requiring less attention, or costing less care to keep the roots through the winter months. One variety especially which we have grown here for several years—a bright, rich scarlet, named Rising Sun, very dwarf, and sturdy in habit, and a profuse flowerer—has given great satisfaction, and this season was planted in a long scroll-bed on a sloping bank of turf near the mansion, the bed being edged with *Centaurea candidissima*. The bed contains about 220 plants, standing at about 18 inches apart, and the bed was prepared in the usual way as for Pelargoniums. The position is much exposed; the plants have not had a stake placed near them. They were planted in the first week in June, and since the end of the following month it has been a splendid bed, the admiration of everyone who has seen it; and at this date (October 24), after a week of stormy weather, it is still bright and good. I would ask what other flowering plant would give such a result under such conditions as have prevailed? We require more of these very dwarf-growing varieties. I obtained it from Messrs. Wm. Clibran & Son, Oldfield Nurseries, Altrincham, some years ago. *Bailey Waddes.*

CHRYSANTHEMUMS WITH AERIAL ROOTS.—A remarkable occurrence of Chrysanthemums forming aerial roots has recently come under my notice. On visiting Mr. Shoemith's nursery at Woking, he pointed out a plant of the variety "Modesto" which had emitted roots all up the main stem, which was 5 feet high. They were about a quarter of an inch in length, and produced in such profusion as to be most noticeable. I have frequently seen roots above the surface for some distance, but never to the

extent as in this case. It would be interesting to know the cause of this phenomena, but it is probably due to the warm, moist atmosphere of the house in which the plants are growing. *E. S., Woking.*

A FLOWER-WALL.—The engraving of a flower-decorated wall at Glendavagh, Teignmouth (p. 289), reminds me how Mr. Burbridge has utilised a wall for the growth of alpine in the Trinity College Garden, Dublin. Some years since it was necessary to put up a low wall to hide some corners utilised for garden-refuse. To make this ornamental, and perhaps create a little novelty, Mr. Burbridge so arranged the crest of the wall that numerous hardy plants quickly found a home, and flourished there. The best patch of Edelweiss I have seen was there growing; also numerous Saxifrages and Aubrietias, so far as my memory serves. *E. M.*

THE CHRYSANTHEMUM RUST.—The Conference recently held by the N.C.S. will undoubtedly lead to much good, and I should like to have taken part in the discussion, but was afraid I could hardly squeeze my say into the five minutes wisely limited to each speaker. I was particularly struck with the large attendance of growers, especially as it is only a few who admit that they are troubled with the rust. The various writers in the gardening journals inform us that they hear that the rust is rather prevalent. "Oh, dear no! they have not noticed it in their collection." Still, it was surprising to note what a large number at the meeting seemed to be deeply interested in the matter. During the past few weeks I have seen many collections, and in no instance have I failed to find the disease. Its course seems peculiar and erratic. One collection of about 300 plants was last year quite free from the rust, although the stock they were procured from was infected. This season new blood was introduced in the way of fresh varieties, and these are now clean, although obtained from a stock which was badly attacked last season; but, strange to say, a few of those which were clean last year have recently become infested with the fungus. In many instances the varieties which were badly attacked last year are almost clean this; whilst those that suffered but little then, are severely attacked this season. It was rather to be regretted that trade rivalry sprang up at the discussion. One member honestly stated that his collection was affected, and further said all trade collections were more or less contaminated, which was nothing but the truth in spite of the fact that some alleged that their stock was clean. During the season plants were sent out by all the more important trade growers which were affected by the fungus, at least, I received them as such; and further, I supplied hundreds of plants and cuttings which were more or less diseased to the members of the trade who attended the meeting; and when one trade grower alleges that the only varieties which he has diseased came from another grower, he is treating the latter unfairly, for if the disease is only in these plants it simply proves that it makes but little difference whether the plants are procured from an infected stock or otherwise, for this grower obtained plants from various other growers where stocks were "rusty." All the principal trade growers obtain large quantities of stock from each other every season. Mr. Wells says he can destroy the spores; many will incline to the opinion of Mr. Massee, that he cannot except by destroying the foliage. It is possible to treat the powdery matter so that it falls off, and also to prevent its spreading by rendering the foliage impregnable to contamination. As to the disease dying-out, I am afraid we cannot look forward with much hope to this. We have the Hollyhock and Potato diseases with us more or less every season, and so it will be with the fungus on Chrysanthemums. As to preventives, there does not seem to be any difficulty in getting the stock clean during the summer, for stocks badly affected during the previous autumn and winter got apparently quite clean during the growing season, but towards the autumn when the foliage is losing its vigour the brown spots appear and affect the whole plant. When once the disease has a good footing, all attempts to stay its spread seem to be useless, and the only chance of keeping it at bay is to commence with the syringing of the stools with some of the various remedies prescribed, and also dipping the cuttings before insertion, and the plants at every potting. Instead of syringing with clear or soot-water every day, use a fungus-destroyer once or twice a week. Every few days make a diligent search for the disease, and should it appear burn every bit of infected foliage, taking great care to gather it carefully, and putting it into a covered box in taking it

to the fire, so that no spores can float in the air. As to remedies, Mr. Wells gave one which he has proved to be good. The Bordeaux Mixture of sulphate-of-copper and quicklime is simple and effective, but care must be taken to use the purest sulphate-of-copper. The rust in Carnations is very similar to the one affecting Chrysanthemums, and it is giving much trouble to American growers, but the most effective remedy yet propounded is a decoction of arsenic. An ounce of this dissolved in a little alcohol, and mixed with 100 gallons of water, is the recipe, but it requires great care in using. That it is very efficacious I have proved. *W. J. Godfrey, Exmouth.*

Obituary.

GOTTLIEB GOESCHKE.—This celebrated raiser of new varieties of Strawberries died at Köthen, on October 10, in his eightieth year. Goeschke was one of the first gardeners to flower the *Victoria regia* in Europe, which he was enabled to do with the simplest means in 1853. The following varieties of Strawberries were raised by him in his nursery at Köthen, viz., *Deutsche Kron Prinzessin*, with erect-growing fruit; *Graf Moltke*, with amber-coloured fruit; the very hardy *Professor Liebig* (1879); *Koenig Albert von Sachsen*, the best of his raising, a great and regular cropper, and an unusually large fruit; *Zulu Koenig*, with reddish, dark-brown fruit; *Komet*, a variety of the Chilian Strawberry, obtained by him from Kriegsminister von Roon, an earlier-raised variety; the juicy *Teutonia*; *Garten-Inspektor Hooff*, an early, piquant-flavoured fruit (1884); *Schwarzer Prinz*, a dark-red fruit; *Weisse Dame*, with fruit of the purest white externally, and rosy-tinted pulp, of Pine-apple flavour; *Die Schoene Wienerin*, with long, honey-sweet, and very fragrant fruit; *Kaiser Nikolaus von Russland*, with fruit of a Raspberry flavour, which the raiser preferred to the variety *Koenig Albert von Sachsen*. Goeschke had, during the last twenty-five years, raised about forty varieties of Strawberries, in which his chief endeavours had been directed to increased productiveness, the size of the fruit, and, above all, the development of good flavour. It was exactly in these particulars that his services to horticulture were the greatest, in view of the number of productive but flavourless varieties raised, which were fast driving the older, better-flavoured ones out of the garden. *Extract from Moller's Gaertner Zeitung.*

SOCIETIES.

ROYAL HORTICULTURAL. Scientific Committee.

OCTOBER 11.—*Present:* Dr. M. T. MASTERS (in the chair); Dr. H. Müller, Rev. W. Wilks, and Rev. Prof. G. Henslow, Hon. Sec.

Pear Leaves Diseased.—With reference to some leaves sent since the last meeting, Prof. William G. Smith (Leeds) reports as follows:—"The Pear leaves with rusty spots are attacked by a *Roestelia*, one of the group of *Uredineæ*. This fungus is one which completes its life-history on two host-plants. The leaves submitted are those of one host—the Pear. They bear two distinct kinds of rusty spots or areas—viz., smooth areas in which the leaf-tissue is almost normal, and swollen areas with the leaf-tissue is abnormally increased and full of starch. The smooth spots are studded on the upper surface with black points, the 'pycnidia' or 'spermatia'; as a rule, these were covered with a hardened film of what had been sticky masses of ejected conidia, generally blackened with smut or bearing saprophytic fungi. The swollen pustular areas also bore spermatia on the upper surface, and also partially developed aecidium cups embedded in the abnormally increased tissues of the lower half of the leaf. The imperfect development of these aecidia prevents me identifying the species of *Roestelia* exactly; it is probably *R. cancellata*. This fungus may also attack the fruit. The second host of this 'rust' is the *Savin* (*Juniperus Sabina*), and it would be useful to know if this or an allied *Juniperus* occurs in this garden, also if they were perfectly healthy. The rust is a common source of trouble, especially a form which occurs on Apple-trees. This latter is very injurious in the United States. American authorities advise removal of the second host, the *Juniper*, also the destruction of badly-diseased trees or branches. After these precautions are carried out, Bordeaux Mixture is said to give good results. It is used in two or three sprayings at intervals of eight to ten days, the first given as soon as the young foliage appears. It is also strongly urged to use varieties of Apples or Pears suited to resist the rust. These, of course, vary for different soils, and must

found out after making the necessary experiments in the localit where wanted."

Apple Diseased.—This was received from Mr. A. H. Pearson, Chilwell, Notts. Professor William G. Smith reports as follows:—

"The Apple sent me shows a 'fruit-rot.' The primary cause is a fungus (mycelium) present in all the discoloured areas, but I should like to see other specimens before saying definitely what is the species. Several fungi have the same action in discolouring and softening the fruit; most of them also cause it to crack. When the flesh is exposed, then the white and blue moulds present on the specimen make their appearance. They are common mould-fungi (*Penicillium glaucum* and a *Mucor*, probably *M. piriformis*), and are not the cause of trouble—at least, they have not yet been proved so by anyone. The primary fungus is the one which has to be dealt with by remedies. The best preventive is probably Bordeaux Mixture. It has been used in the United States, and results obtained appear satisfactory. The Mixture is applied as a fine spray; the first application when the young foliage appears, the second after the fruit has set, the third two weeks later, and perhaps a fourth somewhat later. In this case, where the Apples are grown under glass, much might be done to hinder the progress of the fungus by free ventilation and dry air. The Apple sent seems to be a fine-skinned sort, hence it is all the more susceptible to fungus attack."

Apple with "Glassiness."—The Apples received from Mr. J. Vert, gardener at Audley End, have a peculiar translucent appearance. This is due to water having penetrated the intercellular spaces instead of air. No fungus is present, but the cause of the transudation of water is not known. This glassiness is said to be highly esteemed in Italy.

Dahlias Crossed by Sunflower.—Mr. E. J. Lowe forwarded blossoms having a true *Dahlia* appearance, which he believes to be raised from seeds of a parent the issue of the above cross. Nothing, however, excepting a rather large disc appeared to indicate a cross. The relationship between a *Dahlia* and a *Helianthus* being relatively remote, any *à priori* probability of such a cross being effected is but slight. In experimenting it would be extremely difficult to prevent self-fertilisation, unless it be proved that the pollen is self-impotent in *Dahlias*.

Potato Decayed.—Samples were received from Mr. Veitch having peculiar outgrowths, and being much decayed within, probably from the attacks of *Peronospora*. They were forwarded to Professor William G. Smith for further investigation. Mr. Veitch described the presence of the disease as follows:—"It was first detected early in August, before we had much hot weather, and this is the only garden in the neighbourhood so affected."

Cure for the Lily Disease.—Mr. Horace Byatt, of the Grammar School, Midhurst, Sussex, writes to say that he has found flowers-of-sulphur to be an excellent remedy for this troublesome fungus. "In the autumn of 1896 I removed the sets of bulbs from the ground, and when they were somewhat dry I put them, a few at a time, into a large brown-paper bag, in which was a supply of flowers-of-sulphur. They were then well shaken until the powder got thoroughly into the crevices, after which they were planted. Last season they showed a marked improvement in the blossom-heads, which were weakly, though almost free from disease, and now I have the pleasure of seeing them perfectly healthy, with fine green stems and leaves, promising good blossoms, while the rest of the groups have not a single blossom."

Colours of Flowers and Drought.—Rev. W. Wilks made the following observations on the coloration of flowers of the present season. Similar changes were recorded in *Nature* last year by Mr. Hughes-Gibbs, of Tarrant Gunville, Dorset:—"All through the exceptionally hot weather of the end of July and August all scarlet flowers had a tinge of dull-brown in them, pink had a shade of orange, yellow was very yellow, white was creamy. This was very marked—e.g., in *Dahlias*. Thus, *Fire King* and *Sunset*, two ordinarily bright, clear, scarlet flowers, had a distinct dull-brown tint overlying and spoiling utterly the usual scarlet, so much so that, having been away from home the first three weeks of the heat, I thought on my return that the *Dahlias* must have somehow got wrongly named. But now the weather is cooler the bright scarlet has come back, and the dull brown tint has gone, and all is as usual. The only colour the heat seemed (to me) to suit was the salmons, and they have been very fine and intense, having a sort of glow added to them."

West Indian Junipers.—Dr. Masters showed specimens of a *Juniper*, native to Jamaica, which he had received through the kindness of Mr. W. Fawcett, the Government botanist of the island. This species had been referred to the *J. bermudiana* of Linnaeus, with which *J. barbadensis* of the same author is taken to be synonymous. On comparison the Jamaica *Juniper* is seen to agree very closely with *J. virginiana*, the so-called Red Cedar of the mainland of North America from Canada to Florida. This species furnishes the best "cedar" wood for pencils, and many beautiful forms of it are cultivated in English gardens. The resemblance of the Jamaica plant to the American is so close that Dr. Masters does not hesitate to include them both under the same name of *J. virginiana*. Dr. Masters also showed specimens and wood of the true Bermuda *Juniper*, received from A. Haycock, Esq. The history of this plant, which differs greatly from the preceding, was cleared up by Mr. W. B. Hemsley, in the *Gardeners' Chronicle*, May 26, 1883, p. 657.

Tomatos with Bulbiferous Stems.—Mr. Wilks exhibited specimens of Tomato plants, grown against a wall, which bore small bulb-like protuberances from the insertion

of leaves. From each proceeded a small leafy shoot. An anatomical examination showed that they were formed by an excessive growth of cortex and medulla, the fibro-vascular cylinder being somewhat enlarged as well. It was suggested that experiments should be made of growing the shoots from the bulb-like processes, to see if they would give rise to a perennial form.

OCTOBER 25.—The usual fortnightly meeting of the committees of this society met at the Drill Hall, James Street, Westminster, on Tuesday last. The hall was well filled with exhibits, including many interesting ones. Successful cultivation was well illustrated in the group of foliage plants from Sir HENRY TATE. Chrysanthemums were considerably in evidence, and there were many blooms staged, but better quality will probably be forthcoming. The remarkable absence of frost permitted the *Dahlia* cultivators to make several fine exhibits, which we should suppose will be the last this season. Miscellaneous exhibits before the Floral Committee were numerous, and a few new plants were presented to its scrutiny. The Fruit and Vegetable Committee were called upon to inspect very few novelties, and no awards were made, other than medals, by this body. There were several large collections of Apples and Pears, however, and by far the best of these was one from an amateur, viz., ROGER LEIGH, Esq., Barham Court, Maidstone (gr., Mr. Geo. Woodward). Mr. BECKETT, Aldenham House Gardens, Elstree, contributed some extraordinarily fine samples of Celery. In the afternoon, a lecture was delivered by Mr. GEO. GORDON, V.M.H., upon "Experimental Horticulture," in which he advocated the further development of trial-grounds worked on scientific principles.

AWARDS TO NOVELTIES.

The Floral Committee recommended First-class Certificates to *Dracenas Victoria*, and *Ptychosperma Sanderi*, and Awards of Merit to *Tea Rose Sunrise*, and *Chrysanthemums May Matthews*, Etty Mitchell, Nellie Brown, Baron de Veillard. *Soleil d'Octobre* and *Golden Queen of the Earlies*. A Botanical Certificate was awarded to *Ceropegia Woodi*.

The Orchid Committee recommended a First-class Certificate to *Cattleya Maroni*, and Awards of Merit to *Laelia Perrini leucophæa* and *Laelia pumila Colemanii*.

Floral Committee.

Present:—W. Marshall, Esq., Chairman; and Messrs. Jno. Fraser, Owen Thomas, H. B. May, R. Dean, George Stevens, W. Howe, Jas. Hudson, R. B. Lowe, Jas. Walker, J. D. Pawle, Herbert J. Cutbush, H. J. Jones, E. T. Cook, Geo. Paul, and C. T. Druery.

From Messrs. J. CHEAL & SONS, Lowfield Nurseries, Crawley, were sent sprays of some choice ornamental trees and shrubs, &c. Among these was *Rhus typhina*, the pinnate leaves of which were very richly coloured; *Prunus Pissardi*, *Acer virginicum fulgens*, a very deeply-coloured *Acer* of great decorative value. *Euonymus europæus* carrying numerous fruits, *Cornus sibirica*, the new but well known *Physalis Franchetti* and *P. Alkekengi*, *Azalea pontica*, several *Ligustrums*, *Eulalia zebrina*, and others, every one of which is valuable for the ornamentation of the pleasure grounds during late summer and autumn.

From H. J. ELWES, Esq., Colesbourne (gr., Mr. Lane), were shown several of his new hybrid *Nerines*; *Lady Carrington* (salmon-coloured), and *Miss Shelly* (pink) were very pretty.

There was a group of magnificent foliage plants shown by Mr. W. Howe, gr. to Sir H. TATE, Park Hill, Streatham Common, London, S.W. These were mostly stove species, though there were included several Bamboos. There were excellent specimen plants of *Codiaeums*, *Cordylines*, *Ferns*, *Asparagus* species, and other decorative plants. A nice plant of the rare *Platynerium Willincki* was included. The group which covered a large area upon the floor was remarkable for the well-cultivated plants of which it was composed, and well merited the Silver-gilt Banksian Medal awarded to it.

Messrs. J. HILL & SONS, Lower Edmonton, contributed an exhibit of Ferns in pots. Among these were noticed very fine specimens of *Pteris tremula Smithiana*, *Davallia Mooreana*, and other species; *Nephrolepis rufescens triplinatifida*, and several *Gymnogrammas* (Silver-gilt Banksian Medal).

Messrs. F. SANDER & Co., St. Albans, exhibited a plant of *Ptychosperma Sanderiana*, a graceful, unarmed Palm with pinnate leaves (First-class Certificate). Its light and graceful habit will render it suitable for table ornamentation.

Mr. WILLIAM BULL, 536, King's Road, Chelsea, London, exhibited three nice plants of *Ficus radicans variegata*; also half-a-dozen plants of *Maranta picta*, and a plant of *Dracena Victoria*, a broad-leaved variety of the type of *D. Lindenii*. The leaves are about three inches wide, and have wavy outlines, being beautifully variegated with yellow, especially in the older leaves (First-class Certificate). A Botanical Certificate was recommended to *Ceropegia Woodi* from the same establishment; it has small fleshy leaves mottled green and white, with numerous bulbils on the stem, and highly curious though inconspicuous flowers. Figured in the *Gardeners' Chronicle*, November 26, 1897, p. 358.

Mr. BULL had also a variegated *Mimosa* named *M. argentea*, the base of the leaflets are silver-coloured on the upper

surface, consequently this colour lines the mid-rib of the compound leaf.

Mr. G. W. PIPER, Uckfield, exhibited blooms and shoots of a new Tea Rose named Sunrise, and an Award of Merit was recommended. It has very pretty little buds, and in point of colour is exceedingly attractive. Some of the outer petals are cerise-coloured, but the blooms have shades of copper and bronze.

Mr. R. GULZOW, of Melbourne Nurseries, Bexley Heath, exhibited a large specimen plant of Anthurium crystallinum "Illustra," smaller plants of which were described on p. 293. This plant, exhibited in a wooden and glass frame, was exceedingly handsome. Plants of A. c. foliis variegatis were shown for comparison. The committee has not yet made up its mind whether the plant is distinct or not.

Blooms of single and double flowered tuberous Begonias were shown from the open field by Mr. JNO. R. BOX, West Wickham and Croydon. They were to represent the strain merely, and were very satisfactory.

Mr. H. B. MAY, of Dyson's Lane Nursery, Upper Edmonton, exhibited a miscellaneous group of plants, consisting of thirty Begonia Gloire de Lorraine, neat examples, in 48's, about 18 inches in height, by 15 in diameter, beautifully flowered and grown. These were arranged in three pyramidal groups. Around these were placed Bouvardias in variety, many small examples of choice Ferns, including Davallia fijiensis gracillima, a neat dwarf-habited species; Asplenium Mayi, several Nephrolepis, Adiantum Farleyense, A. fragrans, a charming Fern; Davallia hirsuta, Phrynium variegatum, several Codiaums, Carnation Mrs. Leopold de Rothschild, several Ericas, examples of the white Chrysanthemum, Mutual Friend; Ericas in season, and a generally varied collection of decorative plants. A Silver Flora Medal was awarded.

Messrs. JOHN WATERER & SONS, Ltd., Nurseries, Bagshot, Surrey, exhibited a group on the floor of exceedingly healthy-looking Conifers, just as they had been taken from the open ground, and the root-masses secured in matting; also a few examples of Osmanthus, including the variegated form of illicifolius—a pleasing exhibit of shapely, well-selected plants. We remarked a number of varieties of the useful Cupressus Lawsoniana, including a fine C. L. lutea, of fine tint; there were also Retinospora squarrosa, R. albo epica, R. obtusa stricta; the golden variegated Juniperus chinensis, in capital colour; Abies concolor, Cedrus Deodara albospecta; specimens of the handsome silver and golden Irish Yew; Juniperus japonica aureo-variegata, Thuja borealis argentea variegata, &c. A Silver-gilt Flora Medal was awarded.

Messrs. W. CUTBUSH & SON, Nurseries, Highgate, N., showed a miscellaneous group, consisting of Begonia Gloire de Lorraine, Skimmia oblata, Erica persoluta, the seldom seen E. verticillata major, with bright crimson flowers—a useful plant at this season; Pernettya macronata in variety, in a well-berried state; Nerine Fothergilli, and about a score of plants of Skimmia japonica, &c.

A. KINGSMILL, Esq., Harrow Weald, showed a number of well-berried shoots of Vitis heterophylla. This fruit is produced in slender bunches, and the colour, when ripe, as shown, being cerulean-blue; it is a particularly effective plant in a greenhouse. The leaf is trifid, and measures 3 inches in breadth.

CHRYSANTHEMUMS.

Many of the exhibitors had blooms or plants of Chrysanthemums, and numerous novelties were noticed. Mr. W. WELLS, of the Fariswood Nurseries, Redhill, Surrey, had a fine display of plants and blooms. The early-flowering varieties were well represented, masses of bloom being shown of the varieties Mychett White, Mychett Beauty, a good yellow flowering companion to the first-named; and Market White, a new one of great similarity, but a little different in petal to Mychett White. Market White has stronger stems, and is said to flower later, besides being a much better "doer." Jules Mary, a crimson September or October flowering French variety; Crimson Pride, Nelly Brown, a brownish-bronze sport from Ryecroft Glory (Award of Merit), and others were noticed. Of new Japanese varieties there were also several, including Mrs. White Popham, a large flower the exact colour of which is yet hardly determinable; President Noman, a smooth petalled reddish-buff variety; and President Bevan, with good petals slightly recurving at tips, &c. (Silver Flora Medal).

A fine lot of blooms, chiefly representative of novelties, was shown by Mr. H. J. JONES, Ryecroft Nurseries, Hither Green, Lewisham. Some of the best were Lionel Humphrey, a promising yellow ground Japanese, more or less marked with reddish-brown; Soleil d'Octobre, a very fine yellow Japanese, that will make a charming variety for October blooming (Award of Merit); General Paquie, Rayonante, a Japanese bloom with much quilled petals, very pale purple; Golden Queen of the Earlies, a rich yellow globular Japanese bloom with slightly curving petals (Award of Merit); Miss Nellie Pockett, Melusine, a white Japanese with rose-lilac markings, &c.

Soleil d'Octobre was also shown from Gunnersbury House Garden, Acton, by Mr. JAS. HUDSON, who had capital blooms (Award of Merit).

Messrs. H. CANNELL & SONS, Swanley, Kent, contributed a number of Chrysanthemum blooms, shown upon long stems, and interspersed with inflorescence of Polygonum polystachyum, sometimes called molle. The flowers of this Polygonum that have been shown from Swanley on several recent occasions have attracted much attention. We believe the plants have been planted in rich soil and grown liberally, thus the inflorescences are very fine. It is worth planting to afford blooms in October. Of Chrysanthemums, Messrs. Cannell had

good blooms and plants of Nellie Brown, the coloured sport from Ryecroft Glory, Lady Byron, Mme. Deblanc, a new white Japanese of some promise, Lady Ridgway, Mrs. White Popham, Kathleen Rogers, a seedling Japanese white, with long drooping petals, very promising, &c.

Mr. W. SPINK, Walthamstow, showed plants of some of the novelties, including Mons. Fatogen, a buff Japanese, President Bevan, Marie Calvert, &c.

Messrs. R. & S. COTTEBERT, Southgate, had plants of a good pink flowered decorative variety, known as Mrs. Wingfield.

Messrs. T. S. WARE, Limited, showed in company with a fine exhibit of Dahlias, a collection of early-flowering Chrysanthemum blooms.

Mr. W. J. GODFREY, Exmouth Nurseries, Devon, had a considerable number of Chrysanthemum blooms. He had Baronne de Veillard, a promising incurved flower, crimson with bronze reverse (Award of Merit); also Ettie Mitchell, a golden and reddish-bronze coloured decorative variety (Award of Merit), Mgr. Mathew, a good lilac-coloured incurved (Award of Merit). Amongst others were fine blooms of Le Grand Dragon, Autumn Glory, very pale purple, Japanese, &c. There were 23 Japanese and five incurved varieties in this exhibit.

Mr. ROBT. OWEN, Maidenhead, showed a collection of blooms, including Baronne de Veillard (incurved), Award of Merit. Thos. Singleton, a white incurved of some promise, and others, there being altogether about sixty blooms. There were two plants also of a golden yellow-flowered Japanese named Mrs. Winkeley Smith; the habit of plant and character of bloom recommend the variety.

Mr. W. L. Farmer, gardener to H. P. LESCHELLES, Esq., Windlesham, Surrey, showed a white sport from Reine d'Angleterre, and named Miss Mary Leschelles.

There were also several varieties from Mr. W. SEWARD, Hanwell, including Elthorne Favourite, a Japanese incurved purple with silvery reverse.

Another exhibit of Chrysanthemums embracing 24 Japanese varieties and 12 incurveds, came from Mr. J. Prewett, gardener to C. A. PEARSON, Esq., Farnham.

DAHLIAS.

The presence in large numbers of show, Pompon, and Cactus Dahlias, so late in the season as October 25, is certainly an unusual circumstance. The most finished collection of the pair staged came from Mr. S. MORTIMER, Farnham, and received the award of a Silver Flora Medal. It included no fewer than 120 show and fancy flowers, of excellent form and substance, and prominent amongst them, of the eighty varieties, were Miss Cannell, W. H. Williams, Shirley Hibberd, Mrs. Stephen Walker, Perfection, Shotesham Hero and Rosamond. But the Cactus varieties, of which thirty bunches, in twenty-two varieties, were staged, were even more remarkable, as many of the flowers were singularly good, very so were Starfish, Daffodil, Capstan, Mary Service, Britannia, A. J. Deal, Alfred Vasey, Charles Woodbridge, and Harry Stredwick; whilst Fusilier, Arachne, Mrs. Kingsley Foster, Lady Penzance, Bridesmaid, Harmony, and Mrs. Gordon Sloane, were excellent.

The other collection came from T. S. WARE & Co., Ltd., of Tottenham, who had quite a huge bank of flowers, and probably 100 bunches of Cactus varieties, as well as numerous small ones, Pompons and singles. If a little weakly arranged, they made a brave show, giving bright colouring. Of singles, very charming in diverse hues were Miss Ramsbottom, White Queen, Nance, Etherman, Eclipse, Mikado, Mauve Queen, &c. Of Cactus forms, Robert Cannell, Earl of Pembroke, Charles Woodbridge, Ernest Glassey, Leonora, Lady Penzance, Alanta, Mrs. F. Tell, Cycle, Matchless, Sylvia, Starfish, Harmony, and numerous others; and of Pompons, were capital blooms of Mary Kirke, Admiration, Charles Lockwood, Miss Elsie, Cranston Beauty, Salamander, and others. To this collection a Silver Banksian Medal was awarded.

It is not at all unfair or partial to aver that Cactus Dahlias stand ahead of all other outdoor or garden flowers at this season for quaintness and interest, as at exhibitions they are the most interesting and attractive.

Orchid Committee.

Present: Harry J. Veitch, Esq., in the chair; and Messrs. JAS. O'Brien (Hon. Sec.), De B. Crawshaw, F. Sander, H. Williams, J. T. Gabriel, H. J. Chapman, W. H. Young, E. Hill, W. Thompson, Ch. Winn, S. Courtald, H. M. Pollett, J. Douglas, T. W. Bond, and T. B. Haywood.

Messrs. JAS. VEITCH & SONS, Royal Exotic Nursery, King's Road, Chelsea, were awarded a Silver Flora Medal for a very effective group, in which their hybrid Cattleyas and Laelio-Cattleyas well demonstrated their usefulness during the dull season. Among them were Laelio-Cattleya × callistoglossa var. ignescens, one of the brightest and handsomest flowers of the year; Cattleya × Wendlandiana (Bowringiana ♀, Warscewiczii ♂), and its companion, Cattleya × epicasta (Bowringiana ♀, aurea ♂), the one singularly like C. Bowringiana in growth, the other like a small C. aurea. Of the species and varieties there were some good forms of Cattleya labiata, C. aurea, and other Cattleyas; a plant of the graceful white Cologynne Veitchii; a nice pan of the pretty rose coloured Stenoglottis longifolia; a good example of the very dark-centred Miltonia vexillaria Leopoldi; the singular Catasetum fimbriatum, Odontoglossum Pescatorei, with an immense branched spike; pans of Cypripedium Charlesworthii; C. purpuratum and other Cypripediums, Oncidium Forbesii, Brassia Lawrenceana longissima, Gomeza recurva, &c. Other good things in the group were

Masdevallia × Asmodia (Reichenbachia × Chelsoni), M. × Imogen (Schlimf × Veitchiana), Cypripedium × Milo, C. insigne Sanderæ, the true plant; C. × enanthum superbum and C. × Harrisianum superbum, both old kinds, but worthy to rank with the best; and C. × Arthurianum pulchellum.

Sir FREDERICK WIGAN, Bart., Clare Lawn, East Sheen (gr., Mr. W. H. Young), was awarded a Silver Banksian Medal for a pretty group of well-grown Orchids, comprising the rare Laelia Perrini leucophæa, a white variety, with lavender-coloured tinge, and with the front lobe of the lip of a peculiar slaty-blue (Award of Merit); Cypserorchis elegans, with eight of its dense nodding racemes of cream-coloured flowers; the pretty C. × Winnianus, the pale pink Spathoglottis Veillardii; Laelio-Cattleya × The Hon. Mrs. Astor, a very pretty yellow-tinted hybrid; a fine plant of Cattleya labiata alba, with a three-flowered inflorescence; a singular form of C. eldorado, with flowers somewhat larger than ordinary, and pseudo-bulbs and leaves more like those of a small C. aurea, i.e., with compressed sides, and showing two edges; Cypripedium × Maynardi superbum, C. Godefroyæ leucocylum, C. × Arthurianum, and some good forms of Laelia pumila.

Messrs. STANLEY-MOBBS & ASHTON, Southgate, staged a good group, in which were varieties of Cattleya labiata, the best being the fine white C. l. Lewisii, with purplish blotch on the lip; some good examples of their fine strain of Laelia pumila, Cattleya Warscewiczii, C. Loddigesii, Laelia autumnalis, Oncidium cornigerum, O. trulliferum, O. tigrinum, &c. (Silver Banksian Medal).

HENRY GREENWOOD, Esq., Highfield, Haslingden, showed the original plant of Laelio-Cattleya × Henry Greenwood (C. × Hardyana × L.-C. × Schilleriana), which was awarded a special Medal at the last Ghent Show. This hybrid is one of the prettiest and most floriferous, flowering, it is said, during spring and autumn. The three flowered inflorescence had delicately-tinted, light-rose sepals and petals, and clear chrome-yellow centre, and rich maroon-purple front to the well-expanded labellum.

M. CHAS. MARON, Rue de Montgeron, Brunoy, Seine-et-Oise, France, showed his fine Cattleya × Maroni (velutina ♀, aurea ♂). The inflorescence bore seven very handsome flowers, each rather smaller in size than those of C. aurea, and having sepals and petals of a peculiar bronzy-yellow or old gold tint; the labellum, which preserved the outline of C. velutina very distinctly, having the rounded front lobe veined and tinged with bright rosy-crimson (First-class Certificate).

JEREMIAH COLMAN, Esq., Gatton Park, Reigate (gr., Mr. W. King), showed Laelia pumila Colmani, a very large and handsome form, with bluish-white sepals and petals, the front of the labellum being marked with purple and rose colour (Award of Merit).

Messrs. F. SANDER & Co., St. Albans, staged a group of Orchids, set up with plants of their beautiful scarlet Acalypha hispida or Sanderiana, hort. Among them were a good example of the fine Cymbidium Traceyanum, with two spikes; the rare Masdevallia melanoxantha, with dark purple flowers having bright yellow tails; a good pan of Habenaria carnea, and another of H. militaris; a distinct form of Laelio-Cattleya × elegans, some good varieties of Cattleya labiata, C. Loddigesii, Phalanopsis Esmeralda, and their new Cypripedium × John Carder.

J. GURNEY FOWLER, Esq., Glebelands, South Woodford (gr., Mr. J. Davis), showed Cypripedium insigne Glebelands var., a clear yellow form with indistinct markings in the upper sepal.

WALTER COBB, Esq., Dulcote, Tunbridge Wells (gr., Mr. J. Howes), sent Cypripedium insigne Cobbianum, a yellow variety, similar to that shown by Mr. J. Gurney Fowler.

F. W. MOORE, Esq., Royal Botanic Gardens, Glasnevin, Dublin, sent Angrecum Germinyanum, a singular species, with long narrow segments and funnel shaped white lip (Botanical Certificate); and the curious Satyrium longicaudatum.

W. A. GILLET, Esq., Fair Oak Lodge, Bishopstoke (gr., Mr. Carr), sent cut examples of fine varieties of Cattleya labiata, C. Warscewiczii, and Dendrobium Phalanopsis delicatum.

Mr. JAS. DOUGLAS, Edenside, Great Bookham, again showed his Laelia × Briseis (purpurata ♀, harpophylla ♀), which secured an Award of Merit when last shown. The plant bore a tall spike of pretty cream-coloured flowers, with slight rose tint on the narrow crimped labellum; also Cypripedium × macropterum (Lowii ♀, superbiens ♂).

Mr. WALTER GOODLIFFE, Cambridge Nurseries, Worthing, showed several plant of Cypripedium Io grande × Boxalli.

Mrs. CLORINDA ROBERTS, Rose Hill House, Ipswich, showed Cattleya elongata and C. labiata, grown on Clozone Orchid pots.

Fruit Committee.

Present: Philip Crowley, Esq., Chairman; and Messrs. T. F. Rivers, Geo. Bunyard, A. F. Barron, Jas. H. Veitch, A. H. Pearson, J. Wright, Alex. Dean, J. W. Bates, Geo. Woodward, Geo. T. Miles, Geo. Wythes, H. Balderson, F. Q. Lane, Jas. Smith, Geo. Norman, R. Parker, and Jos. Cheal.

The best exhibit before the Fruit Committee was undoubtedly one consisting of Apples and Pears from Mr. Geo. Woodward, gr. to ROGER LEIGH, Esq., Barham Court, Maidstone. This consisted of sixty dishes of Apples, and forty dishes of Pears. In such a collection, where every variety represented was shown in perfect specimens, it would serve no purpose to particularise them. If our readers wish to know what varieties Mr. Woodward cultivates with best success, the information may be obtained by reading our

report of the recent fruit-show at the Crystal Palace. The committee showed their appreciation of the merits of the exhibit by the Award of a Hogg Medal, the first that has been obtained by an amateur.

Messrs. JNO. LAING & SONS, Forest Hill Nurseries, London, S.E., had an exhibit of Apples, including a hundred dishes, many of the varieties were illustrated by fine specimens (Silver Knightian Medal).

Messrs. CHEAL & SONS, Lowfield Nurseries, Crawley, also contributed an exhibit of 100 dishes of Apples and Pears (Silver Knightian Medal); and Mr. J. Prewett, gr. to C. A. Pearson, Esq., Farnham, had an exhibit of about thirty dishes of Apples, and twenty dishes of Pears (Silver Banksian Medal).

Mr. W. Howe, gr. to Sir HENRY TATE, Park Hill, Streatham, showed three splendid bunches of Black Alicante Grapes. These bunches weighed 15 lb., and were cut from a Vine carrying eighty bunches. The berries were not large, but better finished ones could not be seen.

Mr. Geo. Wythes, gr. to Earl PERCY, Syon House, Brentford, showed a bunch of Banana fruits, under the name of "Syon House Cavendishi." It is described as a dwarf fruiting form of M. Cavendishi, the plant fruiting at a height of five feet. The Committee wished to see it again, there being a possibility that the plant has prematurely fruited on this occasion.

The perpetual-fruiting Strawberry St. Joseph, was again exhibited by Messrs. JAS. VEITCH & SONS, Royal Exotic Nursery, Chelsea. The plants were in 3-inch pots, and were this season's runners. The flavour of the fruits was very good for the late date of season.

An exhibit of six fine fruits of William Tillery Melon was made by Mr. J. W. Miller, gr. to Lord FOLEY, Ruxley Lodge, Claygate, Esher. This variety was raised at Clumber by Mr. Miller, and named after the gardener then at Welbeck Abbey. It is a green fleshed fruit, and was certificated by the R. H. S. in 1879. Mr. Miller has cultivated it ever since.

Some fine samples of fruits of the true Passiflora edulis were contributed from Combe Abbey Gardens, near Coventry, by Mr. W. MILLER (Cultural Commendation).

Some good specimens of the fruit of Diospyros Kaki were shown from the gardens of the Rev. Canon ELLACOMBE, Bitton. These had been grown upon a south aspect wall out-of-doors, and without protection.

Mr. C. Herrin, gr. to the Lady LOUISA FORTESCUE, Dropmore, Maidenhead, showed good fruits of Braby's Late Gage, and Coe's Golden Drop Plums.

There were several varieties of Beet shown from Chiswick, where a trial has been made of them, and reference has already been made to them in these columns.

Mr. E. Beckett, gr. to Lord ALDENHAM, Aldenham House, Elstree, made an exhibit of some extraordinary roots of varieties of Celery. A Silver Banksian Medal was deservedly awarded.

NATIONAL CHRYSANTHEMUM.

The following is the Report of the Sub-committee entrusted with the Investigation of Sites, &c., and presented to a special meeting of the executive committee held at Carrs, 265, Strand, on Monday evening, October 17:—

"The circumstances which led to the appointment of the Investigation of Sites, &c.—Sub-committee commenced with the adjourned annual general meeting of members, held at Anderton's Hotel, on March 21 last; when, as recorded in the minutes of that meeting, Mr. J. W. Moorman proposed that certain resolutions he had drawn up be accepted as recommendations to the executive committee, which proposition was seconded by Mr. J. R. Chomley, and carried. These resolutions (three in number) are as follows—That a sub-committee of five members (exclusive of ex-officio members) be appointed to enquire:—(a) What places can be obtained for holding our future exhibitions, either by a subsidy as now, or in reliance on our own resources, to proceed on independent lines. (b) To closely examine the whole question of minor shows, with the object of ascertaining their advantages or otherwise to the society. (c) To fully consider the question of selling the floor-space, and to report the result of their investigations to the general committee, who shall formulate such recommendations to a general meeting of members, to be held on the first day of the November exhibition, and that no future fixtures be made before this date.

The above was unanimously agreed to, as a recommendation to go to the Committee for action. These resolutions were duly reported and read at a Meeting of the Executive Committee, held on May 11, when it was moved by Mr. J. W. Moorman, seconded by Mr. T. BEVAN, and carried:—

"That the consideration of the foregoing resolutions be referred to a sub-committee of five members, in addition to the ex-officio officers, with instructions to report thereon."

It was further resolved in relation thereto:—

"That the report be presented to the Executive Committee as soon as possible." Also,

"That reasonable out-of-pocket expenses be allowed the sub-committee in making the necessary investigations."

Your sub-committee met on June 20, and resolved, "That in any applications made to likely places as sites for the Society's shows, it should be on the basis of four shows in each year, viz., in September, October, November, and December."

The following were mentioned as likely places in which accommodation for the Society's shows might be found:—

THE AGRICULTURAL HALL, Islington.

THE CRYSTAL PALACE, Sydenham.

THE LONDON EXHIBITION, Earl's Court.

OLYMPIA, Kensington.

THE QUEEN'S HALL, Langham Place.

THE IMPERIAL INSTITUTE, South Kensington.

THE NORTHAMPTON INSTITUTE, Clerkenwell.

The Secretary being instructed to communicate with the secretaries and managers of the foregoing places, to enquire as to the extent of the accommodation afforded, with dimensions of halls; whether three days' exhibitions could be held; whether tabling could be at the disposal of the Society; and the charge for the whole—say for four days.

It was also resolved that an advertisement in the *Daily Telegraph* and *Daily Chronicle* newspapers be inserted, for a central hall of large size, for the purposes of the exhibitions to be held in 1899.

The advertisements brought but one response—that from the secretary of the Public Hall at Peckham—much too small for the purposes of the Society.

With the exception of Olympia, which your sub-committee were informed could not be had, as the large show hall had been disposed of for other purposes, the whole of the foregoing places were visited by deputation, and the following results arrived at:—

THE AGRICULTURAL HALL is not available, because exhibitions are provided for up to the end of 1899, and the shows of the National Chrysanthemum Society could be held there during that year only in the event of one of those falling out, and this could not be definitely made known until April next.

THE EXHIBITION BUILDING at Earl's Court is also not available in 1899, owing to the whole of the space being required for the Colonial Exhibition in that year.

QUEEN'S HALL.—In reference to the Queen's Hall there is about 3600 superficial feet of open space; and after deducting gangways, it would leave about 2000 superficial feet space for show purposes. There is space under the galleries, but artificial light would be necessary all through the day. The rate of hire of the Queen's Hall is heavy owing to its being so much in request for concert purposes; the restrictions are severe, and there would be probable charges for dilapidations. The Queen's Hall was therefore abandoned.

IMPERIAL INSTITUTE.—At the Imperial Institute there is a long north gallery, 700 feet in length, by 25 in width, but difficult to reach, because several of the Indian galleries have to be passed through on the way. Lavatory accommodation is also deficient. The sum of £50 per show would have to be paid as rent; and there would be a charge for lighting also, about 14s. per hour. The place your sub-committee regarded as unsuitable, and the terms prohibitory. Your sub-committee therefore conclude that the Imperial Institute as a site for the shows of the society was out of the question, upon the terms above offered.

THE NORTHAMPTON INSTITUTE.—This is situated in St. John Street Road, Clerkenwell, and near the Angel, at Islington. It is a social and educational institution, with commanding premises, possessing a large hall, 100 feet by 67 feet, with a spacious platform, 41 feet by 39 feet, and a portion of the back of the gallery, running round three sides of the building, could be occupied by exhibits. The area of the hall, which could supply about 1900 superficial feet of tabling, would be too restricted for any one of the exhibitions of the society. A spacious gymnasium might be available, but a licence would have to be taken out to use it. The institute is situated at a considerable distance from any railway-station, and though in a main street, there is no line of omnibuses or tram along it; the nearest point of 'bus traffic being some few hundreds of yards away. It is therefore, difficult of access. There are certain restrictions, also: no intoxicating drinks can be sold; no smoking or profane swearing allowed. The Committee felt that the Northampton Institute could not be entertained as a site for the Society's shows.

THE ROYAL AQUARIUM.—A deputation waited upon Mr. RITCHIE, the Chairman of the Board of Directors of the Royal Aquarium, to consult as to arrangements for the future.

Complaints were made as to deficiencies in lighting the building; Mr. RITCHIE assuring the deputation that the Directors would take reasonable steps to secure a good lighting of the building.

In reference to facilities for judging, Mr. RITCHIE is willing to rope off the whole of the two side galleries, while the flowers staged there are being judged.

In reference to any augmentation of the sum annually allowed by the Directors towards the prize-schedule—namely, £300—it was pointed out that an additional £30 was offered this year in the November schedule. Mr. Ritchie said that if the National Chrysanthemum Society would undertake to enter into a guarantee to carry out a series of four exhibitions annually for the space of three years, the Directors would be willing to consider the matter of adding to the annual grant towards the prize-list. Further, Mr. Ritchie stated, the Directors would be pleased to place before the new refreshment contractors the National Chrysanthemum Society's wishes for special terms for luncheons, dinners, and drinks at the bars.

Subsequently the Secretary was instructed to request the Directors to endorse the preceding points, by appending their signatures to them; and also "to state what sum they are willing to give for a series of four or less shows in 1899, setting forth the amount they will give to each show; also to state what they are willing to give per show for four or less shows, for the space of three years, should the committee be willing to enter into an agreement with the Directors to hold shows at the Aquarium for that number of years."

To that request the following reply was received:—

Royal Aquarium, Westminster, S.W., Sept. 20, 1898.

RICHARD DEAN, Esq., Secretary, National

Chrysanthemum Society,

DEAR SIR,—In reply to your letter of the 20th inst., received on the afternoon of the 22nd inst., which I duly submitted to my Board, I am instructed to say that we confirm the conclusions arrived at, at the interview with the Investigation of Sites Sub-committee, and the subsequent one with Mr. Ballantine and yourself, on the following points, viz.: 1. That the Directors will take reasonable steps to secure the good lighting of the building.

2. That we will give better facilities for the judging at the November show, by roping off the galleries, subject to representatives of the Press being admitted, and to the judging being completed by 1 o'clock.

3. That we will make representations to the refreshment contractors to endeavour to secure your members favourable terms for dinners, &c.

With regard to your questions as to what amounts my Board are definitely prepared to offer for one, two, three, or four, or a less number of shows for the year 1899 and subsequent years, my Directors feel that, on consideration, your committee will see that it is not fair to ask them to categorically answer the questions, unless you are prepared to say that, subject to terms being arranged, you are willing to continue your exhibitions here.

On receipt of your assurance on that point, I am instructed to say that my Directors will be pleased to make propositions, which they think will be satisfactory to your committee.

I am, dear Sir, yours faithfully,

J. W. WILKINSON, Secretary.

CRYSTAL PALACE, SYDENHAM.—A deputation from your sub-committee waited upon Mr. H. Gillman, the general manager, at the Crystal Palace, with a view of ascertaining upon what terms the shows of the society might be held at Sydenham. Mr. Gillman made an offer of the following terms for 1899:—

For an October Show	... £75.
For a November Show	... £175.
For a December Show	... £50.

To set apart the grand central naves for the shows; provide the necessary tabling; arrange a room for the meetings of the Floral and other committees; supply the necessary admission tickets for members, and for the representatives of affiliated societies.—Will supply admission-tickets at half-price.—Would favour the provision of a 1s. 6d. ticket, which would give transit from London to the Palace and back, with admission to the building; so that the sum may be divided in three equal shares between the Crystal Palace, the Railway, and the National Chrysanthemum Society.—Will permit floor space to be let for miscellaneous exhibits.—Will provide plants to decorate the show-tables if required.—Will do the whole of the bill-posting at the expense of the Crystal Palace.—Will do all the advertising with the exception of that in the gardening papers, as at present.—Will endeavour to arrange for a supply of refreshments in the building, on reasonable terms.—And will also take steps to arrange for a cheaper and quicker train-service to and from the Palace.

In reply to a request as to whether the sum named for the November show could be augmented, Mr. GILLMAN said he thought that the arrangement should be tried for one year, and then be re-considered.

No Dahlia exhibition to be held by the National Chrysanthemum Society, as the National Dahlia Society holds its exhibition annually at the Crystal Palace.

Your sub-committee hold that the greater ground floor-space afforded at the Crystal Palace, the better light by day, added to the greater freedom from noise, which is objectionable to some at the Royal Aquarium, constitute advantages which go a considerable way in the direction of meeting the objections to the present place in which the exhibitions of the Society are held, which have found expression in various ways. Your sub-committee, having given due consideration to the foregoing particulars, have decided by a majority to make the following recommendation to the Executive Committee:—

That the terms offered by the Crystal Palace Company for holding three exhibitions in 1899, be accepted, subject to details being found satisfactory. For the foregoing resolution there voted:—

P. WATERER,	Chairman.
T. BEVAN.	
D. B. CRANE.	
J. W. MOORMAN.	Six in number,
J. T. SIMPSON.	
A. TAYLOR.	
Against the resolution:—	
R. BALLANTINE	One.

The other matters referred to the Executive Committee as recommendations, are:—(b.) The advantages or otherwise to the Society of the minor shows, i.e., exhibitions in September, October, and December.

This has not been considered fully by your sub-committee, because if their recommendation to the Executive Committee as set forth above, namely, to hold three exhibitions at the Crystal Palace next year, be adopted, then two of the minor shows will be provided for; that usually held in September will be dropped, a Dahlia show at the Crystal Palace being furnished by the National Dahlia Society. Your sub-committee, judging from past experience, consider the early date of the September exhibition operates to prevent the early varieties being represented in proper character.

In reference to recommendation (c), which deals in the first part with selling the floor-space, any decision in respect to this matter must, your sub-committee think, depend upon the arrangements ultimately made for holding the exhibitions of the Society in 1899. The proceeds from the letting of the floor-space is an important item in the income of the Society, and the practice of letting should not be abandoned without due consideration. The further matter of holding a general meeting of members on the evening of the first day of the November show rests with the executive committee, who are the best judges of its necessity or otherwise. Such a meeting can be called only in the manner prescribed by Rule 11, to the following effect:—

"A general meeting may be called at any time on a requisition signed by not less than twenty members of the Society, being delivered to the General Secretary, fourteen days prior to the date of the proposed meeting."

Such a meeting, if held, cannot in any way set aside any arrangement the Executive Committee may make in regard to any one of the three recommendations submitted to it from the annual general meeting, because they all relate to the shows held by the Society; and Rule 12 sets forth in the clearest manner that "The exhibitions of the Society shall be held at such times and places as the Executive Committee may from time to time determine."

Signed, T. W. SANDERS, Chairman; P. WATERER, Vice chairman; Thos. Bevan, J. T. Simpson, D. B. Crane, J. W. Moorman, A. Taylor.

OCTOBER 24.—A meeting of the Floral Committee of the National Chrysanthemum Society, took place on the above date, when a considerable number of blooms was staged, though owing to the incidence of the season many were ill developed.

First-class Certificates of Merit were awarded to decorative Chrysanthemum Mrs. Wingfield, a pretty and very free flowering variety of a soft rosy tint, from Mr. W. J. Empson, gr. to Mrs. WINGFIELD, Amphill, Beds; to Market White, a decorative Japanese, from Mr. W. WELLS, Earlswood; to incurred Ada Owen, from Mr. R. OWEN, nurseryman, Maidenhead; to decorative Mrs. Geo. Hill, and to Japanese Major Matthew, from Mr. H. J. JONES, Ryecroft Nursery Lewisham; to Japanese Mrs. W. Seward, from Mr. W. SEWARD, Hanwell; to Japanese President Bevan, Jules Mary, and Jeanne Mariet, from Mr. W. J. GODFREY, nurseryman, Exmouth; and to Japanese Mrs. W. Cursham, from Mr. H. WEEKS, Derby. Japanese Autumn Glory (Godfrey) was commended; and several varieties of a promising character the committee wished to see again.

EXETER GARDENERS' ASSOCIATION.—An interesting lecture, entitled "Flowers that Bloom in the Spring," was given by Mr. Andrew Hope at a meeting of the above Society on October 12.

THE "NEW PENNY MAGAZINE."—This is the latest publication of Messrs. CASSELL & CO., and those who remember the interest taken in the appearance of the original *Penny Magazine* will be attracted to it by the title. The present venture is to be on similar lines to the former one, but "adapted to the tastes and requirements of the present day." In sixty-six years these have considerably changed and developed, and for the sum that once purchased eight pages, sixty-four can now be obtained; smaller, indeed, but very full of both information and illustrations. The subjects treated of include "stories of adventure, thrilling records of gallant deeds, vivid pages from history, anecdotal accounts of novelties, curiosities, and famous personages, and graphic descriptions of Nature's most wonderful scenes." Add to this fiction, in the shape of short and serial stories, and it must be admitted that the *New Penny Magazine* is quite as well worth its price nowadays as was its predecessor half a century ago, though necessarily wanting in *prestige*, and perhaps not quite so high in tone.

NOTICES TO CORRESPONDENTS.

ADDRESS: *Johannes Rafn, Denmark.* The *Canadian Horticulturist* is published at Toronto, Ontario, at the price of 10 cents per copy, or \$1.00 per annum.

AQUATICS SUITABLE FOR PLACING IN AN OUT-OF-DOORS POND: *Subscriber, East Grinstead.* Hardy Nymphæas, especially *Marliac's* varieties, *Butomus umbellatus*, *Villarsia nymphæoides*, *Calla palustris*, *Aponogeton distachyon*, *Iris pseudo-acorus*, *Hottonia palustris*, *Pontederia cordata*, *Nuphar advena*, *Menyanthes trifoliata*, *M. nymphæoides*, and many others.

BOOKS: *P. & Sons, Chesterfield.* *Handy Book of the Flower Garden*, by D. Thomson, published by Blackwood & Sons; *Hardy Herbaceous and Alpine Plants*, by W. Sutherland (Blackwood & Sons).

CANDIDATES FOR HORTICULTURE: *J. H. M.* You should apply to the Secretary of the Royal Horticultural Society, 117, Victoria Street, Westminster,

S.W.; or to the Principal of the College of Horticulture, Swanley, Kent.

CARNATIONS: *K. I. T. T.* The blooms are being destroyed by damp in the atmosphere, or by drip, or overhead syringing. Can you not employ fire-heat by day, with abundance of air occasionally.

CLEMATIS: *N. A. S.* The pruning of the Clematis lanuginosa group, which consists chiefly of weak growers, should be of a very slight nature, and done after the flowering of the plant is over. The Jackmanni group, which flower on the young growth, may be pruned in January and February; and the Patens group, which flower on the old wood, may be pruned more or less severely after flowering. Besides grafting on stocks of *C. vitalba*, established in large or small 60's, and mostly raised from seed, cuttings can be successfully employed when these are taken with a heel from plants forced into growth by means of warmth. The cuttings need a warmth in the bed of 75°, and in the air of the house a maximum of 60°. The length of a cutting should not exceed 6 inches.

FUCHSIA: *E. B.* The condition arises from the fusion of two flowers, and is not uncommon.

FUNGUS ON FOLIAGE OF APPLES AND PEARS: *Alpha.* The fungus having continued to spread shows that the dressing was not sufficiently strong, or had not been applied several times, as it always should be. Usually, three dressings of the Bordeaux Mixture, after the fruit is set, are sufficient for the season, the last being applied at least three weeks previous to any of the fruit being consumed; indeed, it is better not to use it on fruit nearing the full size, so much more copper being deposited on a fruit, and it is well to be quite safe. The following is a good formula for Bordeaux Mixture:—Copper-sulphate, 4 lb.; fresh unslaked lime, 3 lb.; water, 40 gallons. Place 6 gallons of water in a wooden tub or barrel (never use iron or tin), and hang in it 4 lb. of pulverised copper-sulphate in a coarse canvas bag. Slake the lime, adding water only as fast as it takes it up, and pour together. Before using, dilute to 40 gals. Enough lime should be added to neutralise the free acid, for if this be not done, the foliage will be injured by it. To test this, buy a pennyworth of ferro-cyanide of potassium (yellow prussiate of potash), and place in a small bottle of water. Add a few drops of this solution to the Bordeaux Mixture before it is diluted, and if it turn it brown the lime is deficient, and more must be added until the ferro-cyanide has no effect. A slight excess of lime is generally desirable. When much Bordeaux Mixture is used, a stock of it can be made by putting 40 lb. of copper-sulphate in 40 gallons of water, and in a box slake 40 to 50 lb. of lime. When needed, measure out 4 gallons of the mixture, and add some of the slaked lime until no brown colour is made when tested. The mixture will be ready when diluted. This is as strong a mixture as it is desirable to use, and after the first application 60 gallons of water may be used, instead of 40 gallons, for the 4 lb. of sulphate of copper and 3 lb. of lime. If the mixture be strained through fine canvas, it can be applied with a syringe or a sprayer. Washes made with caustic soda are of no effect against the fungus, but are effective against insects, especially scale, with soft soap or with resin or Barbadoes Aloes. As much as 2 lb. of soda may be added to 1 gal. of water.

GALVANISED IRON ARCHES FOR CLIMBING ROSES: *W. P.* In view of the injury sometimes occurring to the rind from contact with the raw iron, it is prudent to apply two or three coats of paint, the first of red lead, then one of white lead, and the last of some shade of green or chocolate-brown.

NAMES OF FRUITS.—Applications to name fruits are so numerous at this season, as seriously to hamper us in the exercise of our editorial duties. They entail an expenditure of time, labour, and money, of which our readers can have little idea. We are most desirous to oblige our correspondents as far as we can, but we must request that they will observe the rule that not more than six varieties be sent at any one time. The specimens must be good ones, just approaching ripeness, and they should be properly numbered, and carefully packed. We do not undertake to send answers through the post, or to return fruits. Fruits and plants must not be sent in the same box. Delay in any case is unavoidable.

—*C. W. S.* Apple, pale yellow, believed to be Queen Caroline. The other, with the curious malformed fruit, is Rymer.—*J. O.* 1, Grosse Calebasse; 2, Comte de Lamy; 3, Beurré Bachelier.—*Philomathus.* 1, not known, worthless; 2, Ecklinville Seedling; 3, Rymer; 4, Cellini; 5, Doyenné Bous-

soch; 6, Flemish Beauty.—*C. N. M.* Pear, closely resembles Duchesse d'Angoulême, if melting.—*H. C. W.* 1, Warner's King; 2, Beauty of Kent; 3, Yorkshire Greening; 4, Reinette Blanche d'Espagne; 5, Reinette du Canada; 6, Dumelow's Seedling.—*W. R. F.* Apple, Warner's King.—*B. W. Solon.* 1, not known; 2, Court Pendu Plat; 3, Cellini; 4, Blenheim Orange; 5, Sturmer; 6, Court of Wick.—*H. G. C.* Apple, Edmund Jupp, an Apple much grown in parts of Sussex.—*An Anxious Enquirer.* 1, Doyenné Boussoch; 2, Marie Louise d'Uccle; 3, Pitmaston Duchess; 4, King of the Pippins; 5, Cox's Orange Pippin; 6, Cellini.—*Daniels Brothers.* Apple, New Hawthornden.—*W. B.* 1, Rymier; 2, Washington; 3, Court of Wick; 4, like Yorkshire Beauty; 5, Forge; 6, not known.—*G. W. S.* 1, Comte de Flandres; 2, not known; 3, King of Tomkin's County; 4, Emperor Alexander; 5, Dumelow's Seedling; 6, Blenheim Orange.—*N. S. Margetts.* 2, Beurré Superfin; 4, Emille d'Heyst; 5, Durondeau; 6, Zephirin Grégoire.—*A. B. C. D. A.* Pear, Beurré Clairgeau; *B. C. D.* Forms of Blenheim Orange Pippin.

NAMES OF PLANTS: *Correspondents not answered in this issue are requested to be so good as to consult the following number.*—*A. C.* 1, Goldfussia isophylla; 2, Rudbeckia speciosa; 3, we cannot name the Aster, perhaps *A. dumosus*.—*No. 1.* Origanum Dictamnus.—*J. Davidson.* Physianthus albens.—*A. S.* We cannot tell from detached leaves without other evidence what your tree is. Probably a Crataegus of some sort, or it may be a Pyrus.—*Pickering* should not send fruits and plants in the same packet. The plant is Euphorbia Cyparissias. The Apples next week.—*H. E. G.* and *H. M. E.* Ruellia macrantha, figured in the *Gardeners' Chronicle*, January 12, 1895, p. 45, Oxalis Ortgiesii.—*M. M.* Odontoglossum crispum, ordinary variety.—*Kilmarnock.* Anthurium Scherzerianum, stove plant. It requires moist heat, and plenty of water when growing, diminishing the quantity when the spathes begin to show.—*W. B.* Juniperus virginiana.—*F. C. V.* Plumbago larjento.—*Miss S.* Echinops cephalotes, var. probably.—*H. T.* Polygonum polystachyum.—*J. B. Steele.* Your specimens are too poor.

PELARGONIUMS: *G.* With the exception of some herbaceous perennials, which are true Geraniums, all the plants grown in gardens under the name of Geranium, whether zonal or spotted, are really species or varieties of Pelargonium. This fact has been known for many years. There was also a "Pelargonium Society;" but in spite of that, the erroneous name Geranium persists, and is likely to do so. The Pelargoniums are all originally natives of the Cape of Good Hope; the Geraniums are European chiefly, and natives of cool, temperate climates.

SEEDLING APPLES: *Mrs. C. H., East Barnet.* The fruits appear to be good ones. You should exhibit several of each variety before the Fruit Committee of the Royal Horticultural Society. The next meeting will be on November 8, and the Secretary, to whom you should make application, is the Rev. W. Wilks, 117, Victoria Street, Westminster.

CONTINUED LARGE INCREASE in the CIRCULATION of the "GARDENERS' CHRONICLE."

IMPORTANT TO ADVERTISERS.—The Publisher has the satisfaction of announcing that the circulation of the "Gardeners' Chronicle" has, since the reduction in the price of the paper,

MORE THAN DOUBLED, and that it continues to increase weekly.

Advertisers are reminded that the "Chronicle" circulates among COUNTRY GENTLEMEN, and ALL CLASSES of GARDENERS and GARDEN-LOVERS at home, that it has a specially large FOREIGN and COLONIAL CIRCULATION, and that it is preserved for reference in all the principal Libraries.

(For Markets and Weather, see p. xii.)

THE

Gardeners' Chronicle.

SATURDAY, NOVEMBER 5, 1898.

PALLANZA.

FEW places in North Italy are so attractive to the traveller of horticultural bent as these two, perhaps the most beautiful spots on the Lago Maggiore. Their attractions are not at all similar. Pallanza is not only the most sheltered and warmest—the latter term seems absurd when sweltering in the fierce tropical blaze of mid-August!—spot on the lake, but it is the “home” so to speak, of one of the most interesting nurseries in Italy—that of the Fratelli Rovelli. This celebrated nursery is only a very small one, as nurseries go in England, and is probably not above 10 English acres in extent; but nearly every square yard has its interesting plant, tree or shrub. When Signor Rovelli established himself here in 1848, there was little of note about the place, except its unrivalled position; but a mere walk to-day through the place will demonstrate how much may be done in a spot on which Nature has lavished her favours. It is very difficult to realise that all these magnificent Firs and other trees are the growth of just half a century; yet such is the case, and, happily, Signor Rovelli can now contemplate in his mature years the work he so skilfully designed when quite a young man.

There is so much to see and to take notes of in this nursery that one hardly knows where to begin. In regard to extent, perhaps the Camellia plantation occupies a greater amount of space than any other one genus of plants; there are about two acres of various sorts, and during February, March, and April, the sight of this mass in full flower is said to be a magnificent one. The Rhododendron is another special feature with Messrs. Rovelli, the Sikkim, Himalayan, and almost all other kinds flourishing here at Pallanza with all the vigour that they do in their native habitats. The firm has raised a number of hybrids between *R. argenteum longiflorum* with *arboreum*.

One of the first things that strikes the visitor to the Rovelli Gardens is a magnificent specimen of the Silver Wattle (*Acacia dealbata*), which, in twelve years was grown from a small plant to about 40 feet in height, whilst 30 feet from the parent has sprung up from an underground root an offspring now almost as large as the original. The *Acacia* does extremely well here, and so also do the Bamboos, which latter are a leading specialty with Messrs. Rovelli, the varieties which appear to flourish most freely being *B. erecta*, *B. nigra*, *B. pygmæa*, *B. quadrangularis*, *B. mitis*, and, perhaps the most charming of all, *B. gracilis* (the Rovelli specimen of this is a beautiful tree 30 feet high), attaining in some cases to huge trees with very large trunks. The *Eucalyptus* is another

favourite plant in Italy, and some striking examples of *E. amygdalina* and *E. glauca* occur at Pallanza.

Of course, the Conifers are among the principal attractions of Messrs. Rovelli's place. They grow there with a vigorous rapidity, which is difficult to realise in this country. Amid an embarrassing number of rarities and of specimen-trees, perhaps the most noteworthy are the Golden Larch, *Pseudolarix Kämpferi*, and *Keteleeria Fortunei* (see *Gardeners' Chronicle*, May 3, and March 15, 1884, respectively). Both are magnificent specimen-trees, whilst the *Pseudolarix* was the first tree in Europe to produce flowers, just as the grand specimen at Pallanza is *il più forte esemplare conosciuto in Europa*. The *Keteleeria* forms a more handsome tree than the Golden Larch, it is much more symmetrical in outline, and the various main branches are less irregular. This is rather noteworthy, inasmuch as in its native country its aspect is said to be “peculiar rather than handsome.” The Rovelli specimen is unquestionably unique in Europe; it bears fruit nearly every year, and young plants are readily raised from seeds. Roughly calculating, I should say that both these specimen-trees are about 50 feet in height. The *Keteleeria* is about thirty years of age; its bark has a curious cork-like appearance.

The representatives of the genus *Abies* are both numerous and interesting. The most beautiful of all is, perhaps, *A. lasiocarpa*, of which there is a fine pyramidal-shaped specimen tree. There are also fine growths of the stately *A. Nordmanniana*; *A. bracteata*, a tall, slender, graceful tree, bearing numerous cones; *A. inversa pendula*, a curious “weeping” tree; and *A. rumidica*. Altogether there are about fifty species and varieties of the genus *Abies*, including some which technically belong to other genera, cultivated at the Rovelli establishment. The genus *Pinus* and its immediate allies find Pallanza an entirely congenial habitat. The Korean Pine, *P. koraiensis*, forms a small graceful shrub, and is bearing cones; several forms of *P. Montezumæ*, *P. insignis*, *P. longifolia*, *P. Lambertiana*, and *P. canariensis* are represented by specimen plants. Nearly every variety of *Cupressus* under cultivation is to be found at Messrs. Rovelli's, but the most noteworthy is a splendid tree of *C. torulosa*. There are also good specimens of *Cephalotaxus Fortunei*; of *Podocarpus chilina*; *Sciadopitys verticillata*, and of all Messrs. Rovelli's perhaps the finest and most perfect specimen tree in Europe; it is about 24 feet in height. *Librocedrus decurrens*, which in forty years has attained to about 80 feet in height; and *Cunninghamia sinensis glauca*. The *Araucarias* are also very much at home, particularly such species as *A. Bidwillii*, *A. Cunninghami*, and *A. brasiliana*, which in England are too delicate to be grown elsewhere than in a conservatory. *Prumnopitys elegans* flourishes into quite a large tree.

The genus *Quercus* is represented by one of the most distinct *Q. Mirbecki*; by an exceedingly graceful specimen of *Q. dealbata*, and *Q. suber*.

Palms and their allies of every sort and size are to be found in the open air all the year round here. An especially good plant of *Cocos australis campestris*, is quite 10 feet high; *Chamærops excelsa*, *Jubæa spectabilis*, *Brahea edulis* and *B. glauca* are represented, not merely by large stocks, but also by fine specimen plants in the open. The Laurel is another plant extensively cultivated in Italy, *Laurus glandulosa*

developing with great rapidity into a huge tree; *L. regalis* with its pear-shaped fruit and very fragrant leaves, and *L. camphora*, both flourish well. A magnificent specimen of *Olea fragrans* is also noteworthy, and both *Ilex japonica* and *Thea viridis* may be mentioned as producing fruit with considerable freedom. *Musa japonica*, also in the open, is showing both flower and fruit. Messrs. Rovelli have been making a special feature of this grand plant, and they find that it is not only quite hardy, but that it withstands 10° of frost if the surface is covered with dry leaves or straw; it commences to show signs of life in March or early in April, and the rapidity with which it develops into a graceful fully developed plant is altogether extraordinary. Two other plants, rarely successful in the open air in this country, flourish in all their native vigour at Pallanza, viz., *Bignonia grandiflora*, which in August was covered with its brilliant red flowers, and *Clianthus puniceus*. The rose and violet-coloured varieties of *Lagerströmia indica* may be seen here in a highly flourishing condition, the former with magnificent panicles of flowers.

There are very many other trees and shrubs which will detain the visitor, but to only a few of which can allusion now be made. One of the most noteworthy is a very striking plant of *Rubus leucodermis*, with white stems and branches, which have a distinct and curious appearance of having been whitewashed; *Pittosporum Mayi*, *Nandina domestica*, and *N. laciniata purpurea*, *Gunnera manicata*, *Euonymus citrifolius*, and *Arbutus Andrachne*, may all be mentioned as being ornamental shrubs and trees successfully cultivated for decorative and other commercial purposes at Pallanza. It is difficult to drag one's self away from such an interesting nursery as that of Messrs. Rovelli, where the horticultural visitor ever finds a courteous welcome.

Immediately opposite the nursery is the palatial building of the grand Hotel Pallanza, with its numerous *dépendances*, all finely situated, and all with charmingly laid-out gardens, or to be more correct, shrubberies or arboretums. The Grand Hotel was erected rather less than thirty years ago, and the grounds, which altogether cover probably several acres, were designed and planted out by Sig. Rovelli. The growth of the young trees has certainly been “fast and furious,” and if one were told that they had been established there for over a century, there would be no tax on one's credulity. I do not propose making an “inventory” of all the trees and shrubs in these gardens, but I have jotted down a few notes concerning the more remarkable specimens. A specimen plant of *Laurus nobilis* has over a dozen thick main branches springing from the same root-stock; the Loquat, *Mespilus* (*Photinia*) *japonica*, has not only developed into a huge tree, but has three large trunks springing from the parent root. Another very fine tree is called *Cratægus nepalensis*, but about which name there is, I presume, some mistake. *Buxus balearica*, a beautiful shrub, being, as it is, a native of this part of the world, thrives well; *Benthamia fragifera*, *Podocarpus Makoyi* (?), *Calycanthus præcox*, *Euonymus fimbriatus*, and a variegated form of *E. japonicus*, *Pittosporum sinense*, *Arbutus Unedo*, and *Viburnum lucidum* and *V. Tinus* are among the more striking growths in the gardens of the Grand Hotel, whilst the *Camellia*-tree flourishes and flowers with a luxuriance to be found perhaps nowhere else outside its native habitat.

(To be continued.)

NEW OR NOTEWORTHY PLANTS.

PTYCHOSPERMA SANDERIANA, n. sp.*

NEW GUINEA and the adjacent islands seem to be remarkably rich in elegant small Palms of the group of Arecinæ, and many have been described by various writers. Mr. Micholitz adds another of these beautiful cultural plants to the stoves of Europe in the form of this new and pretty plant.

It has a stem from 10 to 15 feet high, and 1 inch in diameter, with tolerably regular joints 1 to 3 inches long; the leaves over 4 feet long, with a rather slender rachis, which, especially at the base, is covered with a flocculent brown tomentum; the pinne are alternate, over fifty on each leaf, narrow, linear, a foot and a half long, and half-an-inch broad, tapering towards the point, the apex with one long point, and another much shorter, with a deep notch between them. The panicle hangs below the leaves, rather large and many-branched, the branches stout, 8 inches or more in length; the rachis is sprinkled with brown fur, like that of the leaves. The male flowers are borne in pairs, in sockets, arranged spirally. The calyx-lobes are short, rounded, and pubescent, gibbous at the base; the petals nearly twice as long, equal, blunt, and ovate. Stamens fifteen in number, hardly longer than the corolla. The rudimentary pistil is rather large and fusiform, ending in a bent style. The female flowers are borne on a different panicle. I have seen none. The fruit, however, has at its base rather large rounded mucronate petals, and small rounded sepals. The drupe is half-an-inch long, ovoid, and beaked, bright-red in colour, with terminal stigma much resembling that of *P. Macarthurii*, but the seed is deeply five-grooved, and the albumen is not ruminant.

The young plants of this Palm [of which a specimen was recently exhibited at the Royal Horticultural Society by Messrs. Sander] are remarkably elegant, on account of the narrow, tapering pinne closely crowded together, and will form a welcome acquisition to all lovers of decorative Palms. *H. Ridley, Singapore.*

ORCHID NOTES AND GLEANINGS.

CATTLEYA LABIATA ALBA.

A BEAUTIFUL specimen of the pure white autumn-flowering *Cattleya labiata*, bearing six fine blossoms on three leads, was lately to be seen in flower in the collection of C. G. Roebling, Trenton, New Jersey, U.S.A., a collection noted for its pure white *Cattleyas*, of which mention may be made of *C. labiata alba*, *C. Mossii alba*, *C. Bluntii*, *C. Gaskelliana alba*, *C. Percivalliana alba*, *C. Trianae alba*, *C. Skinneri alba*, *C. Loddigesii alba*, *C. Harrisoniæ alba*, *C. Schroderæ alba*, *C. chocoensis alba*, *C. Warneri alba*, *C. Wallisii*, *C. Eldorado alba*, *C. intermedia alba*. Several of these are in duplicate, and it is Mr. Roebling's desire to add a white variety of any other species he can obtain. Two plants of the pure white variety of *Lælia Pattini* are also to be found in his collection.

He possesses a plant of *Dendrobium Phalænopsis hololeuca* with pure white flowers now open, and five varieties of *Cattleya Hardyana*, one of which, called the Trenton variety, so far exceeds all others in size, colour of the bloom, and in the extremely

* *Ptychosperma Sanderiana*, Ridley, n. sp.—Caules octopodales vel ultra, pollicis crassitie; folia 4-podales, pinnata, rachide tomento brunneo tecto, pinnis linearibus acuminatis alternis ultra 50, 1½ pedes longis, ½ poll. latis, apicibus bicuspidatis cuspidate uno longo, altero multo brevioro. Panicula infra foliaceas, majuscula ramis crassis pluribus, rachide pubescente. Flores masculi copiosi bini in fovea una, quatuorversi. Sepala brevia orbicularia obtusa pubescentia basi gibbosa aequalia, ½ poll. longa. Petala aequalia ferme duplo longiora, ovata obtusa. Stamina ad 15, petala vix superantia antheris linearibus versatilibus. Pistilli rudimentum fusiforme apice attenuato. Flores foeminei haud visi. Drupæ semi-pollicares, ovatae rostratae rubrae. Stigma terminalis. Pericarpium crustaceum, endocarpium pulposum. Semen conicum quinque-sulcatum. Albumen aequabile. *E. Papua tulit et. Micholitz.*

gorgeous lip, as to be without an equal. The lovely *Cypripedium Roeblingianum*, one of the finest crosses between *bellatulum* × *insigne* Chantini, and raised at Trenton, is again showing its flower-scape. *H. T. C.*

MR. T. B. HAYWOOD'S ORCHIDS.

When calling recently at Woodbatch Lodge, Reigate, primarily to inspect the Chrysanthemums, it was noticed that the collection of Orchids was in splendid condition. Some seedling *Dendrobiums* in 3 and 5-inch pots had made extraordinary growth. The seed was sown two years ago last April, and some of the pseudo-bulbs are now more than 2 feet in length, the difference in size and vigour between the present pseudo-bulbs and those made last year being extraordinary. There are about 300 of these plants, and there is a good chance therefore, that when the plants flower, there may be a few really good hybrids amongst them; but Mr. Salter would have had greater hopes, had he been able to obtain pollen from the best varieties up to date. Plants of *Dendrobium splendissimum grandiflorum* also had made large growths, so great that the getting of them thoroughly matured needs considerable care. *D. Phalænopsis Schroderæ* is producing a fine lot of blooms. There being about fifty plants of this useful autumn-flowering *Dendrobe*, flowers of many diverse shades are observable, but the darker coloured ones are the less common. The *Pleiones* are also in bloom, and *Vanda tricolor*, *V. cœrulea*, &c. One plant of the last-named species bears four strong spikes. Of the *Cypripediums*, a plant of C. T. B. Haywood, bore eight good specimens of its pretty, lilac-tinted flowers. *C. cœnanthum superbum* is in bloom, and *C. Spicerianum* × *Arthurianum* just showing for bloom. *P.*

ORCHIDS NOW IN BLOOM.

On the occasion of a recent visit to l'Horticulture Internationale, Brussels, *Lælia præstans* in variety was in bloom, the dark varieties being especially beautiful. One plant had white blossoms flushed with rose, the lip violet, with the throat golden yellow. Other flowers had the segments wavy and bent back, the tube of the lip almost wholly white, but rather yellowish within, the front lobe of the lip dark magenta, edged with white, with a central violet spot on the mauve.

A variety of *Cypripedium memoria Moensii* was also in bloom, with a very dark standard, the mid-rib 6 mill. (a quarter of an inch) wide, and deep red merging into brown. *Vanda Lindenii* bears trusses of beautiful white flowers. *V. suavis* and *tricolor* have dark markings on the lip. Among *Catasetums* were *C. macrocarpum*, *aureum*, *punctatum*, *Bungerothi*, *aurantiacum*, and *splendens aureum*.

There is a house containing many varieties of *Lælia Harrisoniæ*, and also a fine *Oncidium luridum*. *Cypripedium callosum* × *C. lævigatum* has gracefully-curving petals, the free tips of which cross one another; they are coffee-brown and magenta coloured, the brown streaks being especially distinct on one-half of the petals. The standard has the colour of that of *C. lævigatum*; green striped with brownish-red. The lip is brown. The flowers are superposed and effective. The leaves are deep green, with prominent veins. *Ch. de B.*

THE CHRONICLE OF A LITTLE CORNISH GARDEN.

(Continued from p. 211.)

SEPTEMBER.—Sunflowers, Michaelmas Daisies, and Dahlias, are, I suppose, the "flowers of the month;" at any rate, they are the most important flowers at present blooming in my garden. Now that the leaves are beginning to drop from trees and shrubs, the great plants of Asters and Sunflowers show up well among the bushes, and make the garden bright with yellow, orange, mauve, and white. Of the Sunflowers, perhaps the most brilliant, on account of its vigour and freedom of flowering, is *Helianthus rigidus*, with large brown-centred golden flowers. Its rampant growth and speedy spreading habit make it a somewhat dangerous plant to introduce very freely into the borders, as a single plant soon becomes many

hundreds if left unchecked. The taller *H. multiflorus* is also beautiful and vigorous, and both it and its varieties are well worth growing. *H. giganteus* should also be grown if room can be found for it, and in good soil it often reaches 15 feet in height. It flowers later than the other Sunflowers, and thus prolongs their blooming season. Another late kind is the graceful Sunflower (*H. orgyalis*), which is too slender to bear itself erect without support, and therefore must be staked or grown among bushes. The only other species I have is *H. latiflorus*, whose large yellow (and yellow-centred) flowers succeed those of *H. rigidus*. All these Sunflowers will grow nearly anywhere, but they are seen at their best (like most other plants) when grown in deeply-dug soil well enriched. One can then appreciate Browning's picture—

"Fancy the Pampas' sheen!

Miles and miles of gold and green,

Where the Sunflowers blow

In a solid glow;

And to break now and then the screen—

Black neck and eyeballs keen,

Up a wild horse leaps between."

In view of the Sunflowers' nationality, it is absurd to associate it with the story of the transformation and constancy of Clytie, although most people still do so. The story is a beautiful one, and the flower worthy of the association, so that one is tempted to say, "May the error prevail!"

It is a good sign that Michaelmas Daisies are gaining in popular attention and favour. When people can admire the comparatively insignificant yet gem-like flowers of the perennial Asters, they are on the road to salvation in matters of floral taste. A bush of *Aster cordifolius*, with its delicate pale mauve stars, represents an exactly opposite idea of beauty to that implied by an average geometric bed—and it is difficult to imagine how the same individual can admire these two things. By growing my Sunflowers and Michaelmas Daisies among bushes and shrubs, I do away with the necessity of formal stakes—which halve the beauty of any plant when used. Where bushy plants are grown away from shrubs and require support, I find that branching sticks (such as Pea-sticks), which can be hidden by the plant's foliage, are much less obnoxious than the ordinary straight rod to which the poor plant must be tied *en masse*.

There are so many good Michaelmas Daisies that I can do little more than name a few which have struck me as especially beautiful. The silky-leaved Starwort, *A. sericeus*, with deep violet flowers, is one of the very best; as is also the lilac Himalayan Starwort, *A. Thomsoni*, a somewhat dwarf species, with large flowers about 2 inches in diameter. Other splendid kinds are *A. acris*, which envelops itself in a mass of soft lilac-blue; the rich violet varieties of *A. Amellus* (especially *amelloides* and *bessarabicus*), the dwarf, bushy *A. dumosus*, with myriads of small mauve blossoms; the Heath-leaved, white-flowering *A. ericoideus*; *A. Novæ-Angliæ pulchellus*, and *A. N. A. roseus*, among the New England Starworts; and *A. Novi-Belgii*, F. W. Burbidge, with very large rose-lilac flowers; *A. N. B. St. Brigid*, *A. N. B. Flora*, and *A. N. B. Arthur Hind*, among the New Belgian varieties.

It seems hard to believe that the Cactus *Dahlia* was only introduced into England as recently as 1880—the year also in which the single *Dahlia* became popular. Previous to that time, it would appear that the show and Pompon varieties held the field. If these kinds were the only Dahlias we possessed, it is likely that with the recent development of taste in favour of flowers of looser and lighter habit, the *Dahlia* would now be lightly esteemed. There is a good deal of thought engendered by reading that in 1836 was published the *Dahlia Register*, containing over fifty coloured plates. The ups-and-downs of a flower's popularity are well exemplified by the *Dahlia's* career.

Of the various Cactus Dahlias, the scarlet kinds, such as *gloriosa*, have given me the greatest pleasure. The new single Cactus varieties I have found more useful for cutting than for decorating the garden, but

that may be owing to some defect in cultivation. Dahlias like a heavier soil than mine, although I am able to grow good bushes and good flowers. There are several very beautiful colours in the single Cactus group—especially the old-gold Earl Ravenswood—among those with which I am familiar.

When one begins to look for the fire burning in the grate, one is apt to turn philosophic, and to question the value of one's labour, whether in the garden or elsewhere.

In gardening we may escape from ourselves, and here, it seems to me, lies its very greatest value—greater even than its use in enabling us to escape from our fellows. A garden is not in any sense a rival of hill and woodland; yet how increasing is the joy with which, day after day, year

name of gardening. To me, gardening is a sort of applied branch of poetry, and poetry has nothing to do with gaudiness, stiff formality, or ostentation. That is why I hold that a small garden is more interesting than a very large one. The individual plants cannot have the same interest, and the personal part must be a smaller one where a staff of gardeners has to be employed. We cannot take the same interest in our children when we count them by the dozen, and have to depute their care to nurses, governesses, and the like. So it is with gardening. And the more interest we are able to take in our plants and flowers, the more readily will they enable us to forget the great problems, as well as those minor worries of life which seem to harass so many foolish people. *Harry Roberts.*

2 feet in length, and 4 inches in diameter. The species is not unlike *E. villosus*, but the fronds are larger, and the stem attains considerable dimensions, both as to length and thickness, the largest stem at Kew being 4 feet high, and a foot in diameter. It has been in cultivation at Kew about twenty years, but it appears to have been first introduced to the Berlin Botanic Gardens in 1874, and to have been sent out as a new plant by Mr. Bull in 1878. [See Masters, in *Gardeners' Chronicle*, April 6, 1878, p. 430.] It is one of the handsomest of the many Cycads grown in the Palm-house at Kew. *W. W.*

VERONICA LINDSAYI.

THIS was raised by me from home-ripened seed of *Veronica amplexicaulis*. It differs from that species chiefly in having pink-coloured instead of white flowers, in the leaves being quite glabrous, not glaucous, and in the habit generally being more compact than in that species.

The probability is that the plant is a natural hybrid between *V. amplexicaulis* and *V. pimeleoides*; at any rate, it is a good addition to this class of hardy ornamental shrubs (see fig. 97). *R. Lindsay.*

HOLLYHOCKS.

YOUR nice description and charming illustration of these in a recent issue of the *Gardeners' Chronicle*, will do much to bring back these old favourites to many a garden. Slowly the tide is turning in favour of these handsome plants. In all directions we hear the welcome news or see proofs of the fact that professional gardeners and amateurs are again trying to cultivate the Hollyhock; and not only trying, but succeeding. Growers for sale in various directions are guaranteeing clean seeds and plants. Others, like your correspondent, "B. R. L., Dulwich," confess to more or less disease each season, but are able to laugh at it, as it does little or no harm. Sow the seeds in the open the last week in May, the seedlings plant out early in August in ground at least 2 feet deep, water and mulch in dry weather, and never leave the plants longer than two years in the same ground, all will then be well with the Hollyhock. It will probably be news to many growers that dark-coloured or black Hollyhocks produce a larger percentage of plants than yellow, white, or lighter-coloured sorts.

The root-runs of Hollyhocks should be cultivated early, and richly manured. Early planting in the flowering quarters also fosters the development of long, strong pipe-like roots, which foster the development of long, strong flower-spikes, and send the roots burrowing down beyond the reach of injury from frosts.

Not a little of our present success with the Hollyhock arises from frequent changes of site or soil. Hollyhocks have always and everywhere more or less of an architectural character. This had a great deal to do with the evolution or intrusion of the Puccinia pest. Hollyhocks are most effective against stone or brick walls, buildings, terraces, &c.; consequently, they were often grown in ungenial, poor, dry, and unsuitable soils. Worse than this, for artistic reasons Hollyhocks were grown year after year on the same sites, in the same soil; the sites were often fixtures in close proximity to houses or terraces.

What was really needed was an annual or biennial change of soil. Instead of that it got too often poisoned with fungoid spores, and utterly exhausted under permanent crops of Hollyhocks. And yet a mere glance at your illustration, or a walk through the Regent's and other London parks, closer still to Charing Cross than Dulwich, shows to the most cursory observer that Hollyhocks are gross feeders. With fair feeding, deep root-runs, and plenty of water through the growing season, vital force beats back fungoid pests and other diseases. Guard Hollyhocks against exhaustion, and its close ally, codling, and as your readers may see for themselves on p. 291 of the *Gardeners' Chronicle*, the Hollyhocks at Dulwich or elsewhere to-day will match those of olden times, notwithstanding our fungoid pests. *D. T. F.*

FIG. 97.—VERONICA LINDSAYI X : FLOWERS PINK-COLOURED.

after year, we walk our same old paths and see the same flowers spring up in their seasons in the same spots where they have regularly flourished before. Still, amidst all this sameness there is constant change. Every day new pictures appear, new arrangements are effected; and though the clump of Daffodils may bloom in just the same spot as before, it is much altered. The plants about it may die, and some have died, others have grown and developed; the flowers may be more or less, larger or smaller; and in thousands of ways, small points of difference—including some in ourselves—have helped to vary the impression. This constant change amidst fixity, is a great part of the secret of the garden's charm. We walk by the border seeing an old friend again blooming, and we receive a little surprise to see that it has new companions. A stroll round a garden of perennial plants is an invariable journey of discovery. To those who appreciate this sort of garden and gardening, such things as planting beds of Pelargoniums, carpet-bedding, and the like, are unworthy of the

KEW NOTES.

MOMORDICA MIXTA.—This handsome tropical Gourd is now attractively in fruit in the Water-Lily-house at Kew, the large egg-shaped spine-clothed fruits being of a rich crimson colour. A figure of the fruit was published in the *Gardeners' Chronicle*, November, 1894, p. 530. Seeds are ripened freely, but as the species is dioecious they are not reliable, as one may easily grow on half a dozen seedling plants of one sex, and consequently fail to get fruits. Cuttings of the lateral shoots root in a propagating-frame, and by this means one can be certain of obtaining a plant of each sex. Half a dozen fruits are quite sufficient for one plant to mature. The flowers are fleshy, pale yellow, with a purple eye-like blotch, and the leaves are like those of the Vegetable-Marrow in shape, but of a more papery substance.

ENCEPHALARTOS HILDEBRANDTI.

A large plant of this East African Cycad is now bearing seven male cones, the longest of which are

MULTIPLE PARENTAGE.

A NUMBER of letters call my attention to Mr. Druery's article in the issue of the *Gardeners' Chronicle*, for Oct. 22. Mr. Druery's assertion is correct so far as he states it, but there is something beyond this which produces multiple parentage; to obtain the combination of four Ferns, the four parents must be used. The combination of four varieties are very rare, but those of three are more common. I have repeated my experiments more than a hundred times in the last forty years, and these multiple varieties have never been obtained by gradual steps, as suggested, but accomplished at once. My last experiments, to me, have been equally conclusive. *Scolopendrium crispum*, *undulatum*, *muricatum*, *spirale*, and *Victoriæ* (crested), have given one variety (amongst others) with two forms of fronds on the same plant; the one form is *crispum* pure and simple, the other is a combination that is crested, undulate, muricate, and spiral.

Mr. Druery commences his article by saying, "The first and most striking instance was Mr. E. J. Lowe's hybrid between the cruciate form of *Polystichum angulare* and a dense form of *P. aculeatum*, a cruciate *aeuleatum* resulting." Now, singularly enough, this is the hybrid that in 1884 I described to the Linnean Society, accompanied by full-sized characteristic fronds. The late Mr. Thomas Moore returned me my MSS., saying the Society did not acknowledge that this was a hybrid, or that Ferns could be crossed, consequently the paper would not be printed; and Mr. Moore added, "I did see the hybrid character, the blood of each was apparant, but, nevertheless, it has not convinced me as regards crossing Ferns."

Next year (1885), Sir Joseph Hooker wrote, "that the crossing of Ferns was an acknowledged fact." In 1867, I had read a paper at the British Association at Dundee "On the production of Abnormal Ferns," and had a large collection of examples at the Nottingham meeting of the British Association in 1866; no one then believed that such crosses could be produced, except the late Professor Balfour. From 1851 I had been constantly exhibiting these varietal forms, notwithstanding they were looked upon with distrust. However, the late Professor Edward Forbes urged me to persevere; and afterwards Mr. Clapham, Dr. E. F. Fox, and Colonel Jones each repeated the experiments, corroborating my results. Dr. Fox took the greatest care in isolation, and in mixing the spores in different proportions, and stated that it was certain that more than one male organ had acted in the impregnation. Mr. Moly and Major Cowburn also helped, and gave encouraging advice. It was shown to me that there was no force in the antheridia (or male organs) to enable it [its contents] to be projected from one prothallus to another; but I pointed out that I used the skipjack for its conveyance. I had found that when prothalli had remained without frond-life for several years, on the skipjack being introduced fronds appeared in twelve days. On repeating the experiment in the present year (for the Biologist Exhibition) on prothalli that had been isolated for three years, fronds again appeared in twelve days, and these were at the exhibition. I had also a collection of 250 fully-grown varieties of my own productions, and the universal expression was that nothing like them had ever been seen before. After examining these for two days, Mr. Moly said that though he had spent his life in the study of Ferns, and knew most of the good varieties, he was astounded at the marvels that were exhibited.

My experiments have not been confined to Ferns. I am working on other plants, animals, birds, &c. More than twenty years ago a swan of mine had an egg impregnated only sixteen hours before it was laid, and a young swan was the result. This was said by a most eminent biologist to be an impossibility, and that a wild swan had visited the female. In the present year I made preparations to repeat the experiment. I isolated some hens for five weeks, and on knowing that an egg was to be laid on a certain day, a male was introduced; this was repeated six different times with different hens, the eggs were impregnated only an hour to two hours before being laid, and in all six instances chickens were

hatched. I have produced chickens in which the eggs were fertilised in one and two hours, and also from one to eight days with one coition, the eggs being some of them impregnated when the shell was calcareous, and others whilst they were membranaceous. The birds were at the biological exhibition together with two ducks from a double yolk egg, &c., another fact said to be impossible.

I ask Mr. Druery to produce my multiple varieties by any number of generations. He cannot do it; they must be produced at once and in a different manner to what he has stated, previous crosses would have produced quite a different result to those I have raised. Such anomalies are not yet understood, they will be eventually, perhaps not in my life-time; but

to be unworthy or unhandsome, a very large proportion compares favourably with the best of the imported species, and at the same time the plants have the merit of being different to them, and flower at different seasons. *Cattleya* × *Maroni*, the subject of our illustration (fig. 98), is a very good example of this, for its flowers are freely produced (the plant from which the illustration was taken having seven flowers on a spike), novel in form and colour, and delicately fragrant. It was raised by Mr. Chas. Maron, of Brunoy, Seine-et-Oise, France, and was exhibited by him at the Royal Horticultural Society on October 25 this year, when the Orchid Committee awarded it a First-class Certificate.

As will be seen by the illustration, the seed parent,

FIG. 98.—CATTLEYA × MARONI.

future generations will know that more than one male germ has originated multiple parentage, and that more than one manner of propagation may be shown. *E. J. Lowe*.

CATTLEYA × MARONI (VELUTINA ♀, DOWIANA AUREA ♂).

As time goes on, hybrid Orchids are being steadily increased in numbers, and sufficient good things appear each year to warrant the continued labours of the hybridist engaged in this kind of work, though occasionally one is led to demur at some of the poorer forms obtained from injudiciously crossing in the easily-worked genus, *Cypripedium*. But such matters soon right themselves in gardens, for the good things are taken care of, and the poorer ones get in course of time elbowed out of cultivation. The crosses made with *Cattleyas* and *Laelias*, and by crossing the two genera named, have produced very happy results, for while none of the progeny can be said

C. velutina (fig. 99, p. 333), asserts itself, especially in the form of the labellum, its narrow base, and the peculiar rounded front lobe. In colour the sepals and petals are of a peculiar bronzy-yellow or old-gold tint; the labellum yellow at the base, the front portion veined and tinged with purplish-crimson, the more pronounced veining being raised above the surface. It should be said that originally the late Professor Reichenbach thought *C. velutina* (which first flowered with Joseph Broome, Esq., in 1870) was a natural hybrid between *C. bicolor* and a form of *C. Leopoldi*, but since that time it has on several occasions been imported in quantity, of a true character, and that theory, therefore, is much weakened.

WINDOW GARDENING.

At this season of the year, the thoughts of all who love their window-garden turn to the important question—"What shall we put in our window-boxes for the spring?" Often it is difficult to think of new

combinations when one has not much time to give to the subject, and it is hoped that the following suggestions may prove useful to many:—

(1). An early and very beautiful display can be had by edging the front and sides of the window-box with a thick band of single-flowering Snowdrops (2s. 6d. per 100), and filling the centre and back entirely with the large Golden Crocus (largest yellow, 2s. 6d. per 100).

(2). Even earlier than the Crocus blooms the cheerful little winter Aconite, and when the flower is over, the green frill which each blossom wore round its neck is still beautiful, and sets off other flowers. Therefore, my second suggestion is, that winter Aconite roots (2s. 6d. per 100), and those of purple Crocuses (large blue, 1s. 9d. per 100), be evenly distributed close together throughout the box. This will scarcely be as showy as the yellow Crocuses above, but I think it will have its charm for some people.

(3). In the same manner the beautiful blue *Scilla præcox* (6d. per dozen) may be grown in conjunction with the winter Aconite; and from the time when the first "gilt spangles" of the winter Aconite appear, very early in the opening year, until the fading of the brilliant blue *Scilla* in May, the effect will always be charming.

(4). A very lovely box might be produced by an arrangement according to taste, either mixed evenly in little clumps, or disposed in lines, of pure white Crocuses (Mary Stuart or Mont Blanc, at 6d. per dozen; or Sutton's Inimitable, white, at 8d.), and *Scilla præcox*. These will usually bloom simultaneously, and will then be extremely effective.

(5). My next suggestion consists of a groundwork of white Dog's-tooth Violets (1s. per dozen), whose beautiful dappled foliage will continue to give pleasure to the eye long after the flowers have disappeared. Amongst these are to be disposed groups of gentian-blue Glory of the Snow (*Chionodoxa sardensis*, 9d. per dozen).

(6). Another pretty effect can be produced by laying down a carpet of double white Daisies closely planted together, through which groups of large purple Crocus spring at intervals.

(7). For those who are contented to wait a little longer for the perfection of their spring window-garden, an edging of white double Daisies along the front, backed with low-growing pink Tulips will probably give satisfaction. Proserpine, at 2s. per dozen, is a very beautiful Tulip, and well suited for the purpose; but Cottage Maid, at 1s. 9d. per dozen, or the rose-coloured Joost Van Vondel, at 1s. 3d., will probably answer well.

(8). A similar arrangement with different materials might be made by substituting white Dog's-tooth Violets for the double Daisies, and miniature Hyacinths of all colours mixed (2s. per dozen) for the pink Tulips.

(9). Yet another combination in the same form, and to my mind a very charming one, is made by edging the front of the box with *Scilla peruviana* (?) (3s. 6d. per dozen), and backing its brilliant blue by rows of snowy-white miniature Hyacinths (3s. per dozen). This *Scilla* is more delicate than *Scilla præcox*, and might be safer for a covering of cocoanut fibre during the severe weather. It flowers later than its hardier relation, and should coincide with the Hyacinths.

(10). The beautiful *Chionodoxa sardensis* mentioned above (see 5) may be combined with red (Artus, 9d. per dozen) and white (l'Immaculé, 1s. per dozen) Tulips to make a tricolor window-box, and the effect will be bright and pleasing.

(11). A very handsome and unusual combination is formed by clumps of black Pansies, alternating with scarlet Van Thol Tulips (8d. per dozen), or deep red Artus (9d. per dozen).

(12). Less sombre than the above, and very dainty in effect are clumps of pure white Pansies, alternating with blue Forget-me-nots, of which latter the best species to choose from are—(1) The true water Forget-me-not, *Myosotis palustris semperflorens*, height about 9 inches; (2) Sutton's Dwarf Blue, height about 4 inches; or (3) *disitiflora*, an early-flowering Forget-me-not, height 9 inches.

(13). One of the above varieties of Forget-me-not may also be used prettily in combination with red Polyanthus.

(14). Clear yellow Pansies may be grown in alternation with deep purple Auriculas with good effect.

(15). A very graceful and lovely window-box will be one in which purple Aubrietia is planted in front and allowed slightly to overhang the edge, whilst pure white Pansies fill the back portion. The best of the purple Aubrietias is *Leichtlinii*, the seed of which is sold at 1s. 6d. per packet.

(16). My last suggestion is, an edging of white double Primroses in the front, backed by pink miniature Hyacinths (Beauty or Eveline, 3s. per dozen).

Anyone who is so greedy as to desire two feasts during the spring might obtain them by beginning with my first suggestion, and, meanwhile, growing *Scilla peruviana* and white miniature Hyacinths, or some other of the later bulbs in pots, ready to put out as soon as the Snowdrop and Crocus display should be over. E. H. G.

[*Scilla peruviana* is surely too big for the purpose. Is not some other species intended? Ed.]

FIG. 99.—CATTLEYA VELUTINA: FEMALE PARENT OF CATTLEYA X MARONI. (SEE P. 332.)

FLORISTS' FLOWERS.

WINTER-FLOWERING ZONAL PELARGONIUMS.

WHILST these very brilliant and long-flowering plants come naturally under the designation of florists' flowers, seldom they are judged on the usual basis of such flowers. These zonal Pelargoniums are ordinarily grown for summer-blooming, both indoors and outside, and in either way give very striking effects. But still the brilliant hues of the flowers seem somewhat too warm when seen under bright summer sunshine, and many of the most beautiful hues, especially those shaded with diverse tints, materially lose in beauty. But these are glorious late autumn and winter-blooming plants, and it is specially interesting to note how singularly lovely are the hues of the shaded or otherwise rich-coloured flowers, when produced in the dull days of winter.

It is commonly assumed that certain varieties are better suited for winter-blooming than are others;

that is so far true that the best bloomers in summer flower most profusely in winter. Practically, all varieties will bloom very well in winter if the plants be properly prepared for that season, and also have furnished to them the needful conditions.

One of our most successful growers of these Pelargoniums, who is a private gardener, and whose facilities are not those which can be furnished so liberally at Swanley, Lewisham, or in other florists establishments, makes it his rule of practice to take the points of the stoutest shoots from the plants about the middle of February, that have been blooming from the beginning of the previous October, and insert them singly into small pots, and stand them on a shelf in a warm-house to root. In a few weeks these are ready to shift into 5-inch pots, and may even receive the first pinching. Then they are got into 7-inch pots, and when partially rooted, stood outdoors on a fine gravel or ash-floor, in the full light of the sun, for the summer. Here they are further occasionally pinched, all bloom-buds being rigidly picked off. An occasional watering with weak liquid-manure is given when the pots are well filled with roots. About the third week in August pinching ceases, and the plants then make free growth. By the middle of September they are put into a light, airy span-house that is but moderately heated, and in two or three weeks become brilliantly flowered, the colours being wonderfully varied, shades and hues singularly refined and beautiful; flowers large and rounded, trusses of good size, and in most cases borne in great profusion. No wonder such a body of plants, probably six to seven dozen, by the end of October, presents a mass of beauty in flowers that at that time of the year no other plants could rival, much more excel. Those who wish to have blooms later into the winter, may easily secure that by pinching and housing rather later. When plants are thus prepared for the purpose, it is quite easy to have them blooming gloriously for a period of fully five months. A. D.

PLANT NOTES.

SCOLOPENDRIUM NIGRIPES.

(= ACROSTICHUM LINDENI.)

AMONG the many interesting plants exhibited at the last Ghent Quinquennial by M. Linden, in commemoration of his father's work, was a Fern named *Acrostichum Lindenii*. In habit it somewhat resembled *Adiantum reniforme*, but the fronds were coarser. An example of it, presented to Kew by M. Linden, has lately produced fertile fronds, which enabled Mr. Baker to at once identify it as *Scolopendrium nigripes*, Hook. (*Schaffneria nigripes*, Fée). It was figured and described in Hooker's *Kew Journal of Botany*, ix. (1857), and there are specimens of it in the Kew Herbarium, from Mexico and Guatemala. I cannot find, however, that it has ever been in cultivation until M. Linden introduced it. The Kew example has formed a rosette of roundish leaves; with stipes less than an inch long, and springing from this is a second series of fronds with smooth black stipes, 3 inches long, and a thick, brittle, reniform or roundish blade, 3 inches across; glaucous green above, yellow-green below, the sori in irregular linear patches. It differs from all other members of the genus, of which about a dozen are known, in having no distinct midrib, but the veins are flabellate, uniting towards the edge. S. Delavayi, from North Muney-pore, figured in the *Journal of the Linnean Society*, xxv., pl. 41, appears to have the same characteristics as S. nigripes, except that its fronds are round, with a cordate base. To lovers of indoor Ferns, M. Linden's plant has much to recommend it. W. W.

TAPEINANTHUS HUMILIS.

A most charming little plant bearing this name, I have just seen at Prof. M. Foster's, Shelford, and it is all the more interesting because it is hardly known at all in cultivation. It at once suggests a comparison with *Narcissus*, and to this genus it appears to be closely allied, although quite distinct in having a corona consisting of only six minute scales. The

leaves are filiform, 2 or 3 inches in length, and the scapes of similar height, bear each an erect, bright yellow-coloured, and rather spreading flower, about $\frac{1}{2}$ inch long, and with quite narrow segments, which are just equalled in length by the six stamens. It was growing in a pot out-of-doors, and flowering at this time of the year, its value among choice bulbs is clearly evident. Perhaps there are among readers of this paragraph, those who, having friends resident in Spain, could send some plants of this species home, and I may, therefore, repeat the Professor's remarks that he finds it succeeds with precisely the same kind of treatment accorded to *Narcissus monophyllus*. It is a native of Spain and Morocco, and is described by Mr. Baker as very rare. *R. I. L.*

FOREIGN CORRESPONDENCE.

MR. LEMOINE'S NEW DOUBLE SEMPER-FLORENS BEGONIAS.

THE most striking of the novelties introduced into commerce this autumn by Mr. Lemoine, are undoubtedly his new Double Semperflorens Begonias. They are the result of about four or five years' steady work of crossing and selecting innumerable seedlings, doubtless the forerunners of a class of plants destined to play as great a rôle as the double tuberous-rooted have done.

The change obvious on comparing the new varieties with the ordinary single semperflorens varieties, is remarkable, both male and female flowers being greatly transformed. Stamens, pistils, petals, &c., have assumed various graceful forms, the male flowers being most perfect, and the whole arrangement of petals, &c., combines to form very pretty, more or less ball-like flowers of about $1\frac{1}{2}$ inches in diameter. The leaves are practically the same as the ordinary run of semperflorens Begonias, perhaps even a little more fleshy in one or two of the varieties, and vary in colour from bright-green to bronze, and even darker according to a more or less sunny position. When grown in pots as specimen plants, and for this they are as yet only really suited, flowering both winter and summer, they grow to about 2 or $2\frac{1}{2}$ feet (70 to 75 cm.) high, including, of course, pot, about 8 inches (20 cm.) high, forming rather tall, elegant plants. A slight drawback, however, especially when wishing to use them as border or group plants, is that they do not branch sufficiently, with one exception, although among the seedlings there are several which seem to be better in this respect, and we may therefore look for improvement.

They bloom in tufts at the ends of the branches, five to ten flowers being open at a time, and the first flowers, as practically with all double Begonias, are the best, the succeeding ones containing more semi-doubles and singles. This is most apparent when planted in the open, as the heavier, double flowers get knocked off more easily by wind and rain, leaving the others to fill the vacancy. The change in the tints of flowers and foliage is in the open also more marked.

The following are the four named varieties:—

Boule de Neige.—Leaves bright green; the flowers, which are well double, are white, assuming a rosy tint in the open. Stamens and pistils, are, as with all the varieties, yellow, either lighter or darker.

Gloire du Montet.—Also a green-leaved variety, which, however, in the open becomes slightly bronzed. The flowers, which are of a pretty dark-rose, are very double, and assume in opening a somewhat reddish tint.

Nancy.—This is one of the best, with green foliage, and flowers of a somewhat more delicate rose than those of *Gloire du Montet*, and very well formed and double. The rims of the flowers are also slightly darker than the centre of same; this variety makes nice bushy plants.

Triomphe de Lorraine.—Leaves bronzy-green, becoming in the open (like *Vernon*) dark reddish-brown. Flowers are dark carmine-red, becoming lighter on passing, and also appearing so under glass.

As already mentioned, they are very effective especially as winter-flowering specimens, and although they will in due course doubtless be surpassed by still better varieties, especially as regards the varieties for groups, they are at present unique, and will doubtless remain so for some time to come. They show what can be done by working with a definite object in view. *H. R. Werdmüller, Nancy, October, 1898.*

THE WEEK'S WORK.

THE ORCHID HOUSES.

By W. H. WHITE, Orchid Grower to Sir Trevor Lawrence, Bart., Burford, Dorset.

Orchids now Growing.—Plants of *Pescatorea Lehmanni*, *P. Klabochiana*, *P. cerina*, *P. Dayana*, *P. Roezli*, *Bollea coelestis*, *B. Patini*, *B. Lalandi*, *B. Schroderiana*, *Huntleya meleagris*, *H. albida*, *H. Wailesiana*, *Batemannia Burti*, *B. Colleyi*, and *Chondorrhynca* (*Stenia*) *Chestertoni*, are now growing freely, and as soon as the night temperature gets low a few degrees more heat than is maintained in the intermediate-house should be afforded them, and the cool part of the East Indian-house is a suitable place in the winter, as none of these plants seems to thrive in a lower temperature than, or much above 60° . Let them be kept near the glass in a shady position, preserving a constantly saturated atmosphere around them, and never allowing them to get dry at the root. Notwithstanding all the dampness afforded, a small species of *acarus* (red-spider) is apt to infest the undersides of the leaves, which, if not quickly eradicated by sponging, soon change the latter to a sickly colour.

Galeandra Devoniana is a pretty Orchid, now coming into bloom, the flowers being produced at the apex of the newly-made growth. The north or shady side of the East Indian-house is a suitable place for it. Keep the points of the stems as near to the roof-glass as possible, without actually touching it; and after the flowers have faded afford the plant a short rest by keeping it moderately dry at the root. Immediately growth recommences, the plant should have an abundance of heat and moisture till the flowering season again comes round.

Cattleya Bowringiana.—At the present time this plant forms the chief attraction in the *Cattleya*-house, for although the individual flowers are smaller than most *Cattleyas*, they are of a rich colour, strong spikes of which carrying about twenty blooms each, produce a fine effect, especially by artificial light. As soon as the flowers fade, repotting should be attended to if it be necessary, because in a very short time new roots will protrude from the base of the flowering pseudo-bulbs, and any delay in repotting would result in injury. The plants should be carefully turned out of their pots, or in the case of well-rooted specimens the pots should be broken. If the roots have seized upon the drainage crocks, let them alone, and place the mass just as it is in a larger pot, filling up with fresh crocks, and such compost as is generally made use of. After the flowers fade, whether the plants have been repotted or not, they should receive only sufficient water to keep the pseudo-bulbs and leaves plump and fresh-looking till growth recommences.

Cattleya Percivalliana having completed its new pseudo-bulbs, should be kept only moderately dry at the root.

Cymbidium Lowianum.—Strong plants which have completed their growth, and are not showing flower-spikes, should be kept for a few weeks longer on the dry side, otherwise they will start into growth, but not produce flowers. Those plants possessing flower-spikes, should receive moisture at the root. The plant should be kept at the lightest and coolest end of the intermediate-house, with its foliage almost touching the roof-glass.

Dendrobium thyrsiflorum, *D. densiflorum*, *D. Schroderæ*, *D. Griffithianum*, *D. palpebræ*, *D. Guibertianum*, *D. Farmeri*, *D. suavisimum*, and *D. chrysotoxum*, which have ceased to grow, may be removed to a cooler and airier house; but if any of these plants should perchance have started growth, a light position in the East Indian-house will be best for them until the growth is completed; for as plants of this section of *Dendrobiums* grow rapidly, there will still be time to get these late growths ripened.

Miscellaneous.—The present mild weather cannot be expected to endure much longer, and as soon as

frost appears imminent, the plants named below should be removed from the cool-house to the cooler part of the intermediate-house, and where they must have abundance of light and air:—*Dendrobium Wattianum*, *D. infundibulum*, *D. Jamesianum*, *Masdevallia tovarensis*, *M. Schlimi*, *M. ephippium*, and all those of the *M. Chimæra* section. *Lælia harpophylla*, *L. monophylla*, *Odontoglossum Kramerii*, *Oncidium Warscewiczii* (*Weltoni*), *O. aurosum*, *O. bifrons*, *Cryptophoranthus Dayanus*, *Angræcum falcatum*, and *Aërides japonicum*. Carefully regulate the temperatures in each division as advised in former calendars, and, above all things, guard against an arid atmosphere.

FRUITS UNDER GLASS.

By G. NORMAN, Gardener to the Marquess of Salisbury, Hatfield House, Herts.

The Early Vinery.—The outside border (if any) of the early vinery should have, if the Vines are to be started in about three weeks, a top-dressing of loam and bone-meal, or some other manurial aid, and if on examination the rain is found not to have penetrated to the bottom of the border, a copious application of tepid water should be made. Having done this, put on a 2-feet-thick layer of Oak, Beech, or Spanish-Chestnut leaves, making this quite firm, and covering the whole with long stable-litter.

The Peach-houses.—Preparation for the next forcing season should commence as soon as the foliage has fallen from the trees, not delaying the work until the buds become prominent, and of course more liable to injury by the various processes of pruning, dressing, &c. Trees in the early-house, and all those which were forced early this year, should be the first taken in hand, finally cutting out all weak and surplus shoots, removing those which have reached the limits of the trellis or the tree, and thinning out the bearing-shoots, so as to avoid the crowding of the foliage. The pruning should be done with a sharp knife, and all cuts made should be made slantingly, and close to triple-buds, or a stout wood-bud. Should it be found necessary to use the pruning-saw, let the rough edges of the bark be made smooth with the knife. The pruning being finished, detach the tree entirely from the trellis, and tie the smaller shoots loosely to the main branches, the latter being secured to the trellis. Having done this, let the wood-work be cleaned, using for the purpose soft-soap and hot water. A large brown-scale is troublesome on Peach-trees at times, but it can be got rid of with a hard scrubbing-brush and soft-soapsuds, using the soap at the rate of 4 oz. to 1 gallon of water. The day after washing the trees, paint them over with a mixture of soap and water of the same strength, with one-twentieth of a gallon of the XL-All dipping compound added, sulphur, clay, and cow-manure being stirred in with it, to afford consistency and body. In dressing the trees with this mixture, dab it into all the rougher parts of the old wood, so as to smother, and thus annihilate the insects harbouring therein; and in dressing the young shoots, let the brush be drawn upwards to the points of the shoots. After the dressing has dried, the trees may be secured to the trellis in the usual manner. In doing this, a beginning should be made with the main branches, using for these tarred string or osiers, taking the precaution to put a patch of leather or cloth round the branch if the pressure is severe. The weak shoots may be tied in with bast of some sort. Let the brick-walls of the house be limewashed, and the surface-soil renewed with turfy-loam and lime-rubble, enriched with partially-decayed bone-meal or manure. The house should then be left open in order to retard the trees as much as possible till forcing is begun. The preparation of the earliest Peach-house being finished, the next in point of earliness may be similarly treated, and so on, till all of them have been put in good order. It is more difficult to afford the necessary rest to the trees if the Peach-houses are filled with plants; yet even then a low temperature should rule, the trees receiving the first consideration. If the borders in the late-house are getting dry, at once afford them a thorough application of water.

Pot-Strawberries.—The time has come when these must be housed or protected in some manner, notwithstanding the plants bear sharp frosts without harm. The best place to winter pot-Strawberries is a cold-pit or frame, and the next best is to plunge the plants up to the rim in fine coal-ashes, while standing on a well-drained bottom, in beds 6 to 8 feet wide, sheltered from harsh winds by a wall or close fence. Some gardeners place the plants on their sides in tiers several feet high, either facing

two ways, or building the tiers against a wall; but the plants are apt to suffer from lack of moisture in the pots, and I do not recommend this method.

THE KITCHEN GARDEN.

By J. W. McHATTIE, Gardener to the Duke of WELLINGTON, Strathfieldsaye, Hants.

Cauliflowers.—Any plants of that fine Cauliflower, Autumn Giant, which may be showing heads, should be lifted with as much soil as will hang to the roots, and heeled-in close together in a cold pit, frame, or open shed, covering them in the latter shelter with clean straw in frosty weather. Continue to plant young Cauliflower-plants out under *cloches* and hand-lights on the south border, or plant out in cold pits and common garden-frames. To prevent spindling, allow 4 inches or more space from plant to plant, and afford air freely at all times when there is no frost.

Spring Cabbages.—It is not yet too late in the South to plant Cabbages. Let the Dutch-hoe be freely used between the rows of Cabbages planted in October and earlier, choosing a day for the job when the soil is not sticky, and leave it with a crumbly surface.

Protecting Broccoli.—The Broccoli plants, which at this date are growing freely owing to the warmth of the soil and the much-needed rains, will be in a tender condition, and more than usually likely to suffer from frost. It will therefore be advisable to give them a slight check, by lifting them with as much soil as will conveniently come away with the roots, laying them in a slanting position in a trench, with their heads turned to the north. In doing this sort of work, the first trench should be thrown out 18 inches wide and 9 inches deep, a space of 2 feet being kept between the succeeding rows, and the plants should lay with their heads near to the ground, but not touching it. Another method is not to lift entirely, but to take out a spadeful of soil on the north side of a plant, squeeze over the stem in that direction, and with the soil similarly removed from the next plant cover the exposed part of the stem, the weight of which will keep the lowered plant steady; and so on through the entire plantation.

Salads.—Lettuces growing in pits capable of being heated must be daily aired, and water afforded when the soil needs it. In wet and stormy weather give air, but do not draw off the lights. Chervil and Parsley transplanted last month, also Radishes, Mustard and Cress, sown in the open border, will be the better, should sharp frosts occur, for some kind of protection, such as that afforded by a few branches of evergreens, and employing Russian mats in very severe weather.

HARDY FRUIT GARDEN.

By W. H. DIVERS, Gardener to the Duke of Rutland, Belvoir Castle, Grantham.

The Pear.—This fruit requires more heat than the Apple to bring it to perfection, and, except in the southern counties, a wall is necessary for such varieties as Glout Morceau, Beurré Diel, Beurré Rance, Thomeon's, Crassane, Ne Plus Meuris, and many others. Trees of these varieties will bear good crops sometimes away from walls, but the fruit is seldom fit for the dessert. The early and mid-season varieties occasionally do well as pyramids or standards in the midland and northern counties, but owing to lack of protection at the period of flowering the gardener has many failures to deplore. The best soil for the Pear is a retentive loam of at least 2½ feet deep, and containing scarcely any lime; still, good fruits may be grown on clay soil if this be properly drained; and on soils overlying the red sandstone and whinstone, if these are of sufficient depth. The wilding Pear-stock is best for soils that are deep and of good quality, and where the sub-soil is suitable for the growth of fruit-trees; but as the Pear-stock is naturally deep-rooting, it cannot be recommended for shallow soils. For these the Quince forms the best stock, owing to the abundance of roots produced near the surface of the ground. The Pear on the Quince grows to moderate dimensions, and trees budded or grafted upon it may be planted at half the distance apart of those on the wilding stock. As a general rule the fruits from trees on the Quince are larger and of better colour than on the wilding, but the quality of the fruit is less good. The method of training a Pear-tree on a wall may be horizontal, fan, or single and double cordon. There are a number of the first two forms at Belvoir, and I am unable to discern any difference between them in regard to their cropping qualities; fan-shaped trees have an advantage in gaps being more easily filled up if a branch die, which is

always difficult with horizontally trained trees. Single, upright, or oblique cordons, on the Quince-stock cover a wall quickly if they are planted at 3 to 4 feet apart, and a crop of fruit is more quickly obtained in this way, as well as greater variety. A west wall forms the best aspect for early and mid-season Pears, and in the southern counties it is warm enough for any variety, but in the midlands and northern counties of England, and in Ireland, Scotland, and Wales, late varieties require a south wall to bring the fruit to perfection. The east aspect is not to be recommended, except for late-blossoming Pears. The following varieties succeed on pyramids in warm seasons in the midland counties, and the names are given in order of ripening: Beurré Giffard, Williams' Bon Chrétien,* Beurré d'Amanlis, Beurré Hardy, Welbeck Bergamotte, Louise Bonne of Jersey,* Beurré Capiaumont,* Dunmore, Doyenné du Comice, Conseiller de la Cour, Marie Louise,* Madame Treyve, Thomson's, Beurré du Buisson, Passe Crassane; and of stewing Pears: Catillac, and Bellissime d'Hiver. Those marked with an * succeed on standards. Selection for walls in their order of ripening: Beurré Giffard, Jargonelle, Fondante d'Automne, Williams' Bon Chrétien, Beurré d'Amanlis, Louise Bonne of Jersey, Beurré Superfin, Beurré Hardy, Doyenné du Comice, Marie Louise, Thomson's, Beurré du Buisson, Pitmaston Duchess, Zephirin Gregoire, Beurré d'Anjou, Beurré de Jonghe, Winter Nelis, Glout Morceau, Doyenné d'Alençon, Easter Beurré, Josephine de Malines, Olivier des Serres, Passe Crassane, Ne Plus Meuris, Bergamotte d'Esperen.

THE FLOWER GARDEN.

By H. WALTERS, Gardener to Lord GERARD, Eastwell Park, Ashford, Kent.

Planting Roses.—The present month offers the most suitable time for planting Roses, although they may be planted as late as March, and potted Roses as late as May and June. The situation which suits the Rose best is one sheltered from cold winds, but which is at the same time open and exposed to the sun. Roses much shut in by buildings, trees, or crowded by other plants, are apt to suffer from mildew; therefore, a spot sheltered on the north and east sides, with an open exposure to the south and west, is a good place for a Rose-garden. Although the Rose will, to a certain extent, grow in almost any kind of soil, a good strong deep loam is the best. The land must be well drained, and if it be clayey or retentive of water, a considerable portion of charred soil, ballast, wood-ashes and road-grit may be incorporated with it in the process of trenching, cow or pig-manure being employed at the same time. The Rose does not grow satisfactorily in very light, sandy, peaty, or chalky soils, and where such is the staple, it should be removed from the beds to the depth of 2 feet, and replaced with some strong loam, preferably the top spit from a pasture. In planting dwarf Roses, see that the point of union between the bud and the stock is buried an inch or two below the level of the ground, and that the roots are laid out evenly and regularly at the bottom of a wide hole, which should be rather convex in the middle, and the soil made firm before putting in the plant, and also after it is planted.

Standard Roses should be staked, and lightly secured at the time of planting. A good mulch of rotten pig or stable-dung should follow the planting, it being buried or covered with soil in the following spring. I give a list of good varieties:—

Dark-coloured H. P. Roses.—Abel Carrière, Black Prince, Crown Prince, Prince Camille de Rohan, Earl of Dufferin, Horace Vernet, Louis Van Houtte, Reynolds Hole, Sir Rowland Hill, Sultan of Zanzibar, and Xavier Olibo.

Pink-coloured H. P. Roses.—Abel Grand, Baroness Rothschild, Captain Christy, Mrs. Sharmian Crawford, Mrs. John Laing, Heinrich Schultheiss, Her Majesty, Madame Gabrielle Luizet, Jeannie Dickson, Marchioness of Downshire, Mrs. George Dickson, and Marchioness of Dufferin, François Michelin.

Red-coloured H. P. Roses.—A. K. Williams, Alfred Colomb, Arthur Dickson, Beauty of Waltham, Camille Bernardin, Charles Lefebvre, Duchess of Bedford, Duke of Edinburgh, Duke of Teck, Dupuy Jamain, Etienne Levot, Fisher Holmes, Captain Hayward, Lady Helen Stewart, Lady Arthur Hill, Gustave Piganeau, General Jacqueminot, Magua Charta, Marie Baumann, Susanne-Marie Rodocanachi, Maurice Bernardin, Marie Rady, and Ulrich Brunner.

White H. P. Roses.—Marchioness of Londonderry, Margaret Dickson, Souvenir de la Malmaison, Violette Bouyer, Boule de Neige, and Merveille de Lyon.

Gloire Lyonnaise is a Rose which should be in every garden; the colour is a pale yellow; the flower-buds are long and filbert-shaped, and it is an enormous bloomer, continuing till late in the autumn; and the plant is robust, and almost evergreen.

Tea Roses, which are tenderer than the hybrid perpetuals, should be planted where they are protected from cold winds by a board fence, hedge, or wall. The following are some good varieties: Beauté Inconstante, Bouquet d'Or, Catherine Mermet, Céline Forestier, Comtesse de Nadaillac, Madame Lambard, Marie Van Houtte, Maréchal Niel, Maman Cochet, The Bride, Souvenir d'Elise Vardon, S. de S. A. Prince, S. de une Ami, Madame Berard, Ethel Brownlow, and Innocente Pirola.

Hybrid Teas.—For general garden decoration, and for obtaining blooms throughout the summer and autumn months, the class called Hybrid Teas surpasses all others, and of these the following may be selected: La France, Augustine Guinoiseau, Cheshunt Hybrid, Grace Darling, Pink Rover, Viscountess Folkestone, Caroline Testout, Lady H. Grosvenor, Kaiserin A. Victoria, and Belle Siebrecht.

PLANTS UNDER GLASS.

By W. MESSENGER, Gardener to H. C. BERNERS, Esq., Woolverstone Park, Ipswich.

Carnations.—A light, airy house is essential for the successful treatment of tree Carnations, moderate fire-heat being employed in cold damp weather, ventilation at the same time being afforded by the upper sashes. Water should be very sparingly used. Green-fly is often troublesome, and measures must be taken to kill the pest as soon as detected. If flowers are wished for during the months of November, December, and January, the plants must be gently forced.

Marguerite-Carnations fail to open their blooms if kept in a low temperature, and in the case of these, a gentle warmth is very necessary; and should the plants be spoiled by being forced, it is but a small loss, fresh plants being easily raised. Miss Joliffe among tree varieties is one that bears gentle forcing, the only noticeable effect that forcing has on it, being that the flowers are rather small and paler in colour. As forcing tends to weaken the plants, it is not wise to propagate from forced plants. Uriah Pike and other varieties that were layered early in cold frames, and are well established in 9-inch flower-pots, may be subjected to gentle warmth, which will induce them to produce flowers. Later layers, well established in 4-inch flower-pots, may be placed into 6-inch ones, and then plunged in coal-ashes in cold pits. Layers of Miss Joliffe or any others intended for flowering in pots next year should be lifted without loss of time and potted. Early-layered Souvenir de la Malmaison will, under fair treatment, have grown into strong plants, and if the plants have plenty of roots they may be re-potted into 6-inch pots. A compost consisting of fibrous loam, with one-fourth part of leaf-mould and decayed stable-dung, with coarse silver-sand, and adding a small portion of finely-broken crocks or lime rubble, will suit them. Pot them firmly, afford good drainage, very little water, and a cool, airy house.

Bulbs.—Another batch of Dutch bulbs may be potted, in the manner advised in a previous calendar. Plants of Spiræa, Deutzia, and clumps of Lily of the Valley should also be potted-up. Lily of the Valley crowns are the better for being frozen before they are forced; and retarded crowns will be found preferable to the ordinary crowns, which seldom force satisfactorily before the New Year. Retarded clumps of Spiræa (Hoteia) are likewise very suitable for being forced at this date, needing very little warmth to bring them into flower. The potted bulbs which are at the present time covered with coal-ashes or Cocoa-nut fibre, should be occasionally examined, and those which have pushed up 2 or 3 inches in height, and have plenty of roots, removed to frames and pits, and shaded till the growth assumes the green tint, when they may be placed in heat at any time afterwards.

Libonias.—Those which are showing flower may be placed in the conservatory, in situation where cold draughts are not likely to reach the plants, the foliage being tender, and soon turning yellow, and dropping if checked by cold. The remainder of the stock of these plants should be encouraged by an occasional application of weak manure-water, and a temperature of 45° to 55°, air being afforded whenever the weather is mild.

APPOINTMENTS FOR THE ENSUING WEEK.

SATURDAY,	Nov. 5	North Scotland Root, Vegetable, and Fruit Show. National Rose Society, at Hotel Windsor (2 P.M.). Royal Horticultural Society's Committees. National Chrysanthemum Society's Show at the Royal Aquarium, Westminster (3 days).
TUESDAY,	Nov. 8	Chrysanthemum Shows at Birmingham (3 days); Highgate (3 days); Yeovil; and Coventry (2 days).
WEDNESDAY,	Nov. 9	Chrysanthemum Shows at Bournemouth (2 days); Jersey (2 days); Wisbech (2 days); Hanley, Staffs. (2 days); Cardiff (two days); Liverpool (2 days).
THURSDAY,	Nov. 10	Harrogate Chrysanthemum Show (2 days). Cambridgeshire Horticultural Society's Chrysanthemum Show at Cambridge; Windsor, Eton and District Chrysanthemum Show; Sidcup (Kent) Horticultural Society's Chrysanthemum Show (two days).
FRIDAY,	Nov. 11	Chrysanthemum Shows at Nottingham (2 days); Leicester (2 days); Sheffield (2 days); Dalkey, Wilmslow, Cheshire (2 days); Bradford (2 days); Huddersfield (2 days); Altrincham, Bowdon, Sale and District Chrysanthemum Society's Show (2 days); Eccles Chrysanthemum Show (2 days).

SALES.

MONDAY,	Nov. 7	Dutch Bulbs, at Protheroe & Morris' Rooms. Clearance Sale of Greenhouses, Heating Apparatus, and Fittings, at the Avenue Nursery, Brondesbury Park, Willesden Lane, N.W., by order of Mrs. E. J. Goubert, by Protheroe & Morris.
TUESDAY,	Nov. 8	Dutch Bulbs and Continental Plants, at Protheroe & Morris' Rooms. Absolute unreserved Clearance Sale of Glass Erections, Apparatus, Fittings, Horse, Van, Utensils, &c., by order of the Trustees under a Deed of Assignment <i>Re</i> Biddles & Co., by Protheroe & Morris (2 days).
THURSDAY,	Nov. 10	Dutch Bulbs, at Protheroe & Morris' Rooms. Special Sale of Hardy Border Plants and Rare Bulbs, at Protheroe & Morris' Rooms. Important Sale of Nursery Stock, at the Portland Grange Nurseries, Matlock, by order of Messrs. Hurd, Sons & Co., by Protheroe & Morris (2 days).
FRIDAY,	Nov. 11	Clearance Sale, by Auction, of the whole of the Nursery Stock and Glass, on the Premises, Sky Peal's Nursery, Walthamstow, by Mr. H. W. Rendell, 99, Queen Street, E.C.
		Imported and Established Orchids, at Protheroe & Morris' Rooms. Dutch Bulbs, at Protheroe & Morris' Rooms.

AVERAGE TEMPERATURE for the ensuing week, deduced from Observations of Forty-three Years, at Chiswick.—43° 2'.

ACTUAL TEMPERATURES:—

LONDON.—November 2 (6 P.M.): Max., 59°; Min., 48°.
PROVINCES.—November 2 (6 P.M.): Max., 60°, east coast of England; Min., 55°, north-east Scotland.
Mild, stormy, rainy.

THE brief announcement made in our last issue that the judge of the County Court at Hastings had pronounced a decisive judgment on the question, What is an amateur? will have been read with much satisfaction. It appears that an exhibitor in the amateurs' classes was, in the first instance, awarded certain sums as prize-money. Payment of the prize-money was, however, refused on the ground that the exhibitor was not an amateur. The prize-winner protested, and sought a remedy in the County Court. It was alleged for the defence that the exhibitor in question was a dealer in plants, and issued a printed priced catalogue. This must have been proved to the satisfaction of His Honour, or he would not have given his

verdict against the exhibitor and in favour of the society.

If abundant experience did not show the contrary, we should have supposed that the exercise of common sense and good feeling, such as ought to animate all the Fellows of a society, would have precluded the necessity of invoking the aid of the law. Unfortunately, however, good feeling and *esprit de corps* vanish in the presence of self-interest, whilst common sense seems as difficult to define as the question What is an amateur? This latter point is often dealt with less as an abstract question than according to particular circumstances, and the proclivities and interests of individuals. We have known the same individual exhibitor approve of a particular restriction when it did not apply to himself, but vehemently condemn it when, in the opinion of the judges, he fell within its scope.

We have known instances where growers have systematically and regularly issued price-lists, and still considered themselves entitled to exhibit in the amateurs' classes, on the ground that they were only disposing of their surplus stock! We have also met designations such as that of "amateur nurseryman," a term surely as difficult of definition as a hybrid Tea-Rose!

Now, is it not the object of these "amateurs" to put money in their pockets, it may not be to make a profit, but to "help to cover expenses?" Wherever financial benefit is the object systematically sought and obtained, the grower becomes essentially a dealer, whatever he may call himself, and it is not fair to his brother dealers to accord him the privileges of an amateur. Of course, from the circumstances of their calling, few can know better than the directors of the horticultural press, which is the recipient of so many protests and complaints, published or unpublished, how difficult it is in all cases and in all circumstances to apply this principle strictly without some amount of real, apparent, or, most often, fancied injustice to particular individuals.

It is for the framers of schedules and bye-laws, whilst upholding essential general principles, to enact regulations to secure that no injustice be done to individuals, and to provide, as far as possible, for accidental contingencies. Of course, do what they may, they cannot provide by rule for all the contingencies that may arise, and hence the imperative necessity for exhibitors to submit loyally to the decision of judges and umpires. There must be confidence in the honour and competence of these officials, or nothing but confusion will ensue. An exhibitor who invokes the law by going into the courts cannot be surprised if his colleagues consider him as one who looks more to his own selfish interests than to the welfare of the society or the advance of horticulture. A Society, if there be such, whose decisions are habitually contested, would likewise not rank highly in the consideration of its Fellows or of the public; and such a state of things would point to the desirability of amending bye-laws, and of taking such steps as might be considered necessary to prevent such undesirable proceedings.

HYDRANGEAS IN THE AZORES.—I am sending you some very interesting photographs of Hydrangeas in the Azores. They represent one of the most remarkable instances of the acclimatisation of plants I know of. Hydrangeas were introduced to the Azores some thirty years ago. Now they form a series of hedges of the most beautiful character. The photograph (fig. 100), was taken by Miss ROSE POMEROY at Fayal, in July, 1897. D. Morris, Barbados.

ROYAL HORTICULTURAL SOCIETY.—The next meeting of the Royal Horticultural Society's Committees will be held on Tuesday, November 8, in the Drill Hall, Westminster. A lecture on "Some of the Plants Exhibited," will be given at 3 o'clock by the Rev. Prof. GEO. HENSLOW, M.A., V.M.H.

NATIONAL ROSE SOCIETY.—The Honorary Secretaries of this Society, Rev. H. HONYWOOD D'OMBRAIN and EDWARD MAWLEY, Esq., Victoria Street, Westminster, S.W., desire us to announce that a meeting of the General Purposes Committee will be held, by kind permission of the Horticultural Club, at their Rooms, Hotel Windsor, Victoria Street, Westminster, on Tuesday, the 8th inst., at 2 P.M. The following matters will then come under consideration, viz., the alteration of bye-laws and regulations. Those already suggested:—1, that General Purposes Committee be appointed in December; 2, the reduction of the penalty as to duplicates; 3, new regulation as to the time of removal of the ties from blooms at exhibitions; 4, arrangements for the annual meeting and dinner. The Committee will meet at 3 P.M., to receive the report of the Committee for 1898, report of General Purposes Committee on suggested alteration of bye-laws and regulations, house-list of Committee and officers for 1899, and other business.

THE ROYAL GARDENERS' ORPHAN FUND.—The following special and other donations were announced at a meeting of the executive committee held at the Horticultural Club on the 28th ult.:—Ealing Gardeners' Society, proceeds of exhibition, £15; Sandringham Estate Cottage Garden Society, £5 5s.; Mr. R. McLachlan, Lewisham, £5 5s.; Trentham Horticultural Society, per Mr. P. Blair, £5; Miss Faulkner, Wimbledon Horticultural Society, £5; Mr. J. Selway, Betteshanger Gardens, Sandwich, £2 15s.; Mr. A. D. Christie, the result of opening the gardens at Ragley, Alcester, £1 13s.; Hesse Gardeners' Society, £1 4s. 1d.; Earl Dysart, £1; Mr. C. Sutton, Chevening Park box, 15s. 6d.; Mrs. Wills, 16, Onslow Crescent, S.W. box, 12s. 6d.; Mr. W. Miles, Southampton box 11s. 9d.; Mr. Parker, Stroud, 10s. 6d.; Mr. H. Burbidge, Weigate, 10s.; Mr. N. Kneller, Malshanger Gardens box, 7s. 6d.; Mr. J. Bendell, Ringwood, 10s. 6d. Were it not for these extra source of income the benevolent operations of the fund would be seriously curtailed; annual subscriptions, and especially from the gardener class, being an uncertain, and it is to be feared, a declining quantity. But while the gardeners about the country hesitate to subscribe, the mothers of the children who are periodically ceasing to be chargeable to the fund, owing to the operation of the age limit, write very cheering and encouraging letters of deep thankfulness to the committee for timely aid afforded at a time of grievous need. When will the gardeners of the United Kingdom, in whose special interest this fund was established, awake to the fact that they do not support the fund as they should do, and as it deserves to be supported? It was arranged that the annual general meeting and election should take place on Feb. 17. Several matters of detail were arranged, and the proceedings closed with a hearty vote of thanks to Mr. William Marshall, the chairman.

YORK FLORISTS' SOCIETY.—There was a full attendance at the White Swan Hotel, York, on the evening of Friday, October 28, on the occasion of the presentation of an illuminated address to the Rev. H. VIVYAN, who for four years has held the office of chaplain to the society, and who has had to resign that position owing to his acceptance of a living in Cornwall. Mr. J. PILLMOOR presided.

DUTCH HORTICULTURAL AND BOTANICAL SOCIETY.—On the occasion of the meeting of the Floral Committee on September 14 last, First-class Certificates were awarded to Mr. H. Hornsveld, of Baarn, for Canna Hofgartendirector Wendland, Cactus-Dahlia Arachne, C.-D. Capstan, C.-D. Keynes' White, C.-D. Standard-bearer; to Mr. T. E. Houtvester, of Utrecht, for Canna H. Wendland; to Messrs. E. H. Krelage & Son, of Haarlem, for Canna Stadtrath Heidenreich; Cactus-Dahlia Arachne, C.-D.

Capstan, C.-D. Daffodil, C.-D. Keynes' White, C.-D. Kingfisher, C.-D. Night, C.-D. Norfolk Hero, C.-D. Standard-bearer, *Montbretia crocosmiæflora* Ori-flamme; to Mr. W. van Veen, of Leiden, for Cactus-Dahlia *Arachne*, C.-D. Keynes' White; to Mr. B. Ruys, of Dedemsvaart, for Cactus-Dahlia Keynes' White; to Messrs. Groenewegen & Son, of de Bilt, for *Rubus sorbifolius*; to Messrs. V. Schertzer & Son, of Haarlem, for *Tagetes Lemon Queen*, and *T. Prince of Orange*. Certificates of Merit were awarded to Mr. T. E. Houtvester, of Utrecht, for *Chrysanthemum Harvest Home*; to Messrs. P. van Noordt & Son, of Bo koop, for Cactus-Dahlia *Koningin Wilhelmina*;

credit on horticulture in this country. It is understood that there will be periodical shows of flowers and fruit during the continuation of the exhibition. A sub-committee of the Royal Commission, consisting of the following gentlemen, has been formed:—Sir J. Trevor Lawrence, Bart.; Sir Edward Grey, Bart., M.P.; W. T. Thiselton Dyer, Esq., C.M.G.; Dr. Masters, Dr. Schlich, T. A. Dorrien Smith, Esq.; and Harry J. Veitch, Esq. The latter gentleman is the hon. secretary to the sub-committee, and any communications may be addressed to him, or to the Secretary, Royal Commission, Paris Exhibition, St. Stephen's House, Westminster, S.W.

and turn sweet naturally; and B, those which never lose their astringency unless subjected to "improvement." The simplest process is drying after removal of the rind. In other cases the fruits are packed in tubs previously moistened with saké (Rice-beer). The tubs must be as nearly air-tight as possible, and the fruit kept in them for fifteen days, when it is said astringency will have disappeared.

INSTRUCTION IN HORTICULTURE IN FIFE-SHIRE.—Dr. JOHN H. WILSON, St. Andrews, formerly Lecturer on Horticulture in the Heriot-Watt College, Edinburgh, is at present engaged in giving a

FIG. 100.—HEDGES OF *HYDRANGÆA HORTENSIS* IN THE AZORES. (SEE P. 336.)

to Mr. H. Hornsvelt, of Baarn, for Cactus-Dahlia *Loreley*; to Messrs. E. H. Krelage & Son, of Haarlem, for Cactus-Dahlia *Loreley*, C.-D. Stern von Schöneberg. *Lathyrus odoratus* Countess Powis, L. o. Lady Nina Balfour; to Mr. B. Ruys, of Dedemsvaart, for Cactus-Dahlia *Loreley*.

PARIS UNIVERSAL EXHIBITION, 1900.—The plans of the Horticultural Section at the Paris Exhibition of 1900, are now complete; from them it will be seen that it promises to be a very attractive building. Space has been secured for British exhibitors, and it is hoped that it will be filled in a manner to reflect

DIOSPYROS KAKI.—Among the most interesting exhibits at the last meeting of the Royal Horticultural Society were some fruits of this tree ripened (or on the way towards ripening) against a wall in the garden of Canon ELLACOMBE, at Bitton. In orchard-houses the fruit is very handsome, and if allowed to become blotted very agreeable in flavour; but let those beware who incautiously taste the noble-looking fruit before it is well blotted like a Medlar. In Japan there are very numerous varieties, the fruit of some being dried like Figs. In the catalogue of the Yokohama Nursery Co., the fruits are divided into two classes: A, those which ripen

series of lectures at twelve centres in Fife-shire. The course is under the auspices of the Fife County Council, the initiative having been taken by the horticultural societies of the county. The practical bearings of the science are carefully kept in view, and discussion freely invited. A deep interest is being taken in the course.

FLOWERS IN SEASON.—An extremely varied collection of *Chrysanthemums*, decorative, Japanese of different types, and Pompons, has been received from Messrs. DOBBIE & Co., Rothesay and Orpington; the flowers having apparently been gathered from

border plants. The beautiful colours, the variety of form, and the general floriferousness of the Chrysanthemum when it is allowed to grow unrestrained, and with, at the most, one cutting back in June of those whose stature is undesirably tall, are qualities unfortunately too little utilised by the gardener in the borders, or against walls and buildings.

DESTRUCTION OF CROPS.—From Mentone, under date October 30, we learn that a terrific hail-storm, which lasted but half-an-hour, swept over that district, and destroyed the splendid crop in the Olive and Lemon plantations. Abnormal weather would seem to have greatly damaged the Olive crop in various districts during the past month.

PRESENTATION TO ALDERMAN ROGERS, OF RED LODGE NURSERIES, SOUTHAMPTON.—This worthy gentleman, member of the Corporation of Southampton, and once Sheriff and Mayor of that town, has felt compelled by increasing years to retire from active participation in business, and his friends embraced the opportunity of showing their esteem for Mr. ROGERS by presenting him with a beautifully illuminated address. The presentation took place in the Mayor's parlour on Wednesday afternoon, October 26, several members of the corporation and other friends being present. The presentation was made by the Mayor; and Mr. ROGERS, in his reply, alluded to his seventy years' connection with the borough, having been initiated into public life by his father; and to the great changes that had taken place at Southampton in that period of time. He had, he said, placed his business on such a footing as he believed would ensure its being successfully carried on by his successors, and he also trusted that his son would live to enjoy the same measure of esteem at the hands of his fellow-townsmen as it had been his happy lot to achieve. Mr. ROGERS was at one time a constant and valued contributor to the pages of this Journal. He had a good knowledge of plants, and his nursery at Red Lodge was a well-stocked repository of choice trees and shrubs.

"**SELL'S COMMERCIAL INTELLIGENCE**" is a weekly newspaper entirely devoted to the spread of authentic commercial information; the price is one penny only. It will inform British merchants and manufacturers of new openings for foreign and colonial trade, and help them to meet the ever-increasing growth of foreign competition. Markets of the world, new and old, will be kept under constant survey, and from all parts of the globe special correspondents will inform the readers of *Sell's Commercial Intelligence* of the latest movements. The aims of such a paper as this commend themselves to business men as worthy of support, and the first number affords a guarantee of the spirit and enterprise with which the new journal will be conducted.

JADOO, LIMITED: ANNUAL MEETING OF SHAREHOLDERS.—The third annual meeting of the shareholders in Jadoo, Limited, was held at the office of the Company, Palace Gate, Exeter, on Wednesday, October 26. Col. HALFORD THOMPSON presided. The Company, as we learn from the report of the meeting, is pushing the business in Continental countries, and in the colonies, but the turnover was small, and seems scarcely satisfactory; and as the chairman said at the meeting, a sum of £4000 to £5000 was required to still further develop the concerns. They were, however, enabled to recommend a dividend of 5 per cent. per annum upon the paid-up capital. The sum of £200 1s. 4d. would be carried over to next year's trading.

GISHURSTINE.—With the advent of wet, cold weather, the gardener must be more than usually careful of his health, and nothing tends to greater freedom from coughs, colds, and rheumatic affections in those whose avocations oblige them to be abroad in all kinds of weather than strong, well-made boots and shoes, rendered waterproof with dubbing, and no better dubbing exists than that which we know of than that sold under the name of Gishurstine, by Price's Patent Candle Company, Limited, Belmont Works, Battersea, S.W.

CHISWICK.

THE Royal Horticultural Society's garden has at the present little to show in the way of flowers, if we except Chrysanthemums grown in a natural manner in the long border which faces the exotic deciduous shrubs. Here lately were to be observed dwarf early varieties of Japanese, Pompons, and decorative, full of flower if a little past their best in some instances, and dashed with the heavy rains in the case of others, but so floriferous as to make it a matter of wonder so few of these bright flowers are made use of in gardens. It may be of service if we indicate a few of the more striking and showy varieties.

American Star, pale flesh coloured, 2½ feet high; Ivy Stark, a little less tall than the first-named, of an excellent pale orange tint; Ruby King, 2½ feet high, crimson, very free; Madame Marie Mesae, of a pale pink, a continuous bloomer, a gem, 2½ feet high; Lady Fitzwygram, white, changing to pink, very free, 2 feet high; Madame F. de Cariel, a reflexed variety, deep golden-yellow; Roi des Precoces, of a deep rose-pink, very free, 3 feet high; Albert Chausson, crimson and gold, a very nice bloom, height of plant 4 feet; Précocité of Delaux, a small reflexed flower, of a bright crimson, also free; Anastasi, a rosy-pink, height 1½ foot; L'Ami Condorchet, pale lemon, 1½ foot high; White St. Crouts, a sport from the pink variety of that name. The last three are Pompons worth having. There were many others, but we must stop.

We shall be much interested in the outcome of the extensive trial of hardy annuals now just showing through the soil. Many species, which are seldom sown at this season, are being put under trial; and we hope the season and climatic conditions will be favourable to the growth of the plants. One cannot go round the gardens without noticing the extensive repairs to the glass-houses, which have been carried out during the past year; much of it, we understand, by the garden staff under Mr. Wright's superintendence. There remain but few structures that have not had the much needed repairs carried out.

A goodly proportion of the crop of Grapes in the big vinery is still hanging on the Vines, and the entire crop of Gros Colman in the narrow wall case, and it is a heavy crop not quite finished. We noted with much gratification, plenty of evidence of zeal tempered with knowledge and discretion in the management of the gardens, and the several improvements and alterations lately carried out.

NOTICES OF BOOKS.

FLOWER FAVOURITES: Their Legends, Symbolism, and Significance. By Lizzie Deas. (George Allen, 156, Coaling Cross Road.)

THIS is a dainty little book, containing verse and prose legends relating to well-known flowers. If these tales are all more or less familiar, that is scarcely the fault of the compiler, for nowadays there are many such books, and it is difficult to find any myths which have not been many times retold. *Flower Favourites* is pleasantly put together, the various quotations in it being introduced with skill, and the verses containing allusions to the blossoms well chosen. The following account of the Edelweiss may be new to some readers:—"According to a cherished Swiss legend, the Edelweiss was once a maiden—a maiden so fair of face, so pure of heart, so noble of mind, that although all men loved, not one was found worthy to win her for his own. And when, still unwed, she died, upon the mountain-top, enthroned amid snow and ice, transformed to a flower, she reigns as Edelweiss. And because through toil and bravery and upward struggle alone may the flower be found, 'to pluck the Edelweiss' has passed into a current saying, signifying to obtain the highest, noblest love that it is possible for mortal man to win—

"It is the type of ideal womanhood, Of all that is most pure, most beautiful, most good." As regards the Rose, Thistle, Shamrock, Leek, Lily

and many another popular flower, there is not much new to be quoted, especially as this is a selection only, in no sense a complete series of literary allusions. We learn that many of the chapters have previously appeared in various magazines, and for this they seem more suitable than for publication in book form.

ONE-AND-ALL GARDENING. A popular annual for Amateurs, Allotment-holders, and Working Gardeners. Edited by Edward Owen Greening. (Agricultural and Horticultural Association, 3, Agar Street, Strand.)

VARIOUS well-known horticulturists and gardeners have contributed practical articles to this handbook. Mr. D. F. Fish is responsible for the gardening calendar; Mr. Sanders and Mr. Wright for various papers on special subjects. The scope of the publication may be understood by its sub-title, and that the information given is reliable, and the result of experience cannot be doubted. The advice is plainly given, and if gardeners only could, and would read, comprehend, and put it into practice, there would soon be fewer of those jobbing-men, competent only to mow grass or roll paths. The annual includes many illustrations, and is altogether surprisingly cheap at twopence, which is the price asked for it. This "has only been rendered possible by the generous enterprise of the Council of the Agricultural and Horticultural Association, and mutual association of some 3000 members, founded twenty-eight years ago." It has certainly issued a useful work containing original and reprinted matter dealing with the various branches of gardening and allotment management.

DARLINGTONIAS.

THE photograph from which the illustration (fig. 101) was taken, represents one of six imported plants received in June, 1893, as single crowns. They were potted as soon as received into 5-inch pots in a mixture of fibrous peat, broken into small pieces, and sphagnum-moss chopped finely of about equal quantities in bulk, with crocks and charcoal the size of small beans, forming one-third, and a good sprinkling of coarse silver-sand. This compost I always make use of, as the large quantity of water required for the successful culture of these plants renders it necessary that the rooting medium be of a very open character. The pots are filled to one-third of their depth with clean crocks, and over them is placed a layer of sphagnum moss. The crown of a plant is kept fully an inch above the rim of the pot, and the compost is rounded up as in the case of most species of Orchid and finished with a thin layer of chopped sphagnum-moss. This layer soon begins to grow, and imparts a tidy and pleasing appearance to the plants.

The plants are watered thoroughly every day throughout the summer, and three times a week during the winter. I do not advise standing pots in saucers, but prefer to make daily and copious applications until it runs from the plants like a shower-bath.

The house where they are grown has a west aspect, is very light, the panes of glass measuring 24 inches square, and fire-heat is only applied to keep out frost and extreme cold, and damp from other occupants of the house. No shading is necessary, as the sunshine tends to bring out the mosaic-like markings of the pitchers. They are placed at the north end of the house over the water-tank, close to the door, which stands wide open all day long summer and winter, unless when the weather is very severe or windy. It is very essential that they get an unlimited supply of fresh air, as they seem to enjoy the wind blowing through the pitchers. This is the position in which I have found them luxuriate after several failures in close greenhouses and cold frames—for coddling they will not bear.

Repotting must be done annually, as owing to the great amount of water required, the compost gets soured and muddy, and must be entirely renewed once a year, or failure will result. About the end of January or February is the best time, that is, just before they begin to develop their first and principal crop of pitchers and flowers. Water is withheld from

the roots for a few days, for if the compost is on the dry side it falls freely from the roots without the slightest injury to them. Have pots and compost, &c., ready, and proceed to repot, taking care that the roots are placed in a natural position; fill in with the compost and make firm, without bruising the roots, finish as already indicated, remove to their quarters, and afford a thoroughly good watering with a coarse rose, and follow out the daily routine.

Propagation is readily effected by offsets. The rhizomes travel round the side of the pot, eventually emerging close to the top edge, and producing a tuft of small pitchers. Carefully remove the compost, and trace the rhizome and sever it beyond a joint with roots. I prefer rhizomes about 6 or 8 inches in length when transferring to fresh pots, twisting or bending them so that the little pitchers are in the centre of the pot. Place them with the established plants in an airy position. On no account place them in close frames or under bell-glasses. The culture of these plants is exceedingly simple, given three conditions: a cool airy position, abundance of water, and renewal of the soil once a year, and then success is certain. They are objects of great beauty and interest all the year round, and they also flower every year in May or June, the flowers being produced singly on long slender stems as in *Sarracenia*s. They are of a dark crimson colour, both beautiful and interesting. A. J. A. Bruce, *The Nurseries, Chorlton-cum-Hardy, Manchester*.

HOME CORRESPONDENCE.

HYBRID FAILURES.—I shall be greatly obliged to any raisers of hybrids or varieties by crossing (not spontaneous seedlings), who will tell me of any species which has failed to take the pollen of any other species, or of any variety of a species which could not be fertilised by crossing it with some other variety or species. I should like also to record any plants which could not be fertilised by their own pollen, or with pollen of other plants of the same species. *George Henslow, 80, Holland Park, W.*

AMARYLLIS BELLADONNA VAR. KEWENSIS.—On comparing the engravings in *Nicholson's Dictionary of Gardening* (figs. 75, 76) with those of the *Gardeners' Chronicle* (fig. 93), I have a suspicion that the artist for the dictionary has been allowed to figure this grand variety as an illustration of the common form of *A. Belladonna*. Is there anything in the form of the bulb to distinguish this hybrid from the common form, of which *Amaryllis* there are two well-marked varieties, the larger one coming into flower generally a week to a fortnight before the other, and being about 6 inches taller? I had often remarked this in the gardens of friends, and can now confirm it in my own garden. *W. Thomson, Bishop's Teignton*.

CHRYSANTHEMUM-RUST.—Referring to Mr. Godfrey's letter in your last issue, we do not think that his rather sweeping assertion as to the universality of the disease should be allowed to appear uncontradicted. We ourselves received diseased plants in the spring from several sources, but by careful quarantine and constant treatment with fungicides, succeeded in getting rid of it; and we believe our collection is absolutely clean at the present moment, and there may probably be a number of others equally fortunate. *J. R. Pearson & Sons*.

NATIONAL CHRYSANTHEMUM SOCIETY.—A perusal of your leading article under this heading on p. 320 leads me to infer that your information on some points is not quite correct. From certain knowledge, I am able to state that it is financial considerations mainly which have actuated those who have sought to remove the exhibitions of the Society from the Royal Aquarium to the Crystal Palace. They have put forward the plea that the sum annually received from the Directors of the Royal Aquarium is an altogether inadequate contribution from the profits derived by the Directors from association with the National Chrysanthemum Society. The majority of the executive, among whom were several of the leading exhibitors, appeared to hold that the central position of the Aquarium, the ready access to it from all parts of the metropolis, the fact that the exhibitions there are now well-known London fixtures, the knowledge that the association

of the Society and its exhibitions with the Aquarium, has done so much to enhance its success and prosperity, added to other advantages, outweighed merely financial considerations, hence the emphatic vote against the change. Nor is it quite correct to say that the sub-committee, which consisted of nine members, "almost unanimously recommended" a change to the Crystal Palace. The chairman of the Executive Committee, the Treasurer, and the Foreign Corresponding Secretary, members of the sub-committee, were opposed to any change, and also the general Secretary, whose vote was not recorded, but who, with the Treasurer, is among the oldest members of the Society, opposed the change. Surely Mr. Dean's long experience of the working of London flower-shows counts for something. I understand that the five elected members of the sub-committee, in addition to the four *ex officio* officers, all of whom recommended the change, were well-known opponents of the policy of holding the shows at the Aquarium, and were nominated on the sub-committee in order to ensure a majority in favour of a change. In reference to your remark as to the "great need of an independent horticultural Institute in London, where all the societies could be accommodated," I am led to infer that you include their exhibitions. This has led me to obtain from the Secretary of the National Chrysanthemum Society the amount of table and ground-space

FIG. 101.—A SPECIMEN PLANT OF DARLINGTONIA CALIFORNICA. (SEE P. 338.)

occupied by exhibits at the recent October show of the society at the Royal Aquarium, and he informed me that 3062 superficial feet of tabling was required, and 1018 superficial feet of ground space, making a total of 4080 feet, and this does not include the ground covered by the exhibits of horticultural requisites, or what was staged in the western gallery. To this must be added quite 5000 feet at least for gangways for visitors and clear ways to all exits (the London County Council being very exacting on this point), and so a hall, at least 180 feet in length, by 50 feet in width, is requisite for such an exhibition as that held in October, leaving out of the question of seating accommodation, band stands, &c.; and this October show represented about one-third of the space which will be required for the great November exhibition to be held next week. *A Member*.

THE PRONUNCIATION OF FOREIGN NAMES.—The pronunciation of such long and uncouth names as are often given to Chrysanthemums raised abroad, is a stumbling-block to the average English gardener. It cannot be expected that young men in gardens, or even the chiefs, can be sufficiently well versed in the French language as to be able to pronounce the words perfectly. The attempted pronunciation of many French names by gardeners is a common source of merriment—on the quiet—to employers and to the junior members of the family. Until English raisers are in the ascendancy with new varieties, we cannot

expect a better selection of names. It is too much to expect a Frenchman to adopt English names for varieties of his own raising, the names of which have a charm in some way or another. Seldom, indeed, does an English-raised Chrysanthemum receive an objectionable name, certainly not one difficult of pronunciation [to an Englishman]. As a rule here, the flowers are named after the raiser or the name of the place. American or Australian-raised varieties receive, as a rule, simple names. True, individual cases of a disposition to exhibit peculiarities of name occur very often, though these do not commend themselves for a lengthened period. In former days, before the Japanese section was instituted, there were hardly any foreign varieties—there was then nothing but plain English names. What could be more easy than Alfred Salter, Empress of India, or even Lord Alcester, of more recent introduction? Directly, however, the increase of Japanese varieties becomes the main, and sometimes the sole, object of certain specialists, we are flooded with—to an ordinary, or, as the late Mr. Wildsmith so often said, a common gardener—names impossible of proper pronunciation. A glance through a Chrysanthemum specialist's catalogue at the present day reveals, perhaps, an improved order of things, as owing to the advance made in the number of English-raised varieties, the lists are much easier of management, and they contain names of easy pronunciation. If Chrysanthemums are to receive French names, as the raisers have a perfect right to bestow, all that we can do is to entreat them to adopt shorter names than the following, for example, Comtesse Jean de la Rochefoucault, Deuil du Tzar Alexandre III., Baronne Dutheil de la Rochère, or Lucile Mahieu de la Drome. None of these are easy of pronunciation to an Englishman, even for a person of education beyond that which falls to the lot of an average gardener. *E. M.*

BEGONIA GLOIRE DE LORRAINE.—When recently visiting the gardens at Luton Hoo, which are under Mr. George Maycock's charge, I noticed a well-grown lot of plants of this fine, late-flowering Begonia. The plants were growing in 48's, and bore healthy foliage, and numerous flowers and buds from top to bottom. The plants stood from 2 to 2½ feet in height, and measured about 2 feet through. They formed loose pyramids. When grown as these were, Gloire de Lorraine forms a striking object. Mr. Maycock told me that his plants were struck singly in small thumbs early in the spring of this year in a mixture of leaf-soil and sand, and during the summer they were placed in a Cucumber-pit, the moist atmosphere of which, and the daily syringing they received, kept red-spider, which often infests the Begonia, in check. When showing flower he removed the plants to cooler and lighter quarters, slightly shading them. *J. Wilson, Greenside Nursery, St. Andrews*.

CASSIA CORYMBOSA.—I enclose a few sprays of *Cassia corymbosa* for you to see how very useful the plant is for making an outside display. I have some large standard plants of it, from which I cut the sprays sent. They are growing in the flower-pots sunk in turf on the lawn, and were put out-of-doors in May, being at that time in bloom, and they have continued in bloom ever since, and they look well now, as you will see by the enclosed; one seldom sees it grown much for outside. *A. B.*

THE AUTOCRAT PEA.—This Pea has done well this autumn, as you will see by the pods sent. The seed was sown on July 4, and I have gathered a splendid lot of pods from that sowing. It is a splendid Pea for an autumn crop. *A. Bateman, The Gardens, Brixworth Hall, nr. Northampton*. [The flavour was excellent. *Ed.*]

THE REMOVAL OF FRUIT TREES.—The season is close upon us when the lifting and transplanting of trees and bushes will be engaging the attention of the gardener; and this season, in more than an ordinary degree, great care will have to be exercised in England in the removal of roots from the soil. The drought has rendered the soil extremely dry and hard, and what rains have fallen in most parts of the country have been so small in quantity as to have been entirely absorbed by the upper crust, leaving the soil at 9 inches and more in depth unmoistened. Where, on digging down to the level of the roots of trees and bushes, this is found to be the case, especially in wall-trees, a copious application of water should be made a day or two previously to commencing the work of removal. This will enable the gardener to get out the roots, big and little, without much loss. And on the completion of each transplantation, water should be freely applied, a mulch being put over on the approach of frost, or immediately following the

watering. For all stone-fruits growing in soils not naturally containing lime, I always employ mortar-rubble finely broken up, or, failing that, slaked lime in the soil, and unslaked on the surface. *H. Markham, Northdown, Margate.*

PEACH SEA-EAGLE.—I have here a small tree, four years old, of the Sea-eagle Peach. The tree carried seventy-five fruits this year. They were all nicely coloured fruits, and weighed from 8 to 12 oz. each. The tree is on an open wall having a south-west aspect. I have had Peaches from the last days of April until the first week in November, which is no bad record for a gardener belonging to the "old school." In the training of our Peach and Nectarine-trees we take considerable pains, always striving to keep the trees thin of wood, also judiciously thinning out the leaves, so that the sun may exert free influence upon both wood and leaves, which, with copious supplies of water from time to time, is absolutely necessary for the maturing and plumping up the fruit-buds ready for the next year's fruitage. These matters properly attended to will give little cause for anxiety as to the dropping of buds when the rise of the sap begins. I am not prejudiced in favour of my own method of the treatment or management of Peach-trees, and would be pleased to adopt any other, provided it would produce better results, but the method briefly described above, has been carried out here successfully for near upon forty years, and as no more than one crop of fruit can be produced from any one Peach-tree in the course of one year, and having satisfied myself that I have done this, I leave it to the so-called experts with their newer methods to say how they can do more. Subjoined is a list of present dessert: Grapes, Peaches, Melons, Figs, Guava, *Passiflora edulis*, Red and White Strawberries (alpine in great plenty), Pears, Apples. *W. Miller, Combe Abbey, October.*

THE ROOTS OF ODONTOGLOSSUM VEXILLARIUM.—Is it the general experience of your readers that *Odontoglossum vexillarium* roots die outright after the first year's growth? My experience is that they do not, but that under proper treatment they grow again from the points of the one-year-old roots, and the same thing happens for several years in succession. If they did not do this, of course they would lose their leaves like *Calanthe*, which are deciduous. I read a paper on the cultivation of *Odontoglossum*, and this particular one included, and several of the members present were of the opinion that the roots of *Odontoglossum vexillarium* were of no further use after the first year, and might as well be cut off. I think otherwise, and said so at the time. I should be glad to know if I am right in my contention. *H. M.*

THE WHEAT CROP OF 1898.

WE are indebted to Sir J. B. LAWES, Rothamsted, for the following summary of the Wheat crop for 1898:—

"During the first week of September (1897), there was a heavy fall of rain over most of the Wheat growing districts of Great Britain, after which there was no rain sufficient to hinder operations in the field until the second week in December. September and the first half of October were below average as to temperature; while the latter part of October, and nearly the whole of November, were unusually warm. Altogether there was a perfect seed time. There was pretty generally an excess of rain during the first half, and towards the end of December, and again early in January, after which there was a great deficiency until the second and last week of April.

With the deficiency of rain the temperature was considerably above the average in January, and during the greater part of February; whilst the end of February was cold, as also, with some warm intervals, were March and April. In May there was a considerable excess of rain, with almost throughout lower, and sometimes much lower, than average temperatures. In June the weather fluctuated very much, the first and third weeks being cold, and the second and fourth warm. More or less rain fell during the earlier and later portions of the month, with scarcely any during the middle, and at Rothamsted, and in some other districts, the total for the month was about three quarters of an inch below the average; there being not sufficient to injure the hay. In July there was almost throughout lower than average temperature, with considerably less than average

rainfall, excepting thunderstorms locally towards the end. The cold weather, accompanied with high winds, laid a good deal of Wheat at an important period of its development, the Rothamsted experimental crops suffering very much. The rain during the first fortnight in August was very partial, consisting chiefly of thunder showers; the last half of August was very hot and dry, and very similar weather continued up to the end of September, the rainfall for that month being unusually low.

So great has been the deficiency of rain from the beginning of the year up to the present time, that in our Wheat-field which is pipe-drained, by which we are enabled to determine the loss of nitrate in the drainage, no water has passed since early in January; and for only the second time during a period of more than 40 years, the Wheat plant was much injured where we have used the heaviest dressing of nitrate of soda, for want of enough rain to form and distribute a sufficiently dilute solution of it; and a similar result also occurred in the year of drought in 1893; whilst in this year, 1898, the Barley plant was much injured with only half the amount of nitrate applied. The immense hay crop grown all over the country was probably due, not only to the abundance of rain in May, but also to an unusual accumulation of nitrate within the soil during the previous autumn and early months of the year, with much less than the usual amount of rain to wash it out.

After such a very favourable seed time, sufficient rain in December and the beginning of January, but afterwards very little and generally over average temperatures during the winter months, the experimental plots showed unusual luxuriance early in the year; and indeed up to June the field showed much more growth than usual, illustrating the effects of the different manures in a very striking manner. In fact, there was, as the results showed, too much above ground growth, with deficient rooting. Under such conditions of early growth, the following results were finally obtained on the selected plots:—

Years.	Unmanured, Plot 3.	Farmyard Manure, Plot 2.	Artificial Manures.				Mean of Plots 3, 2, and 7, 8, 9 (or 16).
			Plot 7.	Plot 8.	Plot 9 (or 16)	Mean.

* Equal to 26½ bushels at 60 lb. per bushel.

† Equal to 29½ bushels at 60 lb. per bushel.

‡ Equal to 27 bushels at 60 lb. per bushel.

§ Equal to 27½ bushels at 60 lb. per bushel.

It will be seen that the unmanured plot gave more, and the farmyard manured, and the two ammonia plots (7 and 8), very much more straw than the average of the preceding 46 years, whilst the nitrate of soda plot gave much less than its average. In fact, the farmyard manured plot yielded more straw than it had ever done before, and plots 7 and 8 had only in a few years given more. The nitrate plot had, however, only in a few years given less straw, the lowest amount being in the year of drought 1893; and it

had generally given much more than this year. It will be seen, that notwithstanding the unusual production of straw, the unmanured plot yielded less, and each of the three artificially manured plots, especially the nitrate, much less grain than their average; whilst the farmyard manured plot yielded even more than its average over the 46 years, but less than over the last 10 years.

The general result is, that the average yield of the selected plots shows less than average produce of grain. In fact, the wet and cold weather of May which contributed so largely to the bulkiness of the hay crop, also favoured the over-production of straw in the Wheat. Then followed much less than the average rainfall in June, but the temperature was very variable, and there was occasionally a good deal of wind. The result was that great injury was done, especially to the heaviest crops at the most critical time, and they were much laid before the ear was well developed and filled.

From the facts stated, it is obvious that, although in their early stages the experimental plots showed great luxuriance, they suffered in a very unusual degree from inclement weather before and about the time of blooming. It is seen then that whilst the experimental results indicate much more than average produce of straw, they show less than average yield of grain, due mainly to the low yields on the artificially manured plots. It is true that the farmyard manured plot, notwithstanding the crop was badly laid, yielded more than its average produce of grain; though taking the average of many years, the artificially manured crops yield as much or more grain than the farmyard manured plot, the artificial manures generally yielding the most in normal or good years, and the farmyard manure most in unfavourable seasons. This year, however, owing to the character of the season, the artificially manured crops were damaged in a very unusual degree. As the yield of the artificially manured crops, which suffered so much more severely than the farmyard manured crops, affects the calculated average so materially, it is considered that the mean result cannot this year be taken as representing the average yield of the country, as in fairly normal seasons it has done so remarkably for many years past. It is, therefore, decided not to use it as the foundation of an estimate of the crop of the country. As further illustrating the exceptional character of the Rothamsted experimental results, it may be stated that two fields farmed in the ordinary way, yielded respectively, 41½, and 32½, bushels per acre; the crop yielding the larger produce having stood up well, and that giving the smaller yield having been partially laid.

The prominent characteristics of the season were in the main very similar throughout the chief Wheat-growing districts of the country. The reports published from time to time of the progress of the Wheat crop, almost uniformly indicated a very heavy produce of straw. But the earlier reports record many complaints of laid crops, rust, blight, and small ears not well filled; and doubts are expressed whether the yield will be equal to what might be expected from the bulk of straw. Nevertheless, as the season advanced, and harvest progressed, the majority of the estimates showed an expectation of over average yield of grain per acre, if not an adequate yield in proportion to the straw. Reports of actual threshings are, however, comparatively few; but upon the whole the later records are more favourable than the earlier; and there can be little doubt that there will be more than an average yield of grain per acre over the country at large.

Since the above was written, there has appeared a further report in *The Times*, said to be founded to some extent upon the yields from the threshing-machine, and the general indication is stated to be that, for the whole of Great Britain, the yield will be about 35 bushels per acre. It may be of interest to observe, that supposing future threshings should confirm an estimate of about 35 bushels per acre for the United Kingdom, the requirements from imports would be from 21 to 22 million quarters."

CRACKING OF PEARS AND APPLES.

THERE is a fungus named *Fusicladium dendriticum*, from the tree-like markings it makes on the leaves (see figs. 102, 103). The same fungus attacks also the fruits; it burrows beneath the rind, feeds on its substance, and ultimately kills it, and destroys its elasticity and power of expansion. As the cellular tissue in the interior grows, and becomes fuller and fuller of water, it presses on the rind, which is no longer able to expand in harmony with the subjacent layers, and therefore cracks. Spraying with weak Bordeaux Mixture two or three times during growth would obviate this mischief.

CHRYSANTHEMUMS.

WOODHATCH LODGE, REIGATE. — The splendid collection of Chrysanthemums at this well-known residence of T. B. Haywood, Esq., is this season as good or better than ever. Mr. Salter, the painstaking gardener, who cultivates with praiseworthy success each department of his charge, has arranged them as usual in the lean-to houses adjoining the Orchid-houses. This season the remarkable number of Australian varieties in the collection is a feature. Some of them, including John Pockett, a crimson Japanese incurved variety with buff reverse, are evidently destined to become popular, but of John Pockett it is too soon to speak circumstantially, except to say that the colour is one that is afforded by very few of the newer or old varieties. Nellie Pockett (First-class Certificate) is a white Japanese that will compete with the very many new varieties of this colour. It is reputed to have taken honours as the premier bloom in two Australian exhibitions last season. Mr. T. Carrington, magenta-coloured, with silvery reverse, from the Antipodes also; and Pride of Stokell, a brownish-red sport, with bronze reverse, from Pride of Maford, may also be mentioned as some of the colonial constituents of the collection. Turning to the other varieties, there are some very fine blooms of Mrs. W. H. Lees, the recurring florets hanging a considerable depth; whilst another white Japanese, and one of the very best of its section, Mrs. J. Lewis, is represented by some beautiful specimens. That splendid Japanese incurved, Robert Owen, was never so good in Mr. Haywood's collection as this season. Robert Powell, a large, globular-shaped flower, with capital petals of a shade of chestnut, was remarked as a good one. Princess Helene is a white Japanese, with a decidedly lemon-coloured centre, the flower being composed of very wide petals. Lady Ridgway is capital, and Lucille de la Drome may be mentioned as a new yellow-flowered incurved, but the blooms are rather flat at present, being not fully developed. Speaking of incurved varieties, we are reminded that many of these are represented by large, well-built blooms of grand quality; but generally, though very promising, the incurveds were not at their best when we saw them.

Among the larger Japanese varieties, one could not but admire the pure reflexed blooms of Dorothy Gibson, probably the best of this latterly-neglected section. The most brilliantly-coloured flowers in the whole collection were some of that first-rate Anemone flowered variety Descartes. There were many additional novelties in excellent condition, including another pure white Japanese, Mdle. G. Seince (Calvat), and Mrs. F. Brewer, bright gold-coloured; but sufficient has been said to indicate the excellence of the collection, and the degree of success that has rewarded Mr. Salter's cultivation. Generally, the plants are a little taller than in an average season. A number of plants of the pretty Pompon varieties, about 3 feet or less high, and in 6 or 7 inch pots, are very attractive, and make good decorative plants.

MR. W. WELLS, EARLSWOOD.

The redoubtable Mr. Wells, of Earlswood, near Redhill, has a collection of Chrysanthemums as large as usual. He has honestly confessed to an encounter with the "rust," but triumphantly claims that he has found a means to keep it at bay (see p. 314, col. 3). Mr.

Wells is, of course, a trade grower, and the continued enthusiasm and success to be observed in such establishments, being a reflection of the public demands, it will apparently be some time before the Chrysanthemum-grower need look for another plant to succeed to popular favour. One of the most striking of the varieties in Mr. Wells' collection is Japanese Mrs. White Popham (Silsbury). It has

FIG. 102.—CLADOSPORIUM DENDRITICUM.
Upper figure magnified 5 times; lower figure shows a section magnified 400 diameters.

FIG. 103.—CLADOSPORIUM DENDRITICUM ON THE PEAR.
(CRACKING OF PEARS AND APPLES.)

wide drooping florets, exhibiting white and purple colour, varying in a wonderful degree according to the bud that has been "taken," and whether the plant has been grown late or early in the season. It has been awarded a First-class Certificate by the National Chrysanthemum Society. Mrs. J. W. Barks, the new bronze-coloured sport from that most

lovely and popular variety Edith Tabor, was noticed in fine condition. Madame Robert de Massey, a new one from Calvat, is rather small apparently, but the rich crimson colour will be welcome. The many white Japanese novelties are further increased by one named Mdle. Madeleine Expulsion: the white is very pure, but it remains to be seen whether the variety has superior claims. Chatsworth is a new white Japanese, with lilac-striped, drooping petals; it will probably be a desirable exhibition variety. General Paquet is a new Japanese of beautiful chestnut colour, reminding one of Col. W. B. Smith. Le Grand Dragon, already exhibited last week, has rich golden-coloured flowers, from second crown buds. Ed. Molynaux has another rival in Jos. Chamberlain (Davis); this new variety is exceedingly bright, but scarcely, we think, so wide in petal as the first named variety. Mr. T. Carrington, Melucine, Nellie Pockett, and John Pockett, already mentioned in the above note upon the collection at Woodhatch, are observed here also. Another one from Australia, at present known only as Seedling 150 (Pockett), is a yellow Japanese, marked irregularly with red. This variety appeared to us to be capable of making a first-class exhibition flower. Next was noted The Convention, which is similar to Col. Smith, but has broader petals. Gertrude Salter, a novelty in the way of Duke of York, and Leocade Gentils, a pretty lemon-coloured hirsute variety. It will probably be found a good addition to the "hairy" section. There were some particularly good blooms of Ella Curtis.

Out-of-doors, but protected somewhat by a frame, were masses of the glorious October-blooming varieties. Side by side with Mychett White was the new Market White, a later bloomer it is stated than the former, and easier of cultivation. This has been awarded the Certificate of the National Chrysanthemum Society. Mychett Beauty (First-class Certificate) might be described as a golden-coloured Mychett White. It will most likely prove one of the best yellow-flowering October bloomers. There is Madame Ligne Ligneau, a true Japanese rich yellow-coloured October-flowering variety, that would be useful for decorative and market work. R.

CASTLE HILL NURSERY, MAIDENHEAD.

This nursery has been famous in the past owing to the many good varieties sent out by the late Mr. R. Owen, who was one of the first to produce seedlings from English-saved seeds. The same enthusiasm is still displayed by his two sons, Mr. W. and Mr. R. Owen, who carry on the business; and numbers of seedlings are still raised annually, several promising ones being now in bloom, of both Japanese and incurved varieties. The following are well represented, and many others are partially open and give promise of good things to come, viz., President Bevan (Calvat), clear lemon-yellow, dwarf habit; La Moscovite (Lacroix), rosy-lilac, dwarf, and early flowering; Mrs. J. W. Barks, a light bronze sport from Edith Tabor; Comte Gabrio Casati, an Italian variety of a rich plum-colour, a promising novelty. Of the primrose sports from Madame Carnot, grown here under the respective names of Yellow Madame Carnot, Mrs. Mease, G. J. Warren, and Primrose Madame Carnot, all appear to be identical, or so near to each other in colour as to preclude any two being staged as distinct; and it is to be hoped that a name may be finally given this fine primrose-coloured sport from the most popular Japanese Chrysanthemum for exhibition purposes. [Mrs. Mease and the yellow sport from Mme. Carnot are very distinct. Ed.]

A seedling from Mrs. F. Brewer was very like Mrs. J. W. Barks, but of a deeper colour and with a larger flower, distinct, and much dwarfer in habit than the last-mentioned variety. This is to be christened General Kitchener, and will be a decided acquisition in a stand of cut blooms. Royal Standard (Owen), bright maroon; Mrs. Winkeley Smith, deep yellow, dwarf habit; Mrs. A. G. Haines, a dwarf incurved yellow Japanese; Countess Grey, an early-flowering pure white; Owen's Memorial, crimson, golden reverse, rather tall; Princess Charles of Denmark, deep golden-yellow; Lady Phillips may be described

as a very dwarf-growing Madame C. Audiguier, and was recently awarded a First-class Certificate by the National Chrysanthemum Society. Among incurved kinds, Miss Godsmark is a large and promising variety, with broad incurving florets, of a coppery-fawn colour—a desirable addition to this class; Ada Owen, a large, broad-petalled, pure white, a dwarf grower, and recently awarded a Certificate; and, lastly, an Italian novelty, which may be described as an incurved E. Molyneux, the flowers produced on 2 feet to 3 feet stems. C. H.

HEDSOR.

Among private establishments, Lord Boston's garden at Hedsor is known locally for the excellent culture of some hundreds of plants for exhibition blooms of the Japanese, incurved, and Anemone sections, besides large batches for general decorative purposes at home. Here the Chrysanthemum-rust has this season made its appearance for the first time, and some varieties are badly affected. Among Japanese, very fine blooms were noticed of Emily Silsbury, Phœbus, Madame Carnot, Australian Gold, Chas. Davis, Mrs. G. W. Palmer, Yellow Madame Carnot, Oceana, Eva Knowles, Edith Tabor, and several others. C. H.

THE RYECROFT COLLECTION.

Mr. H. J. JONES' plants will be at their best in a very few days, for when we visited the collection at Lewisham during the present week many of the varieties were already represented by blooms in the latest stage of development. Mr. Jones is so well known that we need not say much upon the extensiveness of his collection. Like most of the trade growers, he has novelties from almost everywhere, and a goodly number of home-raised seedlings and sports. There are few trade establishments at the present time that have to contend against the disadvantages inseparable from an urban situation in a greater measure than has Mr. Jones, and it is a great point in favour of the Chrysanthemum as a townsman's plant, that he can succeed to flower his collection so successfully as he does.

Our attention was first attracted by a batch of plants representing most of M. Calvat's novelties, such as M. Fatzer, an incurved Japanese, colour yellow; General Paquie, reddish-buff, or orange-red, as some describe the colour; President Bevan, Le Grand Dragon, and Marie Calvat. Most of these have already been exhibited from various collections, but we had not previously seen the last-named variety: it certainly promises to make a capital white or pale pink Japanese flower. A considerable number of growers this season have found many of the buds to be "hard;" such is the case at Lewisham, the continental varieties having opened less kindly than could have been wished. The most distinct of the continental varieties we have seen as yet is Rayonante; it has been certificated. The quilled petals are a pretty tint, that might be described as a lilac-tinted pink. Quilled-petalled varieties are not always satisfactory, but this large ray-like flower will be sure to become a popular one. Since Madame Carnot sported yellow, and gave G. J. Warren, the variety has again sported, and Mrs. W. Mease is a beautiful pale primrose form of the type, quite distinct from the yellow or the white variety. Those who admire the fine white Japanese Mrs. W. H. Lees, may now obtain a yellow sport from the variety. Mr. Jones has this sport, and whilst speaking of such variations, it is interesting to record the circumstance that the hitherto constant Ed. Molyneux has at last given a yellow sport. It is a good tint, and those who like the habit and foliage of its parent, will probably give the yellow-flowering variety a trial. If we may reason from "sport" history, several other colour variations of Molyneux may be expected in the near future. When once a variety has broken away from the type, it appears to possess a greater tendency to variation.

The very best of Mr. Jones' own seedlings is R. Hooper Pearson, a Japanese flower with slightly incurving petals; besides being richer and deeper in colour than any existing yellow variety, it has a capital habit, and will be useful to the grower of

bush specimens as well as to the exhibitor of specimen blooms. The flowers are the same colour from crown or terminal buds, and somewhat resemble in form a fine flower of Mutual Friend. It was unanimously awarded a First-class Certificate by the National Chrysanthemum Society on Monday last. Some bush plants that had been partially thinned were making a fine show; the tallest plants are not more than 4 feet high. Princess Charles of Denmark, a variety sent out by another establishment last season, is also a good yellow-flowered Japanese incurved, the colour being very rich.

We next noticed Yellow Queen of the Earlies, certificated this season; Pride of Mychett, an early-flowering Japanese variety, pink, with gold centre; Sunshine, a beautiful rich yellow-flowered, decorative variety, not so novel, but of great merit. When speaking of these, one cannot refrain from including Ryecroft Glory and its sport, two pre-eminently useful decorative varieties.

Though we all attempt to estimate the value of a variety during its first season, it is not always possible to do so correctly. It was interesting, therefore, to note that of varieties sent out last year, there are again fine specimens of Mrs. Lionel Humphrey, a pale primrose Japanese variety, with notched petals; Mr. Humphrey, a red Japanese, with buff reverse; Mrs. J. Cross, yellow Japanese; and Mr. Hugh Crawford, a Japanese bloom, with shades of chestnut and yellow.

SOCIETIES.

ROYAL HORTICULTURAL. Scientific Committee.

OCTOBER 25.—Present: Dr. M. T. Masters (in the chair); Mr. Bennett-Poë, Rev. W. Wilks, and Rev. G. Henslow, Hon. Sec.

Cypripedium insigne Malformed.—A flower was received from Mr. R. Keeble, of the Gardens, Twyford, Berks, remarkable for being in a very arrested state. The front sepals were nearly separate, not coherent as usual. The posterior sepal was normal, the petals were present, but no pistil, a solid column occupying the centre of the flower, with an abortive stigma at the summit.

Fruit of Diospyros kaki.—Canon Ellacombe sent some specimens "from a tree growing against a south wall, but never protected, which has been there at least a dozen years and possibly more."

Victoria Plums, Second Crops.—Both Mr. Marshall of Bexley, and Mr. Addington of Ford House, St. Neots, sent samples of ripe Plums of this variety, as second crops. Mr. Addington remarks:—"The tree off which I gathered them had an enormous crop of Plums early this year, and it has now a good quantity of a second crop." It is, of course, an unusual occurrence, but the result of the prolonged summer weather.

Lilium speciosum with *Petaloid Stamens*.—A blossom was received from Mr. E. H. Jenkins, of the Queen's Road Nursery, Hampton Hill, remarkable for the exterior (sepaline) stamens being completely changed into perianth-leaves, resembling the others in every way.

Chrysanthemums Damping Off.—Mr. Saltmarsh, of Chelmsford, sent some cut flowers of Chrysanthemums, in which the lower part of the blossom was arrested in growth from internal decay. It was the general opinion that this was due to too gross feeding and a too confined air. Flowers-of-sulphur might correct it, if the other conditions were attended to.

MANCHESTER AND NORTH OF ENGLAND ORCHID.

OCTOBER 27.—Present: Messrs. G. Shorland Ball (in the chair), G. W. Law-Schofield, J. Leemann, A. Warburton, H. Greenwood, J. Backhouse, W. Bolton, T. Cypher, R. Johnson, W. Stevens, and F. Mills (hon. sec.).

JOHN LEEMANN, Esq., Heaton Mersey (gr., Mr. Edge), showed *Cattleya labiata*, *Postelsiana superba* (First-class Certificate); C. I. Leemann, a very beautiful form, with pure white sepals and petals of good shape and substance, and the lip slightly marked with purplish-red (First-class Certificate); Lelio-Cattleya Henry Greenwood (Award of Merit); L.-C. Ophelia (Award of Merit); *Cattleya labiata* (Award of Merit); L.-C. Sallieri magnifica; C. Mantini inversa, *Cypripedium Arthurianum*, C. eucharis, and C. orphanum. This exhibitor also staged a very fine group of miscellaneous Orchids, for which he received a Silver-gilt Medal.

A. WARBURTON, Esq., Haslingden (gr., W. Lofthouse), showed *Cattleya labiata* R. I. Measures (First-class Certificate) and C. Missour. THOMAS STATTEN, Esq., Whitefield (gr., W. Johnson), showed *Cattleya labiata* Statteniana (Award of Merit); *Dendrobium Schroderianum albens* and Lelio-

Cattleya Minerva. Also a group of miscellaneous Orchids, for which a Silver Medal was awarded.

H. SHAW, Esq., Birch Vale (gr., Mr. Cliffe), showed *Cattleya Mantini* (Award of Merit); *Catasetum Bungeorothi*, *Lælia Dayana*, and *Cypripedium insigne*. W. DUCKWORTH, Esq., Flixton (gr., Mr. Tindale), showed *Cattleya Mantini nobilior* (Award of Merit).

Ven. Archdeacon RAWSTONE, Blackburn (gr., Mr. Hewitt), showed *Cypripedium Deedmanianum inversum*. W. CYPHER, Cheltenham, showed *Cattleya labiata superba* (Award of Merit), and staged a group of Orchids, for which a Vote of Thanks was awarded.

MR. J. ROBSON, Altrincham, showed *Cypripedium insigne* Robsoniae, C. i. pallida, and staged a group of *Cypripediums* for which a Vote of Thanks was awarded.

MESSRS. J. BACKHOUSE & SON, York, showed *Oncidium tigrinum*, a very fine variety, and a remarkably well-grown specimen (an Award of Merit and a Cultural Certificate were obtained).

EXMOUTH CHRYSANTHEMUM.

OCTOBER 27, 28.—This, the thirteenth annual exhibition, was a most successful one. We can only deal with the more prominent exhibits.

CUT BLOOMS.

In the class for thirty-six Japanese varieties, H. HAMMOND SPENCER, Esq. (gr., G. Foster), was a good 1st with fine fresh-looking blooms; the more noticeable were Mrs. Mease, Mrs. Molin Grant, Lady Byron, Souvenir de Moulin, Lady Ridgway, Australia, Werther, and Phœbus; 2nd, Rev. G. LYON (gr., J. Styles), a very close competitor. He had Madame Gustave Henry, Australian Gold, Chenon de Leché, Mrs. Mease, all very fine flowers.

For twelve Japanese, the same competitors won, their positions being as before. For twelve incurved varieties, Rev. G. LYON was 1st, having excellent examples of Globe d'Or, Baron Hirsch, and Violet Tomlin; H. HAMMOND SPENCER, Esq., was 2nd, his finest being Major Bonaffon, Topaz, Orientale, and Brookleigh Gem.

For eighteen blooms (local), R. GIBBONS, Esq., was a good 1st; and for six white varieties, R. H. CLARK was 1st; and for six blooms, any variety or colour, R. GIBBONS, Esq., was 1st with splendid flowers of Colonel B. Smith.

Circular Groups.—Here General ROCKE (gr., Mr. Pennel), 1st, had a fine collection, the flowers being of superior size, and the foliage clean; the 2nd was taken by Mrs. GRESWELL (gr., Mr. Kingscote), who likewise was successful with plants of white, yellow, bronze, and crimson varieties.

Several special prizes were offered, viz., for dinner-table decorations, confined to ladies, Miss E. URQUHART being 1st; and Mrs. BAKER, 2nd.

For a basket of Chrysanthemums, Ferns, and foliage, Mrs. HODGSON was 1st; and Miss ARTHORP, 2nd. Mrs. BAKER and Miss ARTHORP were respectively 1st and 2nd for a vase of Chrysanthemums and autumn foliage. H. HAMMOND SPENCER was 1st for nine vases of Chrysanthemum blooms, each consisting of separate colours.

MR. W. J. GODFREY, nurseryman, Exmouth, had an exhibit including plants and cut-blooms of Chrysanthemums, choice Carnations, Cannas, and Begonia Gloire de Lorraine. Mr. T. R. STREET, nurseryman, staged a quantity of cut blooms and flowering plants; Mr. MAYNE, Bicton, flowering plants, including a number of Salvias, Orchids, Primulas, Cyclamens, and foliage plants.

FRUIT.

MR. MAYNE showed numerous Apples and Pears, fine bunches of Lady Downe's and Black Alicante Grapes, Sutton's Scarlet Melon, Queen Pines, &c. A considerable quantity of fruit was shown, many of the Pears being of an unusually large size. Grapes were good, the three bunches of Black Alicante, shown by Rev. H. CLARK, especially so, berries large and of fine colour.

Among the prize-winners for Apples, the Rev. H. CLARK was often in evidence; J. GORDON, Esq., R. LAY, Esq., Mrs. STEVENSON, and Miss PINCKNEY were also very successful exhibitors. Among exhibitors of Pears, General ROCKE, A. F. TERRELL SHARPLAND, Esq., Mrs. GRESWELL, and Dr. HODGSON won 1st prizes.

NATIONAL CHRYSANTHEMUM.

OCTOBER 31.—The Floral Committee of this Society met at the Royal Aquarium, and the meeting was an interesting one on account of the many new varieties shown.

First-class Certificates were awarded to (incurved) John Miles, from Mr. N. MOLYNEUX, gr., Rooksbury, Fareham; the upper surface colour pale chestnut, the reverse bronzy-buff, a flower of good substance and shape, and fine quality. The same exhibitor showed (Japanese) James Molyneux, a flower of ivory-white, with long drooping florets, a variety which found favour with some members of the Committee, but a proposal to award a Certificate of Merit was lost; (Japanese) Sir Herbert Kitchener, a yellow flower, suffused with pale orange-red, with drooping florets—attractive, yet in its form as shown scarcely worthy the award. From Mr. HENRY WEEKS, gr., Thrumpton Hall, Derby, came some very fine varieties, four of which secured First-class Certificates, viz., Emily Towers, deep pink with a silvery reverse, and broad florets—a variety with nice colour and drooping florets, that incurve somewhat; Lady Crawshaw, white, with a slight purple base, and lightly striped with this colour on some of the florets; Mrs. COMBES, pink, pleasing in tint, with a silvery reverse to the florets—drooping florets, and full, large flowers; and Henry Weeks,

a striking variety of an orange-crimson colour with an amber and silvery reverse, rich in colour and showy. The same award was made to Mrs. W. Mease, from Mr. W. GODFREY, Exmouth, one of the yellow sports from Madame Carnot, in this case pale canary-yellow, having all the good qualities of the variety from which it sported. The choicest of the new varieties was R. Hooper Pearson, a magnificent deep golden-yellow Japanese, from Mr. H. J. JONES, Ryecroft Nursery, Lewisham, a real acquisition to the yellow varieties, deep-gold in colour, with broad drooping florets; the flowers large, full, and in every way first-rate. The same Award was made to a very attractive decorative variety, named Ryecroft Scarlet, a plant of which was staged, showing it to be a good grower, and free bloomer; colour bright orange-scarlet, and very attractive. Similar Awards were made to Mrs. White Popham (W. Wells), a large Japanese, of a bright lilac-purple colour, with a silvery reverse to the broad florets, a large incurving flower of fine properties; to Japanese Nellie Pockett (W. Wells), a full white flower, with curling florets of good shape; and to decorative Chrysanthemum Mychett Beauty (W. Wells), a plant being shown from the open ground; the flowers are of a bright golden hue.

Other varieties of a promising character were Fred Joy (Seward), bright orange-chestnut, with an amber reverse, striking and effective; Chatsworth (Cannell & Sons), light ground, with pale purple stripes, large drooping florets; Purple Emperor (Cannell & Sons), rich amaranth-crimson, with a silvery reverse, very striking in colour; Japanese Jean Bloomfield (C. Gibson), deep yellow, of good colour, but not sufficiently developed; W. Carsham (H. Weeks), reddish-chestnut, with buff reverse, large and full, but lacking finish; and Grand Dragon (W. Wells), a striking deep yellow flower, of decided promise. There is, therefore, no lack of novelties, and the present season appears to be as rich in new flowers as any which has preceded it.

EASTBOURNE HORTICULTURAL.

NOVEMBER 1.—No place can be more appropriate for a Chrysanthemum show than the spacious Floral Hall which forms a part of the Devonshire Park, and affords ample space for numerous exhibits, and for the public to inspect them. After such an unusual season, it was a little early to hold the show; still, there was a good all-round display, the incurved varieties being the weakest feature, as more time is required by these. The weather was fine, and a large company came to the show.

CUT FLOWERS.

The 1st prize for twenty-four Japanese varieties came from Mr. J. STREDWICK, Silverhill, St. Leonards, whose leading blooms were Graphic, Eva Knowles, Edith Tabor, Pride of Madford, C. Davis, Madame G. Henry, Australian Gold, and President Nonin; he was the only exhibitor. With twelve blooms Mr. STREDWICK was again 1st; and Mr. J. Harwood, gr. to A. J. JACK, Esq., Seaford, was 2nd. The latter exhibit was 1st with six blooms of one white variety, namely, Simplicity. The best six of any other colour also came from Mr. Harwood, viz., Oceana, in fine character; Mr. A. Emery, gr. to H. OAKLEY, Esq., Eastbourne, was 2nd, with finely-coloured Edwin Molyneux; the incurved varieties were poorly developed.

The competition of six blooms in a vase, arranged with foliage, made a nice feature, Mr. STREDWICK taking the 1st prize with fine blooms set up with autumn foliage; Mr. Camm, gr. to Her Grace the Duchess of CLEVELAND, Battle Abbey, was 2nd, with six fine blooms of a yellow variety.

In the next division, the best twelve Japanese varieties came from Mr. E. East, gr. to Mrs. RAY, Meads; Mr. W. Jupp, gr. to G. BOULTON, Esq., Eastbourne, was 2nd. Mr. A. EMERY had the best eighteen, Mr. W. JUPP taking the 2nd prize.

Mr. A. EMERY had the best six incurveds in Baron Hirsch, Mr. F. Minstral, and Madame Darier, &c.

AMATEURS' DIVISION.

In this section Mr. F. WILLIAMS, Eastbourne, had the best twelve Japanese varieties—a very creditable lot. Mr. W. SOUTHAM, Eastbourne, had the best six. Mr. HIBBERT had the best six incurved varieties. Some good vases were also staged in this division.

The best group of Chrysanthemums in the open division came from Mr. W. JUPP, well-grown and finely-bloomed plants, effectively arranged; Mr. J. GORE, Polegate, was 2nd. The latter had the best group of mixed plants, flowering and foliage, inclusive of Orchids, Carnations, Begonia Gloire de Lorraine, &c.; Mr. W. JUPP, who was 2nd, depended mainly upon bright-coloured Crotons.

In the amateurs' division, Mr. F. WILLIAMS set up a very fine group for an amateur, the plants being well grown and grandly bloomed.

In another division, Mr. Pattenden, gr. to Miss WILSON, Eastbourne, was 1st, with a group of Chrysanthemums and other plants.

MISCELLANEOUS.

Grapes, Apples, and Pears were shown, the two last-named somewhat extensively. The best three bunches of black Grapes were finely-finished Alicante from Mr. CAMM, Battle Abbey; Mr. J. GORE, Polegate, was 2nd, with good Gros Colmar, which, however, lacked colour.

Mr. CAMM took the 1st prize with three splendidly-finished bunches of white Muscat of Alexandria.

The best six dishes of culinary Apples came from Mr. F. W. THOMAS, Fruit Gardens, Polegate.

Mr. CAMM had the three best dishes of baking Pears, the varieties, Beurré Bachelier, Catillac, and Passe Colmar. 2nd, Mr. THOMAS, with Vicar of Winkfield, and Uvedale's St. Germain, differing from the foregoing.

In other divisions, very good Apples, Pears, and Tomatoes were shown.

Messrs. SUTTON & SONS, and others, offered prizes for Vegetables, and these were well represented.

From Mr. May, gr. to His Grace the Duke of DEVONSHIRE, Compton Place, came a fine group of Chrysanthemums backed with Palms, and a fine Araucaria excelsa, which was highly commended; and Mr. G. F. SCOTT, nurseryman, Eastbourne, filled the front of the spacious platform with a very imposing display, having on each side large groups of Chrysanthemums fronted by flowering and foliaged plants, and in the centre, bunches of superb Cactus-Dahlias for the season of the year, backed by flowering and foliaged plants, and fronted with small Ferns, also highly commended.

Messrs. DURRANT, YOUNG & CO., nurserymen, Eastbourne, set up at the west end of the Hall a fine group of Palms, Chrysanthemums, &c., a prominent feature in the arrangements; and Mr. F. G. MILLER, florist, Eastbourne, also had a group.

From Mr. WELLS, Earlswood, Redhill, came a collection of new varieties of Japanese, and Certificates of Merit were awarded to Mrs. White Popham, President Bevan, Crimson Pride, and Mychett Yellows. Mr. WELLS also had some fine bunches of the newer market and decorative varieties.

KINGSTON CHRYSANTHEMUM.

NOVEMBER 1, 2.—The Kingston and Surbiton Chrysanthemum Society has this season held its twenty-second annual exhibition on an earlier date than during its history. There are many who think that a better show would have resulted had the fixture been ten days later. The display opened on Tuesday last was a good one, but hardly satisfactory to the once celebrated and flourishing society in Kingston.

There were some capital blooms shown, but not so much competition as could have been wished. The Champion Challenge Vase, having now been won twice by the same exhibitor, it has become his property. It was a subject of frequent remark, that Mr. MORTIMER showed such a collection of Dahlia blooms from the open that has probably never been equalled upon the same date.

PLANTS.

There were three exhibits of a miscellaneous group of plants, to contain not fewer than twenty-five distinct varieties of Chrysanthemums. The 1st and 2nd prize groups were placed upon the floor, back to back. The 1st prize exhibit was from Mr. J. LOCK, gr. to E. S. EADY, Esq., Oatlands Lodge, Weybridge. In this group was imitated the pond of water and cork bridge arrangement, but in a miniature manner. Such a system is more suitable to an exhibit upon a larger space. Mr. J. Hoskins, gr. to D. SALAMON, Esq., St. James' Road, Kingston Hill, had a group containing better Chrysanthemums and other plants, and, in our opinion, should have been placed 1st.

The 1st prize for four plants of Japanese varieties was won by Mr. W. BRETT; he had W. H. Lincoln, Viviani Morel, Souvenir d'une Petite Amie, and Col. W. B. Smith. Mr. S. PEAD was 2nd.

The best six table plants were shown by Mr. T. H. Bolton, gr. to Mrs. BLACKER, Coombe End, Kingston Hill, his Codæums Golden Ring and elegantissima, and Aralia elegantissima being the prettiest plants. There were also some pretty exhibits of Solanums and other berried plants, and of single and double-flowered Chinese Primulas.

CUT BLOOMS.

The large class for incurveds was won by Mr. F. KING with a collection rather less good than those of the same section in his "Champion Vase" exhibit.

The best twelve blooms of incurved varieties were from Mr. CARYER, gr. to A. G. MEISSNER, Esq., Aldenholme, Weybridge.

The best six incurved blooms of one variety were of Duchess of Fife, white, from Mr. F. KING.

The best collection of twenty-four Japanese blooms, distinct, was from Mr. J. F. McLeod, gr. to J. P. MORGAN, Esq., Dover House, Roehampton. He had capital blooms of Pride of Madford, Lady Ridgway, Madame M. Ricoud, Madame G. Henri, Mons. Pankoucke, Oceana, Lady Byron, Reine d'Angleterre, the new Chatsworth, Phœbus, Madame Ph. Revoire, Edith Tabor, Col. W. B. Smith, Mr. Probyn, Lady Oporto Tai, a good yellow Japanese, sent out by Mr. Cannell, &c. The 2nd prize was won by Mr. F. KING, gr. to A. F. PERKINS, Esq., Oak Dene, Holmwood, Surrey, who was 1st for the Challenge Vase.

The quality in the class for twelve Japanese blooms was not so good. The 1st prize was won by Mr. S. PEAD, gr. to R. S. BOND, Esq., Croylands, Surbiton.

The best blooms in the class for six of any Japanese variety were of Mlle. Thérèse Rey, from Mr. F. KING.

A collection of twelve nice reflexed blooms won 1st prize in this section for Mr. T. CARYER. There was only one collection of twelve Anemone blooms; this was from Mr. G. W. FORBES, gr. to Mme. NICOLLS, Regent House, Surbiton.

The best collection of twelve bunches of Pompons was one from Mr. T. CARYER, who showed a very nice lot; but the other three exhibits in the class were weak.

Single-flowered varieties were capital from Mr. G. W. FORBES, who had a collection of twelve bunches fit for any show, National or otherwise. Anemone Pompons were poor.

Mr. G. W. FORBES was 1st in the class for locally-produced incurveds to the number of twelve, Baron Hirsch and C. H. Curtis being his best blooms.

The class for six incurveds (local) was well won by Mr. Brett, gr. to N. M. CAMPBELL, Esq., Coombe Ridge, Kingston Hill.

There were three exhibits in the class for twelve Japanese blooms, distinct (local); and a collection from Mr. G. W. FORBES was most meritorious. The blooms of Phœbus, Lady Byron, Madame Carnot, and Reine d'Angleterre were best; Mr. C. Smith, gr. to WILSON ADDISON, Esq., Norbiton Place, Kingston Hill, was 2nd.

There were classes also for amateurs and cottagers.

SPECIAL PRIZES.

The principal centre of interest at the Kingston show is occasioned by the Champion Challenge Vase class. This is offered for the best collection of forty-eight Chrysanthemum blooms, distinct, twenty-four Japanese and twenty-four incurved. There were several competitors for this honour, but the 1st prize was worthily won by A. F. PERKINS, Esq., Oak Dene, Holmwood, Surrey (gr., Mr. F. King). The Challenge Vase having been won by this exhibitor upon a previous occasion, it has now become his property. Among the Japanese blooms the following were interesting, either from the excellent condition in which they were staged, or from their novelty:—John Seaward, Ed. Molyneux, International, Chas. Davis, Australie, Phœbus; Mrs. Mease, the Primrose sport from Madame Carnot; G. J. Warren, the yellow sport from Madame Carnot; Lady Northcote, a pure white Japanese; Lady Hanham, and C. B. Haywood, a ball-like white Japanese. The incurveds were better than might have been expected until next week. The following were very good: Mrs. N. Molyneux, Miss M. A. Haggas, yellow; C. H. Curtis, yellow; Lady Isabel, Ernest Cannell, Jeanne d'Arc, D. B. Crane, and M. P. Martignac. The 2nd prize was won by PANTIA RALLI, Esq., Ashstead Park, Epsom (gr., Mr. G. J. Hunt), who staged excellent Japanese blooms, but failed somewhat in the incurveds, some of the blooms being hardly "made up." Of his Japanese, Ella Curtis, Graphic, Australie, Edith Tabor, Madame M. Ricoud, and Edwin Molyneux, may be mentioned; and of his incurveds, Duchess of Fife, Globe d'Or, and Empress of India. The third prize was won by WILSON ADDISON, Esq., Norbiton Place, Kingston Hill (gr., Mr. C. Smith); and the 4th by C. S. EADY, Esq., Oatlands Lodge, Weybridge (gr., Mr. J. Lock).

The best exhibit for the Mayor's prize offered for a basket of cut Japanese Chrysanthemums was won by Mr. S. PEAD. The handle of the basket was covered with Myrsophyllum asparagoides, and the blooms which were cut with long stems, were placed over a covering of Azalea mollis foliage, and other plants.

The best collection of six white Japanese blooms of one variety, was one of Madame Gustave Henry, from Mr. G. W. FORBES; and the best six yellow Japanese blooms were of Phœbus from Mr. W. BRETT.

There were some pretty bouquets, buttonholes, and other decorative arrangements of Chrysanthemum blooms.

FRUIT.

The best three bunches of White Grapes were fine ones of Muscat of Alexandria, shown by Mr. Wm. Taylor, gr. to C. BAYER, Esq., Tewkesbury Lodge, Forest Hill; and the best three bunches of Black Grapes were Gros Colmar, from Mr. A. Sadler, gr. to Mrs. TULK, Cowley House, Chertsey.

The best collection of four dishes of dessert fruits was also from Mr. W. Taylor. He had Figs, Apples, Pears, and Muscat Grapes.

Mr. J. LOCK had the best collection of six dishes of Apples, three culinary and three dessert; and the best exhibit of four dishes of Pears was from Mr. A. H. Rickwood, gr. to the Dowager Lady FREAKER, Fulwell Park, Twickenham, with the varieties Lucchesse d'Angoulême, Beurré Superfin, Durondeau, and Pitmaston Duchess.

NON-COMPETITIVE EXHIBITS.

Mr. H. J. JONES, Ryecroft Nurseries, Hither Green, Lewisham, staged about sixty blooms of Japanese varieties. Prominent amongst these were some recently-certificated sorts, including the pretty primrose coloured Mrs. W. Mease, and the new yellow Japanese, R. Hooper Pearson, richer in point of colour than any yellow one yet raised.

Mr. W. WELLS, of the Earlswood Nurseries, Redhill, had a fine display of the early-flowering Japanese varieties, including Mychett Beauty, certificated the day previously. Also a collection of forty blooms of exhibition varieties, including Mrs. White Popham, and many other novelties of merit.

An extraordinary exhibit of Dahlia blooms was made by Mr. S. MORTIMER, Rowledge Nurseries, Farnham. Although it was November 1, there were shown 120 show-blooms, and thirty-two bunches of Cactus varieties. The colours and freshness of these blooms were astonishing.

Mr. W. HAYWARD, Floral Depot, Fife Road, Kingston, filled a table with Chrysanthemum plants and flowers, and flowers of other species of plants.

There were several large exhibits of fruit. Mr. J. W. MILLER, gr. to Lord FOLEY, Ruxley Lodge, Claygate, had about forty dishes of Apples and Pears, and a few Grapes. Messrs. GEO. BUNYARD & CO., Maidstone, showed sixty dishes of Apples. Mr. W. TAYLER, Osborn Nursery, Hampton, had a collection of Apples, and some Reine Olga Grapes, gathered from out-of-doors. Messrs. J. CHEAL & SONS, Crawley, had seventy dishes of Apples and Pears.

HORNSEY CHRYSANTHEMUM.

THE ninth annual exhibition of the Hornsey and District Chrysanthemum Society was opened on Tuesday at the Hornsey National Hall by the president, Mr. EDWARD W. NICHOLLS.

The past dry season has been severely felt in this suburb, and the cottagers' classes were not so well represented as formerly; the annual exhibits from the Priory, the residence of the late Mr. Alderman H. R. Williams, too, were greatly missed, but with these exceptions the show was up to the standard of previous years. The cut blooms were some of them very fine indeed, and if fault were to be found it would be that there was not sufficient variety. Incurred and Pompons were poorly represented, and there was not a single hirsute variety in the show, while Phœbuses were as thick as Blackberries. A feature of the show were the table decorations, some "not for competition," and of these last Mrs. W. H. REYNOLDS was awarded a Silver Medal, a similar Medal being awarded to Mr. A. MCGREGOR, of Hornsey, for a large stand of Palms, Ferns, and foliage plants, set with Chrysanthemums.

The Three Guinea Silver Cup, given by Mr. H. Burt, M.C.C., was won outright by Mr. W. AUSTIN, of Eastfield Road, Hornsey, and the Eight Guinea Silver Cup, given by Mr. Newenham Grayton, Editor of the *Times of Africa*, was won a first time by Mr. F. J. MATHEWS, of Barrington Road, Crouch End. The first-named is a "cottager," and the latter an "amateur," the one showing eighteen, and the other twenty-four carefully-grown Japanese blooms.

Mr. W. Ward, gr. to Mr. H. T. EVE, Q.C., carried off the 1st prize for groups in the gardeners' class, and Mr. DURRANT in the amateurs' class, and both were also awarded the Certificate of Merit of the National Chrysanthemum Society.

Among other successful exhibitors were Mr. T. L. Turk, gr. to Mr. BONEY, of Southwood House, Highgate, eight 1sts and three 2nds; Mr. A. F. BOUGARD, of Corrie Glynn, Highgate, five 1sts and two 2nds; Mr. G. Saunders, gr. to Mr. HAYES, of Highgate, three 1sts, five 2nds, and one 3rd; Mr. J. NEWMAN, of Myddleton Road, Hornsey, five 1sts, four 2nds, and one 3rd; and Mr. DURRANT, of Gordon Road, Hornsey, three 1sts, four 2nds, two 3rds, and one extra. Sir MARCUS SAMUEL, of The Mote, Maidstone, kindly set up, not for competition, a very choice selection of fruit.

SOUTHAMPTON HORTICULTURAL.

NOVEMBER 1, 2.—The annual autumn show of the Royal Horticultural Society of Southampton was held in the Victoria Hall, and was a success in every way. The hall is commodious, light, and of good approach. The secretarial duties, in the capable hands of Mr. Fudge, were carried out in a thorough manner.

Cut blooms were numerous, and of average quality. The principal class was for twenty-four Japanese blooms. The premier award fell to Mr. W. H. MOSE, Belmont Nursery, Sholing, for a stand of even-sized, fresh, well-built flowers. Especially good were Phœbus, N. C. S. Jubilee, Edwin Molyneux, Pride of Madford, Emily Silsbury, and Duke of Wellington; Mr. J. Bowerman, gr. to Mrs. HOARE, Hackwood Park, Basingstoke, was a good 2nd. Mr. NOBBS, gr. to Her Majesty the QUEEN, Osborne, Isle of Wight, who was 3rd, had a creditable stand.

Mr. BOWERMAN was 1st for eighteen Japanese blooms, staging flowers of good quality; Mr. NOBBS taking a similar place for twelve Japanese blooms.

Mr. Goss, gr. to W. G. TWIG, Esq., Byams, Marchwood, was 1st for twelve blooms in eight varieties.

Incurred varieties were very poor. Amateurs staged blooms equal to those in the open classes. Mr. H. H. LEES, Cedar Road, The Avenue, 1st for twelve and six varieties, closely followed by Mr. E. BROWN, Jun., Hill Lane.

PLANTS.

Groups of Chrysanthemums were well represented. The plants were exceptionally dwarf, and well arranged. The large blooms with which they were furnished showed to the best advantage by the sensible manner in which they were disposed, each plant being given plenty of space. Mr. BAIN, gr. to Mrs. DICKSON, Shirley, was easily 1st in the open class; Mr. E. BROWN occupying a similar position in the amateurs division.

In the Chrysanthemum and foliage plant group class there were no fewer than five competitors, and they made an attractive display down the body of the hall. Mr. JAMES, gr. to the Hon. Mrs. ELLIOTT YORKE, Netley, easily secured the leading award, and was followed by Mr. T. HALL, gr. to Sir S. MONTAGUE, Bart., South Stoneham House, Southampton.

FRUITS, &c.

Fruit and vegetables were well represented. Grapes especially being good. Mr. W. MITCHELL, gr. to J. WILLIS FLEMING, Esq., Chilworth Manor, secured several leading prizes with excellent examples.

Non-competing exhibits were numerous and noteworthy, especially the collection of Apples from Messrs. E. HILLIER & SONS, Winchester; shrubs from Mr. W. H. ROGERS, Red Lodge Nurseries; the floral decorations from Mr. E. H. BAILEY; and the collection of hardy herbaceous cut-flowers from Mr. B. LADRAMS, Shirley.

CATALOGUES RECEIVED.

BEN REID & Co., Aberdeen, N.B.—Forest Trees and Roses.

T. SMITH, Daisy Hill Nursery, Newry—Border Carnations, Pinks, Early-flowering Chrysanthemums, Phloxes, Lobelias, Pansies, Violas, Auriculas, Violets, &c.

JAMES BACKHOUSE & SON, Ltd., York—Trees, Shrubs, Conifers, &c.

BOTANIC GARDENS: K. See *Kew Bulletin*, Appendix iii, 1897. *Hogg's Year Book*, *The Garden Annual*, &c.

CHRYSANTHEMUM LEAVES: H. D. Affected with rust. See our recent numbers, where the fungus is figured and the remedies given.

CREEPERS FOR A HIGH WALL IN A BLEAK SITUATION: A. G. B. Ivies being excluded, you should plant *Cotoneaster microphylla*, *C. Simonsii, *Garrya elliptica, *Prairie, *Ayrshire, *and Turner's Crimson Rambler Roses, *Crataegus pyracantha*, **Pittosporum Tobira*, **Ampelopsis Veitchii*, A. purpurea, *Aristolochia Siphon*, *Clematis montana*, and any of the garden hybrids, *Jasminum nudiflorum*, *J. revolutum, **Lonicera brachypoda*, L. b. aureo reticulata, L. sempervirens, *Menispermum canadense*. Those with an asterisk being of comparatively low growth, should be employed to clothe the lower part of the wall.

EUCHARIS: W. J. P. A fusion of two flowers is not uncommon in this, or indeed in any flower.

FUNGUS? ON BEECH: F. B. The white excrescence is not a fungus, but an insect allied to the mealy-bug. It is very common on the Beech, and very difficult, if not impossible, to get rid of. If the tree is a small one, you might try spraying with a wine-glassful of kerosine stirred up in a gallon of soap suds. Keep the mixture well stirred.

HORTICULTURAL INSTRUCTION: S. P., and Others. We have communicated with the advertiser, but have received no reply.

LINNEAN SOCIETY: Amicus. Why not have written to the secretary? There is no entrance examination, but you must have some interest in natural history, and be recommended as a fit person by three Fellows, and you will then be balloted for at a meeting of the Fellows. Of course, it is a *sine qua non* that you pay your entrance-fee and annual subscription.

MAMMILARIA PICTA: A. J. W. The plant does well firmly potted in rich loam, mixed with an equal bulk of sandstone and mortar-rubble, and stood on a sunny shelf in a hothouse; affording it water in moderation from March to October, and little, if any, the remainder of the year. Provided the drainage is made good annually, the plant will not require repotting oftener than once in three years.

NAMES OF FRUITS.—Applications to name fruits are so numerous at this season, as seriously to hamper us in the exercise of our editorial duties. They entail an expenditure of time, labour, and money, of which our readers can have little idea. We are most desirous to oblige our correspondents as far as we can, but we must request that they will observe the rule that not more than six varieties be sent at any one time. The specimens must be good ones, just approaching ripeness, and they should be properly numbered, and carefully packed. We do not undertake to send answers through the post, or to return fruits. Fruits and plants must not be sent in the same box. Delay in any case is unavoidable.

—Pickering. 3, Ecklinville; 5, Dutch Mignonne; 6, Cox's Pomona; 7, Gravenstein; 8, Yorkshire Beauty; 9, Cellini.—S. G. 1, Mère de Ménage; 2, Lord Grosvenor; 3, Emperor Alexander; 6, Dumelow's Seedling; 7, Blenheim Orange Pippin.—S. E. A., Yorks. 1, Minshall Crab; 2, not known, resembles Beauty of Kent; 3, Court Pendu Plat; 4, Cockpit; 5, Dutch Mignonne.—G. W. 1, Cox's Orange Pippin; 2, Blenheim Orange ditto; 3, worthless; 5, Emperor Alexander; 6, Scarlet Nonpareil.—J. Pitts. 1, Baronne de Mello; 5, Beurré Superfin; 6, Beurré Rance; 9, Brown Beurré; 6, General Todtleben; 23, Marie Louise d'Uccle; 18, Beurré d'Anjou.—Thos. Baxendale. 1, Blenheim Orange Pippin; 2, King of the Pippins; 3, Fearn's Pippin; 4, Warner's King; Pear, Beurré Bosc.—H. Joy. 1, Cox's Orange Pippin; 2, King of the Pippins; 3, Fearn's Pippin; 4, not known, worthless; 5, Yorkshire Beauty. Pear, Thomson's.—D. T. F. 1, Gansell's Bergamot; 2, Beurré Diel; 4, Easter Beurré; 5, Beurré Clairgeau; 6, Souvenir du Congrès.—E. Lazenby. 1, Aromatic Russet; 2, Duke of Devonshire; 3, Brownlee's Russet.—

Foreman. Apples: 1, Warner's King; 2, Maltster; 4, Hoary Morning; 6, Nonsuch; Pears: 1, Catillac; 2, Beurré Bachelier; others decayed.—H. K. Apple, King of the Pippins.—J. O. B. Braddick's Nonpareil.—E. J. Woodward. Apples: 1 and 2, Reinette du Canada; 3, Northern Greening; 4, Hollandbury; 5, New Hawthornden; 6, Tower of Glamis; 7, Cellini.—T. W. Swinburne. The Apple you send under the name of Enderleaf is very similar to Gloria Mundi—a large and very handsome variety. A variety under this name was exhibited at the Apple Congress at Chiswick in 1883.

NAMES OF PLANTS: Correspondents not answered in this issue are requested to be so good as to consult the following number.—A. M. 1, Cornus (Benthania) fragifera; 2, Taxodium distichum.—H. V. 1, A variety of Cupressus Lawsoniana; 2, Elæagnus pungens var. aurea; 3, Euonymus radicans, variegated form; 4, Cotoneaster Simonsii; 5, Escallonia, probably E. rubra.—M. F. Your plant is Ecobolium Elaterium, which furnishes the drug called Elaterium. It is violently poisonous, so that it should not be allowed to remain where cattle can get access to it. The common name is the Squirting Cucumber.—J. A., Antrim. 1, Juniperus recurva; 2, Juniperus virginiana var.; 3, Cupressus Lawsoniana var.; 4, Cupressus nootkatensis, golden var., alias Thuiopsis borealis; 5, Calycanthus occidentalis.—W. S., Brentford. 1, Lomaria gibba; 2, Plumbago rosea; 3, Cypripedium barbatum; 4, Croton, cannot name from specimen sent; 5, Oplismenus Burmani variegatus; 6, Dracæna Baptisti.—R. Y. 1, Aspidium (Cyrtomium) Fortunei; 2, Polystichum pungens; 3, Selaginella stolonifera; 4, Aspidium (Cyrtomium) falcatum; 5, Doodia caudata; 6, Davallia Nova Zealandia; 7, Pteris adiantoides; 8, Nephrodium molle; 9, Asparagus Sprengeri; 10, Selaginella Mertensii; 11, Adiantum hispidulum; 12, Selaginella casia; 13, Pteris longifolia; 14, Pteris tripartita.—R. McO. 1, Not recognised; 2, Common Thyme; 3, Phlox setacea, probably; send when in flower; 4, perhaps Aubrietia deltoidea; 5, Not recognised; 6, Acer monspessulanum. It is impossible to name such scraps satisfactorily.

NARCISSUS POETICUS: H. A. M. For early flowering this late variety is not exactly suited, and if it is so employed, the bulbs should have been potted in August or early in September.

POTATOS: J. P. A. Supertuberation. Perhaps the hot, dry summer has something to do with it.

PELARGONIUM: E. You are quite right, there are a very few species in other regions than the South African. From the point of view of geographical botany, the distribution is very interesting.

ROMAN HYACINTHS: H. A. N. These bulbs, like others, cannot be forced into blossom before they have made a good number of roots, and to enable them to be forced early the boxing or potting of the bulbs should be done early in September. If the boxing, &c., be not carried out before the present date it is not possible to have blossoms under two months.

DIED.—On the 30th ult., very suddenly, at his residence, 31, The Grove, Boltons, Mr. LATIMER CLARK, F.R.S., F.R.A.S., M.I.C.E., M.I.E.E., &c., in his seventy-sixth year. Mr. Clark was a cultivator of alpine plants, and took much interest in them.

CONTINUED LARGE INCREASE in the CIRCULATION of the "GARDENERS' CHRONICLE."

IMPORTANT TO ADVERTISERS.—The Publisher has the satisfaction of announcing that the circulation of the "Gardeners' Chronicle" has, since the reduction in the price of the paper,

MORE THAN DOUBLED, and that it continues to increase weekly. Advertisers are reminded that the "Chronicle" circulates among COUNTRY GENTLEMEN, and ALL CLASSES of GARDENERS and GARDEN-LOVERS at home, that it has a specially large FOREIGN and COLONIAL CIRCULATION, and that it is preserved for reference in all the principal Libraries.

(For Markets and Weather, see p. x.)

THE

Gardeners' Chronicle.

SATURDAY, NOVEMBER 12, 1898.

THE PUKA-TREE AND ITS HOME.

THERE is a small group of islands off the New Zealand coast, known as Moro-Tiri, or Chicken Islands, seven in number; but only four of them are worth mentioning. The islands being out of the track of ships, and the landing bad, they are seldom visited, except by Maori fishermen, who go there to collect Ti-Ti, or Mutton-birds. On the largest of the islands there is a large fortified Maori Pa, probably made about 100 years ago or more; the remains are still to be seen cut out of the sandstone, and naturally protected on two sides by steep cliffs, on the others by narrow spurs with ditches cut across them. In the centre is a large square, where the natives used to camp, and now covered with old pepe-shells (a sort of cockle), brought there for food from the main land. Unfortunately, there are no traditions among the present natives on the mainland as to who occupied this Pa, or anything about the place. That it was occupied by a warlike people, who were afraid of being eaten, is evident from the trouble taken to protect it from surprise. This island is between 300 and 400 acres in extent; on the north it is exposed to the full force of the ocean, its wind-swept cliffs being about 300 feet high.

The bush on the various islands consists of Kohe-Kohe tree and scrub Manuka, Pohutukawa, Puriri, Karaka, &c., all pretty, ornamental trees, that would grow well in the West of England. But what makes the islands so interesting from a botanical point of view is, that it is the home of what has been described as "one of the rarest trees in the world"—the *Meryta Sinclairi*, or "Puka" of the Maori. It is a fine ornamental tree, with large leaves; but here, in its native habitat, does not show to advantage, on account of being surrounded by other trees. It grows to about 30 feet, and is very conspicuous above the other foliage, the large leaves glistening in the sun when looking down the gullies in which it grows. It seems as if nature had adapted the tree to its windy surroundings, as the leaf has not only the usual mid-rib, but also a "rib" right round the edge of the leaf to give it stability, and prevent it being split by the wind. Most of the trees are of the male variety, the female having seed nearly ripe in September, the time of my visit. There were very few young plants about, one reason being that the seed falls and rots in the dark dense bush below, another that the pigeons with which the islands abound, eat a lot of the seed before it is ripe. When broken the branches exude a sort of gum.

Another pretty shrub growing there that would do well in the mild west country climate at home, is the "Whau" or cork-wood of the settler, called so on account of its extreme lightness, and used by the natives for floats for

their fishing nets; it has bunches of pretty white flowers, which change to a black spiky burr as a seed-case. Captain Cook's Scurvy-grass also grows here. On the top of the islands were masses of the large white *Clematis indivisa*, with its white star-like flowers, hanging in long festoons from the various bushes, and pretty green Parrakeets (*Kakariki*) flying round about with no sense of fear. Beneath are masses of delicate Maidenhair Fern, with the new spring fronds sprouting through the heaps of last year's dead vegetation.

Numerous holes in the soft vegetable mould are the homes of the Ti-Ti or Mutton-bird, a kind of Petrel, which lays its eggs, and hatches its young in company with a large lizard called the Tuatara. The young birds become very fat, and are highly prized by the Maoris for food. They generally preserve the birds in their own fat, in bags made of split Kelp, a sea-weed growing round the coast, or in calabashes made for the purpose. To Europeans they taste nasty when fresh, but when preserved by the natives they are simply "beastly." Penguins abound round the islands, and are fond of going ashore and feeding on a species of *Mesembryanthemum*, which contains a good deal of salt in its leaves. The birds make paths up the steep cliffs, it is a long climb for them; but the descent is easy, as they sit tight on the ground, spread out their stiff, rudder-like tails, and slide. If they strike a stone or anything, over they go, with their little white breasts up and legs kicking in the air, but they soon right themselves, and start seaward again.

There is a very rare lizard on the island called the Tuatara, to which I have before referred, and which averages 15 to 18 inches in length; it lives in holes with the Mutton-bird. I should say it is the lizard, from the length of their claws, that dig the holes, and the birds take possession of these holes in the nesting season. These lizards are the representatives of one of the oldest types of reptiles (and they look it), and are only found on the outlying islands on the New Zealand coast. This month and the next they lay their eggs, which it is said take thirteen months to hatch. The eggs are small and white, with a soft shell, like a turtle's egg. The only way to distinguish the male from the female is by the male having a spiky fringe right down the head and back; the female has it, but not so marked. They have very large mouths, with teeth; they bite, but are not poisonous. If kept in captivity in a garden and fed with chopped meat, they become, in a measure, tame.

One or two of the islands are mineral bearing, and good indications of copper are found on the most eastern island of the group. The fact of these islands being the home of one of the rarest trees, and also of an almost extinct lizard, alone makes them interesting. In past ages no doubt they were a portion of the mainland, but now they stand alone, the mainland showing in the far distance. Rare plants, birds and insects, how long will they remain undisturbed? Already the sound of rock-blasting echoes through the hills, frightening countless sea-birds. Bush-fires caused by mining, bird and plant collectors, will soon destroy what has been in existence for thousands of years. The bush burnt, the soil soon disappears, swept into the sea by wind and rain; so in time what was once a pretty wooded islet, will have nothing left but bare rocks and a few tussocks. *Hugh Boscawen, September 2, 1898.* [The *Meryta* is an *Araliad*, figured and described in *Kirk's Forest Flora of New Zealand*. We shall refer to it again shortly. ED.]

ORCHID NOTES AND GLEANINGS.

TRICHOPILIA LEHMANNI, Regel.

THIS handsome and highly fragrant species, figured in the *Gartenflora*, 1888, t. 1276, is usually considered to be a form of *T. fragrans*, although it is a well-marked variation, a notable feature being the length of the ovary, which in *T. Lehmanni* ranges between 2 and 3 inches, thus giving the several-flowered inflorescence a more lax appearance than is observable in those of *T. fragrans*. The petals are also proportionately longer and more wavy, and the lip more distinctly divided. Good examples of it, of pure white colour, are sent by F. W. Moore, Esq., Royal Botanic Gardens, Glasnevin, Dublin. The odour, which resembles the Tuberose, is most powerful and penetrating. It was collected by Consul F. C. Lehmann in the Western Cordilleras of Colombia.

ODONTOGLOSSUM MACULATUM VAR.

A very singular variation of this species, which may be a reversion from *O. × aspersum* (*maculatum × Rossii*), is sent by H. Brittan Evans, Esq., Pembroke Road, Clifton. In general appearance it is an *O. maculatum*, although the sepals are longer and slenderer at the tips than ordinary forms. The colour of the flowers is primrose-yellow, with a greenish tinge on the sepals and petals, on the former of which the usual brown markings of the ordinary varieties are replaced by a greenish-cinnamon line, the petals having a few similar markings at their base; on the labellum the markings are wanting, except one small spot on one flower, and two on the other; the blade of the lip is of canary-yellow colour. The ordinary form would be considered the more handsome by most people, but this is very curious and attractive.

THE BULB GARDEN.

HYMENOCALLIS SPECIOSA.

I HAVE a plant of this species now carrying a particularly fine head measuring 1½ foot across, with a dozen sub-erect flowers. The flowers are 8 inches long and 9 inches across, very fragrant (especially at night), pure white in colour, with the narrow segments, membranous, funnel-shaped, staminal cup, and prominent light green filaments and style characteristic of the genus. As a decorative plant, it is very effective, as all the flowers are open at the same time. Although one of the oldest species of *Hymenocallis* in cultivation, it still holds its ground as one of the best flowering bulbous plants we have, though, perhaps, it was more extensively grown a few years ago than is the case to-day. It requires stove-house temperature, and plenty of water during growth, with occasional doses of manure-water, keeping the bulbs but moderately dry in a lower temperature whilst at rest. A little dried cow-manure mixed with the potting soil suits the plants.

BRUNSVIGIA COOPERI.

An interesting Cape-plant, with a globose bulb, and distichous, glabrous, green leaves, 1 foot long and 3 inches wide, which die down before the plant flowers. It produces a scape 1 foot high, bearing from twelve to sixteen flowers on long stiff pedicels in the form of a candelabrum. The flower measures 2 inches across, is crimson in colour, somewhat resembling a tobacco-pipe in its position on the pedicel. The lower segment in the whorl is boat-shaped, the upper segments, stamens and style recurving upwards, to form a semicircle. There is considerable variation in the colours and forms of the flowers of different plants, some of them being really handsome. They would, however, find more favour amongst lovers of the curious than the beautiful. The bulbs may be started in a temperature of 55°, giving plenty of water when in full growth, withholding it as the leaves show signs of resting, placing them outside in the full sun in the summer

to ripen thoroughly. They flower in late summer, the flowers lasting a considerable time in good condition. It may prove a useful plant for hybridising with species of allied genera lacking rich colouring and multiplicity of flowers.

EUCARIS GRANDIFLORA VAR. LOWI.

This grand *Eucharis* has recently flowered at Isleworth, a bulb having been imported in a case of *E. Sanderi* a few years ago. From three to five flowers are borne on a single scape, each measuring 4 inches across and 4 inches in length, with very wide, wavy segments, a dentately lobed, short staminal cup, slender filaments, and a very large stigma. The leaves are slightly wider than those of *E. Sanderi*, but are in other respects similar. In my opinion, the flowers are superior to those of the best forms of *E. grandiflora*; they are quite as fragrant, but do not expand so fully as that species. It is considered a natural hybrid between *E. grandiflora* and *E. Sanderi*; it certainly possesses the same robust, free-growing habit of the latter, with the large flowers of the former species. I have failed to produce seeds on this plant; it may, however, be propagated by offsets, which it produces somewhat freely if given plenty of root-run. *Geo. B. Mallett.*

NERINES.

WITH reference to the article on p. 304, I beg to state that *N. Novelty* is a very free-flowering hybrid, raised by me from seeds of *N. pudica*, fertilised by pollen of the deep crimson-coloured *corusca*; the most distinct varieties among these seedlings produce flowers which after some time take an almost blue shade.

N. sarniensis insignis and *N. s. carnosa* were probably remnants of the original plants brought home by Jacquin from the Cape. I found them at Vienna, and was allowed by the late Court-Councillor, Fenzl, to take two pots, which were simply labelled "*sarniensis*." I hereafter added the two distinctive names. *N. s. carnosa* has flowers slightly larger and more substantial than those of *insignis*, with a decided and very pleasing shade of flesh colour; but it is not so free flowering.

Mr. O'Brien, when manager at Messrs. E. G. Henderson & Son's, raised many first-rate *Nerine* varieties; among a batch of seedlings, the female parent of which was *pulchella*, and which were sent out as *atro-sanguinea*, one of them turned up in the hands of Mr. Mansell, which was afterwards named *Manselli*. This is a very beautiful kind, and has the advantage of flowering when in full leaf, as late as December. I also raised *tardiflora* and *tardiflora major*, which are equal to *Manselli*, but their colour is not of such a bright rose as this. It is this evergreen *pulchella* which should be chosen by hybridists as the female parent to produce a whole range of late flowering *Nerine*, producing bloom freely, late, and when in full leaf. *Max Leichtlin, Baden-Baden.*

SCOTLAND.

SCOTTISH APPLES.

NOTWITHSTANDING much fear of a failure of the Apple crop, the fruits have attained a size and colour such as is seldom seen in this country; and the fruit may fairly be said to have finished in prime condition. Many trees which promised an over-abundant crop were thinned as was then thought sufficiently, but it is now seen that not a few trees have borne too heavy a crop this dry and hot year. Rain has fallen for more than a week, and on October 17, 18, and 19 a gale arose from the south-east which has stripped much foliage from the trees, and spoiled not a few of the latest Apples still remaining. I think, however, that the buds being forward, next year's crop will in no degree suffer from the rude experience they have lately passed through.

Two things have been noticeable in the gardens I have had the pleasure of visiting this year. One, that trees kept open by pruning have borne large crops, while small crops were found in gardens where no

thinning of the shoots is practised. The heads of the trees left unpruned till they form a thick, tangled mass may bear well sometimes; but, as a rule, unless the growths are freely thinned, so as to produce an open crown, there is little hope of a succession of good crops. Apple-trees should always have their branches thinned while the leaves are still on them. The branches, moreover, must be cut smoothly back to those from which they spring, and in the following summer, if any buds produce shoots round the cut, they are easily rubbed off by the hand.

The other noticeable point among Apples has been the unusually fine crops borne by properly pruned trees. I would not say a word against the system that produces extraordinary crops, the fact that the fruit is there being proof that the trees are properly managed. But produce beyond the capacity of the tree or the soil to bring to its normal size is a defect in the system, and it is now—or it should be—fairly well known that the fewer fruits, in reason, a tree has to carry, the finer, under favourable conditions, will the fruit be, and the less likelihood of the tree lapsing into barrenness, and only experience will teach us to strike the mean between too few and too many, and so by relieving the tree of fruit in its young stage, we allow it not only the chance, but almost certainty of producing the size and fine quality which with good culture our climate allows. But the benefit derived from this process does not stop with the production of finer fruit. It also, to a great extent, assures the certainty of a good crop in the year following, and so on indefinitely. I have seen it somewhere pointed out that it is not the pulp of large fruit which affects the vigour of a tree, but the quantity of seeds produced in the fruits of unthinned trees which weakens them in a great degree for the present and future time. That is a fact worth remembering.

The only tree in the gardens here which was this year afflicted by red-spider was one that carried an enormous crop, which was practically of little value, because the fruit was too small, and that because it had not been thinned. Perhaps no one will dispute the above, but I rather fear that many will crave want of time to carry out thinning, and to many gardeners this is a pregnant reason. But after all, I do not think the work absorbs so very much time, I thin the crops of hardy fruit here, and it is generally done by taking an hour occasionally in the evenings. If one needed consoling about the time thus expended over a pleasant task, the consolation would be found at the gathering time, when fewer fruit would need to pass through the hand, and that all of good quality. At the same time, may I ask if the above is not somewhat of a lame excuse? We thin our Grapes and Peaches, and for exactly the same reasons Apples ought to be thinned. No fact has ever received better confirmation that it is not by the thinning of Grapes so much, as by the thinning of the berries in the bunch to the fewest number possible, consistent with their filling out the contour of the bunch, that not only perfect Grapes are produced, but also the healthiest and freest Vines. We think nothing of thinning *Pelargonium* trusses of their pips, or *Chrysanthemums* of their buds, and even cultivate the rough-growing African Marigold with one stem and one flower a top. Why not thin the fruits of the Apple?

It is one of the drawbacks of Apple culture that so many varieties are in the field, and of these we can only by experience satisfy ourselves of their value in any soil or climate. There is yet another point worth noticing. While the already over-numerous early Apples are continuously being added to, late varieties receive few additions. For example, varieties that do not succeed here are Wellington, Cellini, Lord Suffield, Cox's Pomona, and Cox's Orange Pippin.

However, there are many others from which to choose; and for early Apples I would ask for nothing better than Early Julian, known in Scotland as Tam Montgomery, classified also as a dessert fruit; Keswick Codlin, a large and fine Apple, and on several accounts the best of all soft Apples; Ecklinville, well liked in Scotland, and very acid when cooked; Duchess of Oldenburgh, which does well, and the

fruit colours well—and here it sometimes rots at the core. These are cooking Apples; and the following are good for dessert: Early Margaret, Early Peach, which should not be pruned, but only the branches thinned-out; Duchess of Gloucester, Mr. Gladstone, and James Grieve follow. Of Lady Sudeley and Beauty of Bath, I am not sure about them being good varieties for Scotland. Late varieties are King of the Pippins, nearly ready now; Ribston Pippin, Scarlet Nonpareil, Duke of Devonshire, and Cornish Aromatic. And of the later kitchen sorts, not any are superior to Warner's King, Nelson Codlin, Blenheim Orange (not always a sure cropper), Bramley Seedling (which is extra free), and a fine variety; Mère de Ménage, one of our best, but very acid when cooked; Alfriston, which produces splendid fruit, and is always a certain bearer, and the fruits keep till very late in the new year; and Northern Greening, which requires liberal cultivation and free thinning. I should be quite content with the above selection.

In some gardens, Hawthornden, Stirling Castle, Newton Pippin, Waltham Abbey Seedling, Northern Dumpling, Seaton Castle, Lord Grosvenor, Lord Derby, Beauty of Kent, Thorle Pippin, Golden Pippin, Red Calville (call-d Gaivel), and others, are deservedly held in much esteem.

SOME EARLY PEARS AT TYNNINGHAM.

Our trees of early varieties of the Pear have cropped well. I do not remember to have had *Souvenir du Congrès* better flavoured than this year, still, at its best it is insipid, and here the fruits are generally used in the kitchen. Clapp's Favourite, a variety that is, I think, well worth trying, was in Scotland extra good. Dr. Jules Guyot, a fruit very near Williams' Bon Chrétien in appearance and flavour, was this year quite as good as the last named. *Beurré d'Amanlis* is a fine Pear here, but it is difficult to keep, the core rotting soon after gathering. I am now using *Louise Bonne* (Thompson's) and *Beurré Superfin*, both delicious varieties. Knight's Monarch is this year larger than usual. It is constantly found fault with because some of the fruits drop; but severe thinning will cure this propensity. Late Pears are this year generally a poor crop, and reliance will have chiefly to be put on Winter Nelis after Christmas. Fortunately, there is none better. *Beurré Rance*, *Beurré Diel*, *Glou Morceau*, and other late Pears tried here are not to be depended upon to ripen fit for dessert. *R. P. Brotherton.*

CHRYSANTHEMUMS.

(Continued from p. 842.)

MR. E. F. SUEH'S NURSERY, MAIDENHEAD.—Here the great specialty is the production of *Chrysanthemums* for cut flowers, immense numbers being sent to Covent Garden and elsewhere, and some 60,000 plants of the principal early-flowering varieties are grown outdoors. The weather in the last month was favourable for the flowering of the plants, and on the day of my visit (October 28) the masses of colour presented an imposing sight, notwithstanding that quantities were being cut daily. Nearly an acre of one variety, *Flora*, alone is grown, a free yellow Pompon; and a large batch of *Harvest Home*, a rich bronzy-red, with gold tips to the petals, was really charming, and for general cut flower purposes nothing in the colour could be better. *Crimson Queen* was another very free and effective flower, reflexed crimson, dwarf, with stout, erect stems; *Ivory* was a very dwarf and pure white; *Ambrose Thomas*, reddish-bronze, 2 feet high; *Gustave Grunerwald* had been much cut over, but a quantity of nice flowers yet remained; *Gaspard Bouchardat*, a small bronze Japanese, very dwarf; *Sunshine*, rich bright yellow, of similar type, was also very attractive; *Strathmeath*, an old Pompon variety, was blooming freely, and had been in flower the past two months; *Roi des Précoces*, an old variety, colour rich crimson, was also doing well; *Edie Wright* is a pretty pink variety; *Queen of the Earlies*, pure white; *General Hawkes*, purple-crimson; and *O. J. Quintus*, pink. These, and many others, in smaller quantities, were blooming in perfection in the open at the end of October, while temporary glass structures had been

erected over large quarters of G. Wermig, Madame Desgranges, and a few others. A good representative collection of Japanese and other varieties is grown, but no attempt is made to produce large flowers; quantity for market, and the usual cut flower and plant trade, being the chief considerations at this establishment. C. H.

Downside, Leatherhead.

Naturally, when any grower attains to the high position which Mr. W. Mease, Mr. A. Tate's able gardener, has, as an exhibitor of Chrysanthemums, the condition of his flowers at the commencement of an exhibition season arouses special interest. This year he seems to be in first-rate order for taking the field, especially with Japanese, as with these he is exceptionally strong. In wonderful "form" indeed must be the grower who is better. Whilst he has a very fine collection of incurveds; these are later, but no doubt there will be some first-rate blooms formed a week or so hence. Mr. Mease is less enthusiastic over the incurveds than he once was. Apart from the fact that the Japanese give so much more variety in form and in colour, and so much more to look at, they give less trouble also. Then there was form in the old incurveds of the Queen and Roman types, but the fine quality shown in these is now being submerged in the big semi-Japanese incurveds that are in vogue, and these do not find favour, at least, so far as the incurved quality is furnished, with an old grower. Practically, incurved form is being so much merged into the Japanese type, that it seems hardly worth while to retain the distinction which was for so long dear to Chrysanthemum florists.

Foremost amongst the Japanese novelties at Downside is R. Hooper Pearson, a most brilliant orange-yellow flower—form of Chenon de Leché [or Mutual Friend]; without exception the most brilliantly coloured of all the yellows. It is decidedly superior for depth of colour to Modestum. This is one of Mr. H. J. Jones' seedlings, and should make a sensation in Chrysanthemum circles.

Taking the varieties as they come, the following were wonderfully fine, really superb blooms, whilst many have to be left unnamed:—Mrs. C. H. Payne, Swanley Giant, very fine, having both white and pink blooms on the same plant from diverse buds; Mrs. J. Lewis, Madame Gustave Henry, Robert Powell, better than Col. Smith; Australie, Mrs. F. A. Bevan, Mrs. C. Orchard, Mrs. W. Mease, here very distinct from C. J. Warren; Madame E. J. Nosette, Miss Nellie Pockett, very beautiful; N. C. S. Jubilee, Modestum, James Bidentope, magenta, white reverse; E. Molyneux, exceptionally fine; Mrs. White Popham, very fine blooms; M. M. de la Roche-tierre, fawn colour; Lady Ridgway, C. H. Payne, Mrs. G. W. Palmer, M. Pankoucke, Mutual Friend, Madame G. Bruant, very finely coloured; Madame B. Rivoire, Oceana, Madame Chenon de Leché, wonderfully fine and beautiful; Surprise Admiral, Mrs. E. Cannell, C. W. Davis, Pride of Madford, Miss Elsie Teichmann, Joseph Brooks, Simplicity, Robert Owen, Ella Curtis, Graphic, Matthew Hodgson, rich chestnut; Phœbus, and many others.

Amongst incurveds, the following were of great promise:—Robert Petfield, Duchess of Fife, G. Haigh, C. H. Curtis, Princess of Wales, Mrs. Heale, Violet Tomlin, J. Agate, Prince Alfred, Empress of India, John Doughty, Globe d'Or, R. C. Kingston, Lucy Kendall, Jeanne d'Arc, Brookleigh Gem, Robert Cannell, M. T. Martignat, Dorothy Foster, Ma Perfection, Madame Ferlat, Lord Rosebery, Austin Cannell, and Princess Beatrice.

The plants, of which there are several hundreds, are staged well up under the glass in two large span-houses, and every facility is furnished to enable them to be seen at their best. Out of so large a collection, many escape notice—perhaps because rather late; but these will also in due course present grand blooms for later exhibitions. A. D., November 2.

THE CHELSEA COLLECTION.

Messrs. Jas. Veitch & Sons, at the Royal Exotic Nursery, Chelsea, have this season a collection of Chrysanthemums numbering nearly 1000, 600 of

which are grown on the standard-system, for the production of specimen blooms. Though Chrysanthemums are not treated as a specialty, but rather as a feature of the soft-wooded department, and there are no seedlings to be noticed in the collection, it at the same time includes the cream of the novelties distributed even as late as last spring.

Chelsea is not an ideal situation for the cultivation of Chrysanthemums, and some varieties that have a disposition to "damp" in any locality, have a habit of exhibiting this quality to an unusual extent there. But Messrs. Veitch's capable cultivator, Mr. Weeks, contrives to produce an exhibition of the flower that would be creditable in any district.

It is one satisfaction to know that the "rust" though imported to Chelsea in the spring, has failed to propagate itself there. The following varieties were some of the novelties that were in best form at Chelsea: Nellie Pockett the fine white Japanese from Australia (F. C. C., N. C. S.); Mrs. J. W. Barker, the pretty sport from the ever popular Edith Tabor; Marie Calvat, which promises very well; Chatsworth (F. C. C., N. C. S.), the white Japanese, having petals marked with reddish-purple; Mrs. Mease, the most delicate of the Madame Carnot type, its pale primrose or lemon-tinted florets being peculiarly attractive; Mrs. Hugh Crawford, one of Mr. Jones' good yellow Japanese of last season; Mrs. Philip Mann, a pale yellow Japanese (Godfrey); Mrs. Weeks, a most handsome white incurved Japanese that is given at Chelsea to "damping;" Mr. T. Carrington, and others. But some of the older varieties have been proved to be extraordinary good "townsmen," and it is interesting to record the names of a few of these as a guide to urban cultivators. G. C. Schwabe, for instance, the well-known Japanese variety, with purple and buff colours, is almost always good at Chelsea, and it accordingly is not displaced by the new comers; then Wm. Tricker, a bright-pink flower that has gone through almost every collection, generally succeeds well; Modestum, the rich yellow novelty of a couple of seasons ago, was in fine condition; Lady Byron, too, was good, but the variety is not free from a liability to "damp." In mentioning Modestum we should have included with it another rich yellow Japanese in Phœbus. There were some good blooms of N. C. S. Jubilee, an incurved Japanese of silvery-pink colour; and of the beautiful drooping Sunflower, sometimes difficult of cultivation, but always very charming when seen in good condition. Like the last-named variety, Robert Powell is not always a success, but on the present occasion there were very fine flowers.

The several hundreds of bush-plants were looking well, and some time may be spent in noticing the adaptation of the many varieties for this system of culture. Most of them may be used, but some are more suitable than others. We saw none afford better effect than the well-known white Japanese Souvenir d'une Petite Amie, and the yellow-flowered Amiral Avellan. Ryecroft Glory was looking very bright in small pots, as partially-thinned bush-plants.

We may add, for the consolation of other cultivators who may think they have been specially unfortunate, that, in the show varieties, the grower has had to contend this season against a number of "hard" buds.

THE DOVER HOUSE COLLECTION.

There are few cultivators in the suburbs of London, we believe, who have this year a more satisfactory collection of Chrysanthemums than usual, but this is the case at Mr. J. P. Morgan's establishment at Roehampton. "There has been only one 'hard' bud," said Mr. McLeod a few days since, when showing us his plants. They have already won a 1st prize at Kingston in the twenty-four Japanese class, and 2nd and 3rd prizes in important classes at Wandsworth. About 800 plants have been grown this season, but of this number a proportion have been cultivated as bush-specimens, or for the supply of decorative blooms only. A few days ago the collection appeared to be at its best, and the selected plants were then arranged in one of the vineries. They were faced with a band of Salvia splendens

grandiflora, and together with this uncommonly bright scarlet flower they made a capital picture. The foliage was hardly less remarkable than the flowers, but the height of some of the plants is a trifle more than usual. The best of the older and the cream of the new varieties are here merged together, there being few of the valuable novelties but are in evidence. Lady Ridgway, Sunflower, Edith Tabor, and the pretty variety, M. Chenon de Leché, were especially true to character, and there were very fine blooms. Surprise, too, was most effective, and should be in every collection, by reason of its distinct colour (reddish-purple, with silver reverse), and its very dwarf and excellent habit of growth. Lady Byron, Mutual Friend, Mons. C. Molin, Mrs. R. C. Probyn, Oceana, Jas. Bidentope, Lord Brooke, Madame Carnot, the white and lovely Mrs. H. Weeks, may also be mentioned as extra fine. Lady Oporto Tait, sent out by Mr. Cannell, is going to prove an extraordinary good flower. The great width of the petals, its rich old-gold colour, and moderate height of the plants, are its points of value. Desdemona is pleasing, as offering a change from the solid blooms of some other varieties. It produces moderately few drooping petals of white and pink colours. It is very charming. There were many other varieties of Japanese, as well as the incurved section, that merited notice, but space forbids.

The "rust" was seen in this collection two years ago, but has not reappeared, although, said Mr. McLeod, no particular steps were taken to ensure this. R. H. P.

MESSRS. H. CANNELL & SONS.

Few of present-day cultivators are more familiar with the early history of the Chrysanthemum in England than is Mr. H. Cannell, sen., of Swanley. To this fact it is due in a measure that an inspection of this collection is usually of exceeding interest. From Mr. Cannell's anecdotes, one gets a few sidelights upon the earliest exhibitions, when the then novel Japanese varieties were considered contemptible, and the formal Chinese incurved flower was lauded as the only correct type of the Chrysanthemum.

Although November was a week old when our visit was made, the sun was glorious at Swanley, almost hot, and Dahlia flowers were abundant in the open. Most of the Chrysanthemums were arranged in the large span-roofed house annually set aside for their display, and in this was a very fine show indeed, and some capital blooms.

One of the features in this collection consists in a number of varieties from M. Delaux, possessing flowers with striped petals. A few of them appeared to possess qualities that may make them popular varieties providing they will come to sufficient size, and even should they fail to do this, they would be useful decorative flowers. The following were the best of Delaux's seedlings: Walter Klapp, a buff-coloured Japanese, striped with purple, inclined to be a little rough as seen; Madame la Colonel Gurnier Durand, a large reflexed Japanese white, conspicuously marked with purple stripes; Gaston Morin, also a reflexed Japanese, white, striped purple, a good grower with strong healthy foliage. Miss Mary Underhay is an Australian variety, a creamy-yellow Japanese incurved of promising character. A white sport from Mrs. C. H. Payne is named Madame Louis Remy; it is a pure white flower of the same characteristics as the type. Then Mr. N. Molyneux, a pretty white Japanese, has just sported yellow, and the novelty is to be known as Mrs. Thos. Wood. There is an American variety named W. H. Longfellow, that promises to make a large white flowering Japanese. Some flowers were still to be seen of Kathleen Rogers, a white flowering Japanese incurved, to be sent out next spring. This long-petalled Japanese comes as much as 15 inches across, and will make one of the very largest and best early bloomers.

There were some good flowers of Swanley Giant, a large incurved Japanese sent out by Mr. Cannell last year, and of Baron Tait, a yellow Japanese also sent out last year. The petals in this case are reflexed, and the type reminds one of Madame Carnot. Mr. P. Carrington, an Australian incurved Japanese, was noticed, and several of Calvat's novelties, including

the beautifully-tinted Melucina, a pure Japanese of delicate rosy-purple and white.

An unusually pretty novelty is Madame Gabrielle Debrie, a flower of the style of N.C.S. Jubilee, but lighter and more delicate in shade; the flower is large, and the petals good. Mlle. Gabrielle Seince is a large white Japanese already noticed in several collections this season, and Mrs. Randerson (?) is a very pale primrose Japanese of good depth. There were some capital blooms of Edith Tabor, and of the sport from this, Mrs. J. W. Barks. A pure white incurved of last year, named Yvonne Desblanc, was seen in good character; also Lord Justice Lopes, a rosy-purple incurved, with silvery reverse. But Mr. Cannell has an excellent seedling incurved variety, as yet unnamed. The petals are amaranth in colour, and the reverse purple and silvery; it will apparently make a very large flower, and need little "pulling up." Duke of Wellington has become a truly incurved flower at Swanley this season, and Chrysanthemum Miss Bruant is another incurved Japanese, noticed to be almost as well built as the true incurveds.

In another house was a collection of decorative Chrysanthemums, in which we found the different types and varieties of great interest in their curious forms and peculiar tints. The yellow-flowered Mrs. Filkins, for instance, was seen here, and a new white-flowering variety of the same type, with similarly twisted petals. This novelty will be a very popular one; it does not open pure white, but becomes so before the flower is fully developed. The yellow Mrs. Jas. Carter, also, was noticed here; and a single-flowering variety known as Madge is worthy of mention, through its curious mixing of crimson and yellow and white. There were many varieties of singles just at their best, and they were very attractive. We must not omit to mention Black Hawk, the darkest crimson Chrysanthemum we remember to have seen. It came from America last year, and is a reflexed Japanese, that for decorative purposes will be most valuable, as affording crimson colour of a most effective shade.

MARKET GARDENING.

BULBOUS PLANTS.

THE present is a good time to make plantings of most kinds of hardy bulbs out-of-doors for yielding supplies of cut-flowers for marketing next spring. Foremost among the numerous kinds and varieties of bulbs enumerated in the extensive and admirably got-up catalogues issued annually by our leading nurserymen and bulb-merchants, are Daffodils (double and single-flowered), Hyacinths, Tulips, Spanish Iris, Snowdrops, and Montbretias. Alba plena odorata and Van Zion are the best double Daffodils to grow; Horsfieldi, Bicolor Empress, Poeticus ornatus, and Telamonius being about the best single-flowered varieties. Hyacinths of three distinct shades of colour—red, white, and blue—will be ample, and the same may be said of Tulips, La Candeur (pure white), Rex rubrorum (bright scarlet), both producing double flowers, and the single and sweetly-scented Yellow Prince. Good spikes of Spanish Iris in various rich shades of colour—that is, mixed varieties, command a ready and remunerative sale, as also do the flowers mentioned above. Of the twenty or more varieties of Montbretias now in cultivation the old *M. crocosmiflora* is the best for marketing and other purposes. All the bulbous and Iridaceous plants indicated above will pay well for generous cultivation. If the bulbs are dibbled into ground of medium texture, into which a necessary dressing of short manure has been dug or ploughed, they will take care of themselves. A space of 1 foot will be none too much to allow between the rows of Daffodils, Hyacinths, Tulips, Spanish Iris and Snowdrops, making the holes about 6 inches deep, and at the same distance from hole to hole in the row, closing in the soil over the bulbs with the setting-stick in planting, and the work is completed. Where plenty of light manure is at hand, a surface-dressing of it placed over the ground will

prove beneficial. Bulbs of the description mentioned may also be planted with advantage in orchards and such-like places in good-sized holes made with a crowbar, dropping a handful or two of fine rich soil into each hole before and after depositing the individual bulbs therein. Bulbs planted as indicated will annually increase in size and floriferousness, and in a short time more than pay for the initial cost of bulbs and planting.

Montbretias should be planted about 6 inches deep, in rows about 18 inches apart, and at the same distance in the rows, planting the bulbs in patches of from five to seven bulbs in a patch. In point of usefulness, graceful habit of growth, colour, and freedom of flowering, few flowering plants can equal the *Montbretia crocosmiflora*; the plant is perfectly hardy, and, as already stated, exceedingly floriferous, producing several branching spikes thickly furnished with golden-coloured flowers, the spikes showing well above the elegant Gladiolus-like foliage, being from 20 inches to 30 inches high, according to the fertility of the soil. From three to five or more of the arching spikes, according to size of vase which they are intended to embellish, tied loosely together and garnished with their own foliage, are highly appreciated by both florists and customers alike, the flowers, in addition to their attractive form and colour, keeping a long time in a cut state in water. *Montbretias* planted as described above become so well established in the course of two years as to require transplanting in fresh ground in reduced patches, and October is undoubtedly the best time for doing this. No time need be wasted in sizing the bulbs in the process of transplanting; all that is necessary, the ground having been previously manured, and either dug or ploughed, is to put down the line, open holes at from 18 to 24 inches asunder, and into these drop a cluster of roots taken off the established plants with a sharp spade, burying the crowns about 6 inches from the surface, filling in the holes, and pressing the soil about the roots in doing so. Where large plantings of this charming plant are contemplated, the most expeditious and economical way to do the work is to plough them in—namely, to deposit about five bulbs in every third furrow, in patches about 18 in. apart, several persons being placed at short intervals along the furrow, placing the bulbs in position in order to keep two ploughs going without loss of time. I believe my experience of *Montbretia crocosmiflora* leads me to say the plant is perfectly hardy in any part inland of England, Ireland, and Scotland, when planted about 6 inches deep in land inclined to be light in texture rather than heavy, and dry rather than wet. I may say, that in consequence of the demand being so good for bunches of *Montbretia*, arranged as described above, for the shops, I am now extending my planting, in order to meet the demand, doing the work in the manner set forth above, but with line and spade in my case. *H. W. Ward, Rayleigh.*

CHRYSANTHEMUM NIPPONICUM.

ATTENTION was called to this as a winter-flowering greenhouse plant in the *Gardeners' Chronicle* for January 16 last year, p. 46. A group of plants of it may now be seen in flower in the temperate-house at Kew. They are compact shrubs, 18 inches in height and diameter, the erect branches clothed with dark green, oblong, spatulate leaves, 3 inches long and 1 inch wide; and numerous daisy-like flower-heads, 3 inches across, the yellow disc an inch across, and the whorled white ligules an inch long. Each plant bears about fifty of these flower-heads, which open slowly, and promise to remain in good condition for several weeks. The treatment the plants have received has been exactly that of the ordinary Chrysanthemums as regards soil, water, and exposure, but they are eighteen months old. Some of the flowers lack regularity of form, due probably to want of bright sunlight; but, on the whole, the plant deserves the attention of horticulturists, and especially that of breeders. It is of about the same degree of hardiness as the common Chrysanthemum. [Our illustration (fig. 104, p. 349)

is taken from a specimen obligingly furnished by Mr. Gumbleton. The plant was originally described by Franchet in the *Bull. Acad. Imp. Sc. Petersb.*, xvii. (1892), 420. See also Franchet and Savatier, *Enum. Pl. Jap.* 1, 254. Ed.]

BROOM HOUSE, FULHAM.

[SEE SUPPLEMENTARY ILLUSTRATION.]

IN our issue for September 22 was published a photograph of a very fine specimen of the Purple Beech, growing in Miss Sullivan's garden. But that tree does not by any means exhaust the interest possessed by this remarkable garden, which on one side is bounded by the Thames, and on another adjoins to the grounds in the occupation of the Hurlingham Club. The visitor is surprised to find so fine and so interesting a garden in an area now well within the London smoke district. Miss Sullivan's object is to have something of everything from February to October, and there is not a day in the year on which something of interest may be found.

The gardens and grounds of Broom House include about 10 acres, but the large kitchen garden and fruit and plant-houses are separated from the house and pleasure-grounds by Broom House Lane. By reference to the illustration, a good idea may be obtained of the garden immediately contiguous to the house-front, which is the river side of the residence, as already stated. In front of the house will be seen a hedge of Box about 4 feet high. During the summer this is more or less covered with flowering climbing-plants, such as *Tropæolums*, *Convolvuluses*, &c. These probably injure the hedge somewhat; but as Miss Sullivan remarked, "they look very pretty, and it is not for long." In a more remote position in the grounds one sees Hops and *Ampelopsis* climbing over Holly bushes, and over stout wooden props. Doubtless both are encouraged from a desire to see these plants growing as naturally as may be. Very close to the Box-hedge are the small beds that form the parterre flower-garden, with gravel-walks intersecting them. These have been planted this season with bedding-plants of neat habit, and have been very gay. To right and left of these, however, are beds of large size, and looking for a moment at one of them, one understands how it is, that in a comparatively small garden, Miss Sullivan appears to have something of everything. It is a square cut bed about $4\frac{1}{2}$ yards by 4 yards; in it we noticed four varieties of *Pelargoniums*, blue-flowered *Ageratums*, two varieties of *Marguerites*, *Coleus* and *Lilium candidum*. There was no mixed planting, but each variety was allotted a certain portion of the bed. This will give a key to the bedding throughout, and consequently there are few, if any, good bedding plants but have been represented there during the season just closed. Bulbs are now being planted in most of these beds, and the garden during spring presents a beautiful and varied picture. But after all, the flower-bedding is not so interesting as the numerous species of herbaceous, bog, alpine, and other plants that in all sorts of out-of-the-way but specially suitable places are cultivated with success. There is a rockery that screens a dividing wall, and is much shaded by trees. It is consequently planted chiefly with Ferns, including most of our British varieties, but a few alpine plants grow there. A better rockery, however, is one that has been made near to the embankment of the river, and in full sunshine. To the visitor, it would seem that the atmosphere would be too moist for the well-doing of alpine plants; but Miss Sullivan says that the river being a tidal river, there is plenty of fresh air, and the plants succeed well. Near to the rockery is a small pond, and in the immediate surroundings are suitable species of plants, as, for instance, *Hydrophyllum virginicum*, *Hydrangea hortensis*, several species of *Iris*, *Rhus glabra laciniata*, a very graceful plant, with much-divided leaves; Bamboos, Cannas, *Aralia pentaphylla* (or, to be more correct, *Acanthopanax spinosum*), 13 or 14 feet high; *A. Maximowiczii* (*Acanthopanax ricinifolium*). There is a fountain also, and a large stone basin. Round this are other

FIG. 104.—CHRYSANthemUM NIPPONICUM: COLOURS WHITE AND YELLOW. (SEE P. 348.)

(Pollen grains $\times 400$. Floret of the ray, and floret of the disc $\times 4$.)

uncommon species. The pretty little *Saxifraga sancta* grows close to the stones, in a clump about a foot across. It is rarely seen so vigorous, but Miss Sullivan has studied its needs, as she has done those of most of her plants, and she has found that it does not like to be watered overhead. Now a little pipe runs underneath its roots, and the necessary water is supplied by this means.

Miss Sullivan has a bog garden. It is a sunk bed, and by means of a perforated sunken pipe, the earth can be maintained at what degree of moisture is desired without any overhead waterings. Here are *Osmundas*, *Ranunculuses*, *Pratia angulata*, with its seed-pods almost like purple Turnip-rooted Radishes; *Anemone sylvestris*, *Hellebores*, *Saxifraga peltata*, *Lysimachia brachystachys*; the pretty little *Sibthorpia europæa*, and the more delicate variegated variety, *Eulalia japonica*, &c. Large beds containing herbaceous perennial flowering species, with a few Dahlias intermixed with them. The *Physalis* was pretty in these beds recently. To the right of the residence there may be seen in the photograph an old Pine-tree with a top as flat as a table. Near to this, a small lean-to glasshouse has been built, in which there were Rose-trees, and tree-Carnations planted out, a few plants of the Malmaison varieties being in pots. Some Freesias are just showing above the surface-soil—not in pots, but in the bed. The little house is surrounded by a miniature garden, where recently there were Tuberoses in bloom planted out there when the plants were quite small; also *Crinum Moorei* in bloom, early flowering *Chrysanthemums*, hybrid Cannas, Carnations, &c. Two large clumps of *Yuccas* are observed close to this house also. The conservatory attached to the house contained species of plants generally used for the adornment of like structures, but preparations were about to be made to furnish it with *Chrysanthemums*.

The old Scots Firs upon the place are looking but poorly, for they are evidently slowly dying out.

There are some fine Beech-trees in addition to the purple-leaved variety to which we have already alluded. A good specimen of the Liquidambar close to the house is, said Miss Sullivan, the only tree that has presented a good colour this season. The deciduous Cypress *Taxodium distichum* and the Tulip-tree are nevertheless represented by fine examples.

The kitchen garden and glass structures on the opposite side of the lane are under the capable supervision of Miss Sullivan's gardener, Mr. Wilson, who has been at Broom House a number of years.

CULTURAL MEMORANDA.

CALADIUMS.

The tubers of these should be very carefully dried in a warm house when the foliage begins to decay, and in this house the tubers should be kept throughout the winter. Some gardeners shake the tubers out of the soil, and place them in smaller flower-pots. I have also remarked them being wintered very successfully several in large pots filled with dry sand, and stood in the dry part of a stove, very successfully. *H. M.*

ARGYREIA SPECIOSA.

This plant forms a pretty climber for the stove, being attractive both on account of its flowers and its silvery foliage. This species is a strong grower, requiring a spacious run for its long, twining stems. The flowers are produced upon a strong peduncle about as long as the leaves, and are large and not unlike single blooms of a *Gloxinia* of a pink and purplish colour. The leaves are ovate-cordate, glabrous, and are rich green upon the upper surface, covered with a silvery tomentum beneath, with which the petioles and younger stems are also covered. A good rich compost of peat and loam suit this species well.

LEONOTIS LEONURUS.

This old plant is adapted for walls or pillars, where it will soon cover a considerable space. A plant is now in flower in the corridor here; it is about

12 feet in height, and more than 6 feet broad, and almost all the growths bear three or sometimes more umbels of rich reddish flowers. The foliage is oblong-lanceolate, with serrated margins. Of a robust habit, this plant seems capable of growing in almost any soil; here it is grown in pure loam and sand. Given a sunny position in a greenhouse, it will give an abundance of bloom in September or October. This plant is said to have been in cultivation at Chelsea Botanic Garden in 1712. *R. L. H., Edinburgh.*

WALLFLOWERS.
